The Mahrattas proper, consisting chiefly of Mahratta, Brahman, and Kunbi, scarcely exceed half a million in number, but, owing to the pro-

minent and powerful position so long occupied by them in the country, they have imposed their language and some of their customs on about twice their own number of menial and helot races, such as Dher and Mang, who, Mahratta in Nagpur, speakers of Hindi in the Nerbadda valley, only retain their individuality because they are too low in the scale for absorption. The Mahratta influence, however, did not penetrate much beyond the Nagpur plain, consisting of the lower valleys of the Wardha and Wainganga. To the south of this area the Teling races are intermingled with the settlers from the west, though not in large numbers. To the east Ch'hattisgarh is inhabited, after some fifteen centuries of Rajput ascendency, mainly by Hindu races, except in the remote eastern district of Sumbulpore, which by language belongs to Orissa. The Chamars of Ch'hattisgarh are Satnami sectarians, disciples of Ghasi Das.

The northern line of demarcation may be drawn along the southern crest of the Satpura range; for though a few Mahrattas are found on the table-land, there are probably more Hindi speakers below the ghats in the Nagpur plain, and the almost universal language of the three Satpura districts, Son, Chindwara, and Betul, is Hindi.

The older settlers are in many districts called Jharia (from Jhar, underwood, forest), and are much looser in their observances than later comers of the same caste, eating forbidden food, and worshipping strange gods. For some generations after their arrival, the northern importations generally kept up their home connection by marriage, fearing to ally themselves with degenerate brothers, who may have carried their carelessness in social matters so far as to permit mesalliances, and perhaps even to have contracted some taint of aboriginal blood. In the Hoshangabad district the Ghori (Mahomedan) kings of Malwa seem to have attained deification without distinction of persons, and a Hindu in difficulties would as soon invoke the Ghori Badshah as any other supernatural power. At Murmari, ten miles from Bhandara, the villagers worship at the tomb of an English lady, ignorant, and probably careless, of the object for which it was erected. Gujars are among the steadiest members of the community, and have a great deal too much property of their own to admit the idea of professional cattle-lifting as a possibility amongst civilised people. The Lodhi, mere agricultural drudges in Upper India, have attained some distinction as swashbucklers and marauders in the Nerbadda country, and some of their chiefs still retain all the popular respect due to families which have forgotten to live on their own industry. On the other hand, there are Rajput who have taken to banking.

Damoh has a population of 262,641 souls; there are a few Mahomedans who are cotton carders, weavers, and the like. There are upwards of sixty different castes or sects of Hindus, amongst whom as under:

Kurmi,	34,907	Brahman,	23,666
Lodhi,	31,980	Ahir,	15,281
Chamar,	28,401	Bania,	9,783
Gond,	26,724	Rajput,	9,187

The Lodhi came from Bundelkhand three centuries ago.

The Kurmi from the Doab about A.D. 1620. The Kurmi are a large class of cultivators in the eastern and central portions of Bengal, few in Dehli and in the Upper Doab. According to Sir Henry Elliot, under the different names of Kurmi, Kumbhi, Kunabi, Kumbhi, they extend throughout the greater part of Hindustan, Berar, and the Western Dekhan. They are famous as agriculturists, but frequently engage in other occupations. The Kurmi women, like the Jatni, assist the men in husbandry, and have passed into a proverb for industry:

'Bhalee jat koonbin kee, k'hoorpee hat'h
K'het nirawen apne pee ki sat'h.'

The Kurmi of the Hindustan provinces are said to have seven subdivisions, which are usually enumerated as K'hureebind, Puturya, G'horchurha, Jyswar, Canoujea, Kewut, and Jhooneya.

The Gond of Mandla have the Lamjina Shadi, in which the betrothed lad serves an apprenticeship for his future wife. A Gond girl, however, may exercise her own will and run off with a man, but it is quite allowable for her first cousin or the man whom she has deserted to abduct her from the man whom she has chosen. The Shadi Bandhoni is a compulsory marriage. In the Shadi Baitho a woman goes to a man's house. Widows re-marry either to a younger brother of their deceased husband, or to some other man.

To burn dead men is deemed the more honourable mode of disposing of the remains; women are always buried. When the father of a family dies, if well-to-do, they clothe the corpse in a new dress, and bury or burn the remains; his spirit is, however, supposed to dwell in the house till it be released, and till released, the spirit is the only object of worship in the house. After the funeral, a piece of turmeric and a pice are tied up in a cloth and suspended to one of the beams of the house. When the time comes to lay the spirit, the cloth is removed, and, with a portion of the flesh of a goat or a pig, is offered to the village deity; a feast is given to relatives, the elders, and the release is complete. Human sacrifices were made till after the middle of the 19th century at the temples of Kali at Lanji, and at the shrine of Danteswari in Bastar.

CEPHAELIS IPECACUANHA is a native of New Granada in Brazil; its emetic effects were known from time immemorial, and it received from the Portuguese the name of rais d'oro, or golden root. The father of the celebrated Helvetius established its utility, and was rewarded by Louis XIV. with a thousand louis-d'or.—*O'Sh.* p. 381.

CEPHALÆMIA OVIS or Œstrus ovis occurs in Europe and the East Indies; it lays its eggs in sheep's nostrils, and the worm from it occupies the frontal sinuses, and gives rise to fatal disease.

CEPHALOCROTON INDICUM. *Bedd.*

Adenochlæna Indica, *Bedd.*

A very common tree in the dense moist forests on the Animallays, Tinnevelly, and Travancore ghats, at 1500 to 4000 feet elevation, generally on the banks of streams, and also sparingly in Coorg and S. Canara. It is in flower and fruit at all seasons. Timber is said by the natives to be very good for building purposes.—*Beddome, Fl. Sylv.* p. 261.

CEPHALOPODA, a class of molluscous animals, comprising many recent and fossil genera and species. The fossil Cephalopoda of the cretaceous

rocks of Southern India are numerous about Ootatoor and Trichinopoly.

CEPHALOTAXUS DRUPACEA. *Siebold and Zuccarini.* A splendid yew tree of China and Japan, hardy, and rising to 60 feet. C. Fortunei, *Hooker*, is a variety. C. pedunculata occurs in China.—*Von Mueller.*

CERAMBYX VATICA, or Sal grub, burrows in the wood of that tree, and is sought for by the woodpeckers. See Insects.

CERAMIC MANUFACTURES. The manufacture of porcelain, earthenware, etc., is an art which has for hundreds of years been perfected by the Chinese and Japanese, and has also been acquired to some extent by the Asiatic races who have embraced Mahomedanism. But the Hindu races, though making many beautiful models in clays, have never finished off their work by costly glazing. Their action in this matter has been owing to their views as to ceremonial impurity, which necessitates the destruction of earthenware from many ideal pollutions; and as to break up or throw away valuable porcelain would be ruinous, they use largely copper and brass utensils, which can be purified by fire or water, and common unglazed clay-ware of little money value, which can be thrown away. Urns of elongated shapes have been discovered in ancient Chaldæa; and in British India, fine specimens of common earthenware, ancient funereal, domestic, and cooking vessels, are dug out of the old tombs in the districts of Coimbatore and South Arcot. This kind of pottery has been found in many parts of India in tombs usually arranged in circles, each tomb being built of six slabs of stone, and occasionally surmounted by large mounds of loose stones and earth. They have been thought to resemble the Druidical tombs of England, and are supposed to be of great antiquity, there being no records of them extant. The pottery found in them usually consists of tall narrow cinerary urns of 18 or 20 inches in length, with three or four clumsy feet four inches in length, and of a variety of round, oval, and flattened vessels of different shapes and sizes, some having apparently been used for cooking and others as drinking vessels. The tall urns usually contain burnt human bones, teeth, and ornaments of brass or copper; they are made of a coarse clay, which have not been finished with care. Some of the flattened oval and rounded vessels are made of a fine dense clay that has been carefully prepared; the surfaces are variously ornamented with wavy or crossed lines of red and yellow, carefully painted. The pottery appears also to have been smeared, and it resembles the potterie antique vernissée et lustrée figured by M. Brongniart. There is great purity of form in most of the vessels, which resemble the Etruscan in the precision of the curves and in the angles at which the different surfaces meet. The art of pottery appears to have deteriorated in India since these articles were made, and one branch of it, viz. the smearing or thin glazing on the surface, is rarely practised. Nearly all the porcelain used in India by Mahomedans and Christians is imported from China and Great Britain.

In *Egypt*, the pyramids of Abu Rowash, which may very well date from the so-called second dynasty of Manetho, are surrounded by heaps of broken vessels. Beside this, the pottery made at Thing Thao in China, in 2255 B.C., is modern. Scarabs made of earthenware, finely glazed with a turquoise colour, and bearing the names of such old kings as Cheops, Chephren, and others of the pyramid-building dynasties, are not at all uncommon. The potter's wheel is said to have been first used in Japan by a priest named Giyogi, a native of Idzumi, in 724 of the Christian era; and it is stated that the art of making pure porcelain was introduced into Japan about A.D. 1513.

The rarity of pottery all over *Europe* after the fall of the Western Empire is a curious fact. The practice of making encaustic tiles, which became one of the most beautiful of mediæval arts, betrays a revival; and by the beginning of the 8th century the Moorish wares of Spain had become famous. It is from an offshoot of the Moorish manufactories in the Balearic Islands that Majolica or Majorca ware gave its name to all kinds of glazed pottery. German stoneware, much of it very beautiful, reached perfection towards the end of the 16th century; but simultaneously the delicate Oiron pottery, or Henri II. ware, was begun by Hélène de Hangest, a widow of noble family, in her castle of Oiron. Only about sixty-seven specimens remain; but it has been deceptively imitated of late years.

M. Janvier asserts that the very first porcelain made in Europe was in Venice, there being in the archives a letter, dated 1470, from Uielmo da Bologna, that seems conclusively to prove this fact. This art was, however, lost, to be revived again in France about 1695. The porcelain was what is known as 'soft,'—that is, the materials from which the paste, or body, was mixed, were not thoroughly fused together. In 1709, Böttcher, a German, after repeated failures, succeeded in producing true hard paste at Meissen, near Dresden. It was not for nearly a century that hard paste penetrated to Great Britain; but in 1800, Josiah Spode created, or rather perfected, what was practically a new ware, the bone phosphate porcelain, the only kind now made in England. The English porcelain is of a soft creamy colour, very agreeable to the eye, and very suitable for decoration. Nearly all the ordinary kiln colours can be used on it, and beautiful wares of all kinds are made. In Britain, before the 18th century, pottery was rarely used; the people ate from wooden trenchers, and drank from horn cups, up to the earlier years of the 19th century.

Earthenware or Common Pottery.—There are three distinct branches of this manufacture in India, which, though similar in their manipulation, are different in their results. The most common kind is the red porous earthenware used for pots and cooking vessels, the black used for similar purposes, and the fine white which resembles some of the biscuit earthenware of Europe.

The *red porous earthenware* of India differs very materially in quality according to the locality from which the clay is selected; some are made of a common coarse earthy loam, which has very little tenacity, and yields a brittle kind of pottery, neither susceptible of much finish, nor of being glazed. Most of the pottery of India is of this description; it is made on a curious principle, which is unknown in other countries, but which has probably been followed for many centuries in India. The Indian potter's wheel is of the simplest kind. It is a horizontal fly-wheel, the frame of

wood, the rim heavily laden with clay, two or three feet in diameter, weight 60 to 80 pounds, and is put in motion by the potter's hand, assisted by a stick; once set spinning, it revolves for from five or seven minutes with a perfectly steady and nearly true motion. The mass of clay to be moulded is placed on the centre of the wheel, and the potter squats before it on the ground. This machine has doubtless several defects, but it answers its purpose perfectly. The vessels, which are mostly of a round form, are thrown thick in the neck and upper parts or sides. They are cut off the wheel, and left open in the bottom, with vertical sides; they are then allowed to harden a little in the necks, and as soon as they will bear to be handled, the sides are thinned out by beating with a flat mallet upon a rounded stone or very hard round piece of wood held inside the vessel, which is turned about and beaten till it is closed. This is a very tedious and unsatisfactory mode of working, and the only recommendation is, that it makes a thin, light vessel, but at a great sacrifice of time. From ten to twenty-eight of these is a good day's work, while a skilful European thrower will turn out 800 in the same time. Good samples of this quality of earthenware are made at Travancore from a fine smooth micaceous loam, and the general forms are good, though heavy. A finer description of this ware is made at Hyderabad, from a tough, smooth plastic clay, and the articles are remarkable for elegance of form and extreme lightness of throwing. Some of the vessels are ornamented with gold leaf and coloured lac varnishes; others are made in imitation of Beder ware; some are painted white on a red ground; a few glazed and coloured with a soft lead glaze, composed of 24 parts Moordar Sing or litharge, 3 parts Ghar ka pat'har, and 1 part copper. Sandoor, or the red oxide of lead, may be substituted for the litharge. The Ghar ka pat'har should be well burnt, slaked in cold water, and afterwards reduced to a fine powder, and mixed with the litharge. The copper is mixed with its weight of finely-powdered sulphur, and heated in a crucible till a green scale has formed on it; it is then finely powdered, and mixed with the Ghar ka pat'har and litharge. The whole is again heated, and reduced to a fine powder once more. A small quantity of this powder is well mixed with wheat starch, and kneaded well for some time; water is then added, and it is strained through a fine cloth, and the glaze is gently rubbed in with the hand, after which the pottery is baked. This process of glazing pottery is very similar to that practised in Italy, Germany, and some parts of England, where paving tiles, green flower-pots, and common red earthenware are manufactured. The Ghar ka pat'har is probably either white felspar or pegmatite, a variety of granite very abundant in Southern India, and composed of three parts felspar and about one part of quartz; but at the bangle works at Loonar lake the stone used is chalcedony. The clay which is employed is probably more refractory than the common red clays of India, most of which begin to lose their shape or to become spongy at the temperature for melting such glazes. The native furnace is simply an excavation in the ground of variable depth, in which the ware is placed layer by layer, with dry reeds, straw, etc., and all are burnt together. This rude system must of course give way to the European method, for the construction of all the superior kinds of vessels.

Black Earthenware in most instances is the red pottery blackened by the simple process of damping or checking the fire when it is beginning to decline, and thus throwing a great deal of smoke amongst the wares when the heat is not sufficiently intense to burn it off. A better and stronger kind of black earthenware is manufactured at Bangalore from a fine dense clay that contains both manganese and iron. This approaches the black stoneware of Egypt, and is strong and sonorous when struck.

White Earthenware.—Light and elegant goblets, butter pots and vases, are made at Arcot. This branch of the art is conducted with more care and cleanliness, attention being paid to the sifting of the materials and to the ornamenting and finishing of the articles. The material selected is a decaying white granite resembling the Cornish stone of England or the grauen of Germany. This is carefully washed and decanted to free it from sand or impurities; it is then allowed to subside, the water is poured off, and the soft clay is collected on a clean cloth and laid on a heap of white wood ashes to dry; a small percentage of alkali is thus absorbed through the cloth, and is incorporated through the mass by kneading. This decayed white granite is the true Kao-lin or porcelain earth of China and Europe. It is particularly abundant in India, and occurs in beds of enormous extent, and of every variety of colour. It possesses the valuable qualities of combining with a large percentage of silica, felspar, baryta, or other stony bodies, and of resisting the most intense heats; but in India it is employed alone, and produces a soft, brittle, porous ware, which is not susceptible of being well glazed. Numerous attempts have been made to glaze this description of pottery, but the glaze crazes or cracks all over the surface, and allows water to penetrate to the body. The reason is that the Kao-lins require flint, felspar, or stone to open them, and exposure to a long-continued and steady heat before they are thoroughly burnt in the biscuit state. They also require a hard fritt or porcelain glaze, which cannot be prepared without expensive machinery. The firing also involves a great consumption of fuel, as the heat must be kept up steadily for 40 or 60 hours.

In *China*, the districts of Ping-le and Kot-kow in the province of Kiang-si are the most noted for their plastic clays of all the eighteen provinces of China. Very excellent plastic clays are also found in Wy-chow, in the province of Ngan-huy; the clays are soft, smooth, and, with one exception, uniform in point of colour. The excepted clay alluded to is streaked or veined, and is preferred by many potters. Kin-tee-ching, a town near Ping-le and Kot-kow, from the most ancient times has been pre-eminent for its china-ware factories. The clays are classed as Kao-lin and Pe-tun-tse. The Pe-tun-tse is taken from the quarries to the pounding mills, and then thoroughly crushed in large mortars, by means of pestles moved by water-wheels. It is then thrown into a pond and well mixed with the water. The heavier parts fall to the bottom, but the cream-coloured liquid on the top is drawn off into another basin, where it is well stirred by labourers who walk about in it. The heavier parts that sink

to the bottom are re-pounded and treated as before. The cream-like liquid being allowed to stand, deposits its fine clay, which is formed in moulds into bricks called pak-tan, or white bricks.

The Kao-lin clay is similarly prepared, and the bricks of the two clays are separately powdered and washed, and then mixed and formed into a paste, which is ready to be formed into vessels on the wheel, or by means of knives, and hardened in the sun or in a drying chamber. They are glazed by dipping them in a fluid mixture. The painting of the porcelain is by different artists, who take respectively the landscapes, rivers, trees, butterflies, birds, human figures, and buildings, and are again fired. The designs traced upon their porcelain or china are very inferior, but the colours used by the artists who paint these designs are far superior to any European colouring. The greater part of the modern *Chinese* porcelain, so abundantly imported into Europe, is made at King-teu, near Kin-kiang, and is enamelled or painted elsewhere. *The yellow*, so much prized by connoisseurs, indicates that it formed part of the annual tribute paid by the pottery districts to the emperor.

In *Japan*, the porcelain of the small island of Anadji, in the province of Miodo, requires much skill for its production. The porcelain from the city of Arita, in the province of Saga, is the most important of all the manufactures of porcelain in Japan. Kaga ware is made in the province of Tshi-kawa, and is the best known of all the Japanese porcelain. It is often of the egg-shell quality in thinness, beautifully translucent, and almost invariably ornamented in red and gold, or red only. The Satsuma pottery is the most famous of all the Japanese manufacture. It is made in the department of Kagosina in various potteries belonging to the Daimio Satsuma. The body is very hard,—indeed, half porcelain,—of a soft greyish stone colour, pencilled, daintily coloured, and decorated with birds, insects, flowers. Nagasaki porcelain closely resembles Kaga ware in its delicate thinness and decoration. Porcelain ware of Seto (owari) in Japan is famed for its colours.—*Gray*, ii. p. 230; *Mad. Exh. Jur. Rep.* See Porcelain; Pottery.

CERAM ISLAND is the second in size of the Moluccas, having an estimated area of about 10,000 square miles. The mountains are from six to eight thousand feet in height, sending down innumerable streams to the sea. The sago palm is more abundant and productive than on any of the adjoining islands. Cloves and nutmegs grow wild. The people of Ceram approach nearer to the Papuan type than those of Gillolo. They are darker in colour, and a number of them have the frizzly Papuan hair; their features are harsh and prominent, and the women are far less engaging than those of the Malay race. The Papua or Alfuro, the predominant type in Ceram, gathers his frizzly hair into a flat circular knot over the left temple, and places cylinders of wood, as thick as one's fingers and coloured red at the ends, in the lobes of the ears. They go almost naked; but armlets and anklets of woven grass or of silver, with necklaces of beads or small fruits, complete their attire. The women have similar ornaments, but wear their hair loose. All are tall, with a dark brown skin, and well marked Papuan physiognomy (Wall. ii. 41). Of twenty-eight words of the language of Ceram, nine of the words are Malay, two Javanese, and seventeen are common to these two languages. Casuarius galeatus inhabits the island of Ceram only. It is a stout, strong bird, standing five or six feet high, and covered with long hair-like feathers. Its head has a large horny casque or helmet. The Ceram box manufacture has recently excited a degree of interest from the close resemblance it bears to the ornamental work of the North American Indians. A corresponding manufacture is met with in Borneo, with similar ornamental work of shells or wampum, but coarser.—*Bikmore*, p. 210.

CERAM LAUT. A cluster of islets are lying off the south-eastern extremity of the large island of Seran or Ceram. They produce tortoiseshell, mother-of-pearl shell, beche de mer, wild cinnamon, wild nutmegs, and birds of paradise. Ceram Laut is the most westerly and the largest of the range of small islands which extend 15 or 18 miles east and west. Ceram Laut means Ceram lying to seaward. The islands are low. Ceram Laut is the great place to which the Bugi carried the Papuan slaves stolen from New Guinea. Ceram Laut and Goram are seldom visited by Europeans. The natives of the Ceram Laut islands repair chiefly to the northern coast of Papua, or the island of New Guinea, from which they are distant only about a day's sail, to procure the various articles of produce we have mentioned, that part of this vast island being called by the Bugi, Papua Nothing. Mother-of-pearl shells are, however, procured by the Bugi themselves in greater quantities at the Aru islands.

CERASTIUM CORDIFOLIUM. *Roxb.* A herbaceous annual of Bengal. C. Indicum, *W. and A.*, is chickweed. C. dichotomum and C. vulgatum also occur.

CERASUS, a genus of plants of the natural order Amygdaleæ, which are arranged into the true cherries, the bird cherries, and the cherry laurels. Wallich and Roxburgh mentioned C. Nepalaisis of Nepal and Kamaon, C. puddum of the Himalaya, and C. triflora of China. Dr. Cleghorn mentions the Gilas, Kashmir cherry, as from one variety of cerasus, and Aru ballu, the Kābul cherry, as from another variety, both grown in gardens of the N.W. Himalaya. Griffith mentioned that there is in the Tenasserim Provinces one species of the almond tribe which abounds in prussic acid. C. capronia, the cherry tree of Europe, the Himalaya, Caucasus, etc., in Kashmir is called Aloo baloo. The kernel of this fruit contains the elements of hydrocyanic acid, and is accordingly much used for communicating its peculiar flavour to brandy and liqueurs. C. Japonica is a native of Japan, but long known in English gardens as the double dwarf almond. It is one of the most beautiful flowers that appear in the month of March. C. lauro-cerasus is the cherry laurel of Trebizond and Afghanistan, and is cultivated in Europe. The distilled water of the leaves is much used in Europe as a vehicle for opiates and other anodyne medicines, in doses up to one ounce.—*O'Sh.* p. 827. See Cinnamomum.

CERASUS CORNUTA. *Roxb.*

Prunus padus, *Linn.*

Bird cherry, . . ENG.	Jamuna, ... PANJ.
Himalaya bird cherry, „	Paras, . . . KAGHAN.

This is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 7000 to

10,000 feet about Simla. It grows to a large size, and its wood is esteemed.—*Cleghorn, Panjab*, p. 65.

CERASUS PSEUDO-CERASUS, the Ying-tau or Chinese cherry, is met with in Kiang-nan, Hu-peh, and Honan; but there seem to be several varieties, some of which have been introduced into England. It has a bright red fruit.—*Smith.*

CERASUS PUDDUM. *Wallich.*

Prunus puddum, *Lindley.*

Common bird cherry, ENG. | Paddam, Pyah, . PANJ.
Wild cherry, ... ,, | Chumiari, Amulguch, ,,

This is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 3000 to 7000 feet. Occurs in Kaghan as far as the Indus; also in Kamaon. It is a sacred tree among the Hindus. The bark is called pudmak, and used in medicine by the natives, as it is also in America.—*Cleg. Panj.* pp. 65, 81.

CERASUS SERRULATA, the fine-toothed cherry, is a native of China. C. Nipalensis, *Ser.*, is a small tree of Nepal and Kamaon. C. triflora, *Wall.*, is a shrub of Nepal and China.

CERASUS VULGARIS, common cherry.

Prunus cerasus, *Linn.*

Yuh-li, ... CHIN. | Gilas, ... PANJ.

This grows in China; is found wild in the woods of Asia Minor, where it acquires a very large size. Dr. Royle considers the cherry to be wild in Kashmir.—*Eng. Cyc.* p. 826.

CERATONIA SILIQUA. *W.* Carob tree.

Khirnoob shamee, ARAB. | Locust bean, . . . ENG.
Nubtee, Kharnob, . ,, | Saint John's bread, ,,

The carob tree was introduced into the Saharunpur gardens, and has been tried at Madhopur and other places in the Panjab, as at Lahore, and succeeds fairly. A thick, pulpy, flat, brown, curved pod contains hard red seeds resembling those of the tamarind, embedded in red fibrous pulp. Used by the natives in coughs attended with much expectoration. The pods are used for food, both for men and horses, along the coasts of the Mediterranean, and are said to improve the voice of singers. The seed of this tree is the original of the carat of jewellers.—*Powell, Handbook*, i. p. 342; *Spry's Suggest.* p. 54; *Ainslie.*

CERATOPETALUM APETALUM, the coach-wood, leather-jacket, and light-wood of New Zealand and Australia, is abundant about the Illawara district. It grows to 45 and 50 feet high and 6 feet round. Its wood is soft, fine-grained, light, and has an agreeable fragrance. It is valued for cabinet work and coach-building, but will not bear exposure to wet. C. gummiferum, the Christmas tree, officer tree, and light-wood of Australian colonists, is used for decoration at Christmas times. It is wild near Sydney; grows straight to 15 or 30 feet in height.—*G. Bennett.*

CERATOPHORA STODDARTII, a lizard of the Kandyan hills, remarkable for having no external ear. It acquired its generic name from the curious horn-like process on the extremity of the nose. This horn, as it is found in mature males of ten inches in length, is five lines long, conical, pointed, and slightly curved up.—*Tennent.*

CERATOPTERINA, a group of fishes, in which occur—

Dicerobatis japonica, *M. and H.*, Japan.
D. eregoodoo, *Cant*, Indian seas.
D. Kuhlii, *M. and H.*, Indian Ocean, Archipelago.
Ceratoptera Ehrenbergii, *M. and H.*, Red Sea.

CERATOSTEMA. *Roxb.* A genus of plants. Roxburgh described C. vaccinacea, *Roxb.*, and C. variegata, *Roxb.*, the jalamoot of Bengal, both of them shrubs. The latter is a native of mountain forests near Chittagong, Sylhet, and on the Garo hills, where it blossoms during the cool season, when its numerous, most beautiful, large, variegated, rosy flowers are highly ornamental; the seed ripens in July.—*Roxb.* ii. p. 413.

CERBERA, a genus of plants belonging to the natural order Apocynaceæ. Dr. Roxburgh described C. fruticosa, C. odallam, *Gært.*, and C. maculatum, *Willde.* C. tanghin, the tanghin tree, was formerly used in Madagascar for the trial by ordeal. C. thevetia is a large shrub with leaves like the oleander, and bell-shaped yellow flowers. Its milk is poisonous, bark bitter and purgative, also said to be powerfully febrifuge, two grains being affirmed to be equal to a common dose of cinchona. According to Royle, perfectly naturalized in India.—*O'Sh.* p. 446; *Riddell.*

CERBERA MANGHAS. *Linn.*

C. lactaria, *Buch.* | C. quaternifolia, *Roxb.*
Kullooa, ... BURM. | Kaner zard, . . PERS.
Pili karbir, . . HIND. |

This tree grows in Pegu, Tenasserim, Tavoy, Penang, Singapore, Java, Moluccas, and the adjacent islands, in wet situations. Its fruit is used very extensively by the Burmese, to make an oil which they burn in their lamps and use to anoint their heads. The kernels are described as emetic and purgative. The leaves are said to be used in Java as a substitute for senna, and the bark is said to possess similar properties.—*Roxb.; Voigt; Mason; Eng. Cyc.*

CERBERA ODALLAM. *Gærtn.* Odallam tree.

Cerbera manghas, *Sims.* | Tanghinia odallam, *Don.*
Odallam, . . MALEAL. | Kat-arali, ... TAM.

Common on the western coast of India, Maldives, and Laccadives. Wood white and spongy. Nut narcotic and poisonous. The green fruit is employed to kill dogs.—*Roxb.* i. p. 692.

CERBURA, in the mythology of the Hindus, a varied-coloured dog, one of the dogs of Yama. He has a second dog, called Syama, or black. Cerbura is undoubtedly the Cerberus of the Greeks. Cerbura has other names, all meaning spotted, but it is also called Tri-sira or three-headed. See Yama.

CERCOTRICHAS, a genus of birds in India, known as bulbuls, C. erythropterus, C. Luzoniensis, C. macrourus. See Bulbul.

CEREAL GRAINS of several kinds are cultivated for food. The seeds of all the gramineæ, those of the darnel alone excepted, are capable by cultivation of becoming alimentary. The value of grains, generally speaking, is directly as the size of the caryopsis, and inversely as the thickness of the pericarp. When the grain abounds in perisperm, it is heavy; when the envelope is thick, the grain is, on the contrary, light, thus:—

100	seeds of	wheat	weighed	4·50 grains.
100	,,	barley	,,	3·85 ,,
100	,,	rye	,,	2·60 ,,
100	,,	oats	,,	2·50 ,,

The chemical composition of the grain influences materially the quality of the resulting bread. If the gluten be absent, no fermentation takes place in the dough; if the gluten be in excess, the bread is heavy and acid. Wheat flour may be considered the type of all that is suitable for alimentary

purposes, and in the degree of deviation from this standard consists the inferiority of the other grains. The grains or ears of nearly all the cereal grasses are subject to diseases resulting from attacks of parasitic fungi, animalculæ, and insects. The liability of the seeds of grasses to parasitic infection is explained by the large amount of nitrogenized matter contained in them, and to their softness of texture; and some of the diseases occasion the greatest injury to the agriculturist. Little is known as to the native countries of the cereal grains. The prevalence of particular grains in the earth's zones and continents, has resulted not alone from climate, but has been determined by the civilisation, industry, and traffic of the people, and often by historical events. Without cultivation, all the cereals degenerate. As they now exist, they seem to have been greatly improved from their natural state. Wheat has five, six, or seven distinct species, barley three, and oats two, three, or four. In the scuth and east of Asia, the following grains belonging to the grasses (Panicaceæ or Graminaceæ) are the more largely cultivated:—

Eleusine coracana, *Gært.*, ragi.
E. stricta, *Roxb.*, ,,
Hordeum distichon, *Linn.*, barley.
H. hexastichon, *Linn.*, common barley.
H. vulgare, *Linn.*, spring barley.
Oplismenus frumentaceus, *Roxb.*
Oryza sativa, *Linn.*, rice, black and red.
Panicum miliaceum, *Willde*, common millet.
P. miliare, *Lam.*
P. Italicum, *Linn.*, Italian millet.
P. Germanicum, *Linn.*, German millet.
Paspalum stoloniferum, *Linn.*
Penicillaria spicata, *Willde*, spiked millet.
Poa Abyssinica, *Aiton*, teff plant.
Sorghum bicolor, *Willde.*
S. cernuum, *Willde.*
S. saccharatum, *Pers.*
S. vulgare, *Pers.*, great millet.
Triticum vulgare, *Vieill.*, wheat.
var. (a) æstivum, two varieties.
,, (b) hybernum, ,, ,,
Zea mays, *Linn.*, maize.

CERES. The representative of Ceres, amongst the Hindus, is Lakshmi or Sri. Amongst the Rajputs, Gouri seems to be the analogue of Ceres, and on the festival of the Ahairea, or Muhurat ka Shikar, they hunt, slay, and eat the wild boar.

CEREUS, a genus of the Cactaceæ. About twenty species introduced into India. Many of the species produce beautiful flowers. The stems are angled and jointed; the blossoms open in the evening or during the night, and die away towards the morning. C. flagelliformis of S. America, which grows in Asia and Africa, is the creeping cereus; C. grandiflorus, *Mill*, is the night flowering cereus. C. hexagonus, *Linn.*; C. senilis, the old man's torch thistle; C. speciosissimus, C. triangularis, *Linn.*, and C. truncatus, occur.—*Voigt.*

CERIOPS CANDOLLEANA. *Arnot.* Chowree or Kirree, SIND. A tree of Sind. Wood used for building boats and barges; makes useful knees. The barks of Ceriops candolleana and Rhizophora mucronata are much used in Sind in tanning.

CERIOPS ROXBURGHIANUS. *Arnot.*
Rhizophora decandra, *R.* | Bruguira decandra, *Gr.*
Garan, ... BENG. | Ka-by-ain, . . . BURM.

Grows on all the coasts of tropical Asia. Wood dark reddish, hard, and durable; flowers large, white, and sweet-scented. The bark is used in India for dyeing.—*Voigt; Malcolm.*

CERIORNIS MELANOCEPHALA and C. satyra, Argus pheasants.

CERITHIADÆ, the Cerite family of molluscs, comprising several genera, mostly recent.

CERNE, the name given by the Portuguese to the island of Mauritius on its discovery. Subsequently, while in the possession of the French, it was called l'Ile de France, the Isle of France.

CEROPEGIA, a genus of plants of the nat. ord. Asclepiaceæ. They are creepers and trailing plants. C. Arnottiana, *Wight*, is the Oo-ta-lung of the Burmans. C. bulbosa, esculenta, lucida, juncea, Lushii, elegans, Stephanotis, stapeliæformis, and tuberosa occur in India. C. bulbosa, *Roxb.*, occurs in many places, and every part of it is eaten by the natives. Its roots are of the size of a small apple, and when fresh taste like a turnip. —*Roxb.*

CEROPEGIA ESCULENTA. *Edgeworth.* Galot, PANJ. In Multan its acid leaves and tubers are used as a vegetable.—*Dr. J. L. Stewart.*

CEROPEGIA JUNCEA. *Roxb.* A twining plant; grows all over India. It is succulent, with an agreeable acid taste, and is much eaten as a salad by the people.—*Mr. R. Brown.*

CEROPEGIA TUBEROSA. *Roxb.*
C. candelabrum, *R.*
Bach-chali-manda, Pulla manda, . . . TEL.

The word manda is applied to several species of ceropegia.—*Voigt.*

CEROSTERNA GLADIATOR, a longicorn beetle of India. It eats the bark of casuarina trees.

CEROXYLON ANDICOLA, or wax-palm, a native of the Andes of Columbia, of immense height, often attaining 150 to 180 feet in its length. From fissures in the trunk there flows spontaneously a kind of grey waxy subtance, containing two-thirds of resin and one-third of wax identical with that formed by the bee. Melted with a little suet, this wax makes excellent tapers. Its introduction into India merits attention.—C. australi, *Martins*, is of Juan Fernandez; C. Klopstockia, *Martins*, of Venezuela.—*O'Sh.* p. 641; *Von Mueller.*

CERRUS, the Ohee valayati of the Jullundhur Doab. It grows to the height of about 25 feet. Wood of the old tree brownish, soft, brittle, light. Not ordinarily used as a timber for large buildings, but employed by farmers in their buildings.

CERTHIA FAMILIARIS with C. Himalayana, etc.; and not unfrequently the exact European species inhabit India.

CERTHILAUDA DESERTORUM of Spain and N. Africa, inhabits Sind; and the Ammomanes Lusitania occurs in the deserts of N.W. India, being replaced further south by A. phœnicura.

CERUSE, white lead, carbonate of lead.

Fen-sih, ... CHIN.	Safeda, ... HIND.
Carbonate of lead, ENG.	Cerussa, . . . ITAL.

Used as white paint.

CERVIDÆ, a family of mammalia belonging to the tribe Ruminantia. They are remarkable for their fine horns, called antlers, which they shed annually, and the females of the reindeer, of all the family, possess horns normally. The sub-families of the family Cervidæ comprise the Cervinæ, or true stag, with the genus Cervus, and the Rusinæ, which includes the genera Rucervus, Rusa, Axis, and Cervulus. But the deer tribe of Southern and Eastern Asia have presented unusual difficulties to the scientific men of Europe. Indeed, Schinz (Nachtrage zum 2ten Bande) suggests that under the denomination Cervus muntjak six different species lie hid, viz.:

1. Cervus styloceros, *Schinz*, syn. C. muntjak, *Linn. apud Ogilby*, hab. Himalaya;
2. C. Ratwa, *Hodgson*, hab. Himalaya;
3. C. albipes, *F. Cuvier*, hab. India;
4. C. muntjak, *Raffles and Horsfield*, hab. Sumatra, Banka, Borneo, and Java;
5. C. Reevesii, *Ogilby*, hab. China;
6. C. Antisiensis, *Pucheran*, hab. Andes;

and the names applied by sportsmen are almost as varied as the synonyms of the scientific writers. In the genus Cervus of the sub-family Cervinæ, the horns of adults are typical, with two basal tines, a median tine, and the summit more or less branched. The red deer of Scotland is typical of this group; two species, outliers of Northern and Central Asia, occur in British India, one in the extreme N.W., and the other in the extreme N.E. corner of the province, and others in Eastern Asia. The name of the tribe is obtained from cervus, the stag.

(*a*) C. Wallichii, *Cuv.*, tailless deer of India.
C. pygragus, *Hardwicke.* | Kashmir Stag.

Red deer, . . . ENG.	Maral; Goo-koohi, PERS.
Bara Singha, . . HIND.	Gevezu, ... ,,
Jezrail, ... ,,	Giana, ... TIBET.

Occurs in Persia, Nepal, and the sal forests.

(*b*) C. affinis, Tibetan stag of Hodgson.

Sal forest stag, . . ENG.	Stroa, ... TIBET.
Sikkim stag, . . ,,	

Occurs in Tibet and the sal forests.

(*c*) C. sika, the sika of Japan, of a dark brown colour, with slender horns.

(*d*) Panolia acuticornis. *Gray.*

P. Eldii, *Gray.*	C. frontalis, *M'Clelland.*
Rusa lyratus, *Schinz.*	C. Eldii, *Cal. J. N. H.*
Cervus lyratus, *Schinz.*	
Sangnai, . . . HIND.	Sangrai, ... HIND.

Occurs in the Munipore valley and in the Malay Peninsula; is exceedingly wary.

(*e*) Rucervus duvaucelli, *Cuv.*

R. elaphoides, *Hodgson.*	C. elaphoides, *Hodgson.*
Cervus duvaucelli, *Cuv.*	
Bara Singha, . . HIND.	Buraya, ... HIND

Spotted deer of the Sunderbuns. It inhabits the eastern and northern skirts of Bengal and Hindustan, and the Sunderbuns. It inhabits reedy marshes and the islands of great rivers, never entering the mountains or forests. The tail is short, with no caudal disc and no heavy mane.

(*f*) Rusa equina, *Cuv.*, *Ham. Smith.*

Cervus rusa, *Raffles.*	Rusa equina, *Gray.*
C. equinus, *Cuv.*	R. hippelaphus.
C. hippelaphus, *Elliot, Cat.*	
Rusa etam of the people of Sumatra.	Samboo deer of Bennett.
	Sambur of the Mahrattas.
Rusa etam, . . MALAY.	Sambara, . . . SANSK.
Rusa kumbang, . ,,	Eland or elk of Dutch
Kumbang, . . ,,	sportsmen.

It inhabits the Dekhan, S. Mahratta country, Sumatra, Borneo, and Banka. It is of a pale brown colour. Considering the similarity of colours and size of C. equinus, hippelaphus, and Aristotelis, Mr. Elliot is probably right in considering all three as varieties of the great Indian stag, described by Aristotle under the designation of Hippelaphus; and C. Peronii, *Cuv.* (Cerf du Timor), may probably be added as a fourth variety.

(*g*) Rusa hippelaphus, *Cuv.*

Cervus hippelaphus, *Cuv.*	Rusa Moluccensis of *Gray, Smith.*
C. Timorensis, *Müller.*	
C. Moluccensis of *Quoy* and *Gaim.*	
Sambur of India.	Hippelaphe of F. Cuv.
Mijangan Banjoa, Malay of Java.	Cerf d'eau of Duvaucell.
	Rusa of Java and Sumatra.
Cerf noir du Bengal of Cuv.	Roussaitan ,,

It inhabits the great forests of India, Bengal, Sumatra, and Java. It is about the size of the common stag. In winter is of a greyish-brown, and in summer it is of a brighter and more golden brown. The croup is pale yellow, and the tail is brown, terminated by rather long hair, which is rough and hard; and all about the head and neck and cheeks grows long, like a mane and beard.

(*h*) Rusa Aristotelis, *Cuv.*, *Gray*, *Samber.*

Cervus Aristotelis, *Cuv.*	C. heterocerus, *Hodgson.*
C. hippelaphus, *Ogilby.*	C. Bengalensis, *Schinz.*
C. unicolor, *H. Smith.*	
Jarai; Jerrow, . HIND.	Daim noir de Bengal of
Cerf de Coromand. of Cuv.	Duvaucell.
	Samboo deer of Bennett.

It inhabits the great forests of India. It is not gregarious, and ruts and drops its horns in spring. Mr. Hodgson describes four varieties of this deer.

(*i*) Rusa dimorphe, spotted rusa.

Gower, ... HIND.	Gever, ... HIND.

Occupy the sal forests of India. Colour of a red brown.

(*j*) Rusa Peronii, the smaller rusa; inhabits Timor, Lombok, Bawian, and Ternate.

(*k*) Rusa Philippinus.
Cervus Marianus, *Cuv.*

The Philippine rusa.	Cerf de Philippines of Desmarest.

(*l*) Rusa lepida, the Sundevall rusa, a native of Java, scarcely as large as a roebuck.

(*m*) Axis maculatus, *Ham. Smith, Gray.*

Axis plinius, *Erxleben apud Gmelin.*	Cervus nudipalpebra, *Ogilby.*
Cervus axis, *Elliot.*	*Black var.*
C. pseudaxis, *Gervois.*	Axis major, A. medius,
Axis maculatus.	A. minor, *Hodgson.*
Rusa bunga, Malay of Peninsula.	Thou langna of the Terai.
	Hog-deer.
Spotted deer of India.	Spotted hog-deer of Hodgson.
Chitra, ... SANSK.	
Chital deer of Hodgson and Elliot.	

Inhabits India, the Malay Peninsula. In size and form it resembles the fallow-deer, and at the shoulder its height is two feet six or seven inches. The ground colour of the skin is at all times a rich fawn spotted with white, but is nearly black along the back and snow-white below. It has a white longitudinal line on the flanks. It lives near water in the jungles; feeds at night. It is timid, indolent, and gentle; is easily domesticated, and propagates in captivity. It is the spotted deer of Indian sportsmen. The skin and horns of this graceful deer are articles of commerce. In the years 1851 to 1855 Liverpool imported about 700 skins and 20,000 horns a year. They are not so generally distributed as the sambur, but in many districts are far more plentiful. They go in herds of from six to sixty. So many as six have been killed by one gun during the brief cool stalking hours of the morning and evening. A. porcinus, *Cuv.*, is the hog-deer of Jerdon.

Cervus muntjak, *Zimm.* Cervulus aureus, *Jer.*

Kankuri, . . . CAN.	Bekra, ... MAHR.
Jungli Bakra, . . DUKH.	

This animal does not seem to differ in any respect from the kijang of the Eastern Islands. A young male of this species is of a deep chestnut colour, which becomes browner as the animal grows older. It obtains its Canarese name from its habit of frequenting the kans or natural forest gardens.

(*n*) Hyelaphus porcinus, *Sundev.*

Cervus porcinus, *Zimmer.*	Var. Axis niger, *Dr. F. B. Ham.*
C. hippelaphus var. 3, *Cuv.*	
Para, ... HIND.	Porcine deer of Pennant.
Parha, ... ,,	Sugoria, . . . HIND.
Khar, ... ,,	Shgoria, . . . ,,
Laghuna, . . . ,,	Brown porcine axis of Hodgson.
Hog-deer, . . . ENG.	

Inhabits Ceylon, India, and Assam. Its legs are shorter than those of the axis; it has no black dorsal streak, and no white streak on the haunches. Horns generally short, with short snags. They live in herds on the plains, and do not ascend mountains.

Cervus pumilis of H. Smith is supposed to be a variety, and Cervus dodur of Royle is supposed to be a distinct species.

(*o*) Cervulus vaginalis, *Bodd., Gray.*

Cervus muntjac., *Zimm.*	Cervus plicatus, *Foster.*
Prox. ,, *Zimm. & Sundev.*	
Rib-faced deer of Pennant.	Kidang of the Javanese.
Chevreuil des Indes of Allamand.	Kijang of the Sumatrans.
The Rae of Europeans in Borneo.	Muntjak of the Sundanese.

It inhabits Sumatra, Banka, Borneo, and Java. Its height at the shoulders is about 2 feet 2 inches. On its face are two rough raised folds of skin, marking it with the letter V, the point below; colour, reddish brown or a light brown; belly and front of thighs, pure white. In Java it occupies districts with long grass, and the Saccharum (Holcus) spicatum (allang-allang, JAV.), and Phyllanthus emblica are its favourite food; but Hibiscus, Grewia, Urena, and other malvaceous plants are eaten by it. It is impatient of confinement. The points of its horns are turned forwards; it is about the size of the antelope, which, with the exception of the horns, it resembles in general appearance.—*Low's Sarawak*, p. 76.

(*p*) Styloceros muntjac., *H. Smith.*

Cervus muntjac., *Zimm., Horsf., Sykes, Elliot, Boddært, Schreber, Marsden, Desmarest, Linn.*

Cervus vaginalis, *Foddært.*	Cervus Philippinus, *Smith.*
C. moschatus, *Blainville.*	C. albipes, *F. Cuv.*
C. sub-cornutus ,,	C. ratwa, *Hodgson.*
C. moschus, *Desmarest.*	Muntjacus vaginalis, *Gray.*
C. aureus, *Ham. Smith.*	
Chevreuil des Indes of Allamand.	Kidang, . . . MALAY.

It inhabits the Malay Peninsula, Java, Sumatra, Banka, Borneo, Tenasserim, Nepal, Assam, Bengal, S. Mahratta country, Dekhan.

(*q*) Cervulus moschatus, *De Blain.*

Cervus muntjac., *Sykes, Elliot.*	Cervus Ratwa, *Hodgs.*
C. moschus, *Desmarest.*	Prox. Ratwa of Sundevall.
Styloceros ratwa, *Hodgs.*	P. Albipes of Wagner.
Barking deer of Nepal.	Bekra Mahr. of Elliot.
Ratwa, ... HIND.	Rib-faced deer of Pennant.
Kaher, ... ,,	Jungle sheep.
Baiker of Mahrattas.	

Inhabits India, living in forests in the mountains. It is of a bright reddish yellow colour, with the chin and gullet whitish. The hair is not ringed as in Cervulus Reevesii; six or eight live together. Horns of male fall in May; the females have bristly tufts ending in a knot instead of a horn.

(*r*) Tragulus kanchil, *Gray.*

Moschus palandok, *Marsden.*	Moschus kanchil, *Raffles.*
	M. fulviventer, *Gray.*
Javan musk, . . . ENG.	Kanchil, . . . MALAY.
Chrevrotain de Java, FR., of Buffon and Gray.	Palandok, . . ,,

Inhabits Malay Peninsula, Penang, Lancavay Islands, Sumatra, and Java. The largest adult measures from nose to root of tail 1 foot 6½ in.

(*s*) Tragulus Javanicus, *Pallas.*

Moschus Javanicus, *Gmelin, Pallas apud Raffles.*	Moschus Napu, *F. Cuv.*
Moschus Indicus, *Gmelin.*	Cervus Javanicus.
Oshek Napu, MALAY.	

Inhabits the Malay Peninsula, Sumatra, Java, and Borneo.

(*t*) *Cervulus Reevesii*, Chinese muntjak. A native of China. C. vaginalis, C. moschatus, and C. Reevesii breed together.

(*u*) *Cervulus Pygargus.*

Cervus Pygargus, *Pallas.*

Ahu, ... PERS.	Tailless deer of Pennant and Shaw.
Siaga, . . . TARTAR.	
Tailless roe of Pennant.	Dikajakosa, . . RUSS.

A native of Central Asia.

(*v*) Næmorrhedus Sumatrensis, *Ham. Smith.*

Antilope Sumatranus, *Pennant and Raffles.*	Antilope intus-capularus, *Lichtenstein apud Schinz.*
Kambing utan, . MALAY.	Cambtan of F. Cuv.

Numerous on the Malay Peninsula, but frequents the steepest hilly localities; is shy and active, and exceedingly difficult to obtain.—*Journ. As. Soc. Bengal; Eng. Cyc.; Horsfield and Moore, Cat. E. I. Museum; Jerdon.*

CESAR FREDERICH, a merchant of Venice of the sixteenth century, who wrote of Tenasserim.

CESARIAN ERA of Antioch was established there in celebration of Cæsar's victory at Pharsalia, A.A.C. 47.

CESTRACCION PHILIPPII, the Port Jackson shark or dogfish, usually 3 to 4 feet long.—*Bennett.*

CETACEA, an order of mammals which live in the ocean. Amongst them are the whales, the largest of creatures now existing; also the dolphins, the porpoises, and the dugong. They have fin-like anterior extremities, the posterior extremities being absent, or rather their place supplied by a large horizontal caudal fin or tail. They have no hair on their skin, have no outer ear, and the

bones of the neck are so compressed as to leave the animal without the appearance of a neck. Some of them eat plants, or are phytophagous; some are zoophagous, or animal-eaters. Seven new species of cetaceans have recently been described from the Bay of Bengal, six of the family Delphinidæ, the seventh belonging to the sperm whales Physeteridæ, to be called Physeter (Euphysetes) simus. Professor Owen described the following species from collections made mostly near Vizagapatam by Sir Walter Elliot,—Delphinus fusiformis, D. godama, D. lentiginosus, D. maculiventer, and D. pomeegra; also Phocæna brevirostris, and Physeter simus. The Cetacea are divided by naturalists into two great families, the Balænidæ or whales, the Delphinidæ or porpoises.

Whales.

(*a*) Balæna mysticetus, the Right Whale.

B. Grænlandica, *Linnæus.*	B. Rondolettii, *Willoughby.*
B. vulgaris, *Brisson.*	
Right whale, . . ENG.	*Var. a.* Nord kapper whale.
Whalebone whale, . ,,	Nord caper whale.
Greenland whale, . ,,	*Var. b.* Rock-nosed whale.

According to Lesson, inhabits all the seas of the globe.

(*b*) Balæna marginata, *Gray*, the western Australasian whale, has very long and slender baleen, with a rather broad black edge on the outer or straight side.

(*c*) Balæna australis, *Des Moulins.*

B. antarctica, *Lesson.*

Right whale of South Sea whalers.	Common black whale of Sir James Ross.
Southern whalebone whale of Nunn.	

Inhabits the South Seas; and multitudes were seen by Sir James Ross in very high latitudes. It is of a uniform black colour.

(*d*) Balæna Japonica, the Japan whale, is an inhabitant of the coasts of Japan, which it visits periodically. Its head is covered with barnacles.

(*e*) Balæna antarctica.

B. antipodarum, *Gray.*

New Zealand whale. | Tuku Peru, New Zealand.

Inhabits the New Zealand ocean.

Finners.

(*f*) Balænoptera Indica, *Blyth*, is the Indian fin whale. B. boops, *L.*, the great rorqual, and B. musculus, *L.*, the lesser rorqual, are both found in European seas.

(*g*) Megaptera kuzira, the kuzira. It inhabits the Japanese seas.

(*h*) Physalis Iwasi, the Japan finner. It is very rare. In 1760, one 25 feet long was cast ashore at Kii.

(*i*) Physalis antarcticus, *Gray*, inhabits the New Zealand seas.

(*j*) Physalis Braziliensis, Bahia finner, was brought from Bahia.

(*k*) Physalis australis, the southern finner, inhabits the seas of the Falkland Islands.

Sperm Whales, Physeteridæ.

(*l*) Catodon macrocephalus, northern sperm whale.

Physeter macrocephalus, *Linn.*	P. trumpo, *Bonnaterre.*
P. gibbus, *Schreber.*	Catodon trumpo, *Gerrard.*
	Cetus macrocephalus, *Oken.*

Its principal food are the sepiadæ or cuttle-fish, but it swallows small fishes.

(*m*) Catodon Colneti, the Mexican sperm whale, is an inhabitant of the North Pacific, the South Seas, and the equatorial oceans.

(*n*) Catodon polycyphus, South Sea sperm whale. The cachalot or sperm whale inhabits the Southern Ocean.

(*o*) Catodon kogia, *Gray*, taken near the Cape of Good Hope. It has a short head, and is supposed to be the young of C. polycyphus.

(*p*) Beluga Kingii, has been taken off the coasts of Australia, where it represents the white whale B. catodon, Catodon macrocephalus.

(*q*) Physeter simus, *Owen;* Euphyseles simus, a new species.

(*r*) Globiocephalus Indicus, *Blyth*, the Indian Ca'ing whale. In 1852 a shoal (schule or school of sailors) was carried by a current into the salt water lake near Calcutta.

Delphinæ, Dolphins.

(*a*) Neomeris phocænoides, *Gray.*

Delphinus melas, *Ternus.*

A dolphin of the Indian Ocean.

(*b*) Phocæna communis.

Phocæna Rondolettii, *Will.* | Delphinus phocæna, *Linn.*

Common porpoise, or porpesso.

(*c*) Grampus sakamata, *Schlegel.*

Sakam kuzira, . . JAPAN.

Found off the coast of Japan.

(*d*) Grampus Sieboldii.

Naiso gata, . . JAPAN.

A native of the coasts of Japan.

(*e*) Grampus macrorhynchus, black fish of the South Sea whalers; it inhabits the South Seas.

(*f*) Delphinapterus Peronii, right whale porpoise of whalers. It is found on the Brazil bank, off the coasts of New Guinea, and the higher southern latitudes. It lives in large shoals, and its flesh is esteemed a delicacy. It is black; but the beak, the pectoral fins, and under part of the body are white.

(*g*) *Delphinus.* — Seafaring people call the species of this genus bottle-nose, bottle-head, flounder-head, grampus, porpoise, porpesse, or porpus, sometimes even whale, and give the name of dolphin to the Coryphæna, a scomberoid fish which changes colour when dying. There are several species of Delphinus:—

(*h*) Delphinus Heavisidii, the hastated dolphin, inhabits the South Sea and Cape of Good Hope.

(*i*) Delphinus obscurus, the dusky dolphin, inhabits the Southern Ocean and Cape of Good Hope.

(*j*) Delphinus abusalam inhabits the Red Sea.

(*k*) Delphinus eutropia inhabits the Pacific Ocean and Chili.

(*l*) Delphinus Novæ Zealandiæ, the New Zealand dolphin, inhabits New Zealand and Cape Gable.

(*m*) Delphinus Forsteri, Forster's dolphin, inhabits the Pacific Ocean between New Caledonia and Norfolk Island.

(*n*) Delphinus sao inhabits Madagascar.

(*o*) Delphinus longirostris, the Cape dolphin, inhabits the seas about the Cape of Good Hope and the Southern Ocean.

(*p*) Delphinus perniger, *Elliot, Blyth*, the black dolphin, Bay of Bengal.

(*q*) Delphinus plumbeus, *Dussumier*, the plumbeans dolphin of the Malabar coast.

(*r*) Steno attenuatus, *Gray.*

(*s*) Steno Malayanus.

Delphinus plumbeus, *Dussumier, Cuv.*	Delphinus Malayanus, *Lesson apud Cuv.*
Parampuan, LAUT, MALAY.	Dolphin ventre roux of Paris Museum.

Inhabits the Malabar coast and coasts of Penang. It is numerous, and rather heavy in its movements, but is rarely captured, except by chance in the stake-nets. It eats small fishes, Clupea and Glyphisidon cœlestinus, *Cuv.*

(*t*) Steno frontatus inhabits the Indian Ocean and the Pacific.

(*u*) Platanista Gangetica.

D. rostratus, *Shaw.*	Delphinus Shawensis, *Blainville.*
Platanista, . . . Pliny.	Sou-sou, ... INDIA.
Dauphine du Gange, T. Cuv.	Susa, ... Buffon.

Inhabits the Ganges and Irawadi.

(*v*) Platanista Indi, *Blyth*, the porpoise of the Indus, larger and more robust than P. Gangetica.

(*w*) Halicore dugong.

Trichechus dugong, *Gmel.*	Dugungus Indicus, *Ham.*
Indian Dugong, . ENG.	Le dugong des Indes, FR.

Inhabits the shallows of the Indian Ocean and about Ceylon, where the water is not more than two or three fathoms deep. It does not appear to frequent the land or the fresh water. Its flesh is delicate. The dugong was noticed as occurring in Ceylon by the early Arab sailors, by Megasthenes (Fragm. lix.) and Ælian, and subsequently by the Portuguese. It is this creature which has given rise to the tales about mermaids which have till the present day occupied the world, and doubtless had their origin in the tales of the Arab sailors. They are phytophagous or plant-eaters.

CETONIIDÆ, or rose chafers, a family of the Coleoptera. These and Buprestidæ, or metallic beetles, are the largest and most brilliant of the Coleoptera.

CETRARIA ISLANDICA. *Ach.* Iceland moss. It is chemically allied to starch; it swells in water, and when boiled becomes gelatinous.

CEYLON is called by the Hindus, Lanka. Sinhala-diva, its local name, was corrupted into Serendiva or Serendip by the Arabian mariners; and it is still known amongst Indian Mahomedans by the last name. The Arabs, however, in addition to Serendip, call it also Sinkhul. To the ancients it was known as Tam-ba-pani, from which came the name Taprobane used by Milton when he wrote of—

> 'The Asia kings and Parthian among these:
> From India and the golden Chersonese,
> And utmost Indian isle Taprobane,
> Dusk faces with white silken turbans wreathed.'

The chronicles of the island extend in an unbroken series to 543 B.C. From the Honourable George Turnour's epitome of the sovereigns of Ceylon, it is observed that authentic history commenced with Vijaya, B.C. 543; and the last king of Kandy was Sri Vikrama Raja Singha, who was, in 1798, deposed by the British, and died in captivity at Vellore on the 30th January 1832. Mr. Turnour gives the following fixed points in the chronological history of Ceylon events:—

B.C. 543. The landing of Vijaya, in the year of Buddha's death.
,, 307. The mission from Dharm Asoka to establish Buddhism in Ceylon.
,, 104. Conquest of Ceylon by the Malabars.
,, 90. Founding of Abhayagiri by Wala Gaurbahu.
A.D. 209. Date of the Vaituliya heresy, in Vaivahara's reign.
,, 252. Revival of ditto in the reign of Golu Abhaa.
,, 301. Death of Maha Sen.
,, 545. Another revival of the Vaituliya heresy, in Ambakira's reign.
,, 838. Origin of the Vijra Waadiya heresy, in Mitwella Sen's reign.
,, 1153. Accession of Prakrama Bahu.
,, 1200. Accession of Sahasa Mallawa.
,, 1266. Accession of Pandita Prakrama, Bahu III.
,, 1347. Accession of Bhuwanika, Bahu IV.

The first authentic account of Ceylon or Taprobane is given by Onesiculus, the Macedonian admiral, who lived B.C. 329 or 330. Diodorus Siculus, B.C. 44, gives an account of it; Strabo also mentions it; and Dionysius, who flourished A.D. 36, confirms former accounts, and alludes to its elephants. Sinbad also speaks of it in a volume, perhaps a compilation and in part a romance, as does Abdoor Razak; and still more recently Ribeiro also gives a notice of it.

In the reign of Claudius Cæsar, a Roman publican, who farmed the custom duties of the Red Sea, was driven from Arabia by storms on to Ceylon, where he found a flourishing kingdom and an enlightened sovereign, whom he persuaded to send an embasy of four envoys to Rome, by way of the Red Sea, for the purpose of negotiating a commercial treaty. Ceylon is famed in the literature of India as the scene of Rama's exploits, and as a place to which Asoka sent a mission. In A.D. 1153, a Singhalese monarch fitted out a fleet of five hundred ships to resent an insult offered to his ambassador. Ceylon seems to have been subjected to frequent inroads from Southern India, immediately before and after Christ. Ceylon was occupied by the Portuguese in 1596, was taken possession of by the Dutch in 1658. In 1782 the British took possession of Trincomalee, but Admiral Suffrein recaptured it. In August 1795 the British again took Trincomalee, and in February 1796 they took Colombo, but in 1803 and 1804 they met with reverses. In 1814–15 General Brownrigg invaded Kandy, and on the 2d March 1815 the British assumed the sovereignty of the lowlands. But a serious outbreak occurred in 1817, which occupied the troops for a year, and in 1818 the king of Kandy was taken prisoner to Vellore, where he died in 1832.

The island lies between lat. 5° 55′ and 9° 51′ N., and long. 79° 41′ 40″ and 81° 54′ 50″ E. Its extreme length from north to south, from Point Palmyra to Dondera Head, is 271½ miles; its greatest width 157½ miles, from Colombo on the west coast to Sangeman Kande on the east; and its area, including its dependent islands, 25,742 square miles, or about 1-6th smaller than Ireland. Its circumference is about 900 miles, giving a superficial area of nearly 24,000 square miles.

The mountain system in the south has an area of 4212 miles, and the following are the most remarkable heights:—

Piduratalla galla (8305), 8280 ft.	Adam's Peak (7120), 7420 ft.
Kirrigal potta, . 7810 ,,	Nammune kulle, 6740 ,,
Totapella, . . . 7720 ,,	Plain of Neueraellia, 6210 ,,

Like the Peninsula of India, it has a belt of low land of varying breadth, consisting of tertiary strata, running round its coast. Numerous lagoons exist on the east coast, at Nilla veeli, Baticaloa, etc. Adam's Bridge, between Ceylon and Ramnad,

consists of several ledges of conglomerate and sandstone, hard at the surface, and growing coarse and soft as it descends, till it rests on a bank of sand, apparently accumulated by the influence of the currents at the change of the monsoons. The Mahavelli Ganga river has its source near Adam's Peak, and, after a course of 200 miles, enters the Bay of Bengal at Trincomalee. The Kalani Ganga and Kalu Ganga are on the western coast, and the Walaway Ganga on the south-east. A rich and well-watered plain runs between Colombo and Galle, covered with cocoanut, bread-fruit, and jack-fruit trees.

The census of 1871 showed the total population to be 2,406,000, in the proportion of 1,286,000 males and 1,120,000 females. Pure Singhalese, 1,670,000; Tamils, about 542,000; Moormen (of Arab descent), 160,000; these three classes making up 2,372,000, leaving only 34,000 for all other races. Malays (Mahomedans by religion as well as the Moormen) make up 6800; all other pure Asiatic or African races—including Afghan, Armenian, Bengali, Burmese, Kafir, Chinese, Mahratta, Parsee, Rajput, Sikh—comprise a few thousands more; and European descendants of the Dutch, Portuguese, English, etc., make up not more than 10,000; while pure Europeans, including English, Scotch, Irish, and a few Germans, French, etc., number, exclusive of the military, about 4500.

The numbers of the religious denominations of the inhabitants of Ceylon may be thus stated:—Buddhist, 1,520,575; Saivite, 564,414; Roman Catholic, 182,613; Mahomedan, 171,542; Episcopal Protestant, 24,756; Wesleyan, 6071; Presbyterian, 3101; Baptist, 1478. Of the entire population, one in 723 is insane, one in 160 is deaf and dumb, and one in 357 is blind.

The Tamils of Ceylon belong to the same race as the Tamils of Southern India, and have been on the island for centuries, chiefly in the N.E. portion of the island; and the two towns to which they chiefly resort are Jaffna and Trincomalee. Their main occupation is agricultural. Tamil coolie labourers come over in large numbers from the continent during the coffee season.

The *Singhalese* proper range themselves under the heads of Kandians, low-country Singhalese, and Rhodia. The Kandians inhabit the hill country, and are a hardy, robust race, never till recently intermingling with their low-country brethren. Their language is made up of three component parts,—Elu (or Singhalese pure), the Pali, and the Sanskrit. They possess an extensive literature, and their religion is Buddhism. The low-country Singhalese are Buddhists, Roman Catholics, or Protestants. Among the Kandians, and them only, a form of polyandry is prevalent, and the wife has the possession of all brothers. The children call the eldest brother father. A man can bring in another, not a relation, to have joint marital rights with himself; indeed, the first husband can so introduce as many as the wife will consent to receive as husbands. In Kandy, in the Beena marriage, the husband goes to reside in the wife's house, and the woman shares the family inheritance with her brothers. The husband, in this marriage, can be dismissed summarily by the family of the wife. In the Deega, a more respectable form of marriage, the wife leaves her own house for that of her husband, forfeits all claim on the property of her parents, but acquires some claim on that of her husband, and the wife cannot obtain divorce, unless with the full consent of the husband. Divorces are constantly sought for by women on trivial pretences. A child born within nine months of the divorce, must be maintained by the husband. Sirr (Ceylon) says the principal castes are four, viz. the Surya Vansa or Royal race, which has two divisions, viz. Goe Wansa, cultivators, the most numerous in the island, and to it belong the nobles, chiefs, priests, and nearly all the government servants, and (2) the Nille Makareya, or shepherds, form the second division of the Surya.

Brachmana Wansa, descendants of Brahmans.
Wiepa Wansa, cultivators and shepherds.
Shoodra Wansa has 60 subdivisions.

The *Rhodia* race is regarded as unclean; very numerous; forbidden to approach a temple, or any of the higher castes.

The *Gataroo* is an outcaste race.

Burgher is the name applied to those of mixed European and native origin. One race in Ceylon wear their hair, which is long and luxuriant, dressed like a woman's, with one or two very large tortoiseshell combs fastened in it, which, to a European eye, imparts a peculiarly unmanly look to the wearer. The dress of women differs little from that of men, but they mostly wear a kind of bodice with long sleeves. An aversion to carrying the lightest burden prevails in Ceylon, and the poorest tradesman or servant generally employs a coolie to carry a bundle which a European gentleman would take in his hand.

The vegetable productions of Ceylon are coffee, cinnamon, coir, sugar, rice, tobacco, cotton, cocoa, areca nuts, cocoanuts, cardamoms, pepper, rice, arrowroot, maize, manioca, arrack, cocoanut oil, essential oils of cinnamon, citronella, and lemon grass, dye-wood, ebony and other furniture woods. The sugar-cane was brought to Ceylon from the Mauritius by a merchant of Colombo about 1832. European settlers have largely engaged in coffee planting. This latterly became less remunerative, and tea, cacao, cinchona, and the Liberian coffee were introduced. At the end of 1880, about 5400 acres were under cacao. In 1880 the export of cinchona bark was 1,161,989 lbs., valued at Rs. 12,00,000. The mineral and animal products are precious stones, pearls, ivory, and chank shells. Precious stones are found in the flat country around Ballansgodde, S.E. of Ratnapura, on the western plains between Adam's Peak and the sea; at Neueraellia, in Oovah, at Kandy, at Matelle in the Central Provinces, and at Ruanelle near Colombo, at Matura, and in the beds of the rivers eastward towards the ancient Mahagam; but the chief gem district is in the plains at the foot of the stupendous hills of Saffragam. The ruby, amethyst, topaz, sapphire, and cinnamon stone, are found in great abundance, but not emeralds. Spinell, chrysoberyl and corundum are also found. Sapphires, red, purple, yellow, blue, white, and star-stone, are met with at Matura and Saffragam, and rubies and sapphires in the neighbourhood of Avisavelli, and on the Neuraelliapatam. The corundum of Battagamana is frequently found in large six-sided prisms, and is commonly of a brown colour, from which it is called by the natives Curundu galle, cinnamon stone; occasionally it is to be met with

partially or entirely covered with a black crust, which is merely the stone with an unusual proportion of iron. In the beds of the rivers south and east of the mountain chain in Ceylon, the sands are so rich in comminuted fragments of mica, quartz, sapphire, ruby, and jacinth, as in some places to be used by lapidaries in polishing the softer stones, and sawing elephants' grinders into plates. Dr. Gygax considered the original matrix of these rubies to be a stratum of decomposed grey granite at Ylima Pohura on the south-eastern decline of the Pettigalle Kanda. Corundum is very plentiful at Battagamana, on the banks of the river Agiri Kandura. The great bulk of the gems, however, come from Ratnapura, which means the city of gems. Ceylon affords all the varieties of quartz, as rock-crystal, amethyst, rose-quartz, cat's eye, and prase. Rock-crystal occurs in abundance, both massive and crystallized, of various colours, good quality, and in large masses. Amethyst also is pretty abundant; very beautiful specimens are found in the alluvion, derived from the decomposition of gneiss and granite rock, in Saffragam and the Seven Korles. Adularia is very abundant in some parts of the interior, particularly in the neighbourhood of Kandy, where it is occasionally the predominating ingredient of the rock. Ceylon produces the finest cat's eyes in the world,—indeed, the only kind that is highly esteemed, and that bring a high price. The best specimens have been found in the granitic alluvion of Saffragam and Matura. Prase is of rare occurrence amongst the pebbles on the shore of Trincomalee. Belonging to the schorl family are topaz and schorl. The topaz commonly passes under the name of the 'white or water sapphire.' It is generally white, or bluish or yellowish white; it is commonly much waterworn, perfect crystals of it being very rare. It occurs in many places in the alluvion of granitic rock.

The zircon family is richer in Ceylon than in any other part of the world. It is found in the districts of Matura and Saffragam, and is most abundant in the former. Matura diamond is the name applied to its finest varieties by the dealers in gems. Besides the two well-established species, common zircon and hyacinth, there is a third, massive, opaque, and uncrystallized, and of a dark brown colour. Specimens of it from Saffragam weigh two or three ounces. The yellow varieties of zircon are sold by the natives as a peculiar kind of topaz,—the green as tourmalines, the hyacinth red as inferior rubies, and the very light grey as imperfect diamonds. All the varieties are found in the beds of rivers, or in alluvial ground, which, both in Saffragam and Matura, is of the same kind.

For the ruby, Ceylon has been long celebrated. Four species of it, viz. spinell, sapphire, corundum, and chrysoberyl occur. In gneiss or granitic rock, spinell is comparatively rare.

Ceylon has many animals—elephants, buffaloes, elk, spotted deer, the red or paddy field deer, mouse deer, the hog, bear, leopards, hares, black partridge, red-legged partridge, pea-fowl, jungle-fowl, quail, snipe, ducks, widgeon, teal, golden and other kinds of plover, a great variety of pigeons, innumerable snakes, and the crocodile; but it is free of the tiger, wolf, hyæna, and cheeta. Elephants are now only found in the thickly wooded forests. In one mode of snaring them, called 'atmaddo,' or hand snaring, ropes of hide, with a noose, are slipped by the hunters over the hind foot of the animal, and immediately fastened to a tree; the animal, moving on, stumbles and falls, on which other hunters immediately twist other ropes about the legs in a figure of 8, and a shed is erected for its protection until sufficiently tamed to be removed. The solitary, must, or rogue elephant is called horaalia in Ceylon. The height of a full-grown Ceylon elephant varies from 8½ to 10 feet. The tusks vary in length from 3 to 7 feet, and their weights range from 30 to 120 lbs.; but 60 or 70 lbs. are the average. Upwards of 320 species of birds have been indicated by Dr. Templeton, Dr. Kelaart, and Mr. Layard. Of the fish, the Cybium guttatum, one of the scomberoid fishes, known to Europeans as the seir fish, is the best; but mackerel, carp, mullet, red and striped perches and a sardine (Sardinella Neohowii) are used.—*Prod. F. Zeyl.; Tennent's Ceylon; Forbes' Ceylon; Baker's Rifle; Cunningham, Anc. Geog. of India; Yule, Cathay*, i. p. clxxvi.; *Madras Mail*, Jan. 31, 1873; *Times*, Dec. 27, 1873; *Davy's Travels in Ceylon*. See Architecture.

CEYLON MOSS, edible seaweed.

Gracillaria lichenoides, *Greville*.
Fucus lichenoides, *Turner*.
F. amylaceus, *O'Shaughnessy*.

Shih-wha-tsai, . CHIN. | Mousse de Ceylon, . FR.

A small and delicate fucus, well known for the amylaceous property it possesses, and the large proportion of true starch it furnishes. The fronds are filiform; the filaments much branched, and of a light purple colour. It grows abundantly in Ceylon, in the large backwater which extends between Putlam and Calpentyn. It is collected by the natives principally during the south-west monsoon, when it becomes separated by the agitation of the water. The moss is spread on mats, and dried in the sun for two or three days. It is then washed several times in fresh water, and again exposed to the sun, which bleaches it; after which it is collected in heaps for exportation. 100 grains weight yielded the following proportions:—

Vegetable jelly, .	54·50	Gum, ...	4·00
True starch, . .	15·00	Sulphate and phosphate of lime, . .	1·00
Ligneous fibre, . .	18·00		
Sulphate and muriate of soda, . .	6·50	Total, .	99·00

with a trace of wax and iron. For a decoction, take two drachms ground to fine powder, water one quart; boil for twenty minutes, and strain through muslin. By increasing the proportion of the ground moss to half an ounce, the filtered solution on cooling becomes a firm jelly, which, when flavoured by cinnamon or lemon-peel, sugar, and a little wine, is an excellent article of light food for sick children and convalescents.—*Beng. Phar.* p. 276.

Plocaria candida and Sphæro coccus lichenoides, *Grev.*, also furnish Ceylon moss.

CH. The soft sound of the English ch, as in charm, cheese, chintz, is usually attained in French by tch and in German by tsch. Many of the inhabitants of the south and west of India cannot pronounce the ch, and invariably substitute the s. Thus the noted Pindari leader Cheetoo was called in the Dekhani, Setoo. Again, with many of the tribes of the Indian desert, the s is alike a stumbling-block, which causes many singular mistakes, when Jeysulmir, the 'hill of Jeysul,' becomes Jehulmir. —*Tod's Rajasthan*, i. p. 102.

CHA. HIND., PORT. Tea; also, in Chinese, the camellia.

CHA. TIB. The common fowl, generally small in Tibet. In Sikkim, fowls are remarkably large.

CHA. TIB. Bos frontalis.

CHA-AB, Chab, Kaab, or, following the Persian pronunciation, Tsiab, an Arab tribe who occupy the lower part of Mesopotamia. They are a tall, martial race, strong-limbed and muscular, active and healthy. At Baron de Bode's visit they extended on the north as far as the territories of Shushter and Ram Hormuz, eastwards to Behbehan; and, including Hindiyan in their possessions, they spread south along the head of the Persian Gulf; on the west they do not extend beyond Haniza. They became known to the British in the latter part of the eighteenth century, in consequence of their piratical exploits on the Persian Gulf, and their having captured some British vessels sailing in those latitudes. — *De Bode*, ii. pp. 110–122.

CHABAI. MALAY. Species of capsicum; Chabai Java, Chavica Roxburghii, long pepper; Chabai of Lombok, Capsicum frutescens; Chabai sabrang, a species of capsicum.

CHABANAH. HIND. The name given to all parched cereals and pulses,—from Chabna, HIND., to chew,—because eaten alone.

CHABAQ. HIND. Salicornia bracteata? also root of the black pepper vine.

CHABERIS of Ptolemy, the river Cauvery.

CHABUK. HIND. A whip; hence Chabuk-sowar, a jockey, literally a whip-rider.

CHABUK CHURI. HIND. Hiptage madablota.

CHABUTRA. HIND. A raised platform, a dais or terrace; a flat masonry platform or edging to a well, etc., for sitting on.

CHACH is the name of the great plain to the east of the Indus, immediately opposite to Ohind, which may have been named after the Brahman dynasty of Ohind, as the Banar plain was named after raja Banar. The Brahman dynasty of Sind was also established by a Chach in A.D. 641; and this date corresponds with the period of the expulsion of the Brahman dynasty from Chichito, or Jajhoti, by the Chandels of Khajura. Several places on the Indus are named after the Chach dynasty,—Chachpur, Chachar, Chachgaon, Chachi. Chach was a Brahman who usurped the kingdom of the Rai dynasty of Sind. He was a contemporary of the Shahram or Shahrear, and he is supposed to have invented the game of chess. He seems to have reigned about A.H. 2, and to have been succeeded by his brother. The Rai dynasty had ruled from Kashmir and Kanouj to Makran and the port of Dabal on the shores of the sea of Oman, and from Surat to Kandahar and the Suliman range. The commencement of this dynasty has not been ascertained, but in the time of Rai Diwaij the capital was Alor. He was a powerful chief, who contracted alliances with the rulers of India. He was succeeded by his son, Rai Siharas I. Rai Sihasi was the celebrated son of Rai Siharas, and the next was Siharas II., who reigned 42 years, and was killed in battle. After Sahasi II., a Brahaman dynasty succeeded. Their reign seems to have extended to 137 years, and to A.D. 479.— *Elliot; Cunningham's Ancient Geog. of India*, p. 55.

CHACHEON or Chachiyon. HIND. Rhododendron arboreum.

CHACH-NAMAH, also called the Tarikh-i Hind-o-Sind, is a Persian translation from an old Arabic history, made about A.D. 1216 (A.H. 613) by Mahomed, then residing at Uch in Sind. The ancient Arabic seems to have been written before A.D. 753. It is largely drawn upon by Nizam-ud-din, Ferishta, Mir Masum, and others. The Chachnamah Persian work is descriptive of the Arab conquest of Sind. The Arab occupation of Sind was only temporary. On their retreat, the territory reverted to the rule of native princes, and was practically independent until its absorption into the Moghul empire during the reign of Akbar, in A.D. 1592, for the successes of Mahmud of Ghazni made no permanent impression on them. —*Elliot's Hist. of India*, p. 9.

CHACHRI. HIND. Myrsine Africana.

CHACHUNDI or Chichundi. HIND. The shrew or musk rat, species of Sorex. S. cærulescens, S. Indicus, and many others.

CHACKLER. ANGLO-TAM. A tanner, a shoemaker; properly, Chakkili.

CHACRA. HIND. A wheel, a circle, a cycle of years; a weapon of a circular form often placed in the hands of the Hindu gods. Rasi chacra, the zodiac. Varahaspati chacra, the cycle of 60 years. Nachatra chacra, the sphere of the fixed stars. Prachacra, an epicycle on which the degrees of precessional variation are counted. Chacradhari, or wielder of the discus, the most ancient weapon of the Indo-Getic race. A name of Krishna.—*Warren, Kala Sanhita.*

CHADACHEY. TAM.? A small tree of Palghat; wood of a light-brown colour, used for buildings and carts.—*Colonel Frith.*

CHADACULA. TAM., TEL. Dammer, resin; Vateria Indica.

CHADAR. HIND. A sheet, a dam, a sheet of sheet iron, a scarf. Phul ki chādar, a flower sheet spread on graves.

CHADARGHAT, the site of the Residency of Hyderabad, on the left bank of the Musa river, which is there dammed. It has been irregularly built over, but contains many Christian families, and many wealthy Hindu and Mahomedan residents, bankers, and merchants.

CHADUR KUL, a lake 110 miles N.W. by N. of Kashgar, 11,300 feet above the sea. It was visited by Captain Trotter in 1873.

CHÆROPHYLLUM SATIVUM. *Lam.*
Anthriscus cerefolium, *Hoffmann.*

The chervil, a good culinary herb.— *Von Mueller.*

CHÆTODON. This genus belongs to the Squamipennes, which includes the Chætodons and other curious fishes, as the coachmen, the horsemen, and others.

Chætodon araneus, the Gal handak, a singular and much-admired fish, about 3 inches long; has a delicate and white flesh, greatly esteemed.

Chætodon prætextatus, *Cantor.* Like other species of this and the neighbouring genera, the present expires immediately when removed from its element. It appears to be allied to C. reticulatus and C. lunula, *Cuv.* and *Val.*

Chætodon rostrata, the beaked and rostrated Chætodon of the fresh-water rivers of India, when it sees a fly alighting on any of the plants which overhang the shallow water, approaches the place cautiously, till directly beneath the object of its attack. Then, placing itself in an oblique direction, with its mouth and eyes beneath the surface, it remains a moment

immoveable, and, taking aim like a first-rate rifleman, darts at the insect a drop of water from its tubular snout, but without showing its mouth above the surface, from which only the drop seems to rise, and that with such effect, that though at the distance of four, five, or six feet, it very seldom fails to bring its prey into the water. Another small East Indian fish, the Toxotes jaculator, catches its food by a similar dexterous display of archery. Mr. Hommel, governor of the hospital at Batavia, first noticed the habits of the Chætodon rostrata.—*Wood's Zoography; Cantor.*

CHAGA, also Chaga-laga. TEL. Sanseviera Zeylanica, *Roscoe.*

CHAGDA or Chackradah is an abyss said, in Hindu fable, to have been made by the chariot-wheel of Bhagirath. The legend points to an antiquity which is not borne out by any old vestiges or ancient population. The place is at best a mart, or outlet, for the agricultural produce of the neighbouring districts, being crowded with warehouses.—*Trs. of a Hindoo.*

CHAGHTAI, a Turki race to which Baber belonged. He spoke and wrote in Chaghtai Turki, which continued in use at the court of Dehli until a late period. There were two races, two languages, and two religious sects at that court, —the nobles of Iran and Turan, Persia, and Turkestan, the former of the Shiah persuasion, who spoke Persian, the latter Sunni Mahomedans, who spoke Turki; and in the latter days of the empire the contentions between the two races were a source of its weakness. Tod says (Rajasthan, i. pp. 6, 60, 322) Chaghtai are the Sakatai of the Hindu Puranas, from Sakadwipa, changed by the Greeks to Scythia. The political limits of the great Getic nation in the time of Cyrus, six centuries before Christ, were little circumscribed on the rise of Timur. At this period (A.D. 1330) the kingdom of Chaghtai was bounded on the west by the Dhasht-i-Kapchak, and on the south by the Jaxartes or Jihon, on which river the Getic khan, like Tomyris, had his capital. Kojend, Tashkand, Ootrar, Cyropolis, and the most northern of the Alexandria cities were within the bounds of Chaghtai. D'Ohsson names thirty Chaghtarides on the throne of Transoxiana from 1222 to 1362. As the Chaghtai dynasty drew to its close in Eastern Turkestan, the priestly element began to increase. In 1678, Galdan Khan, sovereign of the Eleuth or Kalmuk tribes of Dzungaria, established the khojahs of the White Mountain. But, after a century of dissensions, in 1757 the Chinese brought the Turkestan states under their rule. Were we to contrast the literary acquirements of the Chaghtai princes with those of their contemporaries of Europe, the balance of lore would be found on the side of the Asiatics, even though Elizabeth and Henry IV. of France were in the scale. Amongst the princes from the Jaxartes are historians, poets, astronomers, founders of systems of government and religion, warriors, and great captains, who claim our respect and admiration.—*Tod's Rajasthan*, i. pp. 6, 60, 322; *Ferrier's Afghans*, p. 423; *Vambery*, pp. 157–159.

CHAGOS ARCHIPELAGO, a group of islands belonging to Great Britain, and a dependency of the Mauritius, about 250 miles S. by W. from the southernmost of the Maldive islands. They are rented in kind to persons of French extraction; the population, 554 in number, chiefly Negro. Pigs are abundant, and poultry plentiful. They were surveyed in 1786 by Lieutenant Archibald Blair, and in 1837 by Captain Moresby. Diego Garcia, called Great Chagos island, extends from lat. 7° 13½′ to 7° 26½′ S., and its centre is in long. 72° 24′ E. The Great Chagos bank occupies the centre of the Archipelago. The other islands are the Six Islands or Egmont islands, Danger island, Eagle island, the Three Brothers, Nelson island, Peros Banhos, and Solomon islands. The Chagos, Laccadive, and Maldive Archipelago are groups of atolls and madreporic reefs, low coral islands, densely clothed with cocoanut trees. The Maldives have upwards of 1000 islands and reefs. The Laccadives are seventeen in number. The Chagos group has some ordinary atolls, some annular reefs rising to the surface, but without any islands on them, and some atoll-formed banks either quite or nearly submerged. The Chagos bank is a half-drowned atoll.—*Darwin.*

CHAGUL. HIND. A leather vessel for carrying water on a journey.

CHAGUL-BANTI. BENG. Dæmia extensa, *Brown.* Chagul khuri, Ipomæa pes-capræ, *Swiet.* Chagul nudi, Sphæranthus hirtus, *Burm.* Chagul patee, Cynanchum pauciflorum, *R. Brown.*

CHAH. PERS. A well. Hence chahi, belonging to a well, or lands irrigated from wells. Many places have this as a distinctive appellation.

CHAHAL. PERS. Forty. Hence Chahlum, the forty days of uncleanness after childbirth.

Chahal Dakhtar, a halting-place in the valley of the Murghab, 60 miles N. of Herat on the left bank of the Khushk river; has a shrine to the memory of 40 virgins who were carried off by Turkomans.

Chahal Minar. See Kermanshah.

Chahal Situn, a palace at Ashraf in Persian Mazandaran, built by Shah Abbas. It has a beautiful enclosed garden. Here Shah Abbas in 1627 received Sir Dodmore Colt, the English ambas-ador.

Chahal Situn, a palace at Isfahan, in the middle of an immense square (Morier).

Chahal Situn, Lithinos pyrgos, the stone tower in Mount Meru.

Chahal-Wasti, or captain of forty, amongst the Nasiri, a nomade race who occupy the Tohti and Hotuki countries in summer, and the Daman or skirts of the Suliman range in winter. In their migrations, they appoint a chahal-wasti, or captain of forty, and a director-general. See Afghan; Nasiri.

Chahal Tan is a cave on the Kābul road, between Chardeh and the city of Kābul, accessible only by a narrow aperture. It is believed that if a person enter it he will be unable to squeeze himself out, unless pure and free from sin. It is therefore not much visited (MacGregor, pp. 212–13). Masson says (ii. p. 85) there are many places of pilgrimage (ziarat) called Chahal tan, and that Kābul has one near Argandi.

Chahal Tan is the loftest mountain in Baluchistan, its highest peak being 12,000 feet. It forms the western boundary of the valley of Quetta or Shawl.—*Pottinger; Postans; Masson; Cook; MacGregor*, p. 110, iv. p. 3.

CHAH-BACHA. HIND. A small masonry tank, used by soap-boilers.

CHAHIL or Chahira, a Rajput tribe in Hissar, of which the greater part is now converted to

Mahomedanism. There are a few in the Hissar district and on the borders of Bikanir. Though Mahomedans, they nevertheless retain charge of the tomb of Goga Chauhan, a Hindu prince now esteemed a saint.—*Elliot; Wilson.*

CHAHONG? A tree of Akyab; grows to a moderate size, and is plentiful in Ramree and Sandoway districts. Used in house-building. (Qu. Is this Cordia myxa?)—*Cal. Cat.* 1862.

CHAHUMAN, the Chauhan Rajput tribe.

CHAI. ARAB. Tea.

CHAIA. MALEAL. Oldenlandia umbellata.

CHAIBAR. Many of the Arabian tribes had been converted by the Jews who fled from the destruction of Jerusalem by Titus. Chaibar was their principal city in Arabia; it was taken by Mahomed A.D. 623-7. Chaibar was in the neighbourhood of Medina; they were removed into Syria by Omar. Hira also was the residence of a Christian prince, who had reigned there 600 years before he was conquered by the Mahomedans.

CHAILE. HIND.? A tree of Chutia Nagpur, furnishing a hard, white, grey timber.—*Cal. Cat.*

CHAIN, low caste races in N. India.

CHAINA. HIND. Panica pilotum.

CHAINHAR of Hazara, Nussiessya hypoleuca.

CHAISHUSHA, one of the Menu. See Menu.

CHAIT, a Hindu month (March—April), commences when the sun enters into Pisces.

CHAIT of Sikkim (borrowed from Tibet) is a square pedestal, surmounted with a hemisphere, the convex end down, and terminated with a cone, crescent, and disc. These are erected as tombs to lamas, and in memory of illustrious people, and are venerated accordingly, the people always passing them from right to left, often repeating the invocation, 'Om mani Padmi hom.'—*Journal of the Asiatic Society of Bengal*, No. 29, p. 427.

CHAITANYA, a Hindu religious reformer. He was born A.D. 1485. His father was a Brahman, who had come from Srihatta, Sylhet, or Tibet, and settled at Nadiya, where Chaitanya was born. In his early youth he married the daughter of a celebrated saint; but in 1509, when twenty-four years of age, he seems to have abandoned the world and domestic life, and, after long journeying, repaired to Cuttack in Orissa, where for twelve years he laboured to extend the worship of Jagannath at Puri, and devoted the rest of his life to the propagation of his views, aided by Adwaitanand and Nityanand, two men of domestic habits. The age in which he was born had been preceded by one of great religious reforms and innovations. There had been Ramananda, who had revived the anti-caste movement; and Kabir, who set aside alike the Hindu Shasters and the Koran, and preached a universal religion. In Bengal, Buddhism had maintained its supremacy up to the 10th century. On the accession of the Sena princes, Saivism gained the ascendency, and predominated in the land. Under coalition with Saktaism, the worship of the emblems of the energy of man and the fruitfulness of woman, it had degenerated to the very licentious creed of the Tantro-Shastras, which culminated in the worst forms of libertinism about the time of Chaitanya. Two thousand years before, a greater reformer had viewed with disgust and a relenting heart the bloody rites and sacrifices of the Vedic Yagya, and to reform the abuses Buddha had promulgated the doctrine of non-cruelty to animals. In like manner, the bacchanalian orgies of the Tantrika, and their worship of a nudely exposed female, had provoked the abhorrence of Chaitanya, and roused his energy to remove the deep blots upon the national character. He commenced his labours by holding meetings of his immediate friends at the house of Sri Bhasa. His labours lasted through six years, when he entrusted his disciple Nityananda to propagate his views; and it is to Nityananda that the origin of the Gosai is owing. Chaitanya was brought up in the faith of a Vaishnava, but his opinion took a great tinge from the doctrines of his two immediate predecessors. From his early childhood Chaitanya gave signs of an eccentric disposition, but he possessed a very superior intellect, and the purest morals. He had also a very affectionate heart, and simple, winning manners. From 1509, when Chaitanya, styled Nemi, formally renounced the world by embracing the life of an ascetic, he wandered from place to place, travelled to Gour, proceeded to Benares, visited Vindraban and Puri, teaching his sentimental theology, making numerous converts, and devoting all his energy, time, and life to the fulfilment of his mission. His peregrinations lasted for six years, at the end of which he returned to Nilachal near Jagannath, and, settling there, passed twelve years in an uninterrupted worship of that divinity. He became afflicted with epileptic seizures, which received the name of Pran Pralap. While still in the prime of life, however, he was afflicted with hallucinations and beatific visions, and in that state of mental derangement he disappeared in A.D. 1527, supposed to have drowned himself at Nilachal or Cuttack, where he had resided, adding energy and repute to the worship of Jaganath.

It was a main part of Chaitanya's doctrine to abolish all caste distinctions amongst his followers, and that they should bestow implicit faith with incessant devotion, which he termed Bhakti. All persons of all castes and occupations are admitted to the sect, from the conviction that all are alike capable of feeling the sentiments of faith and devotion. His doctrine was essentially the worship of Krishna as an incarnation or avatar of Vishnu; and his sect worship Krishna as Parmatma, or Supreme Spirit, prior to all worlds, and alike the cause and substance of creation. In his capacity of creator, preserver, and destroyer, he is Brahma, Vishnu, and Siva; and in the endless divisions of his substance or energy, he is all that ever was or will be. Besides these manifestations of himself, he has, for various purposes, assumed specific shapes as incarnations or avatars,—as ansa or portions, as ansana or portions of portions, and so on ad infinitum. His principal appearance, and in fact his actual sensible manifestation, was as Krishna, and in this capacity the sect believe he again was present as Chaitanya, who is worshipped as the deity, as are the other forms of the same god, particularly as Gopal the cowherd, or Gopi Nath, the lord of the milkmaids of Vindraban (Bindraban), as his Lila or spirit. His disciples form the largest sect in British India, numbering nine or ten millions, and to be found in every village of Bengal. The date of his birth has also been given as A.D. 1479, also 1485 and 1486, and those of his death 1527 and 1534, at Nilachal or Cuttack.

All castes are admitted into Chaitanya's fraternity, and, once admitted, are associated with

on equal terms by all the brethren. His predecessors, Ramanand and Kabir, had taken low caste men for their disciples. But he scrupled not to permit even Mahomedans to enter his fold; and two of his most eminent followers, Rupa and Sonatun, were originally Mahomedans, ministers in the court of Gour.

The Gosai marry; most of the Banya of Bengal follow their tenets, but their doctrines are held in little esteem. They are regarded as gurus or teachers, and no scandal has arisen from them. The Gosai observe none of the Hindu festivals except those of Krishna; but the anniversaries of the deaths of their founders are observed as such. They do not, says Mr. Ward, reject the mythology, or the ceremonies of the Hindus, but they believe that those of Hari (Krishna) only are necessary. On the nights of their festivals, the initiating invocation, or some sectarian exclamations, may be heard resounding through the streets of Calcutta: Hari, Krishna; Hari, Krishna; Krishna, Krishna; Hari Hari; Hari, Ram; Hari, Ram; Ram, Ram, Hari, Hari.—*Calcutta Rev.; Cole, Myth. Hind.* 240.

CHAITANYA-CHANDRODAYA, the Rise of the Moon of Chaitanya, a drama in ten acts, by Kani-karna-pura.—*Dowson.*

CHAITI, spring or Rabi harvest. The guddi padva ceremony, or flying of paper kites, is held as the new year, on the new moon of Chaitra, about the 5th April.

CHAITRYA, written variously Kshatriya, Chetri. Amongst the Aryan Hindus the Chaitrya was a warrior branch taking social rank after the Hindu Brahmans. Menu, writing of their duties, says: 'To defend the people, to give alms, to sacrifice, to read the Vedas, to shun the allurements of sexual gratification, are in a few words the duties of a Chaitrya.' How this soldier branch broke up is extremely obscure; but it is generally supposed that none of the races now in India can trace their lineage to that tribe of Aryans, though some of the Rajput families doubtless belong to them. Their quarrels amongst themselves seem to have led to their own destruction. There seem to have been two branches of the Chaitrya tribe, the Solar, who traced up to Ikshwaku, and the Lunar, who traced up to Budha, who married Ila or Ella, daughter of Ikshwaku. These martial Chaitrya do not appear to have adopted Brahmanism readily; and the Brahmans, to overcome them, consecrated by fire on Mount Abu a warrior body, who still remain, and are known as the four Agnicula Rajput tribes. A common spelling of the word is Kshatriya.—*Warren's Kala Sanhita; Tod's Rajasthan*, i. p. 37. See Hindu; Suryavansa.

CHAITYA. SANSK. From Chit, a funeral pile, a heap. Any sacred object worshipped by the Buddhists, as a tree, an altar, a temple, as well as any monument raised on the site of a funeral pile, as a mound or pillar; and is probably applicable both to the Buddhist chodten, or offering to the deity, and the dungten, a bone or relic receptacle, but is used by the Jains and Buddhists to indicate a temple containing a chaitya. In Nepal and Tibet, and in Buddhist Sanskrit literature, the word is applied to the model of a stupa placed in the temples, and to which the term dhagoba has been applied. These chaityas or dhagobas are an essential feature of chapels or temples constructed solely for purposes of worship, and to which the term chaitya caves has been proposed to be applied. The later forms have a pradakshana, or passage for circumambulation. The stupa or chaitya of Indian Buddhism are supposed to have been erected subsequent to the cave temples and viharas or monasteries. The chaitya of the Buddhists is the ch'hatra of the Brahmans. One chaitya at Sanchi is structural, but all the others known, in number 20 or 30, are cut in the rock. Seemingly the aisle which surrounded the apse could be lighted from the exterior. The ancient stupa were originally meant as receptacles of either the Buddhas, or the Bodhisattwas and the kings who encouraged the propagation of the Buddhist faith. The chodten or chorten of Tibet are similar to the stupa. They consist of a cylindrical vase, and have a cupola over them. They serve as relic repositories, remains of revered lamas, sacred writings. But they are principally offering receptacles, and no Tibetan passes by without depositing some offering or oblation.—*Hardy's Eastern Monachism*, p. 43; *Cunningham's Bhilsa Topes; Ferg. and Burg. Cave Temples of India.*

CHAJ. HIND. A winnowing basket.

CHAJJAN, a fibre recently come into use at Lahore, owing to the rise in the price of other fibres. It can be purchased in Lahore at from £8 to £10 a ton.

CHAK, a portion of land divided off, an arrondissement.

CHAK of Sutlej, Hordeum hexastichon.

CHAK. BENG. Chowk, HIND. A market-place or square.

CHAK or Jag, Bhot occupants of the central part of northern Tibet. Mr. Hodgson supposed them a mixed people, engaged in predatory pursuits.

CHAK, a circle or marked-off plot; a wheel of a cart; any wheel; a potter's wheel.

CHAK or Chuk. HIND. An extract, very sour, eaten in Ajmir to give appetite and promote digestion. It is probably the extract of chuka or sorrel. One tola is sold for one anna.—*Gen. Med. Top.* p. 132.

CHAKAN, also Chakan tubunna. BENG. Celtis orientalis.

CHAKAR. HIND. A servant; hence Chākari, service; generally, however, duplicated, as noukri chakri.—*Elliot.* Chakaran, in Bengal, land set apart to provide funds for the village office-bearers.

CHAKH. CIS-SUTLEJ. A pan for receiving sugar-cane juice when boiled.

CHAKIYARA, in Malabar, a class of out-caste Brahmans.—*Wilson.*

CHAKKAN, also Chakkala. HIND. An oil-press.

CHAKKI. HIND. A small mill.

CHAKKILI. TAM., MAL. A currier, a tanner; shoemaker, the village shoemaker, known to Europeans as a chuckler. The Chakkili is one of the non-Aryan races of India.—*Wilson.*

CHAKLA. BENG., HIND. A large division of a country, comprehending several parganas. Shah Jahan, about A.D. 1772, divided Bengal into 13 chakla. The chakladar is the superintendent of a province.

CHAKLA. HIND. A stone slab for grinding on; also a pastry roller and board.

CHAKMAK. HIND. Flint. In Tamil, chaki-muki kallu.

CHAKOLTI. HIND.? A light, pale, yellow-coloured wood, not strong. Plentiful in the

Santal jungles from Ranibahal to Nonihaut for 35 miles. Furniture, tables, palkis, venetians, and doors are made from this wood.—*Cal. Engineer's Journal*, July 1860.

CHAKOOLYA. BENG. Hemionitis cordifolia.

CHAKOONDA. BENG. Cassia tora.

CHAKOON SEEDS, seeds of Cordia myxa. An ointment prepared from them is an excellent application for ringworm.

CHAKOR or Atash khor. HIND., PERS. The Cacabis chukor of Jerdon. The birds are fabled by the natives to be enamoured of the moon, and at full moon to eat fire. The two Persian words mean fire-eater. The chakor is an extremely common bird in all parts of the valley of the Indus, and throughout Tibet. In winter, when the hills are covered with snow, they are to be found in great numbers close to the rivers, even in the immediate neighbourhood of the villages; in general, when approached, they lie close among the crevices of the stones. Dr. Thomson was invited by the thannadar of Iskardo to be present at a hunting party which he had arranged for the capture of the chakor, by surrounding a spot of ground in which these birds are numerous with a ring of men, who, approaching from all directions, gradually form a dense circle of perhaps a hundred yards in diameter. When the partridges are disturbed by a horseman in this enclosure, they can only fly towards the living wall by which they are surrounded. Loud shouts and the beating of drums and waving of caps and cloaks turn them back, and they are driven from side to side, till at last, exhausted with fatigue, and stupid from the noise and confusion, they sink to the ground and allow themselves to be caught by hand. The scene was a very striking one. The spot selected was a deep dell, full of rocks, but without trees. The sport, however, did not seem so successful as usual, six or eight birds only being captured. —*Thomson's Travels in Western Himalaya*, p. 2.

CHAKOR SURK and Chakor kandla. HIND. Kinds of imported iron.

CHAKOTR, also Chakotra. HIND. Citrus decumana, *Linn.*, the shaddock or pumello.

CHAKOWAR, also Jangli-powar. HIND. Cassia obtusifolia.

CHAKRA. HIND. The discus of the god Vishnu, resembling a wheel or quoit; a sort of missile weapon, whirled round the middle finger, and used as a weapon of war. The chakra, in Hinduism, is mythologically described as a circular mass of fire, darting flame in all directions, which, thrown by the gods, slays the wicked, and then returns to the hand from which it issued. The Sikh Akali used to have several of them on their conical caps. They fly with great rapidity, and strike hard, but with most uncertain aim. They are expensive, and are almost useless weapons. See Hindu; Kasambi; Namam; Siva; Vishnu.

CHAKRA, in Buddhism, is the emblem of the Buddhist law.

CHAKRA, or district of Kuru-Kshetra, is also called Dharm-Kshetra, or the 'holy land,' which is Hiwen Thsang's 'champ du bonheur.' In his time the circle of pilgrimage was limited to 200 li, equivalent to 20 kos.—*Cunningham's India*, p. 332.

CHAKRA. HIND. A small coin; a country cart, a hackery.

CHAKRA-KELI ARITI or Aritiel. TEL. Musa paradisiaca, *L.*; a small delicate kind of plantain. Perhaps Chakra should be read Sakkara, 'sweet.'

CHAKRAM. SANSK. A wheel. It is now sacred to Vishnu. Chakrankam, a brass stamp; the discus of Vishnu stamped hot on his followers' arm. Chakrastambha, a pillar supporting a chakra.

CHAKRA VAKA. SANSK. Ruddy goose; the birds are supposed to be separated through the night. See Chakwa; Casarca rutila.

CHAKRAVARTA. SANSK. A paramount sovereign, an emperor. Literally, one on whom the discus of Vishnu abides. A few sovereigns in ancient times laid claim to this title, but it is now heard of only as the tribal name of a Brahman family in Bengal, under the altered form of Chuckerbutty. In Buddhism it means a universal emperor, endowed with supernatural powers; but it was in use long prior to the advancement of Buddhism. The Empress Victoria is a Chakravarti.—*Hardy's Eastern Monachism*, p. 435.

CHAKRAVARTI KURA. TEL. Chenopodium album, *Linn.* The words mean 'emperor vegetable.' Sansk. syn. Vastuka.

CHAKRI. BEN. Chakrikudu, TEL. An oilman.

CHAKTI. HIND. A disc or flat circular piece of steel, also a disc of leather used on the axle-boxes of carriage wheels.

CHAKWAEN, a small class of Rajputs in Ghazipur.—*Wilson.*

CHAKWAND. HIND. A weed which grows common in mango groves in the N.W. Provinces, and used as a pot herb.

CHAL. HIND. Manners, customs, commonly duplicated into Chāl Chaln, or use and wont. The chal of the Hindu, like the mores of the Romans, or costumi of modern Italy, is significant alike of the mental and external habit. In the moral point of view, it is the path chalked out for him by the sages of antiquity; in the personal, it is that which custom has rendered immutable. Kya boora chal chalta,—In what a bad path does he march! says the moralist. Bap, Dada, chal chora,—He abandoned the usages of his ancestors, says the stickler for custom. Nek-chal, good, and bad-chal, bad habits.—*Tod's Rajasthan.*

CHALA. HIND. Cicer arietinum.

CHALA CARNA, written Chila cārna. This Hindu astronomical term means the true distance of a planet from the earth, in contradistinction to its mean distance, or the radius of the Cacsha or deferent. See Cārna.

CHALAI of Kaghan, Juniperus excelsa; J. arborea, pencil cedar. See Charai.

CHALAN. HIND. A permit, any invoice; a pass, a list. Chalaoni, current coin.—*Elliot.*

CHALAN BIL, a large marsh in the Rajshahi district of Bengal, about 21 miles long and 10 miles broad. It is said to give rise to outbreaks of cholera.—*Imp. Gaz.*

CHALAPACHCAHI. TEL. Indigofera enneaphylla, *L.*

CHALAR. HIND. The Persian wheel of a common well transferred to the bank of a canal, margin of a jhil, or high bank of a river.

CHALAVADI. KARN. A low caste of S. India; also in Mysore, the servant of a Linga merchant, carrying a large ladle with chain and bell on his shoulders. In Telingana, a Sudra who goes from house to house to give notice of a death.

CHALAVA MIRIALU. TEL. Cubebs.

CHALCEDONY, a quartzose mineral found at Cambay and in many parts of India.

CHAL-CHAHRA. HIND. Parmelia Kamtschadalis, and other species of lichens.

CHALCOPHAPS INDICUS. *L.* Called by the Singhalese Neela cobeya. A bird of Ceylon, strikingly elegant both in shape and colour; has a pleasing note.

CHALDÆA is derived by Pococke from Kula, a tribe, and Deva, a god or Brahman. Professor Rawlinson indicates Chaldæa as a part of the great Mesopotamia plain, bordering the Persian Gulf on the south, with Arabia on its west, and the limit between Lower and Upper Mesopotamia on the north. Chaldæa seems to have been divided into a northern portion, from Hit to Babylon, and a southern portion, from Niffer to the shores of the Persian Gulf. In each of these there seems to have been a tetrarchy, viz. Babel, Erech, Accad, and Calneh, in the land of Shinar (Genesis x. 10), and Hur or Huruk, Nipur, and Larsa or Laraucha, which seem to be the scriptural Ur of the Chaldees, Erech, Calneh, and Ellasar. The northern tetrarchy was Babel or Babylon, Borsippa, Cutha, and Sippara, the last the Sepharvaim of Scripture. The discovery by Sir Henry Rawlinson of the Eponym Canon of Nineveh was the means of placing the chronology of Assyria, from the early part of the 8th century B.C. until the middle of the 7th, on a firm and accurate basis. The recovery of the state records from the treasury of Babylon, in 1875, by the discovery of the series of inscriptions known as the Egibi tablets, gave a clear guide for the chronological arrangement of the rulers of Babylon, from the accession of Nebuchadnezzar in B.C. 605 until the reign of Darius Hystaspes. The gap in the chain of chronological documents from B.C. 640 until the rise of the Babylonian empire, has been filled up by the discovery, in the treasury at Sippara, of a series of contracts and fiscal documents dated in the reigns of Samassumukin and Kindalanu, Chaldæan kings, whose reigns are to be identified with those of Saosduchinius and Kiniladanus of the Canon of Ptolemy.

The first dynasties transmitted by Berosus, which are confirmed by the Canon Inscription, are rather to be regarded as marking epochs in national life and development than royal lines. The antediluvian period was the great mythic age. It was, in fact, the reign of the gods, similar to the first of the dynasties of the Egyptian empire; and it was regarded as the dawn-age of Chaldæan social and religious life, and each caste in Babylonian society placed its mythic founder in this period before the flood. Separated from this dynasty by the 'waters of the Deluge,' was the second period in Chaldæan history—the heroic age, the period of the ethnic myths. Chaldæan history proper begins with the Median conquest, an event which, guided by the Canon Inscription, cannot be placed earlier than the 20th century before the Christian era; but long prior to this, civilisation had made great progress in the city kingdoms of Chaldæa. In the marshland of Chaldæa, the region called in the Deluge legend, the 'land at the mouth of the rivers,' the most ancient traditions of Chaldæan civilisation were located. The dwelling of the translated Xisuthrus was there; and from the shores of the Persian Gulf rose the Annedotus Oannes, the Chaldæan Dagon, who first instructed men in the elements of civilisation, in the rudiments of art, science, and letters, and laid the germs of the civilisation which in after time bore such rich fruit in the schools of Babylon and Nineveh. This district, the cradle of western Asiatic culture, was the seat of three of the most ancient cities of the Chaldæan empire. In the immediate neighbourhood of the Shat-el-Hie, which leaves the Tigris at Kut Amareh, and enters the Euphrates near Gounmerek, after a winding south-westerly course through marshes of the Afadj district, are to be found, on the north bank, the mounds of Warka and Niffer, which mark the sites of the ruins of Erech and Kalneh, cities of Nimrud; and M. de Sarzec brought to light the ruins of another city contemporaneous with the cities of the mighty hunter's kingdom. On the west bank of the Euphrates, at Tel Mughier and at Rata, are the ruins of cities closely connected with Semitic and Biblical traditions, the former being the site of Ur, the birthplace of Abraham, while Chaldæan tradition locates the 'garden of Eden,' with its sacred tree, in the city of Eridhu, whose position corresponds with the modern town of Rata. Therefore both tradition and the historic records of Chaldæa point to this region of southern Chaldæa, the Sumir of the inscriptions, the Shinar of the Bible, as the cradle of the learning and wisdom of Chaldæa.

The inscriptions of Sennacherib and Assur Banipal and the lines of sculptured bas-reliefs show that these marshlands were the dwelling-places of a race distinct from the Assyrians and Babylonians, and who bore many traces of being relics of the aboriginal population. During the explorations of Sir Henry Rawlinson and Mr. Loftus in these regions, some few inscriptions and bronze implements were obtained from a mound called Tel Ho, on the Shat-el-Hie, near to the marshy shores of the Wasut lake or pool. By his exploration in this mound, M. de Sarzec has brought to light the ruins of an important edifice, either a palace or temple, which dates from the earliest days of Chaldæan monumental history, and whose builder was contemporary with Likbagas or Urukh, the Orchamus of the classics, the builder-king of Ur. In the ruins of this edifice were discovered numerous valuable monuments, statues of priests and kings, cut out of hard porphyry, granite, and diorite, while there were numerous others in terra cotta and marble, as well as some valuable specimens of the primitive bronze-founder's work. This ancient city is Sergulla, a name which means the 'city of the great light;' and it was one of the chief seats of Chaldæan fire-worship. So impenetrable are the marshes of the Afádj, and so little subject to external influence, that the name which more than 40 centuries ago denoted the Chaldæan Pyropolis, is still extant in the Arabicised form of Zerghul, as the local name of the region in which Tel Ho is situate. From the monuments we are able to trace two types of people, whose features are transmitted to us with extreme fidelity by the primitive sculptors. The first is a beardless type, with a head, as far as we can judge from the statue, of a brachycephalic type, but with distinctly orthognathous features, and therefore with no tendency to the African Negro type. The features, as judged from the finely-carved head discovered by M. de Sarzec,

are distinctly of the Mongoloid type, and of the Ugro-Finnic branch. This first type, again, bears a remarkable resemblance to the Elamite and Sassanian people as figured on the sculptures from Nineveh; and this ethnic similarity receives additional support from the philological agreement which is found to exist between the language of these inscriptions and those of the Turanian tribes of Elam and Media. The head found by M. de Sarzec represents the figure as wearing a close-fitting cap bound round with a decorated turban, a type of head-dress worn by the Elamites in the time of Sennacherib and his successors, and by the Tartar tribes of Central Asia. The second type of features preserved to us, is that of a bearded race with a more Caucasian type of features, with long straight hair. The type is somewhat difficult to recognise, but it is certainly distinct from the first or from the Semitic Assyrian.

Thus, in the very earliest dawn of Chaldæan history, we find people of a distinctly Mongoloid or Turanian type in the oldest cities of the empire, with inscriptions written in an agglutinative dialect, and in a script bearing, as M. Terrien de la Couperie has shown, a curious resemblance in its commonest ideographs to the script first propagated by the Hundred Families of the Celestial Empire. An ingenious attempt has recently been made to assign a Chaldæan origin to Chinese. In 1842, M. Pauthier attempted to prove the identity of the Egyptian and Chinese system of figure-writing.

The discovery of bronze figures and implements in the excavations, the former bearing inscriptions of Gudea and of other early primitive kings, show that at a very early period metallurgy had reached a considerably advanced stage among the settlers in these low, marshy regions. The city of Sergulla was, as the great fire-city, also the earliest seat of the workers in metals, who from this primitive centre supplied the surrounding cities with weapons or statues for their temples and shrines.

The elaborate network of canals which thread the plains, rendered the internal communication of Chaldæa of a highly perfect character. On the banks of these ancient canals we find the most ancient cities of the empire; and the flow of commercial intercourse which made Babylonia the chief of merchant-land, was greatly stimulated by this excellent system of trade intercourse. The Shat-el-Hie, through which the fleet of Sennacherib was navigated in its expedition against the tribes on the shores of the Persian Gulf, was the grand junction canal of Southern Chaldæa; while the Yussifieh canal, which crosses the upper plain of Chaldæa some 20 miles below Baghdad, was the chief artery of Upper Chaldæa or the province of Akkad. The mound of Abu Hubba marks the site of the ancient city of Sippara, the Chaldæan Heliopolis, one of the dual cities of Sepharvaim. Bit Parra, the chief fane of the sun-god in Sippara, was not only the dwelling-place of the patron deity of the city, but was also the chief law court and chancery of the district, and the centre to which flowed all the commercial and fiscal transactions of the province of Akkad, or Northern Chaldæa. The excavators at Abu Hubba penetrated into the Bit Nizirti, or treasury of the temple, and within it were found stored over ten thousand inscribed tablets relating to the commercial and fiscal life of Babylonia. The bronze figures of priests in the British Museum, and the statue of the mother goddess, bearing an inscribed legend of Kurdurmabug, are both examples of the founders' art and product of the forges of Zerghul.

Astronomy seems to have originated with them. They invented and employed a saros, or restitution period of 18½ years. They latterly chose the heavenly bodies as types of the divine attributes, and in later times made them objects of adoration, particularly revering planets. They were acquainted with the precession of the equinoxes, making use of a tropical year of 365 days 5 hours 49 minutes 11 seconds (only 25 seconds too great), and a sidereal year of 653 days 6 hours and 11 minutes. They knew the art of dialling. By the saros period they were able to calculate and predict lunar eclipses, and the days on which the sun's eclipses might be expected. This period is still used by astronomers. The great centre of Chaldæan mathematic learning was the city of Larsa, from the library of which came the tables of square and cube roots. It is therefore very interesting to find upon some of the tablets from this ancient city, rudely-drawn plans or geometrical figures. These tablets seem to point to a school of geometry as in existence in this ancient seat of Chaldæan learning. There are already in the British Museum fragments of tablets which have come from Babylon, Calah, and Nineveh, which show that divination by geometrical figures was in use among the primitive magicians of Chaldæa.

The first metrical weight was determined by the Euphrates; for the Babylonian talent, which they originated with the minæ and shekel, corresponded exactly with a Babylonian cubic foot of water at the mean temperature of that country. The talent, minæ, and shekel became the monetary standard of Western Asia. They divided the circle into 360 degrees, and these again into 60 fractions. Their figures reached to a hundred; yet they also had special signs for 60, or a sossos, as well as for the saros or square of the sossos, and they invented the positional value of figures.

In the Chaldæan mythology—

Il or Ra—Ra is Chaldee, Il is Semitic; from Il is El, Elohim, Allah—is God.
Ana, God, the Supreme.
Anata, the female of Ana, the power of Ana.
Beltis, wife of Bel Nimrud, in Chaldee called also Mulita or Enutes. In Assyria she was called Bilta or Bilta Nipruta, and Bit Ana.
Hoa or Hea, god of life, the third deity of the triad. He is god of knowledge, the king of rivers, and came from the sea to teach the Babylonians. His emblems are a wedge, a serpent.
Div Kina, wife of Hoa.
Sin or Hurki, the first god of the second triad in the moon deity.
San or Sansi, the sun-god; in Semitic Shamus; also probably Parra, perhaps the Ph ra or Pi ra of the Egyptians.
Ai, Gula, or Ananit, the female power of San. She presides over life and over fecundity. Her emblem was an eight or a six rayed star.
Vul or Iva, the god of the atmosphere, is the third deity of the second triad, moon, sun, and atmosphere—the rain-giver.
Bar, Nin or Ninip, the fish god; lord or master; the analogue of Hercules. His emblem the man-bull.
Bel Merodach, the planet Jupiter.
Zir Banit, wife of Bel Merodach.

Nergal, the planet Mars; emblem, the man-lion.
Ishtar or Nana, the planet Venus, the Phœnician Astarte, the Hebrew Ashtoreth; in Babylonia called Nana, seemingly Nanæa of Maccabees i. 13-15, and the Nani of the modern Syrians. She had many appellations.
Nebo, the planet Mercury.
Varamit or Urmit, wife of Nebo.

—*London Times*, 25th May 1882; *Proctor, Saturn and its System*, London 1865; *Rawlinson; Bunsen; Yule's Cathay*, i. p. 54; *Layard's Nineveh*, i. p. 266. See Babylonia.

CHALDEE, an Aramaic dialect, differing but slightly from the proper Syriac. Ezra iv. 8 to vi. 8 and vii. 12–26; Daniel ii. 4 to vii. 28, and Jeremiah x. 10, are written in the so-called Chaldee. There is also a Chaldee gloss in Genesis xxvi. 47. The Babylonian language in the time of Nebuchadnezzar was very close to Hebrew. The Chaldee language may have been that of Terah; but the possibility of the language of Abraham remaining in its original state during the 216 years that he and his family resided in Canaan, and the 430 years that the Hebrews abode in Egypt, and the 400 years from the exodus to David, is untenable.—*Layard, Nineveh*, i. p. 266; *Rawlinson.*

CHALDEE or Kuldi, a race usually called Nestorian Christians, but they do not acknowledge the correctness of the designation. Matran Hanna, the Syrian patriarch at Mosul, gave Mr. Rich the names of the following tribes of this people, whom he called Nestorian Christians,—The Tiyari, Tkoob, Jelooi, Liweeni, Beerwaree, Nerooi. There are both Mahomedans and Christians of the Nerooi and Beerwaree tribes; the others are all Nestorians. There are four villages of Nestorians near Amadia, called Gheranmoosi, who wear felt hats. The Tiyari are an independent Christian tribe of the Chaldee people, who are much dreaded by all the Mahomedans. These Christian tribes are geographically within the limits of the territory of Hakkari.—*Rich's Kurdistan*, i. p. 156.

CHALI. HIND. Amphicome arguta.

CHALIA. SINGH. A race in Ceylon who cultivated the cinnamon tree; Peelers. This caste form the majority of the rural population near Galle in Ceylon. They came originally from the coast of India as weavers or embroiderers.—*Tennant.*

CHALICIDES, a family of lizards, which, like the seps-lizards, are very long and serpent-like. There is a species with five toes in the East Indies, the Lacerta seps of Linnæus.—*Eng. Cyc.* p. 921.

CHALIS-SATUN. HIND. Literally forty pillars; a pavilion built by Akbar, attached to the palace at Allahabad. See Chahl.

CHALITA. HIND. Dillenia speciosa.

CHALK. Carbonate of lime.

Creta,	IT.		

This is said to be found in the Dhone taluk of Kurnool, but it is generally imported from England. When prepared it is called whiting. Other preparations are used in the arts and in medicine. Black chalk, used in the arts, is a dark-coloured clay.—*Royle; Faulkner; Ainslie; Smith.*

CHAL KUMRA. HIND. Benincasa cerifera.

CHALLA. HIND. A thumb ring, and a great toe ring.

CHALLA GADDA. TEL. Asparagus adscendens, *Roxb.*; A. racemosus. Challa Gummudu, Gmelina parvifolia. Challa means butter-milk. Churning-sticks are made from this shrub.

CHALLAMBRAM, a town in the South Arcot district of Madras, famed for its pagodas.

CHALLA MUNTA. TEL. Fluggea leucopyrus, *Willd.*

CHALM-CHI. HIND. A wash-hand brass basin.

CHALO-DHONA. URIA. Erythrina Indica.

CHALODRA. HIND. Eleusine coracana.

CHALON. HIND. Populus ciliata.

CHALUKYA, also called Salunki, a race known as one of the four tribes of Agnicula Rajputs, the other three being the Chauhan, the Pramara, and the Purihara. The Chalukya claim to have been princes of Sooru on the Ganges. They are divided into sixteen branches, viz.:

Bhagela.—Raja of Baghelcund (capital Bandugurh), Raos of Pitapur, Theraud, and Adaluj, etc.
Birpura.—Rao of Lunawara.
Behila.—Kulianpur in Mewar, styled Rao, but serving the chief of Solumbra.
Bhurta and the Kalacha.—In Baru, Tekra, and Chahir, in Jeysulmir.
Langaha.—Mahomedans about Multan.
Togru.—Mahomedans on the Punjnud.
Briku.—Mahomedans on the Punjnud.
Surki.—In Dekhan.
Sirwureah.—Girnar in Saurashtra.
Raoka.—Thoda in Jeypore.
Ranikia.—Daisoori in Mewar.
Kharura.—Allote and Jawura in Malwa.
Tantia.—Chandbhur; Sakunbari.
Almetcha.—No land.
Kulamor.—Gujerat.

The Chalukya once held sway in Gujerat, Kandesh, Kaliani, and Warangal.

This is the oldest ruling race of which we find satisfactory mention made in the records of the Dekhan. The inscriptions collected by Sir W. Elliot relate to four dynasties of princes, reigning over the greater portion of that part of India now denominated the Dakshina or Dekhan, but at that time Kuntala-desa.

The Pallava were the dominant race in the Dekhan previous to the arrival of the Chalukya. In the reign of Trilochana Pallava, an invading army, headed by Jaya Sinha, surnamed Vijayaditya, of the Chalukya Kula, crossed the Nerbadda, but failed to secure a permanent footing, and he seems to have been killed. His queen gave birth to a posthumous son, in the house of a Brahman named Vishnu Somayaji. The son was called Raja Sinha, but afterwards assumed the royal titles of Rana Raga and Vishnu Vard'hana. He successfully renewed the contest with the Pallava, and married a princess of that race. A copper sasanam of his son and successor Pulakesi, bearing date S.S. 411 or A.D. 489, is in the British Museum. From Raja Sinha's first conquest, the whole period of their rule would be about seven centuries. Raja Sinha's great-grandson, Kirtti Varma, had two sons, one of whom ruled in Kalyan, the other in Telingana, after conquering Vengipuram, the capital of Vengidesam.

The Kalyan branch was subverted for a time in the end of the 9th or beginning of the 10th century, and the emigrant prince or his son succeeded by marriage, in A.D. 931, to the throne of Anhalwara Pattan in Gujerat, which his descendants occupied with great glory until A.D. 1145. But in A.D. 973 the dynasty of Kalyan was restored in the person of Tailapa Deva, and ruled with greater splendour than before, till its extinction in A.D. 1189 by Bijjala Deva, the founder of the Kalab'huria dynasty.

The branch in Telingana fixed their capital at Rajamahendri, the modern Rajamundry. They appear to have effected their entrance into Telingana Balaghat by the conquest of Vengi in the 6th century, and, after several changes, the dominion passed by marriage to Rajendra Chola, then the dominant sovereign of Southern India, in whose person the power of the Chola dynasty reached its height. The following were the rulers of the Chalukya dynasty of Kalyan:—

Jaya Sinha Vijayaditya I.
Raja Sinha, Rana Raga, Vishnu Vardhana.
Vijayaditya II.
Pulakesi, A.D. 489.
Kirtti Varma I.
Mangalisa.
Satyasraya began to reign 609.
Amara.
Aditya.
Vikramaditya I.
Vinayaditya, Yuddha Malla began to reign A.D. 680.
Vijayaditya III. began to reign A.D. 695.
Vikramaditya II. began to reign 733.
Kirtti Varma II.
Kirtti Varma III., cousin of last, 799.
Tailapa.
Bhima Raja.
Ayya or Kirtti Varma IV.
Vijayaditya IV.
Taila Bhupa II., or Vikramaditya III., in A.D. 973 restored the monarchy, which had been some time usurped by the Ratta Kula. He died A.D. 997.
Satasraya II., Irivi Bhujanga Deva, A.D. 997.
Vikramaditya V. began to reign about A.D. 1008?
Jaya Sinha Deva, Jagadika Malla, about A.D. 1018?
Someswara Deva I., Trailokya Malla, Ahawa Malla, about A.D. 1040.
Someswara Deva II., Bhuneka Malla, A.D. 1099, expelled by his brother.
Vikramaditya V., Kali Vikrama, Tribhuvana Malla, in A.D. 1076.
Someswara Deva III., Bhuloka Malla, A.D. 1127.
Jagadeka Malla, A.D. 1138.
Tailapa Deva III., Traileka Malla, A.D. 1150.
Someswara Deva IV., Tribhuvana Malla, A.D. 1182; dethroned by Bijjala Deva of the Kalabhuria line.

The style and titles of the Chalukya of Kalyani were Chalukya Kula, Manavyasa Gotra; Hariti putra; whose royal power was the gift of Kausika, nourished by the seven mothers, worshipping Swami Mahasena; having the boar signet (lanchhana), the gift of Bhagavan Narayana.

Their insignia of royalty consisted of the

Swetāta Patra, the white canopy.
Sanka, the conch (chank) shell.
Pancha Maha Sabda, the martial drum.
Hala Kétana, the plough ensign.
D'hakka, the drum.
Varaha lanch'hana, the boar signet.
Mayura Pinch'ha, the peacock fan.
Kunta, the spear or mace.
Sinhasana, the throne.
Makara toranam, the royal arch.
Kanaka-dandam, the golden sceptre.

Their boar ensign was the most celebrated, and was the symbol invariably represented on their money and on their seals, sometimes, in the latter, accompanied by the conch shell, the drum, the peacock fan, or a lotus, an elephant goad (ankus), candelabra, a seat or stool, the swastika cross ┼, and latterly a sword. It was from the boar on the Chalukya coin that the people of the Peninsula of India give the name 'Varaha' to the pagoda, varaha mudra, or boar stamped.

Chalukya dynasty of Rajmahendri:

1. Vishnu Vardhana II., or Kubja Vishnu Vardhana; conquered Vengi, A.D. 605.
2. Jaya Sinha I.
3. Indra Raja, his brother.
4. Vishnu Vardhana III.
5. Manga Yuva Raja.
6. Jaya Sinha II., } bro's.
7. Kokkili, } bro's.
8. Vishnu Vardhana IV. } bro's.
9. Vijayaditya I.
10. Vishnu Vardhana V.
11. Narendra Mriga Raja.
12. Vishnu Vardhana VI., or Koli Vishnu Vardhana.
13. Vijayaditya II., or Guna Gunanka Vijayaditya; conquered Kalinga.
14. Chalukya Bhima I., his brother.
15. Vijayaditya III., or Kollabhiganda Vijaya.
16. Amma Raja I.
17. Vijayaditya IV., or Kandagachita Vijaya.
18. Talapa, usurper.
19. Vikramaditya V., the son of a brother of Amma Raja I.
20. Yuddha Malla.
21. Raja Bhima II.
22. Amma Raja II.
23. Dhanarnava. Interregnum of 27 years.
24. Kirtti Varma, son of Dhanarnava.
25. Vimaladitya, his bro'r.
26. Raja Raja Narendra.
27. Rajendra Chola.
28. Vikrama Deva Kulothinga Chola.
29. Raja Raja Chola, viceroy for one year.
30. Vira Deva Kulothinga Chola, or Saptama Vishnu Vardhana, viceroy from A.D. 1079 to 1135.

The country fell under the sway of Warangal. The family spread southwards into what is now known as Mysore, where they were afterwards the parent stem of the Hoisala Bellala dynasty of Dwara-samudra. They seem to have been of the Jaina faith, but to have subsequently adopted the Vaishnava and Saiva forms of Hinduism. A ruined temple at Buchropully, near Hyderabad, and temples at Hammoncondah, near Warangal, are in a style of architecture followed during Chalukya supremacy. At Warangal also are four pillars, Kirti-Stambha, which were set up by Pratupa Rudra, who had also erected the great temple at Hammoncondah.—*Thomas' Prinsep's Antiquities; Sir W. Elliot, M. L. S. J.*, 1858; *Elphinstone; Fergusson, Architecture*, pp. 389, 731; *Tod's Rajasthan*, pp. 80–97. See Hoisala Bellala.

CHALUN of Kotgarh. Populus ciliata.

CHALUNDAR. Hind. Iris Nepalensis.

CHALYBEATES. There is no one district in which they have been found more frequently than another, unless the outer ranges of the Himalaya; the wells in the Neilgherries are said often to have a trace of iron. None of the Indian chalybeates are thermal; and none of those known, except that at the beautiful spot Nagconda, appear to be strong ones; there are many undescribed chalybeates in the Himalayas. One at Chumba may prove of value.

CHAMA. Tel. Colocasia antiquorum.

CHAMA, a genus of the mollusca. C. albida, C. asperella, C. echinulata, C. gigas, C. graphoides, C. gryphoides, and C. unicornis occur in India. C. gryphoides (C. gigas, *Linn.*) is famous for its enormous size. Individuals have been known to weigh above 300 lbs. The byssus by which it adheres to rocks is so tough, that in order to procure the shell it must be cut with an axe. The animal may be eaten, but its flesh is very tough. One of the valves is sometimes used as a font for baptism in the country churches of Europe. The species are confined to the warmer seas, the Mediterranean being the locality of the lowest temperature where any of them have been hitherto found.—*Eng. Cyc.* p. 931.

CHAMÆLEO VULGARIS, the chameleon.

C. calcaratus, *Merrem.*	C. Parisiensis, *Laurent.*
C. carinatus, ,,	C. Zeylandicus, ,,
C. subcroceus, ,,	C. Mexicanus, ,,
C. mutabilis, *Meyer.*	C. zebra, *Bory.*
C. cinereus, *Aldrovandus.*	L. chameleon, *Linn.*

It is a native of the East Indies, and is the species which is most frequently taken to England. Ch. bifurcus, cucullatus, lateralis, Parsonii, rhinoceratus, and verrucosus are natives of Madagascar, Pardalis of Bourbon, and Tiaris of the Seychelles.—*Eng. Cyc.* p. 937. See Chameleon.

CHAMÆROPS, a genus of Asiatic palms, some species of which furnish useful products. C. excelsa produces the So-e of China, a brown fibre surrounding its trunk, very strong, and employed by the Chinese in many domestic purposes, as for bed bottoms, and used by all the population for ropes and cables for their junks; it grows in northern and central China, and in Japan. The hairy covering of this fan-palm and of Livistonia Chinensis are utilized in Japan for fixing lime plaster to buildings.—*Mueller; Seeman.*

CHAMÆROPS FORTUNEI, *Hooker*, Tsung-lu, and Ping-lu, CHINESE, is a palm of the south of China, and as far north as Yang-tsze, growing upwards of 30 feet high. The fibrous integument is annually removed, and steeped in water to separate the wiry fibre. The bark can be used as splints; also made into matting, combined with fibre. Fans are made of the leaves; and the young flower-buds are eaten, similarly to bamboo sprouts, *Smith.* It stands great cold.

CHAMÆROPS HUMILIS, or Palmetto, occurs from the south of Spain and Portugal eastward, along both shores of the Mediterranean to Asia Minor, often covering extensive tracts of sterile, sandy, or stony ground, and the trunk rarely rising, excepting where protected, more than 1 to 3 feet above the surface. The heart is sold as food in the Algerian markets; the leaves are used in matting, for plaited work, for baskets, brooms, mats, and cordage, and paper and pasteboard.—*Royle, Fib. Pl.* p. 95.

CHAMÆROPS KHASIANA. *Griffiths.* The fan-palm ('Pakha,' KHAS.) grows on the cliffs near Mamloo, on the Khassya hills. It may be seen on looking over the edge of the plateau, its long curved trunk rising out of the naked rocks, but its site is generally inaccessible; while near it grows the Saxifragis ciliaris of English gardens, a common plant in the N.W. Himalaya, but extremely scarce in Sikkim and the Khassya mountains. Ch. Khasiana is very closely allied to, if not identical with, Ch. Martiana of Nepal, which ascends to 8000 feet in the Western Himalaya, where it is annually covered with snow; it is not found in Sikkim.—*Hooker, Him. Jour.* ii. p. 280; *Mueller.*

CHAMÆROPS MARTIANA, *Wall., Griffiths.* Trunk 20 to 50 feet high, and is a noble object. It grows at Bunipa in the valley of Nipal, at an elevation of about 5000 feet above the level of the sea. Newar name, Tuggu.

CHAMÆROPS RITCHIANA. *Griffiths.*

Peer putta, . . . HIND.	Kilu; Kaliun, PUSHTU.
Maizurrye, Pis, PUSHTU.	Pfees, ... SIND.

Grows in masses below 5000 feet on the barren hills and passes leading up into the table-lands of Baluchistan and Afghanistan. Its leaf-bud or cabbage is eaten. The red mossy-looking rete from the axils of the leaves, with saltpetre, is used for tinder. Its leaves, p'furah or phurra, are fabricated into baskets, fans, brushes, sieves, shoes, sandals, pouches, platters, and ropes for water-wheels. Large quantities of the stones of the fruit (which, Trans-Indus, ripens about July) are exported from Gwadur to Muscat, *en route* to Mecca, to be manufactured into rosaries for the pilgrims.—*Stewart, Panj. Pl.* p. 243; *Seeman.*

CHA-MAHI-DAR, properly Che-mahi-dar. HIND. Farm servants, hired for six months.

CHAMAINDOO-POO. TAM. Camomile; Anthemis nobilis, *Linn.*

CHAMAKHRI. HIND. Michelia champaca.

CHAMAK PATHAR. HIND. Oxide of iron, magnetic iron ore. Chamak, 'glancing.'

CHAMALU. TEL. Oplismenus frumentaceus.

CHAMANTI. TEL. Applied indifferently to all the cultivated kinds of chrysanthemum.

CHAMAR, a scattered race in India. In Northern India, the Chamar race is generally said to be subdivided into seven sections, Jatooa, Kaean, Kooril, Jyswara, Jhoosea, Azimgurhea or Birherea, and Koree or Korchamra, who do not eat together nor intermarry. The Jatooa are chiefly in the north-west, Delhi, Rohilkhand, and the Upper and part of the Central Doabs. The Kaean are in Bundelkhand and Saugor. The Kooril occupy the greater part of the Central and Lower Doabs. The Jyswara meet them in the neighbourhood of Allahabad, and extend through Jounpur, Mirzapur, and Benares, to the neighbourhood of Sydpur Bhitree, where they are met by the Jhoosea, who occupy Ghazipur and Behar. The Azimgurhea have their seats in Azimgurh and Gorakhpur; and the Kori or Korchamra in Oudh. The last are generally engaged in the occupation of weaving. Others are mentioned besides these, as the Jatlote of Rohilkhand, the Ahurwar, Sukurwar, and Dohur of Central Doab; but as these latter avow some connection with the Kuril, they may perhaps be included in that tribe. In Behar we meet also with subdivisions of Gureya, Magahi, Dukshinia, Canoujea, as well as the Jhoosea and Jyswara above mentioned, —all tending to show that the division into seven clans is imaginary.

The Dohur are mentioned in Steele's Summary, p. 128, as existing in the Dekhan along with Kutni (cobblers) and Duphgurs (Dubgar, maker of oil-bottles); but he does not include them amongst Chamars, of whom he enumerates the following classes: Sultunger, Marat'he, Paradosh, Purdesi, Huralbhutel, Dubali, Woje, Chour.

Chamars are a dark race, and a fair Chamar is said to be as rare an object as a black Brahman.

Kurea Brahman gor Chamar.
In ke sat'h na ootriye par.

That is, 'Go not in the same boat with a black Brahman or a white Chamar, both objects being considered of evil omen.' Many of the Chamar of the Central Provinces have joined the reformed Sat-nami sect. The Chamar of Hindustan, in respect to members and avocations, are in the same position as the Pariahs, Chakkili, Mhar, Mhang, Hollar races of the south of the Peninsula, where the designations of tanners and leather-workers are—

Sanigar, Madiga, . CAN.	Chakkili, ... TAM.
Madaru, Madigaru, COORG.	Madiga, Madira,
Chamar, ... HIND.	Madgolu, . . . TEL.
Mhang, ... MAHR.	

The Mang or Mhang are scattered through all the north-western parts of the Indian Peninsula, in the Bombay Presidency, in Gujerat, Kandesh, the Konkan, and Kolhapur.

Tanners and leather-workers are perhaps the most humble of all the settled races in the south of India. There they dwell outside the walls of the villages. They are deemed wholly unclean. They are tanners, workers in raw hides and leather, shoe and harness makers, messengers, scavengers, and executioners. They are never horse-keepers, and only a very few have ever been known to have the ability to read or write. The race, as a rule, are of a dark, black hue, short in stature, and of very slender frame; lower limbs particularly slight, and calf and foot delicate. They still eat creatures that most races regard as unclean, and likewise eat animals which die of disease. In rural villages they perform the lowest menial offices, such as messengers and scavengers, and are paid by portions of the crops and some small privileges, but are not permitted to reside within the village walls. The Madaru and Madigaru of Coorg are predial slaves, and seem identical with this race. The Madaru make baskets. In Northern India and in Bengal the Chamar race are workers in hides and leather, tanners, and shoe and harness makers, and there form the great bulk of the labourers, taking the place of the Dher and Pariah of the Peninsula. There are many sections of leather-workers throughout the Hyderabad country, and in Berar they serve as scavenger, guide, watchman, and executioner. Their signature mark is a knife. They are part of the Baluth, and, like the Pariah, are the predial slaves of the village. The Pendi Mang are athletæ. The Mhang worship the leather ropes which they make. They also make cakes, which they place in the ground, and over it five stones and a lamp, and worship these. They also worship the spirits of departed men who have led evil lives. They claim the right to have for food cattle and camels and horses that die of disease, but in some villages this is disputed by the Dher or Pariah; and in the village of Dangopura, in 1866 and 1867, this point was for twenty months under litigation, the ultimate decision being in favour of the Dher. In the Northern Dekhan are the sections Mang Garoro, Hollar Mang, Dekhan Mang. The Mang Garoro are also styled 'Pharasti' or migrants, as they have no settled abode, but move from place to place begging; their men and women assume other clothes, and smear their foreheads with the red kuku, a mixture of turmeric and safflower. They also are conjurors and sleight-of-hand adepts, from which they have their name Garori. The men also beat the drum.

The Bandela and Kuillar Chamar is a tanner and shoemaker; Mahratta Chamar, a shoemaker; Pardesi Chamar, a cobbler; Mang Chamar, who makes sandals; Mahomedan Chamar, who is a bookbinder; Katai Chamar, who make shoes and sandals, and labour in the fields at seed and harvest times. The Katai are identical in personal appearance with the Chuckler (chakkili) of the very south of India.

The Chamar of Aurangabad worship Mariamma and Sitla. They marry when under age amongst themselves, proceeding on foot to the goddess Sitla, whose shrine they circumambulate five times. The expense is about a hundred rupees. They speak Hindi. They burn their dead; but some very intelligent men at Aurangabad did not know that anything followed death.

In the great isolated plain of Ch'hattisgarh, where the jungle has not even yet been thoroughly mastered by man, the Chamar, who make up some twelve per cent. of the population, are nearly all cultivators. The creed adopted by them is the 'Satnami' or 'Rai Dasi,' a branch of one of the most celebrated dissenting movements in Indian religious history. No images are allowed; it is not even lawful to approach the Supreme Being by external forms of worship, except the morning and evening invocation of his pure name (Satnam), but believers are enjoined to keep him constantly in their minds, and to show their religion by charity. Even if the creed be weak as a moral support, it is strong as a social bond; and, no longer weighed down by a sense of inferiority, the Satnami hold together, and resist all attempts from other castes to re-assert their traditional domination over them. They are good and loyal subjects; and when they have grown out of a certain instability and improvidence, which are the natural result of their long depressed condition, they will become valuable members of the community.—*Rost, Edition of Wilson's Essays on the Religion of the Hindus*, i. p. 113 (1862).

CHAMAR. HIND. Ehretia aspera.

CHAMARA, Chawri, or Chowr. HIND. A whisk, made sometimes of peacock's feathers, sometimes from the tail of the yak, sometimes of the shavings of sandal-wood, of horse hair, or of grass, and used for the purpose of driving away flies, mosquitoes, and other insects. They are usually seen in the hands of the attendants of the Hindu gods. The chamara or chawri from the white bushy tail of the Tibet cow, was, in ancient India, fixed on a gold or ornamented shaft, between the ears of the horse, like the plume of the war-horse of chivalry; the banner or banneret, with the device of the chief, rose at the back of the car; sometimes several little triangular flags were mounted on its sides. 'The waving chawri on the steed's broad brow points backwards motionless as a picture.'—*Coleman*, p. 376; *Hindu Theatre*, i. p. 199.

CHAMARFO of Spiti, a deep red earth used in dyeing.

CHAMAR GAUR, a division of the Gaur Rajputs, the highest class, although from their name liable to the suspicion of intercourse with Chamars. They claim for themselves the designation Chaun-har-Gaur, from a Raja named Chaun-har, or sometimes Chiman-Gaur, from a Muni called Chiman.—*Wilson.*

CHAMARI. MAHR. Premna integrifolia.

CHAMAR LENA, Jaina caves near Nasik.

CHAMATEE-PATEE. BENG. Papyrus dehiscens.

CHAMAYEN, a small section of the Gujar tribe in Panipat Bangar.—*Wilson.*

CHAMB. HIND.? Land that receives the drainage of higher lands, generally a heavy blackish clay.

CHAMBA is a state in the Himalaya ruled by a Rajput dynasty. It is within the government of the Panjab. It lies north of the Kangra district, between lat. 32° 10′ 30″ and 33° 13′ N., and long. 75° 49′ and 77° 3′ 30″ E., with an area of

3216 square miles, and a population of 140,000, composed of Rajputs and Gaddi. The district includes the mountain valleys of all the sources of the Ravi, and a portion of the upper valley of the Chenab, between Lahul and Kishtwar. It has Kulu on its east; in the N.W. it is separated from Jamu by a chain of mountains, through which the Padri pass leads from Jamu to Chamba, elevated 11,000 feet. The Sach pass, elevated 14,800 feet, leads over the range in the north, dividing Chamba from Kishtwar. In 1847 a sunnud was given to Raja Siree Singh, assigning the Chamba territory to him and to his male heirs. In 1854 the sanatorium of Dalhousie, in the Chamba territory, was made over to the British by the raja, and a sunnud was given to the raja conferring on him the right of adoption. Its ancient capital was Varmapura, or Barmawar, on the Budhil river, where many fine temples, and a brazen bull of life size, still exist to attest the wealth and piety of its early rulers.—*Cunningham, Ancient Geo. of India*, p. 141; *Aitcheson's Treaties; Hooker f. et Th.* p. 204.

CHAMBA, an idol of the Tibetans.

CHAMBA. HIND. Michelia champaca; also Prinsepia utilis, Jasminum grandiflorum, and J. officinale.

CHAMBA-GADDI, a race who occupy the Kangra valley, near the Chamba range of hills. They call themselves Rajputs, and may always be known by their peculiar conical caps, with lappets to turn down over their ears, like an English travelling cap. They are shorter and stouter and stronger than their neighbours, are sharp and able, and impose upon their less knowing neighbours. Most of the witch-finders are Chamba-gaddi. When Europeans first visited the Kangra valley, they would drink or eat from their hands, and had very slight notions of caste, but since their intercourse with the people of the plain they have become as bigoted as any Hindus.

CHAMBAI. MALAY. Chavica seriboo.

CHAMBAL, a tributary of the river Jumna (Jamuna), which it joins 40 miles below Etawa town as a great river. It rises in Malwa about eight or nine miles S.W. of the cantonment of Mhow, 2019 feet above the sea. — *Imperial Gazetteer.*

CHAMBAL. HIND. Ranunculus arvensis.

CHAMBATT. HIND. Kæmpferia rotunda.

CHAMBELI. HIND. Jasminum grandiflorum.

CHAMBOGUM. TAM. The most beautiful tree in appearance on the coast of Malabar; it has a very close-grained wood, and throws out rather a pleasant smell when cut. It is generally found in the forests of Travancore of about 18 inches in diameter, and from 20 to 25 feet long. It produces a small round fruit, which the natives use medicinally.—*Edye, M. and C.*

CHAMBOOLEE. DUKH. Bauhinia Vahlii.

CHAMBRA. HIND. Artemisia Indica.

CHAMELEON, a genus of a family of reptiles of the section Squamata and order Sauria. There is but one genus, the Chameleo, or chameleon, the thinsemeth of the Hebrews, of which there is one species in India, C. Zeylanicus, *Lour.*, of Ceylon and India. There are twenty-one in Madagascar, bifurcus, cucullatus, nasutus, Parsonii, rhinoceratus, and verrucosus; C. tiaris occurs in the Seychelles, and C. pardalis in Bourbon. The E. Indian species, C. Zeylanicus, has many synonyms.

CHAM GADILI. BENG. Cynopterus marginatus, *Jerdon.*

CHAM HARAIL. TIBETO-CHINESE. A sacred dance of the Buddhists; a masquerade of Hindu gods going in procession, after a model employed at Yung-ho-Kung in Pekin; it lasts two days.—*Edken.*

CHAMI. TEL. Premna spicigera, *Linn.*

CHAMIARI. HIND. Prunus puddum.

CHAMKAT. HIND. Desmodium tiliæfolium.

CHAMKHARAK. HIND. Carpinus viminea.

CHAMLOO, one of the seven Kazzilbash tribes. See Kazzilbash.

CHAMMA. TEL. Canavalia gladiata.

CHAMMA. HIND. Salix alba.

CHAMMARI. PERS. A grateful dish, made by boiling dried apricots to a consistence, with butter, seasoned with spices.—*Masson*, ii. p. 69.

CHAMNO, Khem, and Renpu, three Assyrian deities of Semitic extraction. See Ken.

CHAMOIS LEATHER.

Chamois, ... FR.	Camoscio, ... IT.
Samischleder, . . GER.	Semschanui, Koshi, RUS.

A prepared skin of the chamois, or of the common goat, kid, or sheep. It is of a yellow colour, soft and pliant, and used for cleaning silver plate.

CHAMOMILE, Anthemis nobilis.

Babunuj, ... ARAB.	Babune phul, . . HIND.
Kan-kiuh-hwa, . . CHIN.	,, gao, . . . PERS.
Ku-kiuh-hwa, . . ,,	Chamendapu, . . TAM.

The flowers of the Anthemis nobilis. An aromatic herb, leaves used in garnishing; the flowers infused as bitters, and in fomentations. Of easy culture, raised from seed; held in estimation both in domestic and scientific medicine.

CHA-MORERI, a lake in Ladakh, 15 miles long and 2½ miles broad, 15,000 feet above the sea. It is surrounded by mountains, some of which rise to 5000 feet from the water's edge.

CHAMPA, a province in the peninsula of Cambodia. Before its subjugation by the Cochin-Chinese, it was a considerable state, under a chief, who lived at Phanrye, lat. 11° 10′ N. In the 15th century an intercourse subsisted with the Malays and Javanese, and about the middle of the 15th century the queen of the principal sovereign of Java was a Champa princess. The people are called Loye or Loi in the Anam language, and profess a kind of Hinduism resembling the worship of Buddha or the Jains. Tradition ascribes to ancient Champa sovereignty over all the neighbouring kingdoms to the frontiers of Pegu and China.—*Mouhot's Travels*, i. 223; *Yule, Cathay*, i. p. 104; *Crawfurd, Embassy to Siam; Dict. Ind. Islands.*

CHAMPA, also Champaka. HIND. Michelia champaca. The flower is one of five with which the Hindu Kama, the god of love, ornaments his arrow. When Vasant'ha, the personified spring-time, is preparing the bow and shafts for his friend,

'He bends the luscious cane, and twists the string
With bees, how sweet! but oh! how keen their sting!
He with five flowerets tips the ruthless darts,
Which through five senses strikes enraptured hearts
Strong Chumpa, rich in odorous gold;
Warm Amer, nursed in heavenly mould;
Dry Nag-Kesur, in silver smiling;
Hot Kittikum, our sense beguiling;
And last, to kindle fierce the scorching flame,
Love-shaft which gods bright Bela name.'

CHAMPA CHASTI, a Hindu festival in the west of India, held about the 2d December, on the 6th of Margha shirsh-shud. It is held wherever there is a shrine of Kandoba, as at Jijuri in the Dekhan.

CHAMPAGNE, a deservedly-esteemed wine, named from the province of France producing it. There are two distinct classes of this wine, viz. white and red, each either still or sparkling; but there is a great variety in the flavour of the produce of different vineyards.

CHAMPAH, a tree which grows on the summit of the lofty hills north of Khatmandu; measures in girth 11 feet.—*Smith's Nepal.*

CHAMPA-KALI. HIND. Necklace.

CHAMPA KULA. BENG. Musa sapientum.

CHAMPA-NUTEYA (var. Lal). BENG. Amarantus polygamus, *Linn.*

CHAMPARAN, a district in Bengal, bounded on the north by Nepal, and at its side are the Gandak and the Baghmati rivers. Population in 1872, 1,440,815 souls, viz. 974,451 Hindus, 199,237 Mahomedans, 21,450 Tharu. The aborigines numbered 31,203 souls. The Tharu are an honest, industrious, Indo-Chinese race, inhabiting the malarious Terai. They utilize the hill streams for rice culture. The Maghya Dom, about 800 souls, are a nomade tribe, inveterate thieves; the Dosadh are 69,958, and the Chamar 89,061. The Hindu and other races are—

Brahman, . . .	65,315	Kurmi, ...	77,641
Babhan or military Brahmans, . .	49,288	Nuniya, ...	35,102
Rajputs, ...	69,578	Artisan, ...	141,140
Goala, ...	133,413	Fishing boatmen, .	62,757
Koeri, ...	82,074	Mahomedans, . .	199,237

The Bettia raja is a Babhan. The Nuniya are salt-makers.—*Imp. Gaz.*

CHAMPA-ZARD-RANG. HIND. Amongst dyers, a yellow colour like the champa flower.

CHAMPHUNG, a rude tribe in Munnipur, of about 30 or 40 families, near the source of the Irawadi. See India.

CHAMPIRI KATTA. TEL. Broom grass.

CHAMPLOONG. MALAY. A timber tree of the Archipelago, used as a furniture material at Bawean.

CHAMPU, in Hindu literature, a style of composition, a mixture of prose and verse.—*Ward*, iv.

CHAMRA. HIND. Skins, hides, leather, parchment.

CHAMRESH, also Sunbar. HIND. Rhododendron campanulatum.

CHAMROR. HIND. Ehretia aspera.

CHAMULI. HIND. Michelia champaca.

CHAMUNA. HIND. The edible bulbs of Cyperus bulbosus and allied species.

CHAMUNDA, in Hindu mythology, as related in the Durga Mahatmya, an emanation of the goddess Durga, springing from her forehead to encounter the demons Chanda and Munda, detached to seize Durga by the sovereign of the Daitya. Sumbha having slain the demons, she bore their heads to her parent goddess, who told her that, having slain Chanda and Munda, she should thenceforth be known on earth as Chamunda. She is also termed Kali from her black colour, and Karala or Karalavadana from her hideous countenance (Hind. Theat. ii. p. 57). It is to this goddess that all human sacrifices are made by Hindus. One of the ancient Hindu dramatists, Bhava Bhutta, who flourished in the 8th century, in his drama of Malati and Madhava, has made powerful use of the Aghora in a scene in the temple of Chamunda, where the heroine of the play is decoyed in order to be sacrificed to the dread goddess Chamunda or Kali. The disciple of Aghora Ghanta, the high priest who is to perform the horrible rite, by name Kalapa Kundala, is interrupted in his invocation to Chamunda by the hero Madhava, who thus describes the scene (Act V. scene 1):—

'Now wake the terrors of the place, beset
With crowding and malignant fiends. The flames
From funeral pyres scarce lend their sullen light,
Clogged with their fleshly prey, to dissipate
The fearful gloom that hems them round.
Well, be it so. I seek, and must address them.
. . . . . .
How the noise,
High, shrill, and indistinct, of chattering sprites,
Communicative, fills the charnel ground.
Strange forms, like foxes, flit across the sky;
From the red hair of their lank bodies darts
The meteor blaze, or from their mouths that stretch
From ear to ear, thick-set with numerous fangs,
Or eyes, or beards, or brows, the radiance streams.
And now I see the goblin host: each stalks
On legs like palm-trees, a gaunt skeleton,
Whose fleshless bones are bound by starting sinews,
And scantly cased in black and shrivelled skin,
Like tall and withered trees by lightning scathed,
They move, and as amidst their sapless trunks
The mighty serpent curls, so in each mouth,
Wide yawning, lolls the vast blood-dripping tongue.
They mark my coming, and the half-chewed morsel
Falls to the howling wolf;—and now they fly.'

The belief in the horrible practices of the Aghori priesthood is thus proved to have existed at a very remote period, and doubtless refers to those more ancient and revolting rites which belonged to the aboriginal superstitions of India, antecedent to the Aryan-Hindu invasion and conquest of the country. The worshippers of Sakti of Siva, under the terrific forms of Chamunda, Chinnamustaka, and Kali, are called Kerari, and represent the Aghora Ghanta and Kapalika. The word Chamunda, according to Ward, is from Charū, good, and Mundu, a head. She is said to be identical with the goddess Randi.—*The People of India, by J. F. Watson and John William Kaye; Leyden, Asiatic Researches*, ix. p. 203.

CHAMUNDIBETTA, or hill of Chamundi, is a precipitous hill 2 miles S.E. of the fort of Mysore. It is 3489 feet above the sea. There is on its summit a temple at which human sacrifices were made until the time of Hyder Ali. Half-way up the flight of stairs is a well-executed colossal figure of Nandi in a recumbent attitude, hewn out of the solid rock.—*Imp. Gaz.*

CHAMUTI. HIND. Michelia champaca. Tulipa stellata.

CHAMY. CAN. Panicum miliaceum.

CHAMYARI. HIND. Of Murree hills, Cerasus puddum, Prunus puddum; bird cherry.

CHANA, also Chanaka. HIND. Cicer arietinum; also species of Vicia.

CHANAKYA, a Brahman of the city of Takkasila, who lived B.C. 330, the early friend and subsequent counsellor of Chandragupta. The drama of Mudra Rakshasa, attributed to Visakhadetta, is founded on the story of Chanakya, who is celebrated as a statesman and writer on politics. It was he who plotted against Mahapadma, the last of the Nanda dynasty, and placed Chandra-

gupta on the throne. His name is also written Chanaki, and he is called Kantilya.

CHANAKYA SLOKA, moral couplets from the ancient Sanskrit books, taught to Hindu boys in the village schools. Dr. Haeberlin, an erudite German long resident in Bengal, printed a collection of these Chanakya couplets. Several were very pretty; some were original and quaint; and a few were positively indecent.

CHANAMBU-PARATI, the Maleala name of a servile caste in Anjengo, employed apparently as domestic servants.—*Wilson.*

CHANAMIA. HIND. A tribe of Chandrabansi Rajputs in Jonpur and Gorakhpur.—*Wilson.*

CHANAMU. BENG. Crotalaria juncea.

CHANAN. MALEAL. A tribe who extract the sap from the palmyra tree.—*Wilson.* Plural, Shanar.

CHANAPPAN. TAM., MAL. A weaver of coarse cloth for sacks, of hempen cords, from Sana, hemp.—*Wilson.*

CHANAR. HIND. Platanus orientalis.

CHANARPISI resembles the game of Pachisi, but is more simple and more easily learned. For chanarpisi the board is divided into 25 squares. —*Burton's Scinde*, p. 294.

CHANAURI. HIND. Aralia Cachemirica.

CHANAY KALANGU. MALEAL. Tacca pinnatifida.

CHANCHALI KURA. TEL. Achyranthes alternifolia, *R.* i. 674; Digera muricata, *Mart.*

CHANCHARU. KAR. According to Wilson, a savage tribe tenanting the forests in the south of India. Probably the Chanchawar, Chansuar, or Chanchor is intended.

CHAN-CHOW. CHIN. Dioscorea batatas.

CHANCHY KOLI, a Koli race from Junaghur in Kattyawar, settled as farmers in Bombay.

CHANCIO. GUJ. A tribe inhabiting Gujerat, Kach, and Sind, and wearing a large long pointed turban; a pirate, a sea-robber.—*Wilson.*

CHAND. HIND. The moon. Chandni, silver, moonshine, an awning. Chandni chowk, the market-place.—*W.*

CHAND, a famed heroic Hindu poet of India; author of the Prithivi Raj Chohan Rasa, containing an account of the Prithivi Raja, a Chauhan Rajput, the last Hindu prince of Dehli. It has many books, of which the Khanouj Khand contains the history of Sanjogata Jye-Chand, who celebrated the Aswa Medha sacrifice in token of assumption of empire. It is written in an archaic form of Hindu. See Jye-Chand; Prithivi; Sanjogota.

CHANDA, a district in the Nagpur division of the Central Provinces, lying between lat. 19° 7′ and 20° 51′ N., and long. 78° 51′ and 80° 51′ E., 120 miles long and 130 broad, with an area about 9700 square miles. The siege and storm of Chanda occurred 20th May 1818. The Wainganga flows through its centre. Chanda is two miles to the north of the Warda river; the mean height of the plain surrounding the town is 761 feet. The level of the Godavery is 525 feet; and coal has been found in its vicinity in abundance. The deposit at Chanda occupies 150 square miles. In Chanda and Berar, the beds in the group of rocks in which the coal occurs (known to Indian geologists as the Barakur group), exhibit very great variation both in thickness and quality within short distances. They are often of great thickness locally, but thin out and nearly disappear. The population in 1872 was 534,431:—

Gond,	91,438	Mana,	24,937
Brahmans,	5,963	Mali,	28,995
Kunbi,	81,902	Teli,	25,537

with Kandh, Kurku, Maria, Baiga. The Gonds dwell chiefly east of the Wainganga and the Pranhita, the Telingas along the east centre and south, and the Mahrattas in the northern and western parganas west of the Wainganga. The races of the Chanda district that are believed to be aboriginal are—(1) The Gond, Pardhan, and Halba, of the Gond type; (2) Kohri and Mana, of the Kohri type. The first are famous for the construction of tanks, the second as agriculturists. (3) The Golkar and Gowari, of the Gauli type.

CHANDA. HIND. Convolvulus Dianæ.

CHANDABUNGA, a Santal deity.

CHANDAL. HIND. Antiaris innoxia.

CHANDALA. HIND. In Hinduism, any low caste man. The word is Sanskrit from Chanda, furious, and Ala, to go. According to Dr. Hunter, the Chandala were of the same stock, and formed their name from the same root, as the aboriginal races of Northern India at the present day. The Chandala, as their personal appearance, habits, and occupations are described by ancient writers, were evidently a prior race, who before the advance of the Aryans had been reduced by the non-Aryans into a helot people, and have long since merged as serfs into the Hindu population. The whole nomenclature of the helot castes among the mixed Hindus, both in ancient and modern times, is derived, he says, from the aborigines; thus he indicates the Mali, gardeners and landless husbandmen, who take their name from the tribal term Mali, man. The Dom, Dam, and Dumi; the Kharwar, the Kheroar, or ancient Santal, and the present Kheria of Central India. The Chaura serfs of the Panjab, descendants of the Chaura military out-castes of the Mahabharata. The Coolee or Kuli all over India, and the Hadi, a helot race of Bengal. In Apastamba we find no mention of the mixed castes which come so prominently forward in the Institutes of Menu. The Chandalas and other out-castes who have become degraded by crime are mentioned, and it is declared to be sinful to touch, speak, or look at them. In Gautama's Sutras, intercourse between the castes is recognised, and a name and status allotted to the offspring. Gautama therefore stands between Apastamba and Menu. Chandalia is a tribe of the Bhangi, who might also be termed Chandala.

CHANDAN. HIND. Juniperus excelsa, J. arborea; pencil cedar; Dhupri of Kamaon.

CHANDANA. HIND. Sandal-wood. Santalum album, *Linn.*; in Telugu, Chandanapu chettu. This is the white or true sandal, which grows in Mysore and Canara; the Rakta Chandana is the red sanders wood (Pterocarpus santalinus). The Santalum (or Syrium) myrtifolium grows in the Northern Circars, which Dr. Roxburgh considered a strongly-marked variety of the Malabar sandal-tree. The attractive nature of the sandal-tree is described in the sloka, 'Round the stem of the Chandana dwell serpents, on its top birds, on its branches monkeys, on its flowers bees,—so the riches of a good man are beneficial to all.'—*Fl. Ind.* ii. 454; *Hind. Theat.* ii. p. 96.

CHANDANAVATA, an ancient name of Baroda.

CHANDANA-VIBHUTI. See Tripundra.

CHANDANAYATRA or Chandanotsava. SANSK. The ceremony of offering sandal paste or other perfume to an idol.—*Wilson.*

CHANDA-NAYIKA. SANSK. From Chanda, furious, and Nayika, a female attendant on Durga.

CHANDAN-HAR, also Chandarmah, and Chand-bina, HIND., are articles of female jewellery.

CHANDARNAGAR or Chandernagore, a French settlement on the banks of the Hoogly river, in lat. 22° 50′ 40″ N., and long. 88° 24′ 50″ E. Its population in 1877 was 22,539. It was reduced by the fire from the ships of Admiral Watson on the 23d March 1757, while then under the governorship of M. Law. The place became a French settlement in 1673.

CHANDA SAHIB, a relative and son-in-law of Ali Dost. In the early part of the 18th century, from 1732 till his death in 1752, he threw himself, on the support of the French under Dupleix, against the British and Muhammad Ali. He was an able leader, and, when occupying Seringham, Law, anxious for his safety, treated with Monaji for his escape; but Monaji, on getting possession of Chanda Sahib, kept him prisoner for several years in the fort of Tanjore, and ultimately put him to death. He was humane, generous, and brave.

CHAND BIBI, also known as Chand Sultana, wife of Ali Adal Shah of Bijapur, one of the most distinguished women that have ever appeared in India. When the emperor Akbar sent an expedition into the Dekhan, there were four parties in the field supporting claimants to the throne of Ahmadnaggur, and this princess was acting as regent for her infant nephew, Bahadur Nizam Shah. She appealed successfully to the belligerents to unite against the Moghuls. Nehang, an Abyssinian, cut his way into Ahmadnaggur while the Moghuls were in the act of investing the place, and the other two joined the Bijapur army then marching against the Moghuls. Prince Murad pressed the siege; two mines were rendered useless by the countermines of the besieged; a third mine created a wide breach, and Chand Bibi rushed to defend it, in full armour, and a naked sword in her hand, and a veil over her face, and, after an obstinate continuance of the assault, the Moghuls withdrew in the evening, and they were afterwards bought off with the cession of Berar (February 1596, A.H. 1004). The Moghuls had not long withdrawn, when Muhammad Khan, whom Chand Bibi had appointed her prime minister, plotted against her authority, and called in the aid of Prince Murad. An indecisive battle was fought on the banks of the Godavery, and Akbar sent Abul Fazl, and subsequently he himself left the Panjab in 1598, and reached the Dekhan before the middle of 1599, and sent forward Prince Danial and the Khan-i-Khanan to invest Ahmadnaggur; and Chand Bibi was negotiating a peace with them, when her mutinous soldiery burst into the female apartments, and put her to death. In a few days the Moghuls stormed the fort, and gave no quarter to the fighting men. Chand Bibi is the favourite heroine of the Dekhan, and is the subject of many fabulous stories, which even Khafi Khan and Kazi Shahab-ud-Din perpetuate.—*Elphin.* pp. 459–460.

CHANDEL, , a Rajput tribe spread through the N.W. Provinces. They have many divisions, and are supposed to have come from Muhoba in Bundelkhand. They claim to be of the Lunar race, and they give their name to the Chandeli or Chanderi district. There are four subdivisions of them in the Lower Doab, who suffix to their names the regal terms Rao, Rawat, Rao, and Rana.—*Elliot; Wh. H. of I.*

CHANDELI. HIND. A very fine cotton fabric made at Chanderi, on the left bank of the Betwa, from the cotton of Amraoti. Great care is bestowed in the preparation of the thread, which is prepared so fine as even to sell for its weight in silver. The weavers work in a dark underground room, of which the walls are kept damp to prevent dust flying about.—*Elliot.*

CHANDESWARA, who lived about A.D. 1314, is the author of the law-book Vivada Ratnakara.

CHANDESWARI, in the Tamil country, the prototype of Durga or Kali.

CHANDI, the last day of the month Asoj, ushers in the Hindu winter (sard rit). On this day nothing but white vestments and silver (chandi) ornaments are worn, in honour of Chandra, who gives his name to the

> 'Pale and common drudge
> 'Tween man and man.'

An intercalary month is the mode followed by Hindus to adjust the annual seasons, their ordinary calculations being by lunar months, and such are called lunar. On the Asoj there is a procession of all the Rajput chiefs to the Chougan, and on their return a full court is held in the great hall, which breaks up with 'obeisance to the lamp' (jote ka moojra), whose light each reverences. When the candles are lit at home on this day, every Rajput, from the prince to the owner of a 'skin (charsa) of land,' seated on a white linen cloth, should worship his tutelary divinity, and feed the priests with sugar and milk.—*Tod's Rajasthan.*

CHANDIA, a Baluch tribe, some of whom are found in the Dehra Ghazi Ghan district.—*MacG.*

CHANDI-MANDAPA, chapels in private dwellings in Bengal. Chapels face either the west or the south, never the east nor the north.

CHANDIPAT or Chandipatha, also called Devi-Mahatmya, a Sanskrit poem of 700 verses, forming an episode of the Markandeya Purana. It celebrates Durga's victories over the Asuras, and is daily read in the temples of that goddess. Chanda was a name of the goddess Durga.—*Dowson.*

CHANDLA. HIND. A small wafer-shaped gold or silver ornament worn by Hindu women on the forehead between the eyes; also the painted mark made by women on their forehead. The Ratnamala says, 'Dressed in sixteen garments, a woman without a Chandla does not appear beautiful.'

CHANDNEE. HIND. Calonyction Roxburghii.

CHANDNEY CHOWK, or Silver Street of Dehli, is a name that has become common to the principal avenue in all the great cities of Northern India. In Calcutta, however, the street of that name is not inhabited by bankers or goldsmiths, but by stable-keepers.—*Tr. of Hind.* ii. p. 278.

CHANDNI. HIND. Silver; a white cloth spread on a carpet; a canopy.

CHANDNI, or Chandi. HIND. The practice amongst Brahmans, Charans, and others, of

wounding or killing themselves, in order to extort alms or payment.—*Wilson.* See Chandi.

CHANDO, a caste of toddy-drawers in Ceylon.

CHANDOO, the extract of opium which is employed in opium-smoking, called by the Chinese Yen-kau and Shuh-yen. The opium, as exported from Calcutta, is in boxes containing forty balls, each of the size of a 32 lb. cannon shot. These balls are enclosed in a husk of compressed poppy leaves, and contain a certain quantity of moist opium inside, but which in this state is unfit for smoking, for which it is prepared by four processes, in the following manner:—About three or four o'clock in the morning, fires are lighted, and, as the *first* process, a ball is divided into two equal halves by one man, who scoops out with his fingers the soft part inside, and throws it into an earthen dish; frequently during the operation moistening and washing his hands in another vessel, the water of which is carefully preserved, into which also is thrown the hardened poppy leaf husks, when all the removable opium is obtained.

In the *second* operation, the husks are boiled until all their adhering opium is dissolved, strained through a double filter of cloth and China paper. The strained fluids are then mixed with the opium that was scooped out in the first operation, and boiled down in a large iron pot to the consistence of treacle. The refuse is dried and sold to Chinese, who adulterate good opium with it; and the filter paper is used by the Chinese as an external application in affections of the lower bowels.

In the *third* operation, the dissolved treacle-like mass is seethed over a charcoal fire, strong and steady but not fierce temperature, during which it is worked, spread out, and again and again worked up to expel the water, but prevent it burning. When brought to the proper consistence, it is divided into half-a-dozen lots, each of which is spread like a plaster on a nearly flat iron pot, to the depth of from half to three-quarters of an inch, and then scored in all directions to allow the equal application of heat. One pot after another is then placed over the fire, turned rapidly round, and then reversed, so as to expose the opium itself to the full heat of the red fire. This is repeated three times, the time and proper heat being judged by the workman from the aroma and colour. In this part of the process the greatest delicacy is demanded, for a little more or less fire would destroy the morning's work, or 300 or more dollars' worth of opium. The head workmen in Singapore are men who have learned their trade in China, and from their great experience are paid very high wages.

The *fourth* operation consists in re-dissolving this fired opium in a large quantity of water, and boiling it in copper vessels till it be reduced to the consistence of the chandoo of the shops, the degree of tenacity being the index of its complete preparation, which is judged of by drawing it out by slips of bamboo. The quantity of chandoo obtained from the soft opium is about 75 per cent. But from the gross opium, that is, including the opium and the bark, the proportion is not more than from 50 to 54 per cent.

In this lengthened seething process, the chandoo or extract becomes less irritating and more soporific, the vegetable matter, the resin and oil, the extractive matter, being all thrown out in the refuse matter.—*J. I. A.* No. 1, Jan. 1848; *Dr. Little; Cameron*, pp. 215, 216.

CHANDO-OMAL, or moon goddess. (Qu. Chando Ammal.)

CHANDPUR, the name of many towns in India.

CHANDPUR SAKUMBARI of Tantia are described by Col. Tod as desperate robbers. He saw this place fired and levelled in 1807, when the noted Karim, Pindari, was made prisoner by Sindia. It afterwards cost some British blood in 1817. Though now desolate, the walls of this fortress attest its antiquity, and it is a work that could not now be undertaken. The remains of it bring to mind those of Volterra or Cortana and other ancient cities of Tuscany,—enormous squared masses of stone, without any cement.—*Tod's Rajasthan*, i. p. 100.

CHANDRA. TEL. Acacia sundra; Machilus odoratissimus? and Tetranthera Roxburghii. BENG., Ophioxylon serpentinum, *L.*

CHANDRA. SANSK. The moon, from Chad, to shine. This is a frequent affix to names, as Chandra-Prabhu, shining lord; Chandra-Raya, shining ruler; Chandra-Shekhara, shining mountain peak, a name of Siva. See Amas; Chand; Graha; Haft Dhat; Uma.

CHANDRA, a son of Atri, and father of Budha by Tara. Tara was the wife of his teacher Vrihaspati.

CHANDRA, in Hindu mythology, the moon. Moor tells us it is usually a male deity; sometimes, however, feminine, Chandri, and in such character is more commonly applied to Parvati or Devi, the consort or Sacti of Siva, than to any other goddess. Lakshmi Devi, or simply Devi, as the consort of Vishnu is often called, occasionally coalesces with Parvati; and both, as well as Saraswati, spouse of Brahma, may be identified with the moon or Luna. Thus, in Hindu mythology, the sun and moon, being sometimes regarded as male deities, the three principal female divinities hold a similar union with their respective solar lords. According to Coleman, Chandra or Soma, the moon, is described as the male, and is painted young, beautiful, and of dazzling fairness, two-armed, and having in his hands a club and a lotus. He is usually riding on or in a cart drawn by an antelope. The moon is occasionally represented as Chandri, a female, in which character being visited by Surya, she produced a numerous family called Pulinda. In the third volume of the Asiatic Researches, this sexual change is accounted for by Colonel Wilford, who says, when the moon is in opposition to the sun, it is the god Chandra, but when in conjunction with it, the goddess Chandri, who is in that state feigned to have produced the Pulinda. The moon was also worshipped as male and female, Lunus and Luna, by the Egyptians, the men sacrificing to it as Luna, the women as Lunus; and each sex on these occasions assuming the dress of the other. The Hindus have in their zodiac twenty-seven lunar mansions, called Nakshatra, or daily positions of the moon; and as to perfect the revolutions some odd hours are required, they have added another not included in the regular chart. These twenty-eight diurnal mansions form the zodiac, having been invented by Daksha; are personified as the daughters of the deity, and are the mythological wives of Chandra. In the chart of the

lunar mansions they are curiously represented as a horse's head, a yoni, razor, an arrow, a wheel, a bedstead, a house, etc. The Dii Majores of the Rajput are the same in number and title as amongst the Greeks and Romans, being the deities who figuratively preside over the planetary system. Their grades of bliss are therefore in unison with the eccentricity of orbit of the planet named. On this account Chandra or Indu, the moon, being a mere satellite of Ella, the earth, though probably originating the name of the Indu race, is inferior in the scale of blissful abodes to that of his son Budha or Mercury, whose heliacal appearance gave him importance even with the sons of Vaiva, the sun.—*Cole, Myth. Hind.* p. 131.

CHANDRA-BHAGA, a river formed by the junction of the Chandra and the Bhaga, and is then styled the Chenab river, the Ascesines of the Greeks. In the parts of Ladakh through which the Chandra and Bhaga rivers run, on their banks the people are Bhot up to their junction; after that, Hindu. See Ladakh.

CHANDRA BHUNDA, a tribe employed in the Sunderbuns in the manufacture of salt.

CHANDRAGIRI, a town and taluk in the North Arcot district, near Madras, where the rajas of Vijayanagar resided after the defeat at Talikot, and where, in 1640, was signed the treaty granting to the E. I. Company the site for Fort St. George, Madras.—*Imp. Gaz.*

CHANDRA GOPAL PAL, commonly called Gopal Bhar, was the principal humorist at the court of Krishna. He was a Kūmār or potter by caste, and was a native of Nadiya. Some say he was a Napit, or of the barber caste. He was fond of music, and patronised musicians and khawaths of the Upper Provinces. He delighted in dhurpāds and kheāls, and was a great connoisseur in matters regarding the rāgs and raginis regulating oriental music. He was a great encourager of architecture. He constructed the large building for puja in the Rajbari. It is of Gothic style of architecture, and is considered a splendid dalan. He also built a marble staircase for going down the sacred well Gyan Bapi, in Benares, for the benefit of the pilgrims. He was universally considered the head of Hindu society, and was the arbitrator on all questions of caste.—*Calcutta Review*, No. 109, p. 110.

CHANDRAGUPTA, the Sandracottus or Sandracoptus of the Greeks, the founder of the Mauryan dynasty of Magadha. He was the illegitimate son of the last Nanda, by the beautiful but low caste Mura, from whom he obtained the designation of Maurya. In the Mudra Rakshasa, a Sanskrit drama detailing his elevation, Chandragupta is, however, frequently named Vrishala, a term said to be equivalent to Sudra; and as Nanda himself was the son of a Sudra woman, there can be little doubt that the celebrated Maurya family were of Sudra extraction. In the early part of his career, Chandragupta led a wandering life in the Panjab (see Turnour, Introduction to the Mahawanso, p. 41, quoting the Tika or Commentary), and was probably engaged with his fellow-countrymen in opposing Alexander. His chief adviser, the Brahman Chanakya, was a native of Takshasila or Taxila, the capital of the Western Panjab; and it was in that country that Chandragupta first established himself by the complete expulsion of the Greek troops left by Alexander (Justin. xv. 4: 'Auctor libertatis Sandrocottus fuerat'). It would appear that the Greek colonists in the Panjab had first been placed under Philip, while the civil administration of the country remained in the hands of its native princes, Taxiles and Porus. Afterwards, on the murder of Philip by the mercenary soldiers, Alexander (Anabasis, vi. 2, vii.) directed Eudemos and Taxiles to govern the country until he should send another deputy. It is probable, however, that they continued to retain the charge; for, after Alexander's death in B.C. 323, Eudemos contrived, by the treacherous assassination of king Porus by his general Eumenes, to make himself master of the country (Diodorus, xix. 5). Some few years later, in B.C. 317, he marched to the assistance of Eumenes with 3000 infantry and 5000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected, and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs (Justin. xv. 4: 'Præfactos ejus occiderat;' again, 'Molienti deinde bellum adversus præfactos Alexandri'). Chandragupta was present when Porus was murdered. He afterwards became the leader of the national movement, which ended in his own elevation to the sovereignty of the Panjab. Justin attributes his success to the assistance of banditti (Justin. xv. 4: 'Contractis latronibus Indos ad novitatem regni solicitavit'). But in this Colonel Cunningham thinks he has been misled by a very natural mistake; for the Aratta, who were the dominant people of the Eastern Panjab, are never mentioned in the Mahabharata without being called robbers (Lassen, Pentapot Indica: 'Aratti profecto latrones,' and 'Bahici latrones'). The Sanskrit name is Arashtra, the kingless, which is preserved in the Adraistæ of Arrian, who places them on the Ravi. They were the republican defenders of Sangala or Sakala, a fact which points to their Sanskrit name of Arashtra, or kingless. But though their power was then confined to the eastern Panjab, the people themselves had once spread over the whole country: 'Ubi fluvii illi quivi . . . ibi sedes sunt Arattorum.'—*Lassen, Pentapot Indica, from the Mahabharat.* They were known by the several names of Bahika, Jarttika, and Takha; of which the last would appear to have been their true appellation, for their old capital of Taxila or Takka-sila was known to the Greeks of Alexander; and the people themselves still exist in considerable numbers in the Panjab hills. The ancient extent of their power is proved by the present prevalence of their alphabetical characters, which, under the name of Takri or Takni, are now used by all the Hindus of Kashmir and the northern mountains, from Simla and Sabathu to Kābul and Bamian. On these grounds, Major Cunningham identifies the banditti of Justin with the Takka, or original inhabitants of the Panjab, and assigns to them the honour of delivering their native land from the thraldom of a foreign yoke. This event occurred most probably about 316 B.C., or shortly after the march of Eudemos to the assistance of Eumenes. It was followed immediately by the conquest of Gangetic India (Justin. xv. 4), and in 316 B.C. the rule of Chandragupta was acknowledged over the whole northern Peninsula, from

the Indus to the mouth of the Ganges. Authorities differ as to the length of Chandragupta's reign. The Mahawanso gives 34 years; the Dipawanso and the Vayu Purana give only 24 years. This difference may perhaps have originated in two distinct reckonings of the date of his accession, the one party counting from the death of Nanda Mahapadma, in B.C. 325, and the other party from the conquest of India, in B.C. 315. Some assumption of this kind is clearly necessary to reconcile the different authorities, unless, indeed, we take the only alternative, of adopting the one and of rejecting the other. At this period the capital of India was Pataliputra or Palibrotha, which was situated on the Ganges, at the junction of the Erranaboas or Alaos river. The former name has been identified with the Sanskrit Hiranyabahu, an epithet which has been applied both to the Gandak and to the Sone. The latter name can only refer to the Hi-le-an of the Chinese travellers, which was to the north of the Ganges, and was there undoubtedly the Gandak. Indeed, this river still joins the Ganges immediately opposite to Patna, that is, the city, or metropolis, as its proper name (Patna) implies; the junction of the Sone is some nine or ten miles above Patna. But as there is good reason for believing that the Sone once joined the Ganges at Bakipur or Bankipur, immediately above Patna, it is quite possible that the Erranaboas may have been intended for the Sone, and the Alaos for the Gandak. According to Megasthenes, Palibrotha was 80 stadia or nearly nine miles in length, and 15 stadia or one mile and two-thirds in breadth. It was surrounded with a deep ditch, and was enclosed by lofty wooden walls, pierced with loopholes for the discharge of arrows (Arrian, Indica, x., and Strabo, xv., both quoting Megasthenes). But when Alexander's successors were at peace with each other, the great Seleucus turned his arms towards the east, with the intention of recovering the Indian provinces of Alexander, but Chandragupta formed an alliance with Seleucus, whose daughter he received in marriage. He also received, at his court of Palibrotha, Megasthenes as an ambassador, and in return Chandragupta sent presents with an ambassador to Seleucus Nicator to Babylon. The Hindu drama Mudra Rakshasha records the memorable political event of his usurpation. His name occurs in an inscription at Sanchi, also on one at Ujjain. Tod says he was of the Takshak race. He died B.C. 289. His successor died B.C. 261; and Asoka, the great Buddhist sovereign, the grandson of Chandragupta, then succeeded. Asoka had murdered his brother, whose son converted him to Buddhism, and he was crowned B.C. 259–258, at Patalipura, in the third year of his reign. Asoka engraved on rocks numerous inscriptions inculcating Buddhist doctrines, and erected, it is said, 84,000 chaitya, many of which still remain. — *Bhilsa Topes, Cunningham*, pp. 87–91, 141; *Bunsen, Egypt*, iii. 544; *Tod, Rajasthan; Cal. Review; Indische Alterthumskunde*, i. App. p. xxx., and ii. pp. 1161, 1162; *Jo. As. Soc. Ben.* p. 146; *Thomas' Prinsep*, i. pp. 61, 276; *Burgess and Fergusson*, pp. 190, 725; *Tennant's Ceylon.*

CHANDRAGUPTA, a Chauhan prince of Ajmir, grandson of Manikya Rai, who lived A.D. 695. His descendant, Pritha Rai, was the last Hindu prince who reigned at Indraprestha or Dehli.

CHANDRAGUPTA II., a king of the Gupta dynasty, who A.D. 400 made gifts to the tope at Sanchi, which are recorded on the rail of that monument.—*Fergusson*, 22.

CHANDRA KANTHA. TEL. Mirabilis jalapa, *L.* In Sanskrit the moonstone.

CHANDRAOTA, an ancient town at the foot of the Aravalli mountains. It was anciently the capital of the Pramara rajas, vassals of the Hindu rulers of Gujerat. Its ruins are situated about 12 miles from the foot of the Abu mountain, on the banks of the Bunass, and in a fine, well-wooded country. When Ahmad, grandson of Jaka, styled Wajah-ul-Mulk, resolved to found Ahmadabad, he chose a site occupied by a community of the Bhil race, whose predatory habits were the terror of the neighbourhood, and resolved to create his new capital by means of the city of Chandraota, the materials of which he used, and compelled all its people to follow the spoils of their temples and dwellings to the uninteresting, unhealthy, low flat on the banks of the Sabarmati. It is now only marked by mounds of ruined temples and palaces. Ahmadabad was taken by General Goddard 15th February 1780.—*Tod's Travels*, p. 134.

CHANDRA PALA, a prince mentioned on an inscription at Oomya, A.D. 1439.

CHANDRAPODA. TEL. Argyreia speciosa.

CHANDRASECHA, a mountain in the N.W. Himalaya. See Kali. Chandrasekhara, the moon-crested. One of Siva's many names.

CHANDRA SENA, a ruler at Ujjain about A.D. 50, who followed after Vikramaditya about 100 years. He restored the Hindu kingdom to its entirety.

CHANDRASENI KAYASTHA, a caste of clerks in Poona, who claim to be descended from a raja named Chandrasena, and therefore claim to be regarded in some degree as Kshatriya, and to be entitled to perform the ceremonies of the Vedas,—a claim not recognised by the Brahmans. There are two divisions,—the Patani Prabhu and the Dawani Prabhu. The former are found at Bombay and other towns, the latter at Goa. It is this caste whom the British call Purvoe.—*Wilson.*

CHANDRAVANSA or Indovansa, or Lunar race, a race that reigned in Antarveda and Kasi, but afterwards in Magadha (Behar) and Indraprashtha (Dehli). In this dynasty are included the kings of Kasi (Benares), the line of Puru, and the line of Yadu.

Atri—Muni.
Soma—Lunus, the moon.
Budh—Mercury; married Ila, daughter of the sun.
Alias or Pururavas.
Ayu—kings of Kasi descended from him.
Nahusha—Devanahusha, Dionysos, Bacchus (Wd.).
Yayati—father of Puru and Yadu.

According to Tod, the following are synchronisms of the Solar and Lunar races:—

Budha of the Lunar race married Ila, the sister of Ikshwaku, s. l.

Harischandra, s. l., contemporary of Parasurama of Lunar line.

Sagara, cot. of Taljanga, of Parasurama.

Ambarisha, cot. of Gadhi; founded Kanouj.

In the line of Pura occurs Hastin, who built Hastinapur and Vichitravirya.

Indu, Som, Chandra, in Sanskrit mean the moon;

hence the Lunar race is termed the Chandravansa, or Induvansa, or Somavansa. They are divided into two great branches, the Yadava, who are descendants from Yadu, to which Krishna belonged, and the Paurava, who claim from Puru, to whom belonged Dushyanta with the Kuru and Pandu princes.—*Tod; Thomas' Prinsep's Indian Antiquities; Dowson.* See Magadha; Pandu; Rama; Surya.

CHANDRAWUT, descendants of Chandra, one of the most powerful vassal clans of Mewar. Rampura (Bhanpura) was their residence, yielding a revenue of five lakhs (£110,000), held on the tenure of service from an original grant from Rana Juggut Singh to his nephew Madhu Singh. Chandra obtained an appanage on the Chambal. —*Tod's Rajasthan*, i. p. 261.

CHANDRAYANA, a Hindu penance, which consists in the sinner or devotee 'eating for a whole month no more than thrice eighty mouthfuls of wild grains, as he happens to meet with them, keeping his organs in subjection.' The reward of this is attaining the same abode as Chandra, the regent of the moon; and it absolves a Brahman from the sin of slaughtering a thousand small animals which have bones, or of boneless animals enough to fill a cart; and it is also the common penance for killing a Sudra, a Hindu of the fourth or servile class.—*Coleman*, p. 92.

CHANDRIE. HIND. Calonyction Roxburghii.

CHANDRIKA, a name of Lakshmi.

CHANDRIKI-KA-JHAR. H. Ophioxylon, *sp.*

CHANDUS. HIND. Cotton cloth, coloured border and ends.

CHANDWAR, of the 12th century, is the modern Firozabad. The fields around form the memorable battle-ground on which was decided the contest between the Hindu and Musalman for the sovereignty of India. The heroes Alha and Udal, two brothers, fell here; but their memory is preserved in the songs and traditions of the people, amongst the Mahoba and the Rahtores and Chandals of the Doab. The last Hindu raja, Jye-Chand of Kanouj, here closed his career by leaping into the Ganges.—*Tr. of a Hindoo*, i. p. 378.

CHANG. A deity of the Assamese, replaced in 1665 by Hinduism.

CHANG. HIND. Salix alba.

CHANG, CHIN., is a measure of 10 che, or Chinese cubits of about 14 inches each.—*Staunton's Narrative*, pp. 43, 73.

CHANG. BURM. A fortified city.

CHANG, a beer made by the Bhot race from malted barley; also the barley Hordeum hexastichon.

CHANGA DEVA, a Hindu devotee, whose equipage was a tiger, but other holy men have adopted the tiger as a vehicle. A pious personage of this description was reported to have visited Sri-ranga-patan (the city of Sri Ranga, or Mahadeva, commonly Seringapatam) about the year 1797, and although a Hindu, to have been hospitably invited by Tipu Sultan. He was attended by ten disciples, and declined the royal civilities, saying a tree was sufficient shelter for him. Changa Deva was of that class which pandits call Yug-saddan, or Yug-brashat, or Yug-Vyasa, who by extraordinarily pious pains obtain miraculous longevity; they prolong their existence, it is hyperbolically said, to some hundreds of years.—*Coleman*, p. 426.

CHANGA GADDA. TEL. Sanseviera Zeylanica.

CHANGAL or Champac. HIND.? A moderate-sized tree of Akyab, not plentiful. Wood used for boats.—*Cal. Cat. Ex.* 1862.

CHANGALI GADDI. TEL. Panicum commutatum, *Nees*; P. ciliare, *R.* i. 290.

CHANGALI KOSHTU. TEL. Costus Arabicus, *Heyne.*

CHANGAR, a predatory tribe of the Panjab.

CHANG BHAKAR, a small native state of Chutia Nagpur, with a population of 8919. Its hills are clothed with the sal trees. Its people are Kolarian aborigines (Muasi Kuru), 3195, and Dravidian aborigines, 2955, viz. Gond, and are poor.—*Imp. Gaz.*

CHANG-CHEN-MO. This place gives its name to a route of about 16 marches between Ladakh and Eastern Turkestan, said to be the easiest from India to Upper Asia, much easier than the more westerly Kara Korum route traversed by Schlagintweit and Mr. Johnson. The heights vary from 19,000 to 21,000 feet, but the mountains are generally rounded, and fuel and grass are abundant, save at one stage. Gumah is equidistant between Ilchi and Yarkand, and the Kara Korum route meets this route at Shadula.

CHANGEZ KHAN or Jenghiz Khan, a name from the Uigur chang, firm, and Kissar ghiz, powerful. Temuchin, afterwards known as Changhiz, was born of a Mongol tribe on the banks of the Onon in 1162. He conquered and expelled Mahomed the Kharasmian, and defeated his son Jalaluddin, on the banks of the Indus. Aung Khan of the Keraite Mongols, celebrated in Europe under the name of Prester John, was a contemporary of Changez Khan, whom, at the instigation of jealous enemies, he attempted but failed to destroy.—*Elliot*, p. 498. As the result of Temuchin's successes against the nations of Tartary, he was saluted in 1206 by the diet of his nation as Changiz Khan. According to Quatremère, Changez did not use the higher appellation of Kaan (or Qaan), which was adopted by his son Okkodai and his successors as their distinctive title, identical with Khaqan, the Xaganos of the Byzantine historians. Properly a distinction should therefore be preserved between Khan, the ordinary title of Tartar chiefs, and which has since spread to Persian gentlemen, and in India become a common titular affix to the name of Mahomedans of all classes, and Qaan as the peculiar title of the supreme chief of the Mongols. The Mongol princes of the subordinate empires of Chaghtai, Persia, and Kapchak were entitled only to the former affix, though the other is sometimes applied to them in adulation, and claimed by all Afghans. The conquest of China was commenced by Changez, although it was not completed for several generations. In 1205 he invaded Tangut, a kingdom occupying the extreme north-west of China, and extending beyond Chinese limits in the same direction, held by a dynasty of Tibetan race, which was or had been vassal to the Kin. This invasion was repeated in succeeding years; and in 1211 his attacks extended to the empire of the Kin itself. In 1214 he ravaged their provinces to the Yellow River, and in the following year took Chingtu or Pekin. In 1219 he turned

his arms against Western Asia, and conquered all the countries between the Bolor and the Caspian, and southward to the Indus, whilst his generals penetrated to Russia, Armenia, and Georgia; and a lieutenant, whom he had left behind him in the east, continued to prosecute the subjection of Northern China. Changez himself, on his return from his western conquests, renewed his attack on Tangut, and died in that enterprise, 18th August 1227. Okkodai, his son and successor, followed up the subjugation of China, extinguished the Kin finally in 1234, and consolidated with his empire all the provinces north of the Great Kiang. After establishing his power over that part of China, Okkodai raised a vast army and set it in motion towards the west. One portion was directed against Armenia, Georgia, and Asia Minor, whilst another great host, under Batu, the nephew of the Great Khan, conquered the countries north of Caucasus, overran Russia, making it tributary, and still continued to carry fire and slaughter westward. One great detachment, under a lieutenant of Batu, entered Poland, burned Cracow, found Breslau in ashes and abandoned by its people, and defeated with great slaughter, at Wahlstadt, near Liegnitz (April 12, 1241), the troops of Poland, Moravia, and Silesia, who had gathered under Duke Henry of the latter province to make head against this astounding flood of heathen. Batu himself, with the main body of his army, was ravaging Hungary. The king had been very slack in his preparations, and when, eventually, he made a stand against the enemy, his army was defeated with great loss, and he escaped with difficulty. Pesth was now taken and burnt, and all its people put to the sword. The rumours of the Tartars and their frightful devastations had scattered fear through Europe, which the defeat at Liegnitz raised to a climax. Indeed, weak and disunited Christendom seemed to lie at the feet of the barbarians. The Pope, to be sure, proclaimed a crusade, and wrote circular letters, but the enmity between him and the Emperor Frederick II. was allowed to prevent any co-operation,' and neither of them responded by anything better than words to the earnest calls for help which came from the king of Hungary. No human aid merited thanks when Europe was relieved by hearing that the Tartar host had suddenly retreated eastward. The Great Khan, Okkodai, was dead in the depths of Asia, and a courier had come to recall the army from Europe. In 1255, however, a new wave of conquest rolled westward from Mongolia, this time directed against the Ismaili or Assassins on the south of the Caspian, and then successively against the Khalifs of Baghdad and Syria. The conclusion of this expedition under Hulaku may be considered to mark the climax of the Mongol power. Mangu Khan, the emperor then reigning, and who died on a campaign in China in 1259, was the last who exercised a sovereignty so nearly universal. His successor Kablai extended, indeed, largely the frontiers of the Mongol power in China, which he brought entirely under the yoke, besides gaining conquests rather nominal than real on its southern and south-eastern borders, but he ruled effectively only in the eastern regions of the great empire, which had now broken up into four, viz. (1) the immediate empire of the Great Khan, seated eventually at Keanbalik or Pekin, embraced China, Corea, Mongolia, Manchuria, and Tibet, and claims at least over Tunking and countries on the Ava frontier; (2) the Chaghtai khanate, or middle empire of the Tartars, with its capital at Almalik, included the modern Dsungaria, part of Chinese Turkestan, Transoxiana, and Afghanistan; (3) the empire of Kapchak, or the northern Tartars, founded on the conquests of Batu, and with its chief seat at Sarai on the Wolga, covered a large part of Russia, the country north of Caucasus, Khwarizm, and a part of the modern Siberia; (4) Persia, with its capital eventually at Tabreez, embraced Georgia, Armenia, Azerbijan, and part of Asia Minor, all Persia, Arabian Irak, and Khorasan.

The conquests of Changez Khan, and of his successor Okkodai Khan, in the first half of the century, brought into China a vast influx of Uigoor and Toongani immigrants. Atabeg, also Atabak, in ancient Persia, was an officer or prince, ruler of a province. Luristan seems to have been the latest territory so ruled, until Changez Khan, with his destructive hordes of Tartar and Moghul, overwhelmed the land. Changez Khan, with respect to religion, was the apostle of the most complete toleration. Mahomedans relate that he had the subject discussed in a mosque of Bokhara, and there laid down the principle that he required only faith in one all-powerful God, leaving all the rest to be supplied by man's free study and judgment. But the creed of Changez Khan was Buddhism.—*Prinsep's Tibet, Tartary, and Mongolia*, pp. 3 and 4; *Yule's Cathay*, i. cxviii., ii. 522; *Osborn's Islam; Vambery, Bokhara*, p. 120.

CHANG-GARH. ASSAM. A house raised on posts with a space open underneath,—the ordinary house of the Miri, Burmese, and Malay.

CHANG-KIA-KHOW, a pass from the great wall of China, in the province of Pe-che-lee, about a hundred miles to the westward of that of Kou-pe-keou, by which the embassy of Lord Macartney crossed the wall in 1793, and Sir George Staunton later. The words mean the gate of the Chang family.—*Staunton's Narrative*, p. 22.

CHANGLA. TEL. Aucklandia costus.

CHANGLO, a Tibetan race, a branch of the Lhopa of Butan. The Changlo dialect has a considerable amount of glossarial peculiarity with Tibetan, but in other respects it is entirely Tibetan softened and slightly changed in phonology. It is spoken along that portion of the northern frontier of the valley which extends from the Binji Doar to the confines of the Kuriapura Doar, or from about long. 90° to 92° E. Neither its northern limit nor the numbers speaking it have been ascertained. The inhabitants of this tract occupy the lesser elevations of the southern Himalaya range, and are, generally speaking, agricultural. Their physical appearance exhibits a few shades of distinction noticeable between them and the tribes of the Sub-Himalaya. They are smaller, less muscular, and the hue of their skin possesses a deep isabelline tint. From the latter circumstance, probably, they derive their appellation, the term Changlo meaning black.—*Jour. Ind. Arch.*, April—May 1853, p. 192. See India.

CHANGMA. HIND. Populus balsamifera, P. nigra, also Salix alba.

CHANG-MAI, a mode of spelling Zimmay of

the Laos. It is also written Xieng-ma. It is on the Menam river, between lat. 19° and 20° N.

CHANGO, a tribe of Hungrung Tartars occupying 378 square miles. See Kunawar.

CHANGOS, a village famous in olden times for its pretty dancing-girls; more than one Changos girl entered the zananas of the Dehli emperors. The dark eyes and sunburnt countenances of old and young still testify to a race distinct from their neighbours.

CHANGPA, a semi-nomade tribe near the Pangong Tsi pass. They dwell in their grazing grounds under huts (galkol) made of the yak's hair. The people there call themselves Bot.

CHANGRA. HIND. Capra hircus, *L.*

CHANG-THANG. TIB. On the northern plains to the north of Ladakh, supposed to be the Chatæ Scythæ of Ptolemy.—*A. Cunn.*

CHANG-THANI. PANJ. A kind of wool.

CHANG-TIEN-SZ, the chief of the Taoist priests, living at Kiang-si.—*Smith*, p. 5.

CHANGU. TIB. Canis laniger, *Hodgs.*

CHANI. TEL. Adenanthera aculeata.

CHANJAN WALE. HIND. Asparagus Panjabensis.

CHANK. HIND. A harvest ceremony in several parts of Northern India, differing in each province. After the heap of grain on the threshing ground has been raised a foot high, a man, in silence, standing with his face to the north, a winnowing basket in his right hand, his left hand being full of grain, commencing from the south, goes round from east to west, and again to the south, pressing his basket against the bottom of the heap. This is repeated, changing hands, and when complete, he joins his hands, bows to the heap, and supplicates in a few words, either Parmeshwar or Anna Deota, as,

'Anna Deota ji,
Sahes goona hajiye.'

In the Lower and Central Doab and Sangor, a circle is made with cow-dung or ashes round the Ras and T'hapa at the same time, commencing from the east, and going from south to west till the east point is again reached, the operator taking care all the while to hold his breath. A superstitious observance in the highlands of Scotland bears a remote resemblance to this.—*Elliot.*

CHANK. HIND. Also Chanka, and Ch'hapa. A stamp cut in wood, with the words Akibat ba 'khair bad,—May the end be prosperous; or Iman ki salamati,—Safety in your honour; and impressed on a cake of moist earth (barkat ki matti) on stacks or heaps of grain which are left in the care of one of the parties between whom it is to be divided. The words on the stamp mean, 'May the end be happy,' and 'Security on honour,' implying that the grain is left to the honour of the person keeping it. The seal is then placed on the sides of the heap, never on the top, lest the increase of corn be thereby prevented. It is the system of making an article over to the Supreme Being, common in Africa and the Archipelago, under the term Taboo, and it is similar to the Ch'hutoor of the Hindu.

CHANKEE. MALAY. Cloves. Caryophyllus aromaticus.

CHANK SHELLS, Konk, Conch.

Sukk, ...	DUKH.	Sankha, ...	TAM.
Senkham, . . .	SANSK.	Sangu, ...	,,
Shenku, ...	,,	Senkham, . . .	TEL.

These shells are species of the genus Turbinella, fished up by divers in the Gulf of Manaar, on the coast opposite Jaffnapatam in Ceylon, in about two fathoms water, and at Travancore, Tuticorin, Kila-Karei, and other places. Large beds of fossil chanks have also been found. They form a considerable article of trade in India, as they are in extensive demand all over the country. The fishery is chiefly worked at Kila-Karei in the Ramnad territory, and Tuticorin in the Tinnevelly district. They lie at the bottom in from 2 to 5 fathoms of water. The divers carry a bag round their necks, and dive and grope over the bottom; 20 chanks are a very good haul for one plunge. The rents paid to the zamindar of Ramnad are £500, and to the British Government £1000. The fishing season is from October to March. Chank shell was one of the insignia of royalty of the Chalukya dynasty when ruling at Kalian. The Chank and the Voluta species are used for making the shell ornaments of Dacca.

They are sawn into narrow rings or bracelets, armlets, beads, and are worn as ornaments for the arms, legs, fingers, etc., by Hindu women. Many of them are also buried with the bodies of opulent and distinguished persons. Those which, from being taken with the living mollusc, are called green chanks, are most in demand. The white chank, which is the dead shell thrown upon the beach by strong tides, having lost its gloss and consistency, is not worth the freight up to Calcutta. The value of the green chank depends upon its size. A chank opening to the right, called in Calcutta the right-handed chank, is so highly prized as sometimes to sell for 400 or 500 or even 1000 rupees. Even 20,000 rupees have been named. The Jangam religious mendicants and those of the Viranrusty sect blow them as horns. The commercial returns show an exportation from Madras of ten to twenty-four lakhs of these shells in one year.

1852-53, . .	15,15,495	Rs. 54,780
1853-54, . .	24,60,727	1,04,481
1854-55, . .	10,84,575	56,165
1855-56, . .	Not given	26,171

They are classed as Patty and Pajel, or short and pointed headed, and Wallampory, or right-hand chanks. Bertolacci mentions, as a peculiarity observed by the Ceylon fishermen, that all shells found to the northward of a line drawn from a point about midway from Manaar to the opposite coast at India are of the kind called Patty, and are distinguished by a short flat head; and all those found to the southward of that line are of the kind called Pajel, and are known from having a longer and more pointed head than the former. Nor is there, he says, even an instance of deviation from this singular law of nature. The Wallampory or right-hand chanks are found of both kinds. Chanks are alluded to in Cosmos Indicopleustes, and by Abu Zaid in Voyages Arabes, showing that so early as the 6th century this shell was fished for. The fishery until a few years ago continued a government royalty. The Sankasari of Dacca are famed for their skill in working with the chank or sank. Turbinella rapa is used as a trumpet, a hole being bored through its base. When blown into it gives a loud, sharp, and piercing sound. It is used in Hindu worship to call the attention of the gods to their worshippers. The conch shell, used for pouring water

on the gods, is a smaller one, the Mazza rapa of naturalists. The pictures and figures of the Hindu god Vishnu always represent him with a chank shell in one hand, and a discus or chakra in the other. In ancient times, the Indian warriors used the chank as a trumpet. Chankangan of Shahpur is a silver armlet worn with churis or bracelets.—*Rohde, MS.; Ainslie, Mat. Med.* p. 143; *Tennent's Ceylon; Hooker*, ii. 254.

CHANNA. HIND. The pulse Cicer arietinum, called Bengal gram, gram, and chick-pea. Channa siya is black gram, and Channa Kabuli, Kābul or white gram. Its principal use is to feed horses and cattle, but the people of N. India often eat it. An acid forms on the leaf of the channa, a mixture of oxalic and acetic acids, which is used in chemical processes, and in the preparation of nitric and muriatic acids. Cloths spread on the plant become moistened by the dew, and absorb the acid.—*Elliot.*

CHANNAN, also Chanuni, on the Chenab, etc. Populus alba, the white poplar.

CHANNI. HIND. Daphne oleoides.

CHANOO. BENG. Apium involucratum.

CHANOS ARGENTEUS. *Bloch.* The milk fish. C. salmoneus, introduced from the sea into a tank in Canara.

CHAN-PA, the Tibetan name of Great Tibet. It means snow-land. See Lhassa.

CHANTABURI, a port of Siam, the second in commercial importance. It is at the mouth of a short river, which fertilizes a considerable district by its inundations during the rainy season. The rocks at the entrance of Chantaburi resemble a colossal lion couchant. Chantaburi, which means the nutmeg country, is also a range of mountains east of Siam, whose defiles are held by the Xong or Ching, said to be an offshoot from the Karen. The wax sold by the Xong is the produce of wild bees of gigantic size, which build their cells on the top branches of trees at the height of 150 feet.—*Bowring's Siam.*

CHANUNI. HIND. Populus ciliata, Populus alba; the ban.

CHAN-YO or Chan-Yu. CHIN. Dioscorea batatas.

CHANZ, a pass leading from Kashmir to Tibet. It is also called the Sang-i-Safed.

CHAO. TIB. A monastery.

CHAO-ME-DO, also Chao-mo-to, a place lying between the great wall of China on the Kalgam and Selinginsky, in the country south of the Amur. It is signalized as the place where the rebel Koeur-tan (Kal-dan) was finally defeated, A.D. 1696. Kaldan was uncle to the reigning prince, Tse-vang-Rah-dan, and had stirred up the Eleuth Tartars to rebel. See Kalkas.

CHAORI. HIND. A police station; the village forum.—*Elliot.*

CHAORI. HIND. This is made of ivory, bone, or shell, and is the most ancient ornament of the Indo-Scythic dames. It appears in old sculptures and paintings. In a very old Gothic church at Moissac in Languedoc, the porch, attributed to the age of Dagobert, is the only part left. Sculptures on it represent the conversion of Clovis. Some sculptured figures below are of a distinct age, of an Asiatic character, showing the scarf, the champakulli or necklace representing the buds of the jessamine (champa), and chaori.—*Tod's Rajasthan*, ii. p. 284.

CHAOUS. TURK. A herald, a running footman, an interpreter. The word is supposed to have originated the English phrase, to chowse, or cheat, as the Turkish interpreters so frequently misinterpret.

CHAOU SEEN, the native name of Corea.

CHAP. HIND. An impression from a stamp or seal, from the verb chapna, to stamp or seal. The Chinese 'chop' is a stamped permit; hence also the Hindi term Chapa-khana, a printing press. properly Ch'hap. Chap-ka-lac, sealing-wax.

CHAP. HIND. The refuse of the jhurburee, after the pala is beaten from it.—*Elliot.*

CHAP. BRAHUI. Stone circles of different kinds, commemorative of weddings amongst the nomade Brahui.

CHAPADA, or Chopada. SUMATRAN. Fruit of Artocarpus integrifolia.

CHAPA JANNA. TEL. Fish roe.

CHAPAO, a raid, an inroad. The Turkoman inhabitants of the deserts have ever been famous for their terrible inroads into the Persian provinces. They are of the Sunni creed, a cruel and rapacious race, and always prefer flight to facing a superior force. The arms of the Turkoman are a spear 10 feet long, and a sword. They are excellent horsemen, and pass their lives in pillage and rapine. When a chief determines upon making a chapao, a month is given to his followers to get their horses into proper condition. Spies are sent out, and news being brought, the whole party gallops swiftly on the prey, whether caravan or village. In a few minutes all is over, the people carried off into slavery, and the village burnt. The prisoners are tied to the saddle-bows of the captors, and are treated with horrible cruelty, until they are finally sold in the slave markets of Khiva. The horses of the Turkomans have been known to go over 600 miles in six days.

CHAPAR. HIND. A thatch of straw, also roofing slate.—*Elliot.*

CHAPATI. HIND. An unleavened cake baked on a girdle, eaten by the people of Hindustan. Prior to the mutiny of 1857, wheaten cakes were circulated amongst the people. The meaning of that act remains unknown.

CHAPKAN. HIND. A jacket fitting close to the body, opening at one side of the front, and prefixing.

CHAPLASHA. HIND. Artocarpus chaplasha.

CHAPLET, or immortelle, made of the flowers of an 'everlasting' (Helichrysum, *sp.*), commonly hung about tombs.

CHAPLI. HIND. Leather or leaf sandals.

CHAPTALIA GOSSYPINA. —?

Oreoseris lanuginosa.

Shepherd's tinder, . ENG. | Kuff, Kuffee, Sookta, PAN.

This is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 7000 to 9000 feet. The tomentum or downy filament on the under surface of the leaves is employed by the hill people as tinder.—*Cleghorn.*

CHAPTI-LAC. HIND. Shell-lac.

CHAPU. TEL. Fishers.

CHAR. HIND., PERS. Four. Char-yar, lit. four friends, a Sunni Mahomedan, who maintains that Abubakr, Omar, Osman, and Ali were the rightful succeeding khalifs. Char in composition is softened into chau. Char-Abru, the beard, the moustaches, eyebrows, and hair on other parts of the body.—*W.*

CHAR, also Char-Charoli. MAHR. Buchanania latifolia. Valeriana Wallichiana, Valeriana Hardwickii, Quercus semecarpifolia.

CHAR or Chur. HIND. A shoal, a sandbank. Baluchar, land covered by a deposit of sand.

CHARA. HIND. Fodder, forage, green grain; wheat or other crop cut for forage or fodder; also a truss, a sheaf, grass, food for animals.

CHARA CHETTU. TEL. Buchanania latifolia. Fruit called Chara pappu, Charu mamidi.

CHARADRIUS, the plover genus of birds, species of which are common to India and Europe. Ch. hiaticula, the ringed plover of Europe, N. Asia, Japan, Greenland. Ch. Cantianus, the Kentish plover of Europe and Asia, not uncommon in India. Ch. Philippinus. Ch. minor, the little ringed plover of Europe, Asia, North America; rare in Britain, exceedingly common in India. Ch. pyrrhothorax is a very common Indian species, known in Europe as a straggler.

CHARAGH. HIND. A lamp. Charaghan-i-Zandah Shah Madar, a Mahomedan festival held on the 17th Jamadi ul Awal, in honour of Badi-ud-Din. He is said to have been a Syrian saint; to have lived at Makanpore, in Oudh, to a great age, or to be even yet living, hence the appellation zandah, alive. His flag is black. Dam-i-Madar, or breath of Madar, is a charm against sickness. Charaghi, a present made to a Mullah for offering up oblations at the tomb of a saint; literally, lamp expenses.

CHARAI. HIND. of Kaghan. Juniperus excelsa, J. arborea; pencil cedar.

CHAR AIMAK. Aimak is a Mongolian, Manchu, and Turki word, meaning a tribe. Of these, there are in Kābul and Persia four, the Char Aimak. They dwell to the north of Herat and Kābul, in the undulating country, which in some places assumes a mountainous, in others a hilly character; in some parts is well watered, in others bleak and rough, forming a watershed of two natural divisions, from the western of which flows the Murghab, the Tajend, and the Farrah-Rud, and from the eastern, the Helmand, the south-eastern feeders of the Oxus, and the north-western feeders of the Kābul river. It is said that Timur, exasperated at the depredations committed by the people inhabiting Mazanderan, south of the Caspian, transported the whole of them into the mountains situated between India and Persia. The descendants of that people form the four tribes or Aimak. They are also called Firoz Kohi, after the city of that name (situated about 63 miles from Teheran), where they were defeated and taken captives by Timur. According to Latham, the four Aimak are the Timuni, Hazara, Zuri, and Timuri. Vambery says the four tribes are the Timuri, Teimeni, Firoz Kohi, and Jamshidi, and of Iranian origin, who speak Persian. The Timuri dwell about Gorian and Kah'san, the Teimeni from Karrukh to Sabzwar, the Firoz Kohi near Kala-i-No, and the Jamshidi on the shores of the Murghab. In their reverence for fire, and their respect to the east, to which their tent doors look, they retain many of the fire-worshipping views. Their number is estimated at 400,000. — *Latham's Ethnology; Ferrier's Hist. of Afghan*, p. 3; *Vambery, Sketches of Central Asia*. See Aimak; Mongols.

CHAR-AINA. HIND. Armour-plates worn by the Sikhs.

CHARAITA. DUKH. Agathotes chirayta, *G. Don*. This valuable bitter is largely employed in medicine, being a perfect substitute for the gentian of Europe. Several plants are, however, used under this general name. The Andrographis (Justicia) paniculata is one of the best of these, and the Ophelia elegans is another.

CHARAKA, a medical writer who lived in Vedic times. He states that he received the materials of his work from Agnivesa, to whom they were delivered by Atreya. Professor Wilson gives the 9th or 10th century A.D. as his era. His book was translated from the Sanskrit into Arabic before the end of the 8th century A.D.—*Dowson*.

CHARA KANDA. TEL. Colocasia nymphæfolia, *Royle*.

CHARAN, a sacred race in the west of India, whose character and pursuits almost resemble those of the Bhat, or Bards, and the origin of both is involved in fable. In Hindu mythology, the Bhat are said to have been produced to amuse Parvati, from the drops of sweat on Siva's brow, but they sang the praises of Siva only, which so offended Parvati, that she turned them out of heaven, and condemned them to lead a wandering life upon earth, to sing there the martial deeds of heroes and the praises of the gods. According to another legend, Mahadeva created a bard to attend to his lion and his bull, but the bull was daily killed by the lion, on which Mahadeva, tired with daily creating a bull, formed the Charan to be their attendant. The Charan was equally devout with the Bard, but of bolder spirit, and from that date the bull was never destroyed by the lion. It is an allegory of brute violence and justice. The Charans of the Maru or desert in the sandy tract of the Indus, are mendicants who attend at marriages and festivals, and threaten to injure themselves if not relieved. The Charan is generally revered, and follows the profession of a bard, herald, and genealogist, and as such is often taken as personal security, the breach of which was followed by the death of the Charan, or of some member of his family. On this account it was usual for travellers in Malwa and Gujerat to hire a Charan to protect them, and the sanctity of his name was generally sufficient. If robbers appeared, he stepped forward, waving his long white garments, and denouncing in verse, infamy and disgrace on all who should injure travellers under the protection of the holy members of Siva. If this failed, he stabbed himself with a dagger in the arm, declaring that his blood was on their heads; and if all failed, he was bound in honour to stab himself to the heart. This is termed Chandi. The Charan, young and old, are not merely taught to desire to die when the honour of the family or clan require it, but one and all are eager to be the first to die. Charan are divided into two tribes, the Kachili, who are merchants, and the Maru, who are Bards. These, again, branch out into 120 clans. The Kachili and Maru do not intermarry, but the latter intermarry with Rajputs. The Charan are taught to read and write. The mercantile tribe, who traffic in camels and horses largely, are shrewd men of business. The Maru tribe are genealogists and Bards, celebrate the praises of heroes in legends and songs. The warlike tribes esteem the heroic lays of the Bard more than the homily of the Brahman. The Charans are throughout reverenced by the Rahtor, and hold lands literally

on the tenure of 'an old song.' A colony of Charans from the frontiers of Cutch Bhuj was founded at Murlah, near Chitore, by rana Hamir, who is celebrated in the history of Mewar; he had a leprous spot on his hand, to remove which he made a pilgrimage to the shrine of Hinglaz, upon the coast of Makran, the division Oritæ of Arrian's geography. The Mārlah Charans are of the tribe Kaucholeah, and are grain-carriers. The sanctity of their office made their persons sacred, and the immunity extended likewise to their goods, and saved them from all imposts; so that in process of time they became the free-traders of Rajputana. This community collectively advanced to receive Colonel Tod at some distance from the town. The procession was headed by the village band and all the fair Charani, who, as they approached, gracefully waved their scarfs over him. It was a novel and interesting scene: the manly persons of the Charans, clad in the flowing white robe, with the high loose folded turban inclined on one side, from which the mala, or chaplet, was gracefully suspended; the naiks or leaders, with their massive necklaces of gold, with the image of the pitriswur (manes) depending therefrom, gave the whole an air of opulence and dignity. The women were uniformly attired in a skirt of dark brown camlet, having a bodice of light-coloured stuff, with gold ornaments worked into their fine black hair; and all had the favourite churi, or rings of hati-dant (elephant's tooth), covering the arm from the wrist to the elbow, and even above it. The founders of this little colony accompanied rana Hamir from Gujerat in the early part of his reign, and although five centuries have elapsed, they had not parted with one iota of their nationality or their privileges since that period; neither in person, manners, nor dress had they anything analogous to those amidst whom they dwell. Indeed, their air is altogether foreign to India; and although they have attained a high place amongst the tribes of India, their affinity to the ancient Persian is striking,—the loose robe, high turban, and flowing beard being more akin to the figures on the temples of the Guebres than to anything appertaining to the Char-burrun or four classes of the Hindus. — *Rajasthan*, ii. p. 622.

CHARANA. HIND. Footprints of the Jaina thirthankara, Reshabhanata. See Rayana.

CHARAN-AMRIT, HIND.; also Charanodaka, water in which the feet of a Brahman has been washed.—*W.*

CHARANDAIN, disciples of Charan who lived in the days of Ramanuja. Their ceremonies and habits are similar to those of Vaishnava, Bairagi, and Kabirpanthi.—*Sherring's Tribes*, p. 267.

CHARAN DAS, founder of the Charan Dasi sect, was born at Dehra, near Ulwar, in S. 1760 (A.D. 1703). When very young, he was taken to Dehli. He was a good musician. He died S. 1839 (A.D. 1782). The sect keep images in their temples, and respect Brahmans. He lived in the time of Alamgir II., and Sahaji Bai, his sister, was his first disciple. Charan Dasi are Vaishnava Hindus, who worship Krishna and Radha. Charan Das was of the Dhusar merchant tribe, and resident of Dehli. His followers are both clerical and secular. At Dehli is the samad'h or monument of their founder.—*Wilson.* See Hindu.

CHAR-ANGLI. HIND. of Salt Range. Boucerosia edulis.

CHAR-ANKH. HIND. A meeting; literally, four eyes.

CHARAN-PAD, also called Padka, two feet engraved on the top of the tombstone of a Gosain, to mark his tomb or samad'h.

CHARA-PUPPU. HIND. Buchanania latifolia.

CHARAS, in Kachar, seedling rice for transplanting.

CHARATI. SANSK. Ionidium suffruticosum.

CHARAY, also Churay. HIND. A knife, any knife; also the knife of the Afghan, a long single-edged dagger, used with much effect by them. It is about the size of the old Roman sword, and speaks volumes for the courage of the wielders.—*Burton's Scinde*, ii. p. 267; *Pilgrimage*, i. p. 320.

CHARAYUM. TAM. Arrack. Charaya karan, MALEAL., is a distiller or vendor of spirituous liquor.

CHARAZ, also Charas. HIND. of S. India. Sypheotides auritus, *Latham*; the florikin.

CHARBAR, Charba, or Chewabad Bay, the best in Makran, is formed by Ras Maleddam or Koolab point on the west, and Ras Charbar on the east. Charbar town has about 1500 inhabitants; it is surrounded by a mud wall. The inhabitants and the cattle live entirely on fish, oysters, crabs, and shell-fish, those for the cattle being mixed with dates. All on that coast, which is the country of the ancient Ichthyophagi, have similar food.

CHARCHARILA. HIND. Parmelia Kamtschadalis, and other species of Parmelia.

CHARCOAL.

In the south and south-east of Asia, coal being found only in distant localities, and the cost of carriage great, charcoals are in great request. In the Peninsula of India, the common native mode of preparing them is to set on fire a heap of small wood, and, after allowing it to burn for some time, to quench it either by water or by heaping earth upon it; but charcoal so prepared is of little value in reducing iron ore, and the process is wasteful. The destruction of firewood in the neighbourhood of ironworks is grossly extravagant. Native iron-smelters only employ fuel from one to three inches in diameter; and to procure this they take saplings, or the tops and branches of the largest hardwood trees, allowing the trunks to decay. They do this because large trees are not adapted for fuel for native smelting, as the cost of splitting them adds greatly to the expense; and unless the logs be split, the inner wood is not carbonized. Charcoal, to be good, should be of wood burned with as little exposure to the action of the air as possible, and be black, brittle, easily pulverized, perfectly insipid, solid, and inodorous. Charcoal is mostly used as a fuel, but also in the manufacture of gunpowder. For the forge, the best is that prepared from bamboos and from stems of palmyra leaves (Tati komaloo, TEL.). The tamarind yields a good charcoal for the same purpose, as do most hard woods, but the charcoal of the Acacia sundra is said to be amongst the best

for this purpose. Other woods used in the S. of India are the vella-marda, karra-marda, erool, Indian gooseberry, the poohum, the nux vomica, and the cassan. In Northern India, Acacia catechu, A. modesta, Cassia fistula, Butea frondosa, Capparis, *sp.*, Pinus longifolia, Prosopis spicigera, Salvadora. For gunpowder, the roots of the milk hedge, Euphorbia neriifolia, and of the Calotropis gigantea are preferred. At the Madras Government Powder Mills, that of the gram bush, Dolichos uniflorus, and in those of Bengal and Bombay, the Cajanus Indicus, or pigeon-pea stalks, are used. Charcoal used for gunpowder manufacture is generally made from small shrubs or herbs, as Vitex, Cajanus, Calotropis, and Parkinsonia aculeata, the Parkinsonia being said to yield a very good charcoal for gunpowder, though the gunpowder considered the best is manufactured from the Sesbania Ægyptiaca. The gunpowder charcoal used at the Damuda coal-works is made from an acacia. The Sikhs employed Justicia adhatoda, which is also in use all over India. At Aden the Arabs prefer the Calotropis, probably because it is most easily procured. The grain of all these plants is open, whereas in England closer-grained and more woody trees, especially willows, are preferred. In India, gunpowder charcoal is also made from the Adhatoda vasica, Alnus, Butea frondosa, Colebrookia oppositifolia, Cornus macrophylla, Daphne oleoides, and Hamiltonia suaveolens. In China the gunpowder charcoal is made from the Cunninghamia Sinensis. Charcoal is burned as a disinfectant on the last days of the year, in all Chinese houses. Charcoal powder, Pan-moh, CHIN., is used internally in China, mixed with water, in metallic poisoning, in acute diseases of the throat, and in dysentery.

In Ceylon the cashew nut tree is considered the best sort of wood for charcoal for ironsmiths, and is felled for this purpose only. At Darjiling that of the chestnut wood is used by blacksmiths. In Nepal the best is made of the wood of the bahang, or holly-leafed oak. In Kullu and Kangra the wood chiefly used for charcoal is Chil, Pinus excelsa; but the alder (kaunch) and Alnus Nepalensis, which fringes the tributary streams, is also employed for this purpose, as no hard woods are available. The lighter woods generally yield lighter and more combustible charcoals. Nevertheless the dogwood of Britain, the wild cornel tree, which makes the strongest of the British gunpowders, and is exclusively used for the powder of the breechloading firearms, is a dense, comparatively heavy, slow-growing wood. In Britain, the alder, the willow, and dogwood are the only woods used for charcoal in the Government establishments,—the two former for cannon powder, the last for small arms. Private makers use the same woods, and they use the last for the forest sporting powder. The three woods grow well in England, but they are chiefly obtained from Belgium, Holland, and Sussex, the dogwood selling at £12 to £15 the ton. Coarser woods are used for common blasting powder. There are many circumstances connected with this ingredient of gunpowder not yet understood, but it seems to be the variations in charcoal which cause the differences in the powder. Charcoal is little liable to decay. The best charcoal for a dentifrice is that of the betel-nut. Charcoal possesses remarkable antiseptic properties, as it resists the putrefaction of animal matter, and destroys the smell and colour of many substances. — *Mr. Faulkner; Mr. Rohde; Dr. Cleghorn; M'Culloch's Dic.* p. 266; *Mr. Wall's Report in G. O.* 17th July, No. 1040 of 1859; *Hooker's Him. Jour.* i. p. 9; *Edye, Mal. and Can.; Dr. J. L. Stewart; Quarterly Review*, July 1868.

CHAR-DANGHEH, in Persia, a mode of dividing fields. See Dangah.

CHAR DEH, the town of Kābul is built at the foot of a hill of gneiss that rises 1000 feet above it. The town bends round it from the south-east to the south-west, where, with the dip of another hill opposite, is formed the pass, 150 yards broad, that leads into Char-Deh. Kābul may be described as lying at the foot of a range of hills whose direction is from north-east to south-west. The country is thus divided into the plain of Kābul, and the Char-Deh, or four villages. See Kābul.

CHARDIN, SIR JOHN, travelled in Persia and the East Indies from 1664 to 1670. The first part of his Journal du Voyage was published in London, 1686, and the second and third at Amsterdam in 1711. In 1811 his travels were republished in Paris.

CHARGUL. HIND. An ornament worn by women in Hazara.

CHARI, the doe of the Antilope Arabica.

CHARI. HIND. Stalks of millet, etc., sown close for fodder; also Sorghum vulgare; Carex Indica? Rang-Chari is Elsholtzia polystachya.

CHARIKAR, a town in long. 68° 59′ E. and lat. 34° 28′ N. It is near Beghram, and 30 miles north of Kābul. From Charikar to Jellalabad the road is open, and it is supposed that Alexander, whether he recrossed the mountains at Bamian or at Beghram, marched by this route on India. It is on the high road between Kābul and Turkestan, and the valley offers supplies of all kinds.—*MacGregor*, p. 211.

CHARIKONA SHIM. BENG. Goa bean; Psophocarpus tetragonolobus.

CHARI-MARAM. TAM. Ebony.

CHARIOT. In Judges iv. we are told that Sisera had 900 chariots of iron. From the Sanskrit work called the Dhanūrveda, it appears that the Hindus had war chariots similar to those of Sisera. They are described as having had many wheels, and to have contained a number of rooms. The war chariot was peculiar to the Indo-Scythic nations, and was in use in India from the days of Dasaratha and the heroes of the Mahabharata, to the conquest of the Hindus by the Mahomedans, when it was laid aside. On the plains of Kurukhet, Krishna became charioteer to his friend Arjuna; indeed, the title Dasaratha means a charioteer. The Getic hordes of the Jaxartes, when they aided Xerxes in Greece and Darius on the plains of Arbela, had their chief strength in the war chariot. The war chariot continued to be used later in the south-west of India than elsewhere; and the Cat'hi, Comani, Comari of Saurashtra have, to recent times, retained their Scythic habits, as their monumental stones testify, expressing their being slain from their cars.—*Tod's Rajasthan.* See Hindu.

CHARITA, the first degree in the Saiva system.

CHARIZM, in the 6th century of the Hijira, a Charizmian empire rose on the ruins of the Seljukidæ, which extended itself over Tartary and the greatest part of the Persian provinces. During the reign of Mahomed, Chengiz Khan overran

the Charizmian empire.—*Dow's Hindostan.* See Kharasm.

CHARJ. BENG. Otis Bengalensis.

CHAR-JAMA. HIND. A sort of horse housing in two pieces, one for each side under the saddle.

CHAR-JATI. HIND. The four clans of the first class of the Khatri, viz. Seth, Marhota, Khunna, and Kuppoor.

CHARJUI, in lat. 39° 5′ N., and long. 63° 40′ E., a town in the district of the same name, 6 miles inland from the left bank of the Amu. It has about 4500 inhabitants. The Saugan (Cyprinus calybeatus) and the lakka (Silurus glanis) attain a large size at this part of the Amu.

CHARKA. HIND. Letsæa, *sp.*

CHARKARI MAHAL, in the Panjab, the portion of a doab requiring well irrigation.

CHARKH. HIND. A pulley over which a water-rope runs; a wheel; the sheave of a block; a needlemaker's grinding wheel; a cotton-cleaning wheel; also the rope-twister's apparatus; a spinning-wheel.

CHAR-KHAHEH. HIND. Chequered muslin; also called Zilmili. Charkhi, a kind of silk of Kābul.

CHARKH PUJA. HIND. Cheddul, TAM. A barbarous ordeal among the lower classes and low castes of Hindus of India. By self-inflicted wounds, or being suspended in the air by hooks passed through the back, individuals hope to expiate their sins. It is commonly called the Swinging Festival, because the more prominent form of expiation amongst Hindus is that of swinging, suspended by hooks through the skin over each shoulder-blade, and connected by ropes with one end of a lever, traversing an upright post, to which a circular motion is given. It is held when the sun enters Aries. But children of tender years, aged five or six, were to be seen with bamboo sticks through both cheeks. Hooks from a lever are passed through the skin over each shoulder-blade, and the lever is made to rise high in the air and revolve with the hooked person. Wood and iron and snakes are passed through the tongues, the cheeks, and the skin of devotees and of young children. The devotees are called Gajan, and it is in honour of Siva that they inflict tortures on themselves. The British Government about the middle of the 19th century prohibited its practice in British India. See Siva.

CHARKHRE. HIND. Carpinus viminea.

CHAR-KUCHOO. BENG. Colocasia antiquorum.

CHARLANG, a section of the Bakhtiari tribes.

CHAR-MAGHZ. HIND. Juglans regia; the walnut, lit. 'the four-kernelled fruit.'

CHARMS.

Talsīm, Tawiz, . ARAB.	Ism, . . . HIND., PERS.
Hegab, ... EGYPT.	Incanto, Allettamento, IT.
Charme; enchantement, F.	Encanto, Embeleso, SP.
Nazr-band, . . . HIND.	Mantra, ... SANSK.

Charms are in general use amongst all races; and amulets are worn and used both to work for good and to work for evil. The custom of inscribing mystic characters upon the person as a safeguard, or having them engraved in the form of an amulet or charm, is of the most remote antiquity. Cain had a mark set upon him, which denoted the bearer to be placed under the immediate protection of Heaven, so that no man might slay him. The blood sprinkled on the door-posts of Israel in Egypt was a sign that the destroying angel was not to enter, the inmates being under the divine protection. A similar preserving token is referred to in Ezekiel ix. 2, where the man 'clothed in linen,' having a writing inkhorn by his side, was commanded by God to set a mark upon the foreheads of those who grieved for the abominations of Jerusalem. 'Behold my sign!' says Job xxxi. 35, according to the marginal reading; or, 'Behold, here is my Thau' (a mystic mark), as Calmet renders it. Paul, probably alluding to some acknowledged sacred sign, observes, 'Henceforth let no man trouble me, for I bear in my body the marks of the Lord Jesus.' Portions of St. John's Gospel were worn by the early Christians, and verses of Scripture were even placed upon horses. Among the Anglo-Saxons, amulet gems were much esteemed. King John had a large collection; and, in the 16th century, amulets were warehoused in England in large quantities, and usually worn round the neck, as a protection from pestilence (Gage's Hengrave, p. 155). A MS. poem on the virtues of gems, written by Pierre de Boniface in the 14th century, says: 'The diamond renders a man invincible; the agate of India or Crete, eloquent and prudent; the amethyst resists intoxication; the carnelian appeases anger; the hyacinth provokes sleep' (Milner's Seven Churches of Asia, p. 127). The six descriptions of charms or mantra known in Gujerat, are described in the Mantra Shastra. Marun Mantra has the power of taking away life; Mohun Mantra produces ocular or auricular illusions; Sthambhun Mantra stops what is in motion; Akurshun Mantra calls or makes present anything; Wusheekurun Mantra has the power of enthralling; and Oochatun Mantra of causing bodily injury short of death (Rasamala, Hindu Annals, ii. p. 403). Charms, amulets, talismans, and phylacteries all belong to the list of articles which produce imaginative cures, seeing that the persons who trust to them believe in some good obtainable from them, in purse or in person, in health or in welfare. The amulets, hung in a little bag around the neck, are very widely credited with the power of warding off disease. One peculiar kind of amulet is the phylactery, a bit of parchment on which a few sacred words have been written; if worn on the person, it is a safeguard against disease and calamity. The Jews in the East used to carry such an amulet written with a Hebrew verse from the Bible; and some of the Mahomedans with an Arabic sentence from the Koran. The Burmese insert lumps of gold beneath the skin, to procure invulnerability, and Burmese are said to conceal gold in that manner. Many of the charms worn by Hindus and Mahomedans are merely to distract or avert the evil eye. A not unfrequent one, in sickness, is a string formed of hair of the head, to which is attached a piece of the Acorus calamus root, a cowrie shell, a marking nut, and the eye of a peacock's feather. In the Illahi Namah (section 12), it is mentioned that women, during parturition, derive considerable benefit from wearing a charm composed of certain ingredients made into a little ball, which must be perforated with a hog's bristle (Ouseley's Travels, i. p. 227). Most of the Mahomedan pilgrims, when moving towards Mecca, have a charm or tawiz suspended around their necks; and almost all Mahomedans,

when setting out on a journey, bind a piece of money on their arm, as a votive offering to the Imam Zamin. In Arabia, the instant a foal is born, a charm is tied round its neck in a bag of black cloth, and sometimes in this the pedigree is placed. Many of the Mahomedans of Turkey and Asia carry talismans about with them, especially in war, consisting of verses of the Koran, to which they attach extraordinary influence; and with one Mahomedan soldier, who had fallen in battle, a whole Koran was found wrapped in the rolls of his turban. The Mahomedans put up charms over the lintels of the doors, on the walls of their houses, and almost constantly use them on their arms as amulets, for the cure of ailments, to cast out devils, to ward off demons, fairies, enchanters, and to cleanse a haunted house. In exorcism, certain names (Ism, sing.; Isma, pl.) are used by Mahomedans. The ism-jallali, or fiery or terrible attribute, is used; also the ism-jamali, the watery or air attribute; and with these they cast out devils, and command the presence of genii and demons. Amongst Mahomedan women love-philters are in frequent use; and engraved amulets, and leaves and roots of plants, are worn by them to retain or win affection. The Rev. Mr. Ward saw a Mahomedan woman dropping slips of paper into the river, and upon inquiry found that they contained some sacred words, and that the woman was presenting those papers to the river-saint, Khaja Khizr, in hopes of obtaining relief. Persians consider the number thirteen so unlucky, that, in general, they will not even name it. When they have occasion to allude to this number, instead of mentioning sezdeh (thirteen), they say ziyad (much more) or hech (nothing). In ancient Rome, the ladies wore the phallic emblem to overcome their sterility. It was a mango-fruit, given by a rishi to Jarasindha's father, and eaten by his mother, which begot that famous Maghada prince of old. To this day, very often do barren Hindu women, and those who lose their children in the cradle, repair to the most reputed shrine of Siva in their neighbourhood, and by fasts and vigils ensure his blessings for progeny.

Lane says in Egypt the most esteemed of all hegab or charms is a mushaf (or copy of the Koran). This and others are worn by many women, generally enclosed in cases of gold, or of gilt, and plain silver. Next in estimation to the mushaf is a book or scroll containing certain chapters of the Koran, as the 6th, 18th, 36th, 44th, 55th, 67th, and 78th, or some others, generally seven. The ninety-nine attributes of God, written on a paper, and worn on the person, are supposed to make the wearer a particular object for the exercise of all the benevolent divine attributes. The names of Mahomed's relics are also charms. These relics, called Mukhallafat un Nabi, were two sabhahs (or rosaries), his mushaf (in unarranged fragments), his mukhul'uh (or the vessel in which he kept the black powder with which he painted the edges of his eyelids), a furdeh or kind of woollen covering. Sometimes, for the cure of diseases, and to counteract poisons, etc., a draught of water from a metal cup having certain passages from the Koran, and talismanic characters and figures engraved in the interior, is administered to the patient. Water from the sacred well of Zem-zem in the temple of Mecca, and pieces of the black brocade covering of the Kaba, small oblong flat cakes of a kind of greyish earth mixed with saliva, supposed to be composed of earth from over Mahomed's grave, are believed to be a cure for every disease. They are sold at the prophet's tomb, and are occasionally eaten. The Chinese have a written charm, praying for the three mauys, happiness, long life, and sons; and nine libes, prosperity, dignity, longevity, etc.; koo-tung-king, the old brass mirror, to cure the looker of insanity. The Singhalese believe that certain charms are efficacious in protecting them from the violence of bears.—*Skinner's Overland Journ.* ii. p. 70; *Ward's View of the Hindoos*, ii. p. 71; *Milner's Seven Churches of Asia; Herklot's Kanoon-i-Islam; Tr. Hind.* ii. p. 3.

CHAR-MUGHZ, Pers.; also Girdighan; Jouz-i-roomi. Juglans regia; walnuts.

CHARNOCK, JOB, the founder of Calcutta. In the end of the 17th century he dwelt at Barrackpur, which the natives have named Achānak, after him. He resided there so as to be near the grave of his wife,—a Hindu woman, whom he had espoused after rescuing her from burning on the funeral pile of her deceased husband. The mausoleum over her remains is the oldest piece of masonry in Calcutta. His sorrow for the loss of his wife was unbounded. So long as life lasted, he on the anniversary of her death sacrificed a cock in her mausoleum in the cemetery of St. John's Church. His epitaph—

D. O. M.
Jobus Charnock, Armiger,
Anglus. et nup. in hoc
Regno Bengalensi
Dignissimus Anglorum
Agens,
Mortalitatis suæ exuviæ
sub hoc marmore deposuit, ut
in spe beatæ resurrectionis ad
Christi Judicis adventum
obdormirent.
Qui postquam in solo non
suo peregrinatus esset diu,
reversus est domum suæ æternitatis decimo die Januarii
1692.

CHAR-PAI. Hind. A sleeping cot or bedstead; literally, four legs.

CHARRAH. Arab. Lagenaria vulgaris, *Ser.*

CHARRAS, the gum-resin of the hemp plant, Cannabis sativa. It exudes from the flower heads, and also from the seed when ripe. In the Panjab, when the seed is gathered, the heads are rubbed with the hands, and the charras collected. The finest charras is produced in Yarkand and Kashgar. A kind called garda is much in use, and of this again there are three sorts, surkha, bhangra, and khak. It is brought into the Panjab from Ladakh viâ Kulu, Kangra, and Kashmir; also from Yarkand and Persia viâ Peshawur and Dhera Ismail Khan on the western frontier of the Panjab. A small quantity placed in the hookah and smoked, produces almost immediately an intoxicating effect. It seems to have been employed as an intoxicating substance in Asia and Egypt from very early times, and even in medicine in Europe in former times, as Dr. Royle mentions a notice of it in Dale (Pharmacologia, i. p. 133) and Murray (Apparat. Medicaminum, iv. pp. 608–620). In Central India, the Saugor territory, and Nepal, charras is collected during the hot season.

Men clad in leathern dresses run through the hemp fields, brushing against the plant with all possible violence; the soft resin adheres to the leather, and is subsequently scraped of and kneaded into balls, which sell at from five to six rupees the seer. A still finer kind, the Momia, or waxen churrus, is collected by the hand in Nepal, and sells for nearly double the price of the ordinary kind. In Nepal the leathern attire is dispensed with, and the resin is gathered on the skins of naked coolies. In Persia, it is stated by Mirza Abdul Russac that the churrus is prepared by pressing the resinous plant on coarse cloths, and then scraping it from these and melting it in a pot with a little warm water. The charras of Herat is considered to be the best and most powerful of all the varieties of the drug. It is said also that when the bhang leaves are picked off and the stalks remain, the little knots which occur wherever a leaf issues from the stem, are picked and collected as ganja, and these contain much resin. Indian hemp secretes a much larger proportion of resin than is observable in the European plant; but a difference is observed in this point in India between plants grown in the plains and those of the mountains, and also when grown thickly together. The natives plant them wide apart, to enable them to secrete their full powers. In Europe, the thick sowing, and moister, often dull, climate will prevent the due secretion of the peculiar principles of a plant of the Persian region.—*Powell; O'Shaugh.*

CHARRI. HIND. The royal or imperial rod, a long staff or javelin, and often placed by Hindu princes on the royal cushion or throne. It is an emblem of authority, and Charri men zor hai—His rod is strong—is meant to indicate that the authority is obeyed.

CHARSA of Ptolemy, the modern Kars.

CHARSA. HIND. A huge bucket made of hide, for a well.

CHARSUDDA, a town in the Peshawur valley, near which the Swat river joins the Kābul river.

Marine charts of coasts, seas, and oceans.

CHAR-TARA, a musical instrument, literally four-stringed, as the sih-tara is three-stringed.

CHARU. MALEAL. A jungle tree which grows to about 40 feet high, and 2 feet in diameter. It is used in building native vessels, particularly for planks, but is not very durable.—*Edye, M. and C.*

CHARU, in Hinduism, one of the five Jagna, who consist of the Bali, Charu, Baswadeva, and Agnihotra.

CHARUKAR, a town in Afghanistan. It was burned 3d October 1842.

CHARUMAR, predial slaves in Malabar, whose name Wilson derives from Chera, in Maleali, the soil. They follow the rule of Maruma-katayam. They are very diminutive, with a very black complexion, and not unfrequently woolly hair.

CHARUNG, a difficult pass in the Himalaya, in lat. 31° 24′ N., and long. 78° 35′ E. The crest is 17,348 feet. See Kunawar.

CHARVADAR, in Persia, the chief muleteer of a caravan, and generally owner of the animals. He employs a certain number of the Ratirchi or mule-drivers as his servants or assistants.

CHARVAKA, a Hindu philosopher who lived about the third century of the Christian era, and founded a school of materialism. The atheistical philosophy which he put forward is called Lokayata, and its followers Loka-yati. It forms one of the six atheistical systems of philosophy current amongst the eastern Aryan race in India. The other five are the Yogachara, Sidhanta, Waibashika, Madhyamica, and Digambara, all full of indeterminate phrases, and containing a jumble of atheism and ethics. The derivation of Charvaka is from Charoo, insinuating, and Vaka, a word. Charvaka, as the founder of the materialistic school of the Hindus, was the Pyrrho and Epicurus of India. The Charvaka system does not recognise the authority of the Vedas. The sect maintain that in this world of continual changes, which is developed out of four principal elements, prosperity is heaven and adversity is hell, and that there is no other heaven or hell besides these conditions. The philosophic speculations as to the nature of the soul and its relation to the Supreme, called the Adwaita, the Dwaita, and the Visishta adwaita, are derived mostly from the views of the three great apostles of the Vedantist school, who flourished in Southern India, viz. Sankaracharya in the ninth century, Ramanuja in the twelfth century, and Madhavacharya a little later.

Dwaita, the doctrine of duality held by many Hindus, distinguishes two principles in creation, spirit and matter, as opposed to the Adwaita or Monad doctrine, which acknowledges the reality of spiritual existence only. Ananda Tirthachari was the founder of the Dwaita school. Sankaracharya was the propagator of the Adwaita doctrines. The Vivishtadwaita school, non-duality with a difference, was founded by Ramanujacharya. It maintains an intermediate doctrine that the universe is a reality depending upon and supported by God, as the body is by the soul; that the divine and human soul are in some respects identical; yet that for all human purposes they are regarded as distinct, and that, in life, the human soul is subordinate and responsible to the divine soul.

CHAR VALAYAT, four territories under Afghanistan, comprising Maemana, Andkhui, Shibbargaum, and Siri pul, with a population of above 250,000.

CHARWAHA, a herdsman, a grazier, of North India.

CHAR-YARI. HIND. Char, four, and Yar, a friend. A Sunni Mahomedan who acknowledges Abubakr, Omar, Osman, and Ali as the four legitimate khalifs.

CHAR-ZANOO. HIND. Lit., on four knees, *i.e.* sitting cross-legged.

CHASA, also Apaynum. SANSK. Opium. Chasa is said to be derived from Khas khas, poppy seed.

CHASA. A Bengal cultivator. Chasa signifies a cultivator of the ground.

CHASARFO, a yellow earth of Spiti.

CHASHM. HIND., PERS. The eye. It is deemed amongst Eastern Mahomedans an organ of the body by which they can swear, possibly originating in the old practice of blinding persons. The Persian expressions 'Ba-chashm' and 'Ba

sar-o-chasm,' also the Hindi words, 'Mere sar aor ankh par,' meaning 'Your order be on my eyes,' are usual reponses on receipt of an order, and acknowledging that it will be obeyed, on the penalty of the head and eyes. The evil eye is the Chashm-i-bad or Bad chashm of the Mahomedans of Persia and India. Chashm-i-khoras, Abrus precatorius, *Linn.* Chashm-i-maidah, cat's eye; the gem so called. See Evil Eye.

CHASKU. HIND. A cloth dyed with kussumbha and printed.

CHASMAH-i-BAD, a spring in Khorasan on the road from Astarabad to Damghan. The people believe that if its waters be defiled, a furious wind rages till a tribe of the neighbourhood restore its purity.—*Eastwich; Morier; Fraser; MacGregor.*

CHASNI, a sugar-boiler; syrup of sugar; a vessel for taking out boiled cane juice.

CHASTE TREE, three-leaved, Vitex trifolia, *Linn.*; five-leaved, Vitex negundo, *Linn.*

CHATA CHARETTA. HIND. Cicendia hyssopifolia, *Adans.*

CHATAI. HIND. A mat.

CHATANULU, TEL., a sudra sect who worship Vishnu exclusively, and whose occupation is the sale of flowers. This seems to be the race known in the Peninsula as the Satani or Satani-wanlu, followers of Chaitanya.—*Wilson.*

CHATARASI KURA. TEL. Mollugo spergula, *L.*; M. verticillata, *R.*

CHATERA, an embosser or chaser of silver and gold work; derived from Chitarna, to adorn, embellish.

CHATGARI, a frontier district of British India, situated between Desh Durrung and the Bhutan hills, occupied by the Kachari or Boro; about 30,000 dwell in the Assam valley, and on its N. and S. borders. They have no written character; but a large part of their vocables are identical with those of the Garo, and almost all the rest may be traced to some dialect of the Tibetan. See India.

CHATHULU. TEL. White ants.

CHATIN. BENG. Alstonia scholaris.

CHATISGHAR, the south-eastern division of the Central Provinces of British India, comprising the districts of Raipore, Belaspore, and Sumbulpore. It lies between long. 80° 30′ and 83° 15′ E., and lat. 16° 50′ and 23° 10′ N. It has Bustar on its south. Its population is 206,000. The Chamar race form a fifth part of the population, and have all joined the Satnami sect. See Satnami.

CHATNEY, Chutney, or Chetney, a warm condiment in use in India.

CHATR, an umbrella, a caravansary, cloth covering of a carriage, or ekka canopy. A sunshade. In the Native States of India, sovereigns grant the right to use the Chatri, sometimes designating its colour; similar grants are made for the palanquin, shawls, naobat, etc.—*W.*

CHATRA. HIND. Leucas cephalotes.

CHATR-ANGA, the game of chess, so called from imitating the formation of an army, the four (chatur) bodied (anga) array, of elephants, chariots, horse, and foot, in Indian armies. See Chess; Shatranj.

CHATR-GO-PUTR. HIND. The Kayastha or Kaet race, in the Peninsula of India, claim this mythological person as their ancestor. They say he was the secretary to Yama, the god of the infernal regions.

CHATRIWAL. HIND. Euphorbia helioscopia.

CHATRIYA, a warrior branch of the Aryan Hindus, taking social rank after the Brahmans. Menu says, 'To defend the people, to give alms, to sacrifice, to read the Vedas, to shun the allurements of sexual gratification; such are in a few words the duties of a Chatriya.' How this martial race broke up is extremely obscure. They were a brave race, and all Rajputs claim a Chatriya descent.

CHATTA-PAT. HIND. Leaf of Licuala peltata.

CHATTO. HIND. A canopy of royalty.

CHATTRAM. TAM. Chattar, HIND. A caravansari, temple, or choultri.—*Wilson.*

CHATTRI. HIND. Agaricus campestris.

CHATUR-ANGA-BALAM. TEL. An army of the four arms, horse, foot, elephants, and chariots.

CHATUR-BHUJ, a name of Vishnu with four arms. In a deed of conveyance by Maharao Sri Jey Singh, this deity is invoked. The deed runs thus: 'At this time, Brother Maun Sing, I bestow upon thee, of my own free will, the village and lands of Jaetpoorah. This donative shall not look to rankroos (physical infirmity), su-poot (worthiness), ca-poot (unworthiness); your issue shall enjoy them. Of this intention I call the four-armed divinity (Chatur-bhuj) as witness. You are my own child (chooroo); wherever and whenever I order, you will do my service; if you fail, the fault be on your head.'—*Tod's Rajasth.* i. 610.

CHATUR-BHUJA DEVI, a form of Durga, represented sitting on a padmasana or lotus seat.

CHATUR-DASI, in Hindu astronomy, the 14th day of the lunar Pacsha.

CHATUR-DASI, in the Hindu religion, festivals held on the 13th and 14th of the month Cheyt, in honour of Kama, the god of love. Madana, he who intoxicates with desire (kama), are both epithets of the god of love. The festivals on the 13th and 14th are called Madana triodasi (thirteenth) and Chatur-dasi (fourteenth). On these days the Rajputs of Udaipur sing hymns handed down by the Bards: 'Hail, god of the flowery bow: hail, warrior with a fish on thy banner! hail, powerful divinity, who causeth the firmness of the sage to forsake him! Glory to Madana, to Kama, the god of gods; to him by whom Brahma, Vishnu, Siva, and Indra are filled with emotions of rapture!' There is no city in the East where the adorations of the sex to Kamadeva are more fervent than in Udaipur, the city of the rising sun.—*Tod's Rajasthan*, i. p. 577.

CHATURJEE, properly Chaturu padhyaya, the name of a family of Brahmans in Bengal learned in the four Vedas.—*W.*

CHATUR-MASYA. SANSK. Four kinds of sacrifices—Vaiswadeva, Varuna Praghasa, Sakamedha, and Sunasiriya, to be offered in four consecutive months, or every four months, consisting of roasted cakes of rice-flour, offered in the first to the Viswadevas, in the second to Varuna, with two figures of sheep made of flour, in the third with vegetables to Agni? and in the fourth to Indra.—*W.*

CHATURTHI, the fourth day after the new and full moon, sacred to Vighnesvara. On the Ganesh Chaturthi, or Chauth, was born Ganesh, called also Ganapati, made from the turmeric and oil off the head of Parvati. He is the god of wisdom, who removes obstacles, and is invoked at the commencement of all undertakings. Ganapati has a man's body with the head of an elephant.

His head is said to have been cut off or destroyed by Siva, when Ganesh tried to prevent Siva entering the chamber of Parvati when bathing. Clay images are made and worshipped for from one to nine days, and then thrown into water. The Chinchor or Chinchwad, who resides at a village of that name near Poona, is believed to be an incarnation of Ganesh, who promised an ascetic named Moroba, who lived in Sivaji's time, that he would be incarnate for seven generations in his family. The earth image of Ganesh is one of three forms, in which the earth deity Mrittika is worshipped by Hindus. The first is the Nag-pancham, in which feast a snake of clay is worshipped; the second is Gokul Ashtami, when a clay image of the infant Krishna is worshipped; and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The vahan or carriage of Ganesh is a rat. The feast in honour of his birth is held on the 4th of the month Bhadrapad, and falls on the first days of September, and has some planetary or seasonal connection. Ganesh is brought to the house with much pomp.

CHATURUPADHYAYA. SANSK. The name of a family of Brahmans in Bengal, commonly pronounced Chaturjia or Chaturjee.

CHATUR-VEDI. SANSK. Meaning a Brahman who has studied the four Vedas. It is usually pronounced Chaubi. The term is now applied to a class of Brahmans who are not always of a literary character; and in the Upper Provinces they are usually boxers, wrestlers, and the like.—*Wilson.*

CHAU. HIND. Four. Chau-bach'ha, in former times, in the Dehli territory, a levy of revenue on four things, the poll-tax, hearth-money, and hornegeld.

Chaubisi (24), any tract containing 24 villages in the occupation of a particular tribe.

Chaurasi (84), a subdivision of a pargana embracing 84 villages.

CHAUDA-RATNI, also Chaturdesa-ratna, in Hindu mythology, fourteen precious articles, called gems, obtained by churning the ocean. The second incarnation of Vishnu was in the form of a tortoise, hence known as the Kurma avatar. The principal incident in it was the churning of the ocean with the huge mountain Mandara as a churn-rod, using the great serpent Sesha as a churning rope; while Vishnu, in the form of a tortoise, sustained the vast load. The produce was the fourteen precious articles (or gems), the chaoda-ratni, or more classically the chatur desa ratna, one of which was medicine, another poison. See Vishnu.

CHAUDHARI, the headman of a trade in towns; the headman of a village; also, in Hindu temples in the Peninsula, the figures at the corners of the temple supporting each succession of platforms. See Dhara.

CHAUGHAN, a game of Tibet resembling hockey, but played on horseback, on a plain about 60 yards broad and 350 long, with a stone pillar at each end as the goal. The ball is somewhat larger than a cricket ball, and is called in Tibetan, Pulu, and now known to the British as Polo. The stick or Byntu is of the strong and straight bough of the almond-tree, about 4 feet long, and let in at the top and passed quite through to the other end of a curved piece of solid birch-wood, about the size and shape of a drenching horn. The game is mentioned by Baker. It is played in every valley in Little Tibet, Ladakh, Yessen, Chitral. See Chicane; Choughan.

CHAUHAN, one of the principal Rajput races, descended from Prithi Raj, the last Hindu ruler of Indra-prestha, or Dehli, and spread through Malwa and Rajasthan. The principal families are the Khichi, Hara, Bhadauria, Rajkumar, Rajor, Pratapnir, Chakarnagar, and Manchana. The head of the Manchana is the raja of Manipuri. This was the most valiant of the Agnicula Rajputs, and of the whole Rajput race. Its branches (saca) long maintained all the vigour of the original stem; and the Hara, the Khihi, the Deora, the Sonigurra, and others of the twenty-four, have their names immortalized in the songs of the Bards. The derivation of Chauhan is coeval with his fabulous birth,—the four-handed warrior Chatoor-bhooja, Chatoor-baha, Vira. Their name is often written Chauhōn, also Chahuman. They are in every part of the N.W. Provinces, as well as in Malwa and Rajasthan; the chief of this tribe now in the Raht district of Ulwar claims to be the living representative of Prithavi Raj.—*Tod.*

CHAUK. HIND. A market-place.

CHAUKA. HIND. A cleared space in which a Hindu cooks his food or performs any religious ceremony.

CHAU-KALASA. MAHR. A section of the Sudra, so named from their having four (chau) ornaments (kalasa) to the bridegroom's litter in a marriage procession.

CHAUKAT. HIND. A window frame or a door frame.—*Elliot.*

CHAUKI. HIND. A police station. Chaukidar, a watchman, policeman. Chaukidari, a tax levied to defray the cost of the village watch.

CHAULAI. HIND. Amarantus mangostanus. On the hills, A. polygonoides, a small-seeded variety of A. frumentaceus. Lal chaulai is A. anardana.

CHAULARYA. NEP. Borax.

CHAULMOOGRA. HIND. Gynocardia odorata.

CHAU-MUKHA. SANSK. A quadruple image, or four images of a Jaina thirthankara placed back to back.

CHAUNI. HIND. Cleome pentaphylla.

CHAUNSH. HIND. Berchemia, *sp.*

CHAUPAN PAL, or Pahal of Kashmir; shepherds who tend the flocks of other people.

CHAUPAT or Chausar. HIND. A game played with dice.

CHAU-PHRA of the Shan race, means lord, ruler. It is the Tsan-bwa of the Burmese.

CHAURANÆI SCYTHÆ of Ptolemy, supposed to be the people of Khor, a territory S.E. of Ladakh, and eastward of the Byltæ.

CHAUR-ANGA. SANSK. Lit. a square altar or pedestal for the linga.

CHAURAPUPPOO, Charul, also Chironji, of Hindustan, is the seed of the Buchanania latifolia, removed from the small stone or kernel of the achhar or fruit; it is very palatable and nutritious, especially when roasted; is used also in medicine, and considered heating; one seer and a half costs a rupee. The fresh fruit is very agreeable.—*Gen. Med. Top.* p. 131.

CHAURASA, HIND., from Char, four, is often applied to square tools. Chaurasa, a spiter for making holes in a wire-drawer's plate. Chauras bira, a narrow chisel. Chauras mekh, a small square anvil; Chaurasi reti, a square or two-faced file.

CHAURASI or Chouriasi, in Indian land revenue, a common subdivision of a district, comprising 84 villages. Satiasi, or 87 villages, is also not unfrequent.

CHAURI. HIND. A whisk; a flyflapper of hair, or shavings of sandal-wood, or ivory, etc.

CHAUS. *Shaw.* Felis chaus, *Guldens.*

CHAUSI. HIND. Broad cotton cloth, the web having 400 threads. Chausuti, plain cotton cloth, four thread. Chautahi, a bed-cover, also used as a wrapper by villagers.

CHAUTH. HIND. An assessment equal to a fourth of the original standard assessment, which the Mahrattas compelled other nationalities in India to pay, as the fee for abstaining from ravaging their countries. They collected it through their own agents. A quarter, a fourth part.—*W.*

CHAUTHI. HIND. The ceremony of untying the wedding bracelet on the fourth day after consummation.—*W.*

CHAUWAN. HIND. A millet of E. Oudh.

CHAVALAN, low caste Nairs? who are fishermen.—*Wilson.*

Betle leaf pepper, . ENG.	Nagabali, ... ,,
Vetta, ... MALEAL.	Tamalapaku, . . . ,,

This trailing plant is cultivated in many parts of India and through the Archipelago for its leaf (pan), which is used to enwrap ingredients—betle-nut, quicklime, aromatics, astringents—presented to guests on ceremonial visits. The plant thrives best in a stiff soil. This is well ploughed or dug, thoroughly cleaned and levelled, then enclosed with stakes and brushwood, and covered with a roof of seutha grass, Saccharum procerum. Shallow trenches 2 feet wide and 5 or 6 inches deep, and about 5 feet apart, are next scooped out and filled with water, and when the ground is thoroughly saturated the planting begins. A full-grown plant is cut down to the roots, which are separated and laid horizontally, and the sprouts, which in three or four days arise from the joints, each forms a separate plant. Planting goes on from February to April, and each row receives two or three waterings daily. The stripping of the leaves commences about the middle of June, and continues regularly for about a year, when the site is abandoned. The leaves are packed in bundles of 200, called dholi, and the dholi are sold at from 1½ pice to 14 annas per dholi, according to the quality and age of the leaf. Pan plants are grown to protect ferns, caladiums, and other foliage plants from sun and frost. See Betle.

This plant is extensively cultivated, but it grows wild on the banks of streams in the Circar mountains, S. Konkan, Bengal, Sylhet, and on the banks of the Irawadi. The dried catkins of the female plant form the long pepper of commerce.—*Roxb.; Voigt; Useful Plants.*

CHAWUL. HIND. Husked rice.

CHAWURA or Chaura, a tribe once renowned in the history of India, though its name is now scarcely known, or only retained in the chronicles of the Bards. Of its origin, says Col. Tod, we are in ignorance. It belongs neither to the Solar nor Lunar races. The capital of the Chawura was the insular Deobunder, on the coast of Saurashtra; and the celebrated temple of Somnath, with many others on that coast, dedicated to Balnath, or the sun, is attributed to the tribe of the Saura, or worshippers of the sun. The Balabhi princes were succeeded in the rule of Gujerat by the Chaura, who finally established their capital, in A.D. 746, at Anhalwara, now Patan, and became one of the greatest dynasties of India. The last raja dying in A.D. 931 without male issue, was succeeded by his son-in-law, a prince of the Rajput tribe of Salonka or Chalukya, whose family were chiefs of Kalian in the Dekhan, above the Ghats.—*Elphinstone's History of India*, i. p. 401; *Tod's Rajasthan*, i. p. 101.

This is the root of a small biennial plant, the Oldenlandia umbellata, which is largely used as a scarlet dye. It is extensively cultivated in Ceylon and the Peninsula of India, but also grows wild, and the Singhalese prefer the wild plant. The plant grows in light sandy ground near the sea, where its roots strike very deep. The colouring matter resides entirely in the bark of the root, the inner portion being white and useless. This root is of great importance to the S. Indian dyer, yielding a red dye similar to munjeet, Rubia cordifolia. The celebrated red turbans of Madura are dyed with it. That of Madura is considered superior of its kind, but this superiority is probably owing to some chemical effect which the water of the Vigay river has upon it, and not to any peculiar excellence of the dye itself. Wild chay roots are shorter, and are considered to yield one-third or one-fourth more colouring matter than the cultivated root; this probably arises from too much watering, as much rain injures the quality of the root. Roots of two years' growth are preferred when procurable. It is said that chay root rapidly deteriorates by being kept in the hold of a ship, or, indeed, in any dark place. When cultivated, the minute seeds are gathered, together with the surface sand, and sown in land previously prepared. It is watered for a year, and then dug, and sells at Rs. 20 the candy of 500 lbs.

If left longer in the ground it increases in value, and does not require further watching.

When first sown, it is immediately watered with water in which cow-dung has been dissolved. This binds the surface, and prevents the seeds being blown about by the winds. The dyers in the Peninsula of India test the value of the root by mixing some of the pounded root and quick-lime. If good, the mixture soon assumes a fine red colour, if the mixture become pale or brown, or if no change of colour take place, it is considered of little or of no value. If a white colour prevail in the inside of the bark and on the wood, it may be pretty certain that the root is spoiled; a green colour is a sure indication of its goodness (Rhode, MSS.). It furnishes the colouring matter for the durable red for which the chintzes of S. India are famous. Chay root forms a considerable article of export from Ceylon. It grows there spontaneously on light, dry, sandy ground on the sea-coast. The cultivated roots are slender, with a few lateral fibres, and from one to two feet long. Attention was drawn to it as a dye-stuff in 1798 by a special minute of the Board of Trade recommending its importation; but Dr. Bancroft's report discouraged its further importation.

Dr. Heyne's description of dyeing cotton yarn with chay root is as follows:—

The yarn, being washed and untwisted, that it may not become entangled, and being so separated that every part may be equally penetrated by the colouring matter, is divided into bundles of thirty or forty threads, through each of which at the middle and extremities a cotton thread is loosely sewed, but so as to allow of every thread being exposed to the sun's rays when hung up, and the threads spread out on a bamboo.

The yarn is washed and cleansed in cold water, aided by half an hour's manipulation; it is then kept in water in covered vessels till it acquires a putrid smell, which takes place in from twenty-four to thirty-six hours, during which it is occasionally pressed and worked for a quarter of an hour together; it is then to be washed as clean as possible, beaten on a stone or earthen pot, and then hung up to dry.

While this process is going on, a lye is prepared of the ashes of the plantain or other tree in cold water. It is an object to have this lye of sufficient strength, which is determined by adding to a small quantity about half as much gingelly oil and giving to it a gentle motion. Should it turn immediately white, having no visible globules of oil swimming on the surface, it is good.

The quantity required of clean lye being poured off and strained, sheep dung, in the proportion of three ounces to a pint of lye, is dissolved in one-half of it, and this solution is again strained. The other half of the lye is mixed with half its bulk of gingelly oil and half as much tsiky (the saponaceous water procured during and retained from former process, being, in fact, a solution of soap in water); the two liquors are then mixed together, and if things are favourable a milky scum arises.

The proportions required for say half a pound of yarn would be,—gingelly oil, half a pint by two pints; tsiky (soapy liquor from former process), a quarter of a pint; sheep dung, two or three ounces.

The yarn having been thoroughly imbued with this mordant, is dried in the sun for some hours; it is then again soaked and dried as before. The same night it is treated with an additional portion of mordant, is put into covered vessels, and allowed to remain till morning. If any mordant remain, the same process is again repeated.

The yarn is at night moistened with the lye first prepared, diluted with one-third of its bulk of water, and put into covered vessels. The yarn in drying, it should be remarked, should have the position constantly changed, to prevent the mordants or lye from accumulating in the lower part.

Next day the yarn is spread out to dry on the bamboo. It is taken in at night, and treated with lye. This alternate soaking or thorough moistening with lye at night and exposure during the day are continued without intermission till the yarn appears saturated with lye, or, in fact, till the oil is converted into soap. This, if the lye is sufficiently strong, may occupy five days. This is ascertained by washing a few inches from off the bundle in water holding some astringent in solution; a whitish scum will arise, and it is from the feeling of this scum when worked between the hands, and the appearance of it afterwards, that they determine the state. The workman being satisfied of the completion of this process, the yarn is again moistened for one day, morning and evening, with much diluted lye or plain water. The yarn may be immediately washed, but the process is much improved by retaining it for some weeks, probably to allow the anamalizing matter to get fixed.

Before washing it thoroughly, the yarn is washed in a small quantity of water, which, receiving the soapy particles in solution, is retained by the dyer under the denomination of tsiky. It gradually acquires some consistence and a disagreeable smell. The yarn is then washed in a tank till nothing of the mordant seemingly remains, but the smell and a certain softness to the touch. Occasionally the whole process is again repeated.

The yarn being thus thoroughly impregnated with the mordant, a cold infusion of cassa leaves in water is made, and after some hours the yarn is put into it and handled in such a manner as to expose every thread to its action. It is allowed to remain therein all night. The quantity of leaf used in the infusion is so great that it resembles a paste.

Next morning the water is wrung out from the yarn, the adhering leaves are shaken off, and fresh ones with an equal quantity of chay root substituted; for half a pound of yarn a handful of each is sufficient. After two hours the yarn is laid in the liquor.

The same process is repeated on the third day; by this time the yarn usually changes to a reddish-yellow colour, with occasional red spots. A liquor in which to soak the yarn is now prepared of a handful of chay root in water.

On the fourth day the yarn will appear in the evening of a light red colour. It is to be treated in the same manner as on preceding days, and a similar liquor to the last-named is prepared for soaking it in at night.

On the fifth day the yarn is washed in a tank, and afterwards dried in the sun. As usual, for soaking it in at night, a liquor is prepared of

pounded cassa leaves, mixed with gingelly oil sufficient to form a dry paste, of which about half an ounce is mixed in the usual portion of water; after standing two hours, a handful of chay root is added, and the yarn immediately immersed for the night.

The mode of proceeding on the sixth day is precisely similar, but the liquor for the night is prepared wholly of chay root.

On the seventh day the yarn is again washed, dried, etc. On this and the next day it is immersed in a liquor composed of equal parts of cassa leaves and chay root in water.

The yarn is now boiled in a liquor composed of that strained from it at the last night's process, with the addition of chay root, a handful for half a pound of yarn, and sufficient water to give room to agitate the yarn freely. The pot containing the liquor is placed on the fire, which is kept up briskly till it begins to boil; it is then kept simmering till a rose-coloured froth rises and covers the surface, when the fire is withdrawn, and the pot with its contents allowed to cool gradually. During the boiling the contents of the pot are stirred quickly, so as to expose the yarn as little as possible to the action of the air. When cold, the yarn is taken out and washed in a tank, beaten as usual, and dried in the sun; its colour should be a bright and lively red. If it fail, it is occasionally brightened by steeping once more in a liquor composed with cassa leaves and chay root, the former being mixed first with a little gingelly oil. A temporary brilliancy is further given by putting it in a cold infusion of safar wood.—*Rohde; M. E. J. R.; Simmonds.* See Dyes.

CHAYRUKA. MALEAL. Capparis Heyneana.

CHE-ANA, literally six annas, a clan of the Garo, who are rated at six annas.

CHEAYTI. BENG. Agathotes cherayta.

CHEBULIC MYROBALAN. Six kinds of chebulic myrobalans are used in India, all known as Halileh:—

H.-i-Zira, is the fruit dried when just formed, and the size of a cumin seed or Zira.

H.-i-Javi, the fruit dried when the size of a Jao or barley-corn.

H.-i-Zingi, the fruit dried when of a larger size, and black like a Negro.

H.-i-Chini, larger than H.-i-Zingi, and greenish.

H.-i-Asfar, the fruit near maturity, and yellow.

H.-i-Kabuli, the fruit at full maturity. Mature Kābul myrobalans sell for a rupee apiece in the Bombay market, under the name of Sarwar-i-Hindi.

CHECHAR. HIND. Rhus buckiamela.

CHECHER, under the Mahomedan system of land-tax, lands which had suffered from inundation or excessive rains, the rent of which was remitted for five or six years. See Khiraj.

CHEDA. PERS. A funeral pillar erected by the Brahui nomades, modern representations of the ancient Buddhist chod'ten or chaitya. They are, like the cairns or tsalai of the Afghans, piled over the graves of their holy men and martyrs.—*Bellew.*

CHEDARASI. TEL. Mollugo spergula, *L.*

CHEDDI or Cherri. TAM. A tree, a plant.

CHEDDUL. TAM. The charakh puja.

CHEDDULU. TEL. White ants.

CHEDI, a kingdom in Saurashtra to which Krishna resorted, once as a fugitive, and again as a conqueror. See Krishna.

CHEDUBA, a moderately high island, extending from lat. 18° 40′ to 18° 56′ N., its greatest breadth being almost 15 miles. Its N. peak is in long. 93° 31′ E. Area, 120 square miles. It is a volcanic island, lies off Arakan, and is about 1760 feet high; it was lifted 10 feet up about the year A.D. 1750. Population in 1872, 22,078. Petroleum is found in several parts of the island; and at the N.W. corner is a site, known as the volcano, from which issues an inflammable gas. The neighbouring seas of Cheduba and Ramree need careful navigation. Hallstead gives an account of it in Bl. As. Trans., 1841, x. p. 350. It was taken from the Burmese on the 27th May 1854.—*Horsburgh; Dr. Buist; Imp. Gaz.*

CHEDU BADDU DUMPA. TEL. Dioscorea pulchella, *R.* iii. 801. The name signifies 'bitter climbing tuber.' Not uncommon in the forests of the Manyam lands, in the hill country of Vizagapatam and Ganjam. Chedu bira, Luffa amara, *R.* iii. Chedu potla, Trichosanthes cucumerina, *L.*

CHEEHEE, a Gujar tribe.

CHEEL, also Cheer. HIND. Pinus longifolia. Plentiful on the lower hills of the Himalaya; its upper limit is 6000 feet.—*Captain Gerard.*

CHEEL. HIND. A kite. The word is applied to the Haliastur Indus, which is called the Sankar cheel, or Siva's kite, and is known to Europeans as the Brahmany kite; also name of the Milvus ater or common kite of India, Malayana, and E. of Europe.

CHEENA. BENG., HIND. Panicum miliaceum.

CHEENAPU. TAM. Lagerstræmia Indica, *Linn.*

CHEE-NEB. BURM. This tree, of maximum girth 4 cubits, and maximum length 22½ feet, is abundant in Tavoy and Mergui. When seasoned it sinks in water. The flowers have an intolerably fetid, sickening smell, hence its name. It is used by the Burmese for boxes, tables, etc., and is a long-fibred, tough wood when new, but rots readily.—*Captain Dance.*

CHEENEH, a subdivision of the Jat race in the Panjab. See Jat.

CHEEP. GUJ. Mother-of-pearl shell; a corruption of the Persian sipi, any shell or mollusc.

CHEER, a pheasant of the Himalaya, also called Charir; Phasianus Wallichii.

CHEERA MELLA. HIND. Phyllanthus longifolius.

CHEERI. SANSK. Mimusops hexandra; also Wrightia antidysenterica.

CHEERONJI. HIND. Buchanania latifolia.

Its Oil.

Cheese is made by the natives of India, but that used by Europeans is imported, and is known in

the market by names derived from the places of manufacture, such as single and double Gloucester, Stilton, Cheddar, Dunlop, Dutch, Cheshire, etc. Cheese is made from milk in China, also from a mixture of cream and butter, and called tsiang-shwui. In Britain the chief season for cheese-making is from May to September, and it is carried on in nearly every county; but particular districts have acquired great repute. In Cheshire cheese, the salt is well mixed with the curd, and not merely rubbed on the outside. This, which is the most celebrated English cheese, is made in quantities amounting to nearly 14,000 tons annually. The average annual produce of cheese in Great Britain and Ireland is 80,000 tons, most of which is made in Cheshire, Gloucestershire, Shropshire, and Derbyshire. The rich cheese called Stilton is made in Leicestershire; it is not sufficiently mellow for use under two years old. Double and single Gloucester cheese is also well known. The former is made of the milk and cream, the latter of the milk and half the cream. Bath and York are famous for cream cheeses. Good cheeses are produced in large quantities in Holland. In Gouda cheese, which is considered the best in that country, muriatic acid is used instead of rennet. Hence it is never infested with mites. Parmesan cheese from Parma, in Italy, is skim-milk cheese, owing its rich flavour simply to the fine herbage on the banks of the river Po. Swiss cheese, especially that of Gruyère, is pleasing to some tastes. It is flavoured with herbs. — *Tomlinson*, p. 359; *Faulkner; M'Culloch's Commercial Dictionary*, p. 271; *Statist. of Commerce.*

CHEESE-MACARONI, Ju-sien, CHINESE, is made by the Chinese.

CHEETA. HIND. The several leopards and panthers of India are so named. The word, meaning spotted, is so used by the natives of India, but they prefix another word to indicate the particular animal intended. Generally, by the word cheeta is meant the Felis leopardus, *Schreb.* The F. pardus is called the tendwa, also chita and chita-bag; it is the larger cheeta or pard or panther, and the hunting leopard the shikari cheeta. The black or kala cheeta is supposed by some to be a variety of the F. pardus. The smaller variety, the leopard, is the gor-bacha or bor-bacha, or bibia-bag. The hunting leopard, the Felis jubata, is carried to the field on a flat-topped cart without sides, drawn by two bullocks. Each animal has two attendants, and is loosely bound by a collar and rope to the back of the vehicle, but is also held by the keepers by a strap round the loins. A leathern hood covers their eyes. By skilful management the cart approaches within two hundred yards of the game. The cheeta is then unhooded and loosed from its bonds, and it drops quietly off the cart. It approaches them at a slow, crouching canter, masking itself by every bush and inequality of ground. As soon, however, as they begin to show alarm, he quickens his pace, and is in the midst of the herd in a few bounds, rolls over the one he fixes on, and in an instant is sucking the life-blood from its throat. The instant that the deer is pulled down, a keeper runs up, hoods the cheeta, cuts the victim's throat, and, receiving some of the blood in a wooden ladle, thrusts it under the leopard's nose. The antelope is then dragged away and placed in a receptacle under the cart, while the cheeta is rewarded with a leg for his success. Jerdon regards as one species the three cheetas of India, viz. the two varieties of Felis pardus, the panther and the leopard; also the black cheeta or black leopard, Felis melas, *Peron.* The hunting leopard or shikari cheeta is the maned leopard, Felis jubata, the pard of the ancients.—*Schreder; Mundy's Sketches in India.*

CHEETA-MEENA, a branch of the Meena race, from whom spring the Mair or Mera clan, the mountaineers of Rajputana, one of the aboriginal races of India, whose country is styled Mairwara, or 'the region of hills.' The Mair branch of the Meena is also called Mairote and Mairawut. Mairwara is that portion of the Aravalli chain between Komulmir and Ajmir, a space of about 90 miles in length, and varying in breadth from 6 to 20. Rajputana rises from 3000 to 4000 feet above the level of the sea. Mera is 'a mountain' in Sanskrit; Mairawut and Mairote, 'of or belonging to the mountain;' the name of the Albanian mountaineer, Mainote, has the same signification. The Meena race consists of as many branches as their conquerors, the Rajputs. All these wild races have the vanity to mingle their pedigree with that of their conquerors, though in doing so they stigmatize themselves. The Cheeta-Meena accordingly claim descent from a grandson of the last Chauhan emperor of Dehli. Unail and Anoop were the sons of Lakha, the nephew of the Chauhan king. The cocoanut was sent from Jeysulmir, offering princesses of that house in marriage, but an investigation into their maternal ancestry disclosed that they were the issue of a Meena concubine, and their birth being thus revealed, they became exiles from Ajmir, and associates with their maternal relatives. Unail espoused the daughter of a Meena chieftain, by whom he had Cheeta, whose descendants enjoy almost a monopoly of power in Mairwara. The sons of Cheeta, who occupied the northern frontier near Ajmir, became Mahomedans about the 15th century, when Doodha, the sixteenth from the founder of the race, was created Dawad Khan by the hākim of Ajmir; and as Athoon was his residence, the 'Khan of Athoon' signified the chief of the Mairotes. Athoon is still the chief town of the Mair race. Chang, Jhak, and Rajosi are the principal towns adjoining Athoon. Anoop also took a Meena wife, by whom he had Burrar, whose descendants have continued true to their original tenets. Their chief places are Burrar, Bairawara, Mundilla, etc. The Meena were always notorious for their lawless habits; and importance has been attached to them so far back as the period of Beesildeo, the celebrated prince of Ajmir, whom the Bard Chand states to have reduced them to submission, making them carry water in the streets of Ajmir. Like all mountaineers, they break out whenever the hands of power are feeble. In the autumn of 1882 the Meena committed a cruel outrage in the Jeypore territory.—*Tod's Rajasthan*, i. p. 681.

CHEETOO, a famous Pindari chief of the early part of the 19th century, who would not yield to the British, but sought refuge in forests, where he was deserted by all his followers. His mangled body was at length found in a tiger's lair, with his sword, and a letter-case holding some important papers.—*Heber*, ii. 551.

CHEETUL. HIND. The spotted deer. Axis maculatus.

CHEETZ. MAHR. Tamarindus Indica, *Linn.*

CHEGA. TEL. Sanseviera Roxburghiana.

CHEGA GADDA. TEL. Vangueria spinosa.

CHEGO, a race in Malabar, who seem to be noticed by Wilson as the Chegavan or Chekavan, and whom he describes as a man of low caste, commonly a Tair, one whose occupation is drawing toddy. The tradition is that the Chego came originally from Ceylon, where they belonged to the military caste. The Chego say that in the time of Cheram Perumal, a washerwoman, whose house adjoined that of an Ajari (carpenter), being occupied as usual in washing a cloth in water mixed with ashes, and having no one at hand to hold the other end of it, called to a young daughter of the Ajari, who was alone in the house, to assist her. The child, not knowing that this was an infringement of the laws of her caste, did as she was requested, and then went home. The washerwoman was emboldened by this affair to enter the Ajari's house a few days afterwards, and upon the latter demanding angrily how she dared to cross his threshold, the woman answered scornfully that he belonged now to the same caste as she did, since her daughter had helped to hold her cloth. The Ajari, learning the disgrace that had befallen him, killed the washerwoman. Upon this her friends complained to Cheram Perumal, who espoused their cause, and threatened the carpenters, whereupon the latter combined together to take refuge in Ceylon, where they were favourably received by the king of Kandy. Cheram Perumal begged the king of Kandy to send them back, promising to do them no injury. The Ajari did not place entire confidence in these promises, but asked the king to send with them two Chego and their wives, to witness Cheram Perumal's conduct towards them, and to protect them. The king granted their request, with the stipulation that on all occasions, such as weddings and deaths and other ceremonies, the Ajari should bestow three measures of rice on each of these Chego and their descendants, as a tribute for this protection,—a custom which still exists. If the Ajari is too poor to afford the outlay, he is still obliged to present the requisite quantity of rice, which is then given back to him again,—the rights of the Chego being thus maintained. From these two couples all the Chego of Malabar are said to be descended. This caste comes next below that of the Sudra, but is considered much less honourable. In times of civil war or rebellion, the Chego are bound to take up arms for the lawful sovereign; and some princes employed them as soldiers on other occasions, if they had not a sufficient force of Nairs. Their principal occupation is that of drawing cocoanut toddy, which is compulsory on their caste. The Chego are subdivided into two castes, the Chego and the Twen Chego.

CHEHAL TAN, properly Chahal Tan. Near the Jahan Numa, in Shiraz, is a building called Chahal Tan, 'the forty bodies or persons;' another the Haft Tan, or 'seven persons,' from the number of holy men there buried.—*Ouseley's Travels.*

CHEH'L-WASTI, or captain of forty, amongst the Nasiri, a nomade race who occupy the Tohti and Hotuki countries in summer, and the Daman or skirts of the Suliman range in winter. In their migrations, they appoint a cheh'l wasti, or captain of forty, and a director-general.

CHEHOOR. BENG. A pale brownish-coloured cordage of Birbhum, coarse, and of moderate strength.—*Royle.*

CHEIRANTHUS ANNUUS. *Linn.*

Na-farmani, . . HIND. | Todri safaid, . . HIND.

The natives of India recognise five kinds of seed, which they distinguish by their flowers. Lab or surkh, red, and zard, yellow, appear to be wallflower seeds. Safaid (white), nafarmani, and nila (blue), are stock seeds.—*Powell's Handbook.*

CHEIRANTHUS CHEIRI, wallflower, from Cheir, the hand, and Anthos, a flower, derives its English name from growing wild on old walls and ruins in England. It is of a light yellow colour, but, when cultivated in gardens, assumes a rich dark tint, mixed with brown; the double variety of a yellow colour, and striped with deep orange. In the Panjab it is called Lahori subu. It has small linear, acute, reddish seeds (todri surkh, lal todri), and the flowers said to be cordiac and emenagogue, are used in paralysis.—*Powell.*

CHEIRONECTES, the frog-fish of the British, in India, belong to the family of Lophiadæ or anglers, and are met with in many seas. In this group the bones of the carpus form arms that support the pectoral fins, and enable these fishes to walk along the moist ground, almost like quadrupeds. Cheironectes immaculatus, *Ruppell*, has feet or claws rather than fins. Hartwig mentions a frog-fish of the Asiatic islands and the southern hemisphere, remarkable for its hideous appearance and its capability of surviving for several days on land.—*Tennent's Ceylon*, p. 330. See Fishes.

CHEIROPTERA, the bats.

A sub-order of mammals of the order Primates. The bats, or flitter mice, derive their scientific name from the two Greek words, Cheir, a hand, and Pteron, a wing, from the circumstance that a membranous fold of their skin, commencing from their neck, spreads out between their fore feet and their fingers. They include four families, viz.,

Fam. Pteropopidæ, Frugivorous bats.
3 Gen.—Pteropus, 4 species; Cynopterus, 2 species; Macroglossus, 1 species.
Fam. Vampyridæ, Vampire bats. *Sub-Fam.* Megadermatinæ.
1 Gen.—Megaderma, 4 species.
Sub-Fam. Rhinolophinæ.
5 Gen.—Rhinolophus, 11? species; Hipposideros, 10 species; Cælops, 1 species; Rhinopoma, 1 species; Nycteris, 1 species.
Fam. Noctilionidæ. *Sub-Fam.* Taphozoinæ.
1 Gen.—Taphozous, 5 species.
Sub-Fam. Noctilioninæ.
2 Gen.—Nyctinomus, 1 species; Cheiromeles, 1 species.
Fam. Vespertilionidæ. *Sub-Fam.* Scotophilinæ.
3 Gen.—Scotophilus, 11 species; Noctulinia, 1 species; Nycticejus, 8 species.
Sub-Fam. Vespertilioninæ.
8 Gen.—Lasiurus, 1 species; Murina, 2 species; Kerivoula, 5 species; Vespertilo, 7 species; Myotis, 6 species; Plecotus, 3 species; Barbastellus, 3 species; Nyctophilus, 1 species.

Some of the frugivorous bats are eaten in the East. The Indian fruit-bats are Pteropus Edwardsi and Pt. Leschenaultii; that of Australia, Pt. poliocephalus; and Cynonycteris collaris is the collared fruit-bat.

CHEITUN, a Brahman of Naddiya, who in the

beginning of the 16th century introduced the reforms of Ramanand into Bengal.

CHEKAVAN or Chegavan. MAL. A toddy-drawer in Malabar.—*Wilson.* See Chego.

CHE-KIANG, a province on the east of China, of 57,000 square miles. It is washed by the China Sea. Its chief towns are Hang-chau, Ningpo, and Wan-chau.

CHE-KIANG RIVER, or Pearl river, disembogues after a course of 500 miles. As it passes Canton, it divides into two branches, which, embracing the island of Honan and the Flat islands, re-unite below the Flat islands to form the true Pearl river, which flows on in a broad stream, receives many tributaries, and finally empties itself by many mouths into the sea below the Bogue Forts. It drains 150,000 square miles. The channels are narrow, but most of them are navigable by boats to all the large towns in the provinces of Kwang-tung and Kiang-si.

CHEKONADI. TEL. Cadaba Indica, *Lam.*

CHEKURTI TIVVA. TEL. Pentatropis microphylla, *R.* ii. 35.

CHEL. HIND. Cannabis sativa.

CHELA. HIND. Alangium decapetalum.

CHELAH means literally an adopted dependant. It neither applies to a slave nor an adopted child, but to a person who is admitted to the claims of a dependent relation. In use, it means a disciple, a pupil, a slave. Tod (ii. 608) says it includes servitude or domestic slavery, but implies at the same time treatment as a child of the family, or disciple. Tod mentions that at Bhynsror the head of the establishment came forth to bestow his blessing on him and to beg something for his order. He, however, in the first place elected Colonel Tod one of his chela, or disciples, by marking his forehead with a tika of bhaboot, which he took from a platter made of dhak leaves. —*Tod's Travels; Malcolm, Central India.*

CHELAT-PIPPUL. BENG. Stillingia sebifera.

CHELIDONIUM MAJUS. *Smith.*

Chi-mu, ... CHIN. | Celandine, . . . ENG.

It is used as an expectorant.

CHELIFER. Amongst the insects which infest books in India are two genera, which are usually regarded as accomplices in the work of destruction, but which, on the contrary, pursue and greedily feed on the larvæ of the death-watch and the numerous acari which are believed to be the chief depredators that prey upon books. One of these maligned genera is a tiny tailless scorpion (Chelifer), of which three species have been noticed in Ceylon, the Ch. librorum, *Temp.*, Ch. oblongum, *Temp.*, and Ch. acaroides, *Hermann*, the last of which it is believed had been introduced from Europe in Dutch and Portuguese books. Another genus of book insects is the Lepisma, the fish insect genus, and called so by Fabricius from its fish-like scales, —tiny silvery creatures which feast on the acari and soft-bodied insects that infest books. There have only been two species described, viz. the L. niveo-fasciatus and L. niger, *Temp.* It has six legs.

CHE-LING-TCHA-POO, a division of the country of the Kalkas, in the district of Pola, adjoining the Russian district Selingsky.

CHELKA DUDUGA. TEL. Unona discolor.

CHELLAWN, HIND., properly Chilan. An invoice, a passport, from Chilana, to forward.

CHELLU. TAM. Termites, white ants.

CHELLUMBRUM, a town in S. Arcot district, famous amongst Saiva Hindus for its shrine, called Sabanaiker Koil, to which pilgrims repair. It was built by one of the kings of Chola Mundalum. The Hindus of Ceylon and the Nattu Kotta merchants of Madura contribute largely to its support. The single blocks of granite in the gateway and roof are each 30 feet long and 5 feet square. In one part there is a roof supported by 1000 solid granite columns; and the lights from the Gopuram, 122 feet high, can be seen at sea 10 miles distant.

CHEL-MAR-ZAI, one of the four divisions of the Med, a seafaring and fishing population on the seaports of the Makran coast; the other three divisions are Guzbur, Hormari, and Jellar-zai.

CHELMERI. HIND. Cicca disticha.

CHELMON ROSTRATUS. *Linn.* One of the archer fishes. Chætodon rostratus, *Shaw*, according to Sir J. E. Tennent, is the archer fish of the fresh waters of India. On seeing a fly settle overhead on a leaf, it propels a drop of water and brings it down. See Chætodon toxotes.

CHELONIA, an order of reptiles, known as tortoises and turtles, generally considered the first by zoologists. They are also termed Testudinata, from testudo, the Latin for a tortoise. They belong to the section Cataphracta or shielded reptiles; and the families, genera, and species in S.E. Asia are as under :—

SUB-CLASS, REPTILIA PROPER.

The Order of Tortoises—Chelonia.

I. Land Tortoises, Testudinidæ.

Testudo elegans, *Schöpff.*, Peninsula of India, Ceylon.
T. Horsfieldii, *Gray*, Afghanistan.
T. elongata, *Blyth*, Gamboja, Arakan, Mergui.
T. Indica, *Gmel.*, Galapagos.
T. radiata, *Shaw*, Madagascar.
T. stellata, ,, Vizagapatam.
T. platynotus, *Blyth*, Burma.

II. Freshwater Tortoises, Emydidæ.

Manouria emys, *M. and Schl.*, Penang, Arakan, Tenasserim.
Cuora Amboinensis, *Daud*, Eastern India.
C. flavomarginata, *Gray*, China, Formosa.

B. Ellioti, ,, Kistna river.
B. affinis, *Cantor*, Malay Peninsula.
B. dhongoka, *Gray*, Nepal, Assam.
Platysternum megacephalum, *Gray*, China, Pegu.

III. Freshwater Turtles, Trionycidæ.

Emyda granosa, *Schöpff.*, Hindustan, Sikkim, Bengal.
E. Ceylonensis, *Gray*, Ceylon.
E. vittata, *Peters*, Goa.
Trionyx Sinensis, *Weigm.*, China, Chusan, Formosa.
T. Gangeticus, *Cuv.*, Ganges, Penang.
T. Javanicus, *Schweigg*, Ganges, Dekhan, Penang.
T. ornatus, *Gray*, Siam, Gamboja.
T. subplanus, *Schweigg*, Singapore, Penang.
T. Guntheri, *Gray.*
Chitra Indica, ,, Ganges, Malay Peninsula.

IV. Marine Turtles, Chelonidæ.

Caouana olivacea, *Eschech*, coasts.
Chelonia virgata, *Flem.*, coasts.
C. midas, *Schw.*, Bay of Bengal.
Caretta squamata, *L.*, coasts.
C. imbricata, *Schw.*, Bay of Bengal.
Dermatochelys coriacea, *L.*, coasts.

Chelonia midas is the green turtle; Caretta imbricata, hawksbill turtle; Caouana olivacea, loggerhead turtle. As an article of food, the green turtles (Tortues Franches of the French) are so highly prized that they have become a considerable article of commerce. The fat of many species, when fresh, is used with success in lieu of butter and oil in cookery; and, in those kinds which have a musky odour (Chelonia, Caouana, and C. caretta, for instance), is used for embrocations, leather-dressing, and as lamp-oil. The imbricated turtles furnish that valuable article, tortoiseshell, or rather the best sorts of it, so highly prized in ancient and modern times, and so ornamental and useful in the arts. The eggs of all species, particularly those of the green turtles, are excellent. Chelonophagi inhabited the shores of India and the Red Sea, as Strabo and Pliny testify. They used the shells of the turtles which they caught, for roofs for their houses and boats. The largest shell seen in modern times was 7 feet.—*Yule's Cathay; Eng. Cyc.* pp. 1004-1007. See Reptiles.

CHEMA KURA, also Chama dumpa. TEL. Colocasia antiquorum, *Schott.*

CHEMANTI. TEL. Chrysanthemum Roxburghii, *Desf.*

CHEMBADI-VADU. TEL. A fisherman.

CHEMBAGA-NOVEL. TAM. Eugenia jambosa.

CHEMBRUMBAKAM, a large tank or reservoir about 14 miles from Madras. It was originally formed by the native rulers, and held from 55·61 to 77·80 millions of cubic yards of water, and had an area of 4648 acres, or 7·26 square miles. The British in the 19th century enlarged the head sluice and supply channel with the intention of making the reservoir hold 196·87 millions of cubic yards; but its present capacity is 102·91 millions of cubic yards, and the water spread 5729 acres, or 8·95 square miles.

CHEMBU NARINGI. MALEAL. Indigofera enneaphylla.

CHEMISTRY, Kimia, ARAB., was largely cultivated by the Arabs, and, after their conquest of Egypt, it spread over the old world. The most celebrated alchemists of Europe were Albertus Magnus, Roger Bacon, Raymond Lully, Arnoldus de Villa Nova, John Isaac Hollandus, Basil Valentine, Paracelsus, and Van Helmont.

CHEMMAN. MALEAL. A currier. See Chamar.

CHEMMANUTHI. TAM. Sethia Indica.

CHEM-MARA. MAL. Amoora rohituka.

CHEMPAKAM. MAL. Michelia champac, *Linn.*

CHEMRI. HIND. Eleusine flagellifera.

CHEMUDU. TEL. Euphorbia tirucalli, *L.* E. cutteamundu. See Cutteamundoo.

CHEMULA or Chemuda, the Semylla of Greek writers.

CHENA. HIND. Panicum miliaceum. It is sown and reaped in the hot season after all the rabi crops have been cut. It needs much water, hence the saying—

'Chena ji ka lena,
Choudah pani dena,
Byar chale to, na lena na dena.'

To get the chena crop, water it fourteen times. If a blast strike it, then neither harvesting nor selling. It is a very precarious crop.—*Elliot.*

CHENAB, next to the Sutlej, is the largest of the five great rivers of the Panjab. It is also called the Trimab. Ptolemy called it Sindabal or Sandabilis, but the Greek historians of Alexander called it Akesines. Its source is in the high land of Tibet, about lat. 32° 50′ N., and long. 77° 40′ E., near the Bara Lacha pass. The Chandra and Bhaga rise on opposite sides of the Bara Lacha pass, which is in lat. 32° 45′ N., and long. 77° 22′ E.; and as their junction form the Chenab, they give also its Sanskrit name, Chandrabhaga, or moon garden. It runs north-west to Murumurdwun; south-west to its confluence with the Jhelum, thence south-west to the Ghara, or continuation of the Sutlej. Its length to the Ghara is 765 miles. It descends at the average rate of 40 feet per mile for the first 200 miles. Its estimated elevation at Kishtawar is 5000 feet. It receives the Suruj Bhagu, Murumurdwun, and the Dhark, all short streams. It becomes navigable for timber rafts at Aknur. Above Darwas it is a rapid river, running through a deep rocky channel.

The portion of it which passes through the territories of the maharaja of Kashmir is about 200 miles long. From the junction of the Chandra and Bhaga at Tandi, in British Lahul, to Aknur, where the river debouches upon the plains, its length is about 300 miles. The fall, according to General A. Cunningham, is 34 feet per mile from Tandi to Kishtawar, and 26 feet per mile from Kishtawar to Aknur. The flora of the upper valley agrees in most respects with that of Kunawar; lower down there is an approach to the vegetation of the Outer Himalaya. In the basins of the Chenab and Jhelum are four distinct races, but all of Aryan origin, viz. the Dogra, Pahari, Kashmiri, and Chaibati. The races on its valley call it Sanda Bhaga, Jenab, Ghenab, Jenal, and Ghenal.—*Powell*, 532; *Thomson's Tr.* 348; *Cleghorn, Rep.* 134, 153; *Panjab*, i. 10, 11.

CHENA CULTIVATION. ANGLO-SINGH. In Ceylon, Chena means scrub land, patches of forest, burned, cleared, and cultivated for two or three years, and then abandoned and allowed to become forest lands again. This destructive form of cultivation is known as Kumari on the western coast of India.—*Tennent; Dr. Cleghorn.* See Kumari.

CHENA-GHANRI. BENG. Xyris Indica.

CHENEBROON, a large tree of Akyab used in house-building; plentiful in the Ramree and Sandoway districts.—*Cal. Cat. Ex.* 1862.

CHENK PURI, also Thungon-Puri. BURM. The elytra or wing-cases of the genus Buprestis, order Coleoptera. See Beetles. They are used for ornamenting the dress and person; 5000 maunds procurable during the rains. Price in Akyab, from 6 to 7 rupees per maund.

CHENNA, also Chinna. TAM. Small. Many towns seem to be called from this word.

CHENNA. HIND. Cicer arietinum, *Linn.* This is called Bengal gram, in contradistinction to Koolti or Madras gram, Dolichos uniflorus. Properly Channa.

CHENNANGI. TEL. Lagerstrœmia macrocarpa, *R.*, and L. parviflora, *R.* ii. 505.

CHENNAPPA NAYAKKAR, father-in-law of the Nayakkar of Chingleput, a petty local chieftain; a feudatory of the Chandragiri raja, from whom the English obtained possession of a little fort on the coast, which they converted into a fortified factory, and it became the fortress and town of Madras, which is known to the native inhabitants as Chenapatan.

CHENNAT NAIR, a forest near Palghat, with well-grown Terminalia glabra, Pterocarpus marsupium, and Inga xylocarpa trees.

CHENOPODIACEÆ, the goosefoot tribe of plants, many species of which occur in the S. and S.E. of Asia, of the genera chenopodium, beta, blitum, salicornia, spinacia, basella, salsola, and atriplex. Several species are used for culinary purposes. Garden orach (atriplex), chard-beet, beet, mangold wurzel (beta) belong to this order, and soda is obtained from species of salsola and salicornia. Ch. album (beta sag), common in Bengal, is used by the natives as a pot herb; Ch. laciniatum, an erect annual, and Ch. viride, of which there are two varieties. Ch. olidum, stinking goosefoot, smells like putrid salt fish, and exhales ammoniacal gas. It is employed as an emenagogue and antispasmodic.—*O'Sh.* p. 523; *Voigt.*

Chenopodium album, *Linn.*

Kulf, ... ARAB.	Ructanala, . . SANSK.
Khuljeh ke baji, . DUKH.	Parupu kire, . . TAM.
Bhatwa, Bathu, . HIND.	Pappu kura, . . TEL.
Bathu, ... PANJ.	Chakra varti kura, ,,

Grows all over India, coming up with the spring crops in N. India and the Panjab hills. The poorer people use it largely as a pot herb.

Chenopodium auricomum, *Lindley*, a tall perennial herb of the Darling river to Arnbern's land, furnishing a nutritious and palatable spinage. It can live in arid desert regions.—*V. Mueller.*

Chenopodium blitum, *V. Mueller*, Blitum virgatum, *Linn.* An annual herb found from S. of Europe to India, cultivated as a spinach plant; fruits furnish a red dye.—*V. Mueller.*

Chenopodium rubrum, Chih-hien and Hien-tsai of the Chinese. Much cultivated in Hu-peh, in China, as a vegetable.

Chenopodium viride, *Roxb.* ii. 58.

Rockeb el jammel, ARAB.	Betoya, ... BENG.
Beto sag, ... BENG.	Chawut, ... BY.

Chenopodium vulgare, Bhatwa of Panjab. Goosefoot is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 7000 feet. Entirely a rain-crop; grows to six feet high; seeds considered nourishing.—*Cleghorn, Report.*

CHEN-PO. CHIN. Michelia champaca, *Linn.*

CHENSUAR, a wild, half-savage forest tribe inhabiting the Eastern Ghats of the Peninsula of India. They are known to their settled neighbours as the Chenchu kulam, Chenchwar, and Chensuar. They seem to be the people whom Wilson names Chenchu-vadu (vadu, TEL., a man). They are about 1200 in number, and dwell in the tract of jungle covering the westernmost range of the Eastern Ghat line, between the Pennar river and the Kistna, and known locally as the Nulla-Mulla and the Lankamulla; occupy the Palicondah hills to the west of the Nellore district, but chiefly in the Nandikandah pass, on the road between Cumbum and Ghooty, where they serve as watchmen and guides. They inhabit clearings in the forest, live in beehive-shaped huts like the African, Nicobarian, and many of the ruder Asianesian tribes. These are of wicker-work, with walls about three feet high, and a conical straw roof, with a screen for a door. The women dress like the wandering female basketmakers, whom they resemble in features. They speak Telugu with a harsh and peculiar pronunciation. They look on weaving and other manufacturing arts with contempt. Some of them occasionally visit Nellore, living in patchwork tents, from which they are named Bonta Chenchu. They bring for sale bamboo seed and bamboo flutes. They never engage in cultivation, but live by hunting deer, wild hog, hares, using darts which they throw by hand. They also collect forest products, wax and honey; and a few rear sheep, goats, and cattle. Their food consists of all kinds of flesh, with bamboo seed, wild roots, and ragi, when obtainable. A few firearms are in their possession. They build small round huts of stone and grass, in clusters of ten or fifteen. The men are almost nude; they wear piece cloths, sometimes a cloth round the waist. The more savage members of this race are said to wear leaf-aprons, and never to leave the forests. Their colour varies from dark brown to black. The men are shorter than the neighbouring Hindus, slightly but well made, except about the knee, which is large, and the leg. The features of the men are small and animated; cheek-bones higher and more prominent than in the Hindu in general; nose flatter, and nostrils more expanded; eyes black and piercing. Their hair is more shaggy and less straight than that of the Hindu, and they wear it very long, and rolled up at the back or near the crown like that of a woman. They bury their dead, but sometimes burn; and the Nandial Chenchwar, like the Tartar, carry the deceased's weapons to the grave. They use the spear, axe, or matchlock, or bamboo bow and reed arrow tipped with iron. They are patient and docile. It is suggested by Mr. Logan that the Chensuar are a continuation of the wild forest Surah of the mountainous tracts further north in the line of the Eastern Ghats. They have large dogs; and a few are employed as hill police in the pass from the Kuman to Badwail. Vocabularies of six of the non-Aryan tongues — the Kond, Savara, Gadaba, Yerukala, and Chentsu — are given in Beng. As. Soc. Journal for 1856.—*Newbold in R. As. Soc. Journ.* 1845; *Logan in Journ. Ind. Arch.*

CHENSU KARRIR, a wandering race mentioned by Buchanan as residing in the hilly tracts near Coimbatore. They are described as without houses or cultivation; but by snares, or with the bow, catch birds or large game, which they dispose of for rice. The white ant is said to be used by them for food. They approach their game under the shelter of a cow or buffalo, which they have taught to stalk. Their language is a dialect of the Tamil, with a few Canarese words intermixed. Those near towns learn the use of Telugu words. A Tamil man is unable to understand their language. A few reside in little huts out-

side on the outskirts of villages, and have a little blanket, but their ordinary clothing is a loin-cloth. In the denser forests they dwell in caves or hollows of trees, or under the shelter of a hut made of branches of trees, and use only a few leaves for covering. They describe the Animallay as their original country. They seem to have disappeared from that locality.

CHEPANG, Haiyu, and Kusundu, three uncivilised Bhot tribes who reside amid the dense forests of the central region of Nepal, to the westward of the great valley; they dwell in scanty numbers, and nearly in a state of nature. They live in huts made of the branches of trees, on wild fruits and the produce of the chase. The Chepang are slight, with large bellies. Mr. Hodgson says they are of Mongol descent. Their language is akin to the Lhopa. The Chepang, Haiyu, and Kusunda seem to belong to the Rawat group of frontier populations. They are named by Mr. Hodgson, the Durre, Denwar, and Bramho. They occupy the districts where the soil is moist, the air hot, and the effluvia miasmatic.—*Latham.*

CHEPATI. HIND. Cakes made of wheaten flour and water or milk, baked on the girdle. They form the principal article of diet of the Hindus of N.W. India and of the Rajput races.

CHEPU-NARINGI. TAM. Indigofera enneaphylla, *Linn.*

CHEPURU VALELLU. TEL. A grass grown in Kimedy, from the roots of which neat table mats and teazing-brushes are made.

CHEPU TATTA. TEL. This term is applied to several plants. Desmodium polycarpum, *D. C.* Hedysarum purpureum, *R.* iii. 358. Coldenia procumbens, Asarum Europeum, and Elytraria crenata.

CHER, in the Panjab, statute labour.

CHERA or Kerala, an ancient dynasty in the south of the Indian Peninsula. They seem to have risen on the fall of the Pandiya sovereignty, and to have ruled over a small state between the territory of the Pandiya and the western sea. It comprehended Travancore and parts of Malabar, Coimbatore, and Salem. It is mentioned in Ptolemy, and may have existed at the commencement of the Christian era. It spread at one time over the greater part of Karnata, but was subverted in the 10th century, and its lands partitioned among the surrounding states. The Chera princes appear to have been established first at Scandapura in the Malabar coast, and subsequently at Talcad or Dalavanpura on the Cauvery and Mudugondapatnam, perhaps the same as the modern village of Mudugondoor, on the road from Seringapatam to Koonghul. The Carura regio Cerebothri has been supposed to indicate that Caroor in the Coimbatore country was one of their earliest seats. They were powerful in the 4th and 5th centuries. Their 16th king boasts of having conquered Andhra and Kalinga; and their 20th king, Kongani Raya III., boasts of having conquered Chola, Pandiya, Dravida, Andhra, Kalinga, Varada, and Maharastra desas, as far north as the Nerbadda river. Vira Chola (A.D. 927–977) seems to have checked their victorious career; and Ari Vara Deva, another Chola king (A.D. 1004), to have completed their destruction. He also boasts of having carried his victorious standard to the Nerbadda, and to have been a benefactor to Chillambaram. After this, the Bellala of Mysore, and the Chalukya in Central India, seem to have became dominant.

The Kongu Desa Rajakal is a book describing the series of the Kongu or Chera princes, from Vira Raya Chakravarti to raja Malla-deva.—*Elphinstone's History of India*, p. 414; *As. Res.* xv. p. 40; *Fergusson*, p. 321; *J. R. As. Soc.* viii. p. 5. See Kerala; Narapati; Pandiya.

CHERAITA. HIND. Valuable bitters, equivalents of gentian, obtained from the genera Ophelia, Exacum, Agathotes, Adenema, and Andrographis (Justicia).—*Dr. Cleghorn, Ed. New Phil. Mag.*, No. 6 of 1856. See Chiretta.

CHERAKEN. JAV. Croton seed.

CHERAN, a name of the Chera race, who ruled at Kerala on the Malabar coast.

CHERAT, a hill cantonment and sanatorium, near the Markulan pass in the Peshawur district, 34 miles from Peshawur in the Panjab, in lat. 33° 50′ N., and long. 72° 1′ E., on the west of the Khatak range. It is 4500 feet above the sea.—*Imp. Gaz.*

CHERI. TAM. A town, a village, a hamlet. Paraicheri or Parcherry, the Pariah district of a town, Tellicherry, Pondicherry.

CHERIBON or Cherimai, a mountain in lat. 6° 54½′ S., and long. 108° 28¼′ E., in the north of Java, 10,323 feet high.—*Horsburgh.*

CHERIMELLE, Cheramella, or Harriphal. BENG.

Cheremin, . . MALAY. | Cherambola, . . PORT.

In Japan this fruit is pricked all over with a needle, and laid in water. For use it is boiled up with sugar, and kept with syrup in glass bottles. These fruits are often eaten with tea. They are sometimes eaten unripe with a little salt, and may likewise, when in that state, be preserved in salt. Sometimes they are eaten ripe, and have then a subacid taste.—*Thunberg's Travels*, ii. p. 292.

CHERIMOYA. Anona cherimola.

CHERIN. —? a form of divination.

CHERKH. PERS. A breed of hawks used in Persia in hunting antelope. They are trained to fly at and pounce on the deer's head, so as to enable the dogs to come up with the antelope.

CHEROOTS, the dried leaves of the tobacco plant, formed into small rolls for the purpose of smoking. In Europe, Havana cigars are usually reckoned the best. In India, Manilla cigars are most esteemed. Imitation Manillas, Chinsurah cheroots, Lunka, Dindigul, and Trichinopoly cigars are the chief kinds manufactured in India.

CHERRAPOONJEE or Charapunji is a hill station in the Khassya hill district of Assam, 4588 feet above sea-level, in lat. 25° 15′ 58″ N., and long. 91° 46′ 42″ E. Its average rainfall during 1874, 1875, and 1876 was 368·41 inches, and in 1861 the fall was stated to be 805 inches. The station stands on the first of a series of hills that rise abruptly from the plain of Bengal, and catch the vapour of all the clouds that roll up from the sea. The principal race in the neighbourhood are the Khassya, an able-bodied people, who differ little from the Garo. They are arranged in petty rajaships in the Khassya hills. They build their houses on piles; they trap fish like the people of Borneo, Java, and Sumatra. A bed of coal is raised on an insulated summit; sandstone, composing here as elsewhere the base of the coal-measures, forms the lofty front of the mountains facing the plains. The lower beds consist of a

coarse conglomerate, resting on greenstone, after the manner of similar conglomerates in nearly all countries in which their fundamental rocks have been observed. Between Ringhot and Cherrapoonjee, and at other places in the hills, are bridges made of the fibre of the India rubber tree. The Khassya race inter their dead in places where they erect oblong pillars, hewn or unhewn, three to thirteen in number.—*Bl. As. Trans.* iii. p. 25, xiii. p. 614; *Dr. Buist's Catalogue; Latham.*

CHERRO NALMAPELLA. TAM.? A light brown-coloured wood of Travancore, sp. gr. 0·483, used for making canoes.—*Col. Frith.*

CHERRO-POONA. TAM.? A dark-coloured wood of Travancore, used for building houses.—*Col. Frith.*

CHERRO-TIMBA. TAM.? A dark-coloured wood of Travancore, sp. gr. 0·843, about 3 feet in circumference, used for house-building, tools, etc. —*Col. Frith.*

CHERRU. TEL. A tank.

CHERRU PINAKOTTE. CAN., MALEAL. Calophyllum calaba.

CHERRY.

Kirsche, ... GER.	

The fruit of the Prunus cerasus. The bird cherry, P. padus, occurs in the Panjab, the N.W. Himalaya, and Afghanistan. It has a mawkish taste.

CHERRY LAUREL, Cinnamomum cerasus.

CHERRY-STONE OIL, oil of Prunus cerasus.

CHERRY TREE of Norfolk Island. The bark is used for tanning; and it furnishes one of the most useful woods.

CHERSYDRUS, a genus of sea-snakes. C. annulatus and C. granulatus occur in the sea at Madras. See Hydridæ; Reptiles.

CHERU, aborigines in Ghazipur, part of Gorakhpur, the southern part of Benares, Mirzapur, and Behar. They are sometimes said to be a branch of the Bhur. They seem to be the same as the Sivira or Seoree, but Buchanan considered them distinct. Cheru declare themselves to be descended from the great serpent, from which they may be supposed to be the Nagbansi of Magadha. Remains of buildings attributed to them are found near Buddha Gya, Sasram, and Ramghur, and the images of Siva and Hanuman found in them indicate that they belonged to the Hindu religion. They appear to have been expelled from their ancient abodes by the Pramara of Bhojpur, the Hyobun of Hurdi, and the Bhoonhar, a little before the first Mahomedan invasion, about which time there seems to have been a general convulsion in N. India, during which several tribes acquired their present possessions. The features of the Cheru are said to resemble the occupants of the Vindhya mountains. They live by cutting timber, collecting drugs, and killing game; and though their numbers are very low, they continue to create a raja for every five or six houses, and invest him with the tilak in due form. The emperor Sher Shah subdued Muharta, a Cheru zamindar of Behar, which seems to have been a last but strong effort of the Cheru race. The chief of Singrowlee in Mirzapur is a Cheru, though he calls himself a Benbans. Sir H. Elliot suggests that the Sivira, Seori, and Cheru may perhaps be the Sauraseni. In the Harivansa is the following passage: 'From this race came the Sauravira and Saurasena. The great king Saurasena has given his name to the country over which he reigned' (Elliot, Glos.). They have almost disappeared from the seat of their ancient splendour. Once rulers of Behar, a petty population (2377) now represents the nation there. Not above 400 remain in their old home on the plateau of Shahabad, and about 3000 live in the land bordering on Nepal. They were driven into the Nepal Terai, and into the highlands of Chutia Nagpur, where they number 17,632, but are a very humble class of cultivators and day-labourers. They are usually of a light-brown colour, with high cheek-bones, small eyes obliquely set, low, broad noses, and large mouths with protuberant lips, but considerably softened by the alliances with pure Hindu families, which their ancient power and large possessions enabled them to secure. The village of Munka in Palamaw belongs to a Cheru. The Cheru and Kharwar and Kol observe triennial sacrifices. Every three years a buffalo and other animals are offered in the sacred grove 'Sarna,' or on a rock near the village. They also have, like some of the Kol, a priest for each village, called Pahn. He is always one of the impure tribes, a Bhuiya, or Kharwar, or a Parheya, and is also called Byga, and he only can offer this great sacrifice. No Brahmanical priests are allowed on these occasions to interfere. The deity honoured is the tutelary god of the village, sometimes called Duar Pahar, sometimes Dharti, sometimes Purgahaili or Daknai, a female, or Dura, a sylvan god, the same, perhaps, as the Darka of the Kols.—*Elliot; Wilson; Dalton, Ethnol.*

CHERUMAN, a class of predial slaves in Malabar, whose name Wilson derives from Chera, MALEAL, the soil. General Briggs names a non-Aryan race Cherumar. They follow the custom of Maruma Katayam.—*Wilson; Briggs.*

CHERUMA PERUMAL, a viceroy of the 9th century, who governed the whole Malealam country of Chera or Kerala, including Malabar and Travancore, but afterwards established himself as an independent ruler. He is supposed to have founded the town of Calicut, and all the royal races of Malabar claim descent from him.

CHERU PINNAY. TAM. Calophyllum spurium, also C. calaba, *Linn.*

CHERU-PUNA, TAMIL, is the small leaf or real mast poon, which is preferred for the masts of ships or vessels. The peon or puna woods are similar in shape and growth; the large sort is of a light, bright colour, and in the forests of Corumcul, in Canara, it grows to a length of 150 feet. At Mangalore, Mr. Edye procured a tree of this sort that would have made a foremast for the Leander sixty-gun ship in one piece, for the sum of 1300 rupees, or £149 sterling. Poon of the forests of Cochin and Travancore is of a very inferior quality to that before stated; one sort is named the Karapa puna, which is dark poon; and Malai puna, meaning the hill poon; and another sort, the Vellai puna, or the white poon, is small, not more than 12 or 18 inches in diameter, and 18 or 20 feet long. In Canara, another sort, named Merchie puna, grows to 28 inches or three feet in diameter, and from 30 to 50 feet long, and is very much like American birch. It is generally

defective and not durable; when felled, it opens and splits at the top and butt for many feet in length. The weight of the poon may be said to be from 40 to 48 pounds the cubic foot; but the lightest Edye met with was 34¾ and the heaviest 50 pounds the cubic foot when dry. The leaf of this tree is small and oval, about two by one and a half inches broad, and the fruit grows in bunches; it is about the size of coffee-berries. From this the natives extract oil, which is used for various native purposes.—*Edye, M. and C.*

CHERVIL, Chærophyllum sativum. The leaves are used in soups and salads.

CHESS, the Shatranj of the Persians, is supposed to have been invented by a Brahman who succeeded the dynasty in Sind. In Hindu legend, the wife of Ravana invented chess to wile him from his martial propensities.

CHEST, the commercial form in which opium is sold. A chest of Behar opium, consistence 75, made at Patna, contains 105·107 lbs. avoirdupois.

A chest of Benares opium, consistence 70, made at Ghazipur, contains 98·1 lbs. avoirdupois. The 'consistence' is the percentage of fine opium, excluding all water.

A chest of Malwa opium is usually assumed to range a little above 126·128 lbs., of 90 to 95 per cent. of fine opium.

A chest of Behar opium contains ·83, and a chest of Benares opium at most ·78, of the contents of a chest of Malwa opium.

The actual cost of a chest of Benares opium is Rs. 373, and of a chest of Behar opium, Rs. 436. The sum paid to the cultivator is Rs. 4½ to Rs. 5 a seer, at 70 per cent. consistence.

CHESNEY, General F. R., an officer of the Royal Engineers, who in the years 1835, 1836, and 1837 conducted an expedition for the survey of the rivers Euphrates and Tigris, and wrote the reports.

CHESTNUTS.

Sin-lih, Pan-lih, . Chin.	Kastamen, . . . Ger.
Tuh-kiah, Sanskrito-Ch.	Castagne, ... It.
Chataignes, . . . Fr.	Castanas, ... Sp.

The fruit of the Castanea vesca of Europe. The chestnut tree grows to a large size in China, and one, two, or three nuts are found within the large, dehiscent-spiny fruits. They are constantly spread for sale in Chinese streets in both the raw and roasted forms. Chestnut of China is Southwellia balanghas.

Horse chestnuts are the fruit of the Æsculus hippocastanum, *Linn.*, an Asiatic tree, planted in Europe for shade and ornament; they are used for feeding sheep, horses, etc.

Water chestnuts are the horned fruits of species of Trapa, T. bicornis, T. bispinosa, and T. natans, *Linn.*, growing in ponds, lakes, etc., in the temperate climates of Europe and Asia. In China and Kashmir they are largely used for food.

CHETAN. Mal. On the Malabar coast, a man-servant, a slave, a weaver of a particular caste.—*Wilson.*

CHETANA SWAMI, a Hindu religious reformer, the preceptor of Baba Lal, who founded the Baba Lali sect.

CHETCHEN, a tribe of the Eastern Caucasus, a branch of the Mitchendegen or Kists, one of the seven clans of that range. They dwell along the banks of the Terek. They are Mahomedans and fanatical, and plunder and enslave their pagan neighbours, receiving assistance from the Lesghi and all Mahomedans. They headed the opposition to the Russians on the eastern, as did the Circassians on the western, side of the Caucasus, whilst there rallied round them the smaller tribes, Abehas, Ubiche, Tschigetian, Tartar (Karatschai), and Kabardan, related with the Adighe by blood and tongue. They inhabit the beautiful mountain chain between the high Caucasian chain and the Terek. Shamyl was their leader in opposing the Russians.

The Chetchenzi tribes were considered the most formidable of all those which inhabit the innumerable rocky valleys of the eastern line of the Caucasus. Their predatory excursions, whether in large or small bodies, were not only a dread to their own immediate neighbours, tribes like themselves, though of less extent and power, but their sudden descents, ambuscades, and continued warfare, kept the disciplined Russians constantly on the alert. These lords of the mountains seemed never to rest, day nor night. Unwearied in their watch for prey, and like lightning in attack, for they struck or were lost to sight as quickly. The bride always brings a dower, consisting of cattle, etc. She is brought home to the house of her betrothed husband, and then the ceremony is completed by dancing, drinking, and carousal.—*MacGregor; Porter's Travels*, i. p. 62.

CHETEK, a climbing vine of Java; its sap is poisonous.—*Bikmore*, p. 53.

CHETI POTLA. Tel. Trichosanthes cucumerina, *L.*

CHETIPPA. Tel. Hymenodyction excelsum.

CHETKA. From this town to Neilung, on the Jankee or Jannubee branch of the Ganges, is the lofty pass of Chungsakhago, not under 18,000 feet. See Kanawar.

CHETKOOL. From this place to Burasoo in Garhwal the road leads over the Sungla pass, about 16,000 feet high. See Kanawar.

CHETRIYA, commonly pronounced k'hetri, in the Hindu castes; also written Chatriya, Ch'hatri, Khetri, and properly Kshatriya. All Rajputs claim to be of this caste, but none of the ancient race are supposed to have survived their incessant wars. Menu says (Art. 43, 44, ch. x. p. 346) that several of the Chetriya tribes—Paundraca, Odra, Dravira, Camboja, Yavana, Saca, Parada, Pahlava, China, Cirata, Derada, C'hasa, Cirata, and Derada—had gradually sunk from the second to the Sudra class, owing to their omission of holy rites and to their seeing no Brahmans. See Chattri; Khetri; Kshatriya.

CHETTU. Tel. A tree.

CHETTU-KARAN. Maleal. A toddy-drawer; a grass-cutter.

CHETTY, pl. Chettiar, a titular distinction for the traders and financiers of the Peninsula of India, under the forms of Seth, Sheth, Sethi, Chettiar. It is applied without any reference to caste or race, to the Zoroastrian Parsee engaged in trade, to the Mahomedan Borah, the Teling Komati, the Tamil Vellaler, the silk-weaver, the Kavary; and amongst the Telugu races the title is conceded to the Gajoola balija bangle-makers, the Vaniar oil-pressers, the Elavaniar cloth-merchants, and the Komati (Comati) grocers and general dealers. In the Tamil country to the south it is allowed to the Natoo kottiyar, keen, enterprising

general merchants, and to the Kusavan potters. The Tulu race also take Chetty as a title. Many of the traders and shopkeepers of Madras are of small stature, but they are fair-coloured. They are intelligent and successful business men, and a few have lately entered into commercial transactions to distant countries. Their wives dress with the sari, but only of late years have any of them adopted the choli or bodice. A Sudra naidoo, the late Latchmenarsu Chettiar, member of the Legislative Council of Madras, took this title. None of them have ever had any political relation with the Native States.

CHEUNAKA. SANSK. Cicer arietinum.

CHEVA CHETTU or Mranu. TEL. Red-wood timber.

CHEVANESSIA ESCULENTA, a creeper cultivated in British Burma. See Caoutchouc.

CHEVIKAM. MALEAL. Piper nigrum.

CHEVUKURTI CHETTU. TEL. Slevogtia verticillata, *D. Don;* Adenema hyssopifolium.

CHEVULAPILLI TIGE. TEL. Ipomœa pescapræ, *Swiet.*

CHEWA. HIND. Ephedra Gerardiana.

CHEWAGIR-CHHATRA. HIND. Morchella semilibera.

CHEWANG, a chief of one of the vassal states into which feudally governed China had been divided. He made himself sovereign of the empire, under the title of Che-hwang. He was a great conqueror, and was successful in opposing the inroads of the northern barbarians, the Heung noo or Huns, one of his measures to withstand whom was the erection of the celebrated Great Wall.

CHEWKA. TEL. Tamarindus Indica.

CHEYAIR, a tributary of the Pennar river; also a tributary of the Palar river.—*Imp. Gaz.*

CH'HACH'H. HIND. Butter-milk.

CH'HAEE or Chhai. HIND. A pad to prevent laden bullocks from being galled.

CH'HAGUL-BATEE. BENG. Naravelia Zeylanica. Ch'hagul-bantee, Dæmia extensa. Ch'hagul-khoori, Ipomœa pes capræ. Ch'hagul-nudi, Sphæranthus hirtus. Ch'hagul-patee, Cynanchum pauciflorum. Ch'hagul-putputee, Euphorbia dracunculoides.

CH'HAJ. HIND. A basket used in winnowing.

CH'HAKRA. HIND. A cart or carriage without sides, used for conveying cotton. The gari has sides.—*Ell.*

CH'HANTI. HIND. A coarse cloth.

CH'HAP. HIND. A stamp, a seal; in North India, the Pottadar's stamp. The Chinese chop. In Dehli and the Upper Doab it is the name applied to a small bundle or heap of thorns about a foot high. When large, it is called Khewa, *q.v.* Ch'hapa-Kaghaz, a newspaper, a printed paper.

CH'HAPPAR. HIND. Thatch or a thatched roof. Ch'happar-band, a thatcher.

CH'HATARPUR, the chief town of a feudatory state in Bundelkhand of 1240 square miles, and a population in 1875 of 170,000; revenue, £25,000. Its chief is a Puar Rajput. Its troops, 62 horse and 1178 infantry and police, with 32 guns.—*Imp. Gaz.*

CH'HATIN. BENG. Alstonia scholaris.

CH'HATISGARH, the S.E. division of the Central Provinces, lying between lat. 20° 1′ and 22° 33′ 30″ N., and long. 80° 28′ and 84° 26′ E. The area of the plains of Ch'hattisgarh is computed at about 10,000 square miles, including most of the zamindari estates, but excluding tracts of hill and forest. The population in 1866 was 2,103,165. The Chamar caste maintain here a numerical preponderance. They are not, however, leather-workers, but are eager and industrious agriculturists; and nearly a fourth of the cultivation of the land must be in their hands. About the middle of the 19th century, under the teaching of Ghasi Das, they became monotheists; every evening they fall prostrate before the sun, exclaiming Sat Nam! Sat Nam! from which they have been styled the Sat Nami, meaning worshippers of the Pure God. But serpent-worship seems to have largely prevailed in former times in many parts of the Central Provinces; and other races are spirit-worshippers, believe in sorcery and witchcraft, and have recourse to the ordeal. See Central Provinces; Chamar; Gond; Rai Dasi; Raipur; Satnami.

CH'HATRI. HIND. An umbrella; a small ornamented pavilion built over a place of interment, the cenotaph of a Hindu chief.

CH'HATTOOR, also Ch'hattur. HIND. The name given in Northern India to a covering placed on a heap of winnowed corn. It is from the Hindi Ch'hatr, an umbrella, but is known also by the names of Burhawun and Chank, *q.v.* In Benares it is generally a mere cake of cow-dung; elsewhere it is a shoot of grass or a dry stick of the arhar, Cajanus Indicus, with several (generally five) projecting twigs, on each of which a small piece of cow-dung is placed, or a flower of the ak or mudar (Calotropis gigantea). Sometimes a spear is stuck in the ground at the side of the heap; and sometimes an artificial flower is placed at a short distance from the bottom of the heap. The object in view is to prevent the effect of an evil eye, or the injury which is sure to be sustained from the praises of any casual visitor, or any eye-biter, as an Irishman would say. That this strange opinion was entertained among the ancients, is known to every reader of Virgil and Theocritus. It is a prevalent opinion not only among the Scotch and Irish, but with almost every other nation of the globe. But by the native of N. India the Ch'hattoor is devoutly believed to offer a sure safeguard against the disastrous effects of fascination. If his ras or heap be but provided with this protection, the husbandman may sleep secure; but as sure as he neglects it, should an evil eye fall upon the grain, he will have to weep over the lost hopes of a year's labours.

'Nam quocunque aciem horribilem intendisset ibi omnes
Cernere erat subito afflatos languescere flores.
. . . . . .
Spem que anni agricolæ mœsti flevere caducam.'
—*Elliot.*

CH'HAUR. HIND. A custom in the N.W. Provinces of India, of walking a boundary with a raw cow-skin on the head, under a solemn oath to decide correctly; five sticks are held in the hand, to imply that the arbitrator is the representative of the panchayat.—*W.*

CH'HAYA. BENG. Ærua lanata.

CH'HAYA means a shadow. In Hindu astronomy, Vishuva ch'haya, the shadow of a gnomon, when the sun is in the equinoctial points. Madhyama ch'haya, the mid-day shadow of the same at any other time of the year. Sama mandala ch'haya, the mid-day shadow of the same when the

sun is east or west of the gnomon. Ch'haya suta, one of the names of Saturn, meaning born from darkness.—*Warren.*

CH'HAYA. HIND. A shade, a spirit, the shade of a goddess or deity. In the hysterical or cataleptic seizures which happen to Hindu devotees, where a deity is supposed to take possession, the expression used to denote it is Ch'haya aya or Saya aya; and the body of the possessed is said to be filled, ang-bhara. In Hindu mythology, Ch'haya is the wife of the sun.

CH'HEDA. HIND. A destructive little animal similar to the weevil (Calandra granaria), from Ch'hed, HIND., a hole, the verbal root of Ch'hedna, to pierce. It is also the name of the disease which grain sustains when affected by the ravages of this insect.—*Elliot.*

CH'HEENKA. HIND. A network made of strings or cords; to place anything on the cords of a bhangi.

CH'HEENTA, also Ch'hinta. HIND. From Ch'heentna, to sprinkle. A field in which peas and linseed have been sown by broadcasting while the rice crops are standing on the ground. When the rice is cut, these crops are left to grow, and are harvested in the beginning of the month Chait. In Dehli the term Ch'heenta is applied to throwing more seed amongst a growing rice-crop. The same word is employed in Gorakhpur to signify lands in which seed has been scattered after a single ploughing; more particularly at the extremities of villages, with a view to secure possession.

Ch'heenta is also a drop of water. Ch'heente-cheente parna, spitting of rain. Dud'h ki handi men, pani ki ch'hinti dalna, to sprinkle water into a jar of milk, meaning to cause unnecessary annoyance. From this word is the English chintz. —*Elliot.*

CH'HIL-TAMBA. HIND. Oxidized copper filings.

CH'HINDWARA, a town which gives its name to a British district of the Central Provinces, with an area of 3852 square miles, and a population in 1872 of 316,095. The midland Gond kingdom of Deogarh had its capital in this district; the hill parts have long been held by Gond or Kurku chiefs, and the British have allowed the petty rajas to retain their lands and rights as tributaries. The Gonds in 1872 numbered 109,469, besides Bharia and Kurku; Ahir or Gaoli, 23,844; Bhoyar, 10,506; Dher or Mhar, 27,790. The others are Hindus, Brahmans, Kunbi, Teli. Ch'hindwara is 2200 feet above the sea. Coal of the same quality as that of Raniganj occurs. The Ch'hindwara forests are very extensive, and lie principally on the southern slopes of the Satpura mountains.—*Imp. Gaz.*

CH'HIPA or Ch'hipi, a printer of cottons, a stamper of chintz.

CH'HIPIA, a small village in the Gonda district in Oudh, in lat. 22° 3′ 30″ N., long. 78° 59′ E. It has a handsome Vaishnava temple of stone and marble, erected by Sahājanand, a religious reformer in Western India, who is regarded by his followers as an incarnation of Krishna, and is worshipped as Swami Narayan. His descendants are at the head of the sect at Junagarh. Many Hindu pilgrims visit the birthplace of their deified leader.—*Imp. Gazetteer.*

CH'HITUA. HIND. Broadcast sowing.—*Elliot.*

CH'HOD-TEN, an offering to a Buddhist deity; a Buddhist temple. These are numerous in Tibet, consecrated to the celestial Buddha, in contradistinction to the dungten, which are built in honour of the mortal Buddhas, and which ought to contain some portion of relics, either real or supposed. See Buddha; Chaitya; Dungten; Tope.

CH'HOLA. BENG. Cicer arietinum.

CH'HOONCHOO MOORMOORI. BENG. Isolepis squarrosa.

CH'HOR. HIND. Release. Chor-chitti, a deed of release.—*Ell.*

CH'HOTA, Ch'hoti. HIND. Ch'hoto, BENG., small.

Ch'hota-kelu, Asparagus racemosus.
Ch'hota-lewar, Andromeda fastigiata.
Ch'hoti-lane, Suæda fruticosa.
Ch'hoti-manhari, Solanum xanthocarpum.
Ch'hoti-van, Salvadora Persica.
Ch'hoti-mai, Tamarix orientalis.
Ch'hoto-akundo, Calotropis herbacea.
Ch'hoto-bich taruka, Argyreia argentea.
Ch'hoto-chand, Ophioxylon serpentinum.
Ch'hoto-doodhee-luto, Gymnema sylvestre.
Ch'hoto-genda, French marigold, Tagetes patula.
Ch'hoto-gothoobee, Cyperus dubius.
Ch'hoto-hulkusa, Leucas aspera.
Ch'hoto-jalgantree, Panicum repens.
Ch'hoto-jam, Eugenia caryophyllifolia.
Ch'hoto-jantee, Utricularia diantha.
Ch'hoto-jhunjhun, Crotalaria prostrata.
Ch'hoto-keruee, Euphorbia chamæsyce.
Ch'hoto-kirata, Slevogtia verticillata.
Ch'hoto-kokshim, Vernonia cinerea.
Ch'hoto-kulpu, Trichodesma Indicum.
Ch'hoto-kut, Sagittaria sagittifolia.
Ch'hoto-looniya, Portulaca meridiana.
Ch'hoto-mechheta, Hemiadelphis polysperma.
Ch'hoto-musoor, garden tare, Ervum hirsutum.
Ch'hoto-mutur, grey pea, Pisum sativum, P. quadratum.
Ch'hoto-neelpud-mo, Nymphæa stellata.
Ch'hoto-okra, Zapania nodiflora.
Ch'hoto-pan-choolee, Villarsia cristata.
Ch'hoto-phootika, Osbeckia aspera.
Ch'hoto-pine-nutee, Cynodon filiformis.
Ch'hoto-ruktu-kumbul, Nymphæa rosea.
Ch'hoto-sada-makhum-shim, Canavalia erythrosperma, flore albo.
Ch'hoto-shundhi, Nymphæa edulis.

CH'HOTA UDAIPUR, also called Mohan, the chief town of a tributary estate in the province of Gujerat; area, 873 square miles, and population 62,913, 86 per cent. being the Bhil and Koli. The chief is of the Chauhan Rajput. During the rebellion in 1858, the chief refused to admit Tantia Topi into his capital, and Tantia was defeated there by General Parke. Revenue, £30,000; and tribute, £1050.—*Imp. Gaz.*

CH'HURA. HIND. A big knife used by Afghans as a weapon. Ch'huri, a small knife.

CH'HURI-KA-BANDHA. HIND. A ceremony, formerly in use in the Mahratta country, of formally investing a Sudra with a bill-hook, in imitation of the investiture of the Brahman with the cord.

CH'HUTTEE. HIND. A Mahomedan rite on the sixth day of a woman's confinement.—*Herk.*

CH'HUTTHEH, a subdivision of the Jat race in the Panjab. See Jat.

CHIA KAI. MALEAL. Pods of Acacia concinna.

CHIAN and Cyprus turpentines, gum-resins, products of a pistacia. See Gums.

CHIBBUR. SIND. Cucumis pubescens.

CHIBH, a tribe south of Kashmir, but little reclaimed from barbarism either by Hindu or Mahomedan conquerors.

CHICACOLE, in lat. 18° 17′ 25″ N., and long. 83° 56′ 25″ E.; a town in the Ganjam district of the Madras Presidency. It is four miles from the sea on the Languliga river. It was at one time the Kalinga capital. It gives its name to a district with a population of 169,094 souls, mostly Vaishnava Hindus, and speaking Telugu and some Uriya. It forms part of the Northern Circars, which have been under the Reddi or Gajapati; during the 16th century under the Kutub Shashi, in the 18th century under the Nawabs of Hyderabad and Arcot. In November 1753, M. Bussy obtained it for the French E. I. Company, but it was afterwards ceded to the British. In 1791, and again in 1866, Chicacole suffered greatly from famine.—*Imp. Gaz.*

CHICANE of Languedoc is the game of Choughan, once universally practised throughout Persia, and formerly often played on a level piece of ground near Shiraz. As a game on foot, we have it in the cricket of England, the golf and shinty and hockey of Scotland, and the hurling matches of Ireland. Pietro della Valle (Viaggi, Lettera de Casvin 25 Iuglio 1618) discovered it in the Florentine Calcio. Ci' e solo questa differenza tra il giuocho de Persiani e 'l calcio de Fiorenti, che i Fiorentini giucano con molta gente a piedi, etc.; Ma i Persiani, piu nobilmente giucano a cavallo. The chicane of Languedoc is played as in Persia, with a wooden ball and a club headed like a mallet or hammer.—*Ouseley's Travels*, i. p. 346. See Choughan.

CHICHA KOTTA. In a battle fought here A.D. 1772 by the British, the forces of the Bhutan raja were defeated.

CHI-CHAY, a Buddhist sage of China, whose writings have been very influential.—*Dr. Edkins.*

CHI-CHIA, also Pudma and Purpinja. HIND. Juniperus communis.

CHICHIRIA. B. and H. Achyranthes aspera.

CHI-CHOU and Chi Hsien are district magistrates in the province of Kwang-Tung in China. See Kwang-Tung-Chi.

CHICHRA. HIND. Butea frondosa.

CHICHRI. HIND. Plectranthus rugosus.

CHICHRU. —? The Himalayan nettle.

CHICHUNDA. HIND. Trichosanthes anguina.

CHICKAN, also Chickan-dozi. HIND. Plain embroidery. That in use for European families is usually called work or Chikkan work. It is a large branch of muslin work of India. Flowers are worked in silk, muslin, or cotton, on a cotton ground.

CHICKARA. HIND. Tetraceros quadricornis. See Bovidæ.

CHICK-PEA, Cicer arietinum.

CHICKRASSIA TABULARIS, *Ad. Juss.*
Swietenia chickrassa, *Roxb.* ii. 379.

Chikrassi, . . . BENG.	Ganti malle, . . SALEM.
Pudha of . . . BOMBAY.	Hulang-hik-gas, . SINGH.
Yimma, Zimma, . BURM.	Aglay maram, . . TAM.

Bastard cedar, . . ENG.	,, karra, . ,,
Chittagong wood, . ,,	Chetakum ,, . ,,
Deodar, ... ,,	Madagari vembu, . ,,
Pubha, Pabba, Hool, MAHR.	

This large tree occurs in the mountainous countries to the east of Bengal, in Chittagong, also in Coimbatore, Ceylon, is rather common in the southern jungles of the Bombay Presidency, but much less so in the northern, where, in common with one or two other light red-coloured woods, it currently passes under the general name of cedar or bastard cedar, and all are extensively employed in cabinetmaking. This has quite a cedar-like smell. In Madras it is extensively used in cabinetmaking under the denomination of Chittagong wood, being imported from that province, though it is abundant in the mountainous parts of the Peninsula. It is close-grained, light-coloured, and delicately veined; makes beautiful and light furniture, but is apt to warp during the season of hot land winds. Its wood could easily be creosoted. It furnishes one of the deodars of Malabar. The Chickrassia tabularis enters the market as one of the cedars, bastard cedars, deodars, and Chittagong wood. This is the true Chittagong wood. The bark is powerful.—*Mr. Rohde; Roxb.* ii. 379; *Beddome.*

CHICKWEED, Cerastium Indicum, *W. and A.*

CHICORY. Ku-tu, CHIN. Cichorium intybus, C. endivia. The root in Europe is largely employed to adulterate coffee.

CHICUDA. CAN. Phaseolus max.

CHI-FU, Chi-le-chow, and the Chi-l-tung-chi are the prefects of the province of Kwang-Tung.

CHIGARA VANTIGE. KARN. A form of land tenure in Mysore, by shares, in which the whole village lands were parcelled out in lots of equal value.—*W.*

CHIGHEH. PUSHT. On the occurrence of a robbery or act of violence in an Afghan village, all the able-bodied men turn out in pursuit. This is called the chigheh.

CHIGRI. CAN. Antilope cervicapra, *Pallas.*

CHIHA, a haul bridge in use in Jummoo.—*Drew.*

CHIHAI or Chihara. HIND. A cremation place where Hindu dead bodies are burned, from Chaee, ashes.

CHIHE. HIND. A division of the Gujar tribe.

CHIHI. BHOT. Arctomys bobac.

CHIH-KIAU. CHIN. Lac.

CHIH-LING, a fabulous beast of the Chinese, unicorn with mane and cleft hoofs, said to appear once in ten thousand years. The last time was at the birth of Confucius, known to curiosity-hunters as, and commonly spelt, kyling.—*Frere, Antipodes.*

CHIHNA. SANSK. An emblem of the Jaina thirthankaras; a cognisance.

CHIH'RA. HIND. The countenance; a descriptive roll. Chihra-navesi, taking a descriptive roll.

CHIJ. HIND. Wastage allowance in goldsmith's work, Dehli.

CHIJAKRI. HIND. Podophyllum emodi.

CHIJLA. HIND. Fraxinus xanthoxylloides.

CHIK. HIND., TAM. A screen made of rattans, suspended in India outside of verandahs, over doors or windows, to keep off the glare of the sun's rays. The chik is often made of strips of split bamboo, also of grass, or of the khus-khus grass, the Anatherium muricatum; the Arundo donax, the Saccharum sara, and S. spontaneum are also largely used for the chiks of houses.

CHIKALDAH HILL, in lat. 21° 24′ N., and long. 77° 22′ E., near to and somewhat higher than the fort of Gawilghur. Chikaldah, elevated 3777 feet, is on the Vindhya, or, as some call it, the Gawilghur range of hills, and about 15 miles from Ellichpur. The plateau of Chikaldah is not above three-quarters of a mile broad, and about a mile in length.

CHIKAN. HIND. Euonymus fimbriata.

CHIKARA. HIND. Antilope quadricornis,

Blain; A. Arabica, *Hemprich;* A. sub-quadricornutus, *Elliot.*

CHIKATI MRAKU or Tamalamu. TEL. Xanthochymus pictorius?—*R.*

CHIKAYA or Sikaya. TEL. Acacia concinna, *D.C.;* A. rugata, *Buch.* The tender acid leaves are eaten in curries; and the skin of the ripe legume is used like soap to cleanse the hair.

CHIKBALLAPUR, a town in Mysore. The Morasu Wakkala, a tribe of hereditary cultivators, during the 14th century founded dynasties of polygars throughout Mysore. In 1761, Hyder Ali conquered this place, and sent the last of the Gauda a prisoner to Coimbatore.—*Imp. Gaz.*

CHIK-CHAK, Ptyadactylus gecko, a lizard of Labuan. It is very domestic, like the chaplak of India. It is said to be luminous on occasions.

CHIKI. HIND. Gouffeia holosteoides.

CHIKILINTA GADDI. TEL. Panicum verticillatum, *L., R.* i. 301. The rapid growth of this beautiful grass has given rise to the common saying, Chikilinta aiswaryam, lit. grass, like riches, come and go.

CH'IKKI. HIND. A hand-mill, a quern.

CHIKNA-KALR. HIND. A kind of earth used to remedy kalr or reh in soil. Chikni-Matti, clay, fireclay.

CHIKRI. —? Buxus Nipalensis.

CHIKSA. HIND. A perfumed powder composed of a variety of odoriferous substances, generally mixed up, when used, with sweet-scented oil (phoolail ka tel).—*Herklots.*

CHIKU VELAGA. TEL. Dicliptera parvibracteata, *Nees.*

CHIL, also Chir, in the N.W. Himalayas, are the generic terms for the genus Pinus; and P. excelsa and P. longifolia are so named.

CHIL or Cheel. HIND. The kites of India. Haliastur Indus, *Bodd.*, is the Bahmany Chil; Milvus Govinda, *Sykes*, is the Chil proper; Baza lophotes, *Cuv.*, is the crested black kite; and Elanus melanopterus, *Daud*, is the black-winged kite.

CHILA. HIND. Casearia tomentosa.

CHILAGADA DUMPA, or Genusu gadda and Mohanam. TEL. Batatas edulis, *Ch.* About Vizagapatam, Dioscorea fasciculata, *R.* iii. 801, is cultivated under this name. It seems to be only a variety of D. aculeata.

CHILAKA DUDUGA. TEL. Guatteria suberosa, *Don.;* Uvaria sub., *R.;* also Unona discolor, *Vahl.*—*R.*

CHILAKA TOTA KURA. TEL. Amarantus fasciatus, *R.* iii. 609.

CHILAMBARAM or Chidambaram, a small town of 15,519 inhabitants in the South Arcot district of the Madras Presidency. It is famed throughout Southern India for its Hindu temples. The Sabhanaikan Kovil or Kanak Sabha (golden shrine) is sacred to Siva and his wife Parvati. It covers 39 acres of ground. The magnificent principal hall has 936 pillars. It is mostly of granite, with many monoliths 40 feet high; none of its pillars are less than 26 feet high. In the centre is the shrine of Parvati, a beautiful building containing a golden canopy. Opposite it stands the Miratha Sabha, regarded as the most perfect gem of art in S. India. There are other temples; also the Siva Ganga, or Hemapash karani (golden tank).—*Imp. Gaz.*

CHILAMCHI. HIND. A flat metal wash-hand basin.

CHILAN. From Chilna, HIND., to go. A waybill of the post office, etc.; a list of contents; a clearance; written Chillawn. Chilaoni, current coin.

CHILAS. This country is bounded on the north by the Indus river, on the south by the watershed of the ridge over Looloosur lake, on the east by the watershed of the same ridge as above Looloosur lake, culminating in the lofty peak of Munga Parbut; the Astor boundary marches with Chilas here on the west to a point beyond the village of Sazeen, where the Indus takes a turn to the south-west. Chilas affords good pasturage, but lies under snow for a considerable portion of the year. The Sheen, claiming an Arab descent, are the proprietary and governing class. Crime is rare; women have more liberty and power than among Mahomedan tribes, and breaches of chastity are punished by death. They were visited in 1866 by Dr. Leitner, at the request of the Bengal Asiatic Society. Their language seems distinct from Pushtu, Persian, and Hindi, and is not understood by their neighbours the Syud race, who inhabit Durreil and Tankeer to the west of Ghilghit. According to their own traditions, the inhabitants of Chilas were conquered about the middle of the 18th century, and converted to the Mahomedan faith. Up to about 1840, the Kahgan Syuds received quantities of gold-dust as religious dues from the people of Chilas; but when the Syuds, aided by the Sikhs, failed in an attack on Chilas, the dues were discontinued. A second attack by the Sikh nation was successful, and a small annual tribute of 3 tolas of gold-dust and 100 goats is paid to the Kashmir durbar.

CHIL BINJ. HIND. Strychnos potatorum, clearing nut.

CHILCHIL. HIND. Celosia argentea.

CHILDREN.

Aulad, ...	ARAB.	Batch-Katch, . .	HIND.
Batche, ...	HIND.	Pulli, ...	TAM.

Male children are greatly longed for by all the races inhabiting the south and east of Asia. One prevailing feeling regarding them is such as is expressed in Psalm cxxvii. 4, 5: 'As arrows are in the hand of a mighty man, so are children of the youth. Happy is the man that hath his quiver full of them: they shall not be ashamed, but they shall speak with the enemies in the gate.' Most persons will hesitate to attack a large united family. Amongst Hindus and Chinese, with all of whom spirit-worship prevails, sons are particularly longed for, in order to obtain from them duties to the manes of their parents. The eastern custom of nursing a child from the hip or side, as in Isaiah lx. 4, lxvi. 12, is still continued; and a child born after vows is still, as in Proverbs xxxi. 2, called the son of a vow; and many Hindu children of both sexes, but principally girls, are devoted to the gods. As in Genesis xxv. 6, the children of Mahomedans, born of a wife of humbler birth, or of a harm woman, are not deemed equal in social rank to the children of a high-born wife. Infanticide is still continued amongst certain Rajput races, but the causes are not for fulfilment of any vow, or from any religious duty, but pride or poverty induces them to destroy their female children, and many Rajput tribes have the utmost difficulty in obtaining wives. The British Indian Government, in the early

part of the 19th century, declared the throwing of children into the Ganges to be criminal, and has made continuous efforts to prevent the destruction of children. The Chinese have complete power over their offspring, even to life, but in no country of the south-east of Asia is the sacrificing of children, on religious grounds, continued; though, down to comparatively recent historic times, the Phœnicians, Carthaginians, Aramæans, Syrians, Babylonians, and even Israelites, and their neighbours on both sides of the Jordan, sacrificed their children with the hoped-for object of averting any great and serious misfortune. A Phœnician legend is of El, the strong, offering up his son Yedud or Yedid, the beloved,—El being the Kronos (Bunsen, iii. 286). Malek Bel was the same as the Tyrian Hercules, or Moloch or Bal-Moloch, to whom, as also to Hecate and Melekhet Artemis, dogs were sacrificed. In Exodus xiii. 13, xxxiv. 20, the animal's neck or backbone had to be broken unless redeemed. The principal sacrifices offered to Hercules Usoo, as well as to his mythical companion, were human beings, who in Laodicea of Phœnicia might be ransomed by a doe. At Carthage, the practice of sacrificing their favourite children, and those of the highest rank, in honour of Hercules, continued down to their latest wars. The legend of the Grecian Hercules is that he became insane, burned his own children, as well as those of his twin brother Iphicles, and murdered his guest Iphitus.—*Bunsen*, iv. 212, 213. See China; Harm; Infanticide; Rajput.

CHI-LE-CHOU and Chi-le-tung-chi, prefects in the Chinese province of Kwang-Tung.

CHILGHOZA. Hind.; corruptly Galghoza. The nuts or seeds from the cones of the edible pine, Pinus Gerardiana. In Hazara, the seeds of the Chil, P. excelsa and P. longifolia, are so called.

CHILIANWALAH. A drawn battle was fought here on the 13th January 1849, between the British and the Sikhs, where 14·2 per cent. of the British soldiery fell in the action. It lies between the Chenab and the Jhelum rivers.

CHILI PINE, Araucaria imbricata. The harsh, rigid, scale-like and persistent foliage of dark green, and its singular mode of branching, render this tree very conspicuous. The seeds, borne in large round cones, are eaten in Chili, where it forms widespread forests between lat. 37° and 48′ S. The cones are about the size of a child's head, each enclosing between 200 and 300 nuts; and not unfrequently twenty or thirty cones are borne on a single tree, so that eighteen Araucarias are reckoned to maintain a single person for a whole year. The nuts, in form like an almond, but twice the size, are eaten by the Indians either fresh, boiled, or roasted, the latter mode of cooking giving them a flavour something like a chestnut. It might be introduced into India.—*Dr. Poeppig.*

CHILIVA. Hind. The Indian bleak of N.W. India, a lonely little fish, seldom reaching more than two or three ounces; he is active, playful, and ravenous; his appearance is like new silver (the scales being used in making false pearls), and he ranks among the most delicate at table. Lady anglers, with a long, graceful wand, whip for him with great success on fine clear evenings, near the cold season, with tiny midges of rainbow hue, begirt with gold tinsel. Five pounds' weight and more of these pearly playthings have been the reward of a lady party on one evening, caught without much exertion from a boat, and under the shade of contiguous topes and groves, along the river Rapti. Besides the artificial fly, the chiliva greedily seizes everything from a mosquito to a butterfly; and a grub or flesh maggot, a bit of paste, or a large grain of tough rice, are equally good. He is essentially a surface fish, active and cleanly in his predilections; of a delicate constitution, he soon dies after handling, especially if he has been hooked. The casting net is the proper *modus operandi* to get stock fish for a water, and the supply should be kept very few together, or they will rapidly die; earthen pans carried on a pole across a man's shoulder by night are best. This fish is very prolific, but his enemies are abundant in proportion. From his surface habits, he falls an easy prey to the ducks, fish-hawks, kingfishers, snakes, turtle, etc. To feed them or cause them to congregate, burn a little ghi or fat in a pot over the fire, and when it begins to smoke, empty out the contents on the pool or lake, and the chiliva will soon be seen hunting this new food on the surface. Coarse flour slightly melted and thrown in will also attract a great number; the casting net thrown on the spot will gather quite a silvery load. The Indian angler prizes the little chiliva beyond all his confreres, for he is the shining bonne bouche which, when properly spun on a first-class rapid, tempts the majestic mahseer of discreet 50 to 120 lbs. from all his propriety, or seduces the golden-eyed bokhar of 20 to run amok.

CHILKA-DUDUGU. Tel. Guatteria cerasoides, *Dun;* Unona discolor, *Vahl.*

CHILKA LAKE, a marine lagoon in the Orissa and Ganjam districts on the north-western side of the Bay of Bengal. It bounds the Northern Circars on the north. It seems to be the result of a breach of the sea over a flat sandy shore, whose elevation is something above the level of the country within. Pulicat lake appears to have had the like origin. Each of them communicates with the sea by a very narrow but deep opening, and are shallow within. The Chilka lake, extending from lat. 9° 28′ to 19° 56′ 15″ N., is about 44 miles in length from N.E. to S.W., and in most places 12 or 15 miles wide. It is at the extreme end of the Puri district, just where it touches the Presidency of Madras. It is separated from the Bay of Bengal by a long sandy ridge of a few hundred yards in breadth, against which the force of the south-west monsoon expends itself in vain. Its area varies from 344 to 450 sq. m., during the dry and rainy seasons respectively. It is dotted with half-formed islands, and hardly anywhere exceeds six feet in depth. Here and there there is a forest of reeds and high grasses, and in some places the lake is fringed by picturesque and wooded hills. It is annually frequented by numbers of waterfowl.—*Rennell's Memoir*, p. 242.

CHILKI. Hind. A rupee of Kashmir, value ten annas.

CHILLA. Hind. Casearia tomentosa.

CHILLA CHETTU or Indupu Chettu. Tel. Strychnos potatorum, *L.*

CHILLA GADA, also Grasugada. Tel. Batatas edulis.

CHILLAH, the fortieth day after childbirth, on which a Mahomedan woman performs her

purifications. It is the forty days of Lev. xii. 4. —*Herkl.*

CHILLA-JAIDAR, a kind of silk of Bokhara.

CHILLAMA COOR. A small village, 193 miles from Madras. Earth salt is abundant.

CHILLANKI. TEL. Inga umbellata, *Willd.*

CHILLAR. HIND. The husk, skin, or rind of fruit, grain, etc.

CHILLAR. HIND. Small money or change; it corresponds also to the English word 'upwards,' as a hundred rupees and upwards,—sao rupai challar.

CHILLHA. HIND. A holy place where a fakir sits, so called from the initiatory Chihla (40) days' abstinence. It is also known as a fakir's takia.—*Elliot.*

CHILLIES.

Capsicum, ...	ENG.	Lombok; Chabai,	MALAY.
Cayenne pepper, .	,,	Lada mera; Lada china,	,,
Mirch, ...	HIND.	Mollaga, ...	TAM.
Lombok, ...	JAV.	Mirapa-kaialu, . .	TEL.

Chilli is the Mexican name for all varieties of capsicum, though they are natives of the East and West Indies, and other hot climates. C. annuum is the species commonly noticed, but there are numerous varieties which, by many, are reckoned species. Thus C. frutescens is a shrubby plant, which grows to a large and more bushy size; C. minimum supplies the variety called bird pepper; C. baccatum has a globular fruit, and furnishes cherry or berry capsicum. They are all of the simplest culture; but culture appears to increase the size, and to diminish the pungency of the fruit. Their acridity is owing to an oleaginous substance called capsicin. When the fruit is fresh, it has a penetrating acrid smell; is extremely pungent to the taste, and produces a most painful burning in the mouth. When dried, they form a large article of local and foreign traffic, and form the basis of cayenne pepper; but in vinegar, when green or ripe, they are an acceptable pickle. In Bengal, the natives make an extract from chillies, which is about the consistence and colour of treacle. In all Southern and Eastern Asia both rich and poor daily use them, and they form the principal ingredient in all chatnis and curries; ground into a paste between two stones, with a little mustard, oil, ginger, and salt, they form the only seasoning which the millions of poor in those countries can obtain to eat with their rice. They are worth about 40s. the candy of 600 lbs. Cayenne pepper is used in medicine chiefly in the form of tincture, as a rubefacient and stimulant, especially in cases of ulcerated sore-throat. It acts on the stomach as an aromatic condiment; and when preserved in acetic acid it forms chilli vinegar. Red pepper may be considered one of the most useful vegetables in hygiene. As a stimulant and auxiliary in digestion, it has been considered invaluable, especially in warm countries. Immense quantities of the capsicum are used by the native population of the West Indies, Africa, and Mexico; the consumption there as a condiment being almost universal, and perhaps equal in quantity to salt. The 'wort' or cayenne pottage may be termed the national dish of the Abyssinians, as that or its basis 'dillock' is invariably eaten with their ordinary diet, the thin crumpet-like bread of teff or wheat flour. Equal parts of salt and the red cayenne pods are powdered and mixed together with a little pea or bean meal to make a paste. This is called dillock, and is made in quantities at a time, being preserved in a large gourd shell, generally suspended from the roof. The wort is merely a little water added to this paste, which is then boiled over the fire, with the addition of a little fat meat and more meal to make a kind of porridge, to which sometimes is also added several warm seeds, such as the common cress or black mustard, both of which are indigenous in Abyssinia. A kind called the Tobago red pepper is said to possess the most pungent properties of any of the species. It yields a small red pod, less than an inch in length, and longitudinal in shape, which is so exceedingly hot, that a small quantity of it is sufficient to season a large dish of any food. Owing to its oleaginous character, it has been found impossible to preserve it by drying; but by pouring strong boiling vinegar on it, a sauce or decoction can be made, which possesses in a concentrated form all the essential qualities of the vegetable. A single drop of this sauce will flavour a whole plate of soup or other food.—*Johnston's Abyssinia; O'Sh.; Faulkner; Simmonds*, p. 429. See Capsicum.

CHILLOUNEA, a singular tree of Nepal. Its upper coat is entirely composed of innumerable needle-form fibres, partially united by a kind of gelatinous sap. The wood makes good beams and rafters, and is held in such estimation by the natives, that no house is considered secure in which more or less of the timber has not been employed.—*Smith's Nepal.*

CHILLUM. HIND. A pipe bowl, a hookah bowl.

CHILON. HIND. Populus ciliata.

CHILRAI, also Khatrow, Picea (Abies) Webbiana, P. pindrow, the silver fir.

CHILTA-RITA. TEL. Phœnix farinifera.

CHILUCHI. HIND. Iris Nipalensis.

CHILU NUTIYA. BENG. Amarantus polygonoides.

CHIMA-PUNJI. MALEAL. Cochlospermum gossypium.

CHIMBARI. HIND. Dactyloctenium Ægyptiacum, Eleusine flagellifera.

CHIMKANI. HIND. Cathartocarpus fistula.

CHIMNANU, of Lahoul and the Chenab, Amygdalus Persica, the peach.

CHI MOEE. CHIN. A bacchanalian game played at Chinese parties.

CHIMONANTHUS FRAGRANS. *Fortune;* the Lah-mei or Hwang-mei-hwa of the Chinese. This shrub is sometimes grafted. The flowers, mounted on brass wire, are the favourite winter ornament of Chinese women of all classes. The Chinese macerate the tree in water, and then polish it a beautifully black brilliant surface. It is a favourite in England, where it blooms in the open air at Christmas. It is quite common in China.—*Fortune's Tea Districts*, p. 79.

CHIMPANZEE, one of the Simiadæ, which approach near to man. The term has been applied to the Simia satyrus of Linnæus, the oriental orang, but it is now generally restricted to a West African genus, the Troglodytes niger of Geoffrey, the Homo troglodytes of Linnæus.—*Engl. Cyc.* p. 1015. See Simiadæ.

CHIMU, also Chimyaka. HIND. Syringa emodi, Morus serrata, Podophyllum emodi.

CHIMURUDU. TEL. Cadaba Indica, *Lam.*

CHINA. HIND. Panicum miliaceum.

CHINA, the empire in the centre and east of continental Asia, known to Europe by this name, is called by the western Mongols, Cathay; by the Manchu Tartars it is called Nikan Kourn; and by the Chinese Tchoung-koué, the last term meaning the Central Kingdom (Duhalde, Hist. of China, p. 1), also Tchoung-kuo, the Empire of the Centre. According to M. Huc (i. pp. 349–350), the Chinese also name it Tchoung-hoa, or Flower of the Centre; also Tien-hia, the Beneath the Heavens, or the world, as the Romans called their dominions Orbis. The name most in use is Tchoung-koué. It is also, however, called Tang-shan, the Hills of Tang (the name of one of their most celebrated dynasties). The present reigning family has given it the name of Tat-sing-kouo, the Empire of Great Purity; and in government proclamations, especially in those addressed to Barbarians, it is often called Tien-chao, the Celestial Empire. Other figurative appellations are Tchoung-thang and Tien-chao, Heaven's Empire. The natives call themselves Chung-kuo-teih-jin, men of the middle kingdom; also Han-jin and Tang-jin, men of Han or of Tang (from the dynasties of those names). China is supposed to be the country mentioned as the land of Sinim in Isaiah xlix. 12. Chinese annals extend back for three or four thousand years. Fo-hi is the first named sovereign of the Chinese, but the date of his reign is not ascertained. Yu the Great is the first monarch of whose reality there is no historic doubt. Their Bambus-book contains the record of the ancient imperial dynasties from B.C. 1991 to A.D. 264:—

1st. Hia, the first emperor Yu beginning B.C. 1991, reigned 432 years.
2d. Shang, began B.C. 1559, lasted 509 years; 28 reigns in 15 generations.
3d. Tsheu, began B.C. 1050, lasted 479 years. The 12th emperor Yeu Yang began to reign B.C. 781. His sixth year was B.C. 776. Confucius lived under this dynasty, and he recorded the observations of the solar eclipses from B.C. 481 upwards to 720.
4th. Tsin, began B.C. 255, and lasted to 207, 49 years.
5th. Han, began B.C. 206, and lasted to A.D. 264, a total of 469 years.

But systematic Chinese history hardly goes back so far as the reign of Yu, who was the founder of the dominion of the kings or princes of Shen-si in S. China, as far as the great river. He diverted the course of the Yellow River to fertilize the lands between the two rivers.

Prior to Chi-hoang of the Tsin dynasty, about 255 years B.C., the country had been subdivided into numerous principalities and commonwealths, but that warrior emperor brought them all under subjection. He built the Great Wall to keep off the Tartars. Seres, which Horace and the ancients used, seems to have been strictly applicable to some nation in the west of China, and many authors have surmised that the term China (Cheena) was given to the country when the Tsin dynasty carried their arms to the west. China (Cheena) was early given by the people of the N.W. of India to the nation which Europe now calls China.

The Tsin dynasty was overthrown by Lin-pang of the Han province, who was the first of the Han dynasty. With the destruction of the Tsin dynasty great injury resulted to the Chinese annals; but most of the Han princes were munificent patrons of literature. During the reign of Ming-ti, the 15th of the Han dynasty, considerable intercourse was carried on between the princes of India and China; but it was particularly during the dynasties of Sum, Leam, and Tam, from the fourth to the seventh centuries A.D., that princes from Bengal and Malabar northwards to the Panjab sent embassies to the Chinese monarchs. Nearer our own times, the Ming and Tsing dynasties have ruled from A.D. 1368 to the close of the 19th century, viz.:

Origin and Early History. — All the ancient traditions of the Chinese refer to their migrations from the west. Chevalier Bunsen (Report, Brit. Assoc., 1847) says that, according to Chinese traditions, Tibet is the land of their earliest recollections. But the first settlers of this race in China were probably emigrants from the lands lying to the south of the Caspian. An early relationship existed between Chinese and Mesopotamian culture, among the most striking proofs of which are the facts that 'the primitive Chinese, like the Babylonians, recognised five planets besides the sun and moon, and, with one exception, knew them by the same names;' and 'a comparison between the ancient names of the months given in the Urh ya, the oldest Chinese dictionary, with the Accadian equivalents, shows, in some instances, an exact identity.' A number of ethnological and linguistic facts point to the Chinese having left a home in the south of the Caspian Sea, where they had been brought under the influence of Accadian culture. From this resting-place they moved eastward about the twenty-fifth century B.C., probably in consequence of the invasion of Susiana by some possibly Turanian tribe, and finally struck the northern bend of the Yellow River, the course of which they followed until they reached the fertile plains of Shen-si. The Chinese immigrants found the country in possession of a number of Taic tribes, such as the Kwei, Lung, Pung, and Li, all of whom possessed a certain amount of culture. With these tribes they contended for dominion, and by force of a superior civilisation gained the mastery over them. The relations thus established produced effects

which have left their mark on the history of the nation through all time. In the language at the present day, as well as in the traditions and customs now existing, are reflected traces of this intermingling of races more than four thousand years ago. The admixture of Taic blood was also of paramount importance to the Chinese; and they owe much of their endurance as a nation, and of their superiority in mental and bodily physique, to the constant introduction of new blood into the national life. They have a tradition of a deluge, B.C. 2357, in the reign of Yaou. The first settlement of the immigrant Chinese was in the northern portion of Chih-le; and Chinese legendary history tells us that Yaou, who reigned 4200 years ago, had his capital at the city of Tsin-chow, situated about 100 miles only to the south of the present capital, Pekin. From this the people spread gradually westward and southward, colonizing the newer regions, and displacing the aboriginal inhabitants.

Extent of China.—The territorial distinctions of China proper and the Chinese Empire have existed from the earliest periods of Chinese history. China proper has meant, at all periods, that portion of the east of the Asiatic continent which has been possessed and permanently occupied by the Chinese people. The Chinese Empire has meant, besides China proper, those large portions of the whole Asiatic continent occupied by Tartar nomades or other non-Chinese peoples, but which have from time to time been under the sway of the Empire of China, and more or less directly ruled by Chinese officers and armies. China proper has at all periods been characterized by Chinese civilisation; that is to say, its population generally, besides being physically of the same race, has always been governed in its domestic, its social, and (with the exception of some very short periods) its political life, by the principles and rules laid down in the Chinese old sacred books. The non-Chinese peoples of the Chinese Empire have, on the other hand, at all periods either been destitute of anything that could be called civilisation, or have been slightly tinged with Chinese civilisation, or have been marked by some different civilisation, as for instance at present, in the inhabitants of Turkestan by a Mahomedan civilisation, and the inhabitants of Tibet by one strictly Buddhistic. At present China proper and the Chinese Empire are supposed to be 3,010,400 square miles in extent, and may be noticed under three territoral divisions:

China proper, as the empire existed under the Ming dynasty, which ruled in China from A.D. 1368 until the Manchu conquest in A.D. 1644.

Manchu, or, as known in Europe, Manchuria, the country of the reigning dynasty.

Colonies of China, in Mongolia, Soungarra, Eastern Turkestan, Tibet, and the countries of the several tribes bordering on Kan-su and Sze-chuen.

China proper is the largest as well as the most compact country in any part of the globe, extending in length from about lat. 19° to about 42° N., and in breadth (taking one extremity, where it borders upon the peninsula of the Corea) from about long. 125° (taking the other extremity, where the Great Wall extends to the west) to about long. 85° E., being 23° in lat. and 39° in long. The area given by Sir George Staunton is 1,292,000 miles. A recent estimate is 1,534,953 English square miles; and in 1844 its revenue, 191,803,139 taels = £63,934,713.

It is separated on the north by the Great Wall from the desert lands of the Mongol tribes, and from the scarcely less dreary Manchu country; on the east is the Gulf of Pe-che-li, the Eastern Ocean, and the Formosa channel; on the west barbarous tribes; and S.W. are the kingdoms of Tonquin, Cochin-China, Burma, and Laos.

In the course of ages the Chinese Empire has varied greatly in extent. It has been more than once larger than it is even now. It was so, for example, about 2000 years ago, under the fifth emperor of the Han dynasty, when it embraced the greater portion of inhabited Asia east of the Caspian Sea, and inclusive of Siam, Pegu, Cambodia, and Bengal. In the intervals between these great extensions, it has shrunk up to the size of China proper, and even this latter has been occasionally subdivided for considerable periods under two or more ruling families or dynasties, each acknowledging no superior. But the Chinese people has continued the same, even when under several rulers, and has been steadily increasing its territorial possessions. They have annexed all the parts neighbouring on China proper from Manchu and Mongol races. The dynasty now is Mongol, and the army Manchu, and furnishes Manchu soldiers in Mongolia and Tibet.

Government.—The idea of the family is the grand principle that serves as the basis of society in China. Filial piety, the constant subject of dissertation to moralists and philosophers, and continually recommended in the proclamations of emperors and the speeches of mandarins, has become, in the views of the Chinese, the fundamental root of all other virtues. All means are made use of to exalt this sentiment, so as to make of it an absolute passion. It assumes all forms, mingles in all actions, and serves as the moral pivot of public life. Every crime, every attempt against the authority, property, or life of individuals, is treated as filial disobedience; whilst, on the other hand, all acts of virtue, devotion, compassion toward the unfortunate, commercial probity, or even valour in battle, are referred to filial piety. To be a good or a bad citizen, is to be a good or bad son. This grand principle dominates and penetrates more or less deeply all the strata of society. The emperor, as the head of the family system on which Chinese political life is based, is responsible only to the gods. In civil cases the last appeal is to the emperor, and the registers of capital offenders are submitted to him. The names of the officials who merit promotion or disgrace are likewise submitted to him. He is called Hoang-te, August Sovereign, or Hoang-chou, August Elevation; but his name *par excellence* is Tien-dza, or Tien-tsze, Son of Heaven.

The empress of China, on the other hand, is the representative of mother earth. She is supposed to be ignorant of politics, and occupies herself in feeding silkworms, winding silk at the cocoon festival, and inspecting the silk stuffs woven by the women of the imperial household.

China has 18 political divisions,—Shang-tung, Pe-che-li, Shan-si, Shen-si, in the north; Kwang-tung and Kwang-si in the south; Che-kiang, Foh-kien, and Kiang-su, in the east; Kan-su, Sze-chuen, and Yun-nan, in the west; and Nang-

hui, Kiang-si, Hoo-nan, Hu-peh, Ho-nan, and Kwei-chu, as midland provinces.

Executive Civil Government.—The entire administration is under the direction of two councils, attached to the person of the emperor, the Nei-ko and Kiun-ke-tchou. The first is charged with the preparation of plans, and the despatch of current business. Its duty is, according to the official book, 'to put in order, and to make manifest the thoughts and designs of the imperial will, and to regulate the forms of administrative decrees.' It may be regarded in some measure as the secretariat of the empire. The second council, named Kiun - ke - tchou, deliberates with the emperor concerning political affairs. In the Nei-ko, or Interior Council Chamber, are four chief councillors, two of them Tartars and two Chinese, who bear the titles of Choung-thang and Ko-laou. The Tartar minister presides.

Loo-Poo is the general appellation for the six civil and criminal tribunals of China. The first of these, properly termed Loo-Poo, has four departments for the administration of the provinces; the second, named Hoo-Poo, takes charge of the imperial revenues; the third board is named Lee-poo; Ping-poo-war is the fourth; King-Poo, the criminal department; Kung-Poo, or public works, being the fifth and sixth.

The provinces of the country are each under a governor, or, where two provinces are united, a governor-general. Every province is divided into a certain number of districts, called 'Fu,' 'Ting,' 'Chow,' 'Heen.' A 'Fu' is a large portion or department of a province under the general control of a civil officer, immediately subordinate to the head of the provincial government. A 'Ting,' a smaller division than, and sometimes a portion of, a Fu; when separate, it is governed as a Fu, and called a 'Chuh-le.' A 'Chow' is similar to a Ting, as also a Heen, but each is a smaller division. Each Fu, Ting, Chow, or Heen has one or more towns or walled cities under its guidance, one of which takes its name and rank as 'Kwang-Chow-Fu' and 'Shang-Hae-Heen,' which latter, although of that subordinate rank, is the largest maritime city in the empire, and the greatest resort of the native ships or junks. But with all these, there has, besides, always remained a powerful and vivacious spark that the Tartar government has never been able to extirpate; and secret societies have been formed all over the empire, the members of which have seen with impatience the Manchu domination, and cherish the idea of overthrowing it, to obtain a national government.

Titles.—Also, there are five orders of nobility, the koung, heow, paak, tze, and nan, which correspond to the duke, marquis, earl, baron, and baronet of Britain. Each of these has classes. The Kee-Too-Wye is a lower grade, and the Wan-Kee-Wye a still lower. Other grades of rank are arranged as Chung or Tsung-deputy. Hereditary titles only exist for the imperial family and for the descendants of Confucius, who are still very numerous in the province of Shang-tung. Of the twelve orders of the Imperial nobility of China, tsinw'n is the first, kiui-wang the second, beileh third, beitseh fourth, chin kwoh kung fifth, f-kwoh kung sixth. To the hereditary titles which the relations of the emperor enjoy, there are attached certain prerogatives, as well as a very modest allowance, the right of wearing a red or yellow girdle, of putting a plume of peacock's feathers in their caps, and of having six, eight, or twelve bearers to their palanquins. They cannot, more than any other citizen, pretend to any public office, without having previously taken their literary degree at Pekin and Moukden, the capital of Manchuria. Many of these nobles are to be seen living in idleness and penury on their small pensions, and having no other proof to show of their illustrious origin than the red or yellow girdle. A private tribunal, however, is charged to govern them and superintend their conduct.

The first civil and military mandarins who have distinguished themselves in the administration or in war, receive the titles of koung, heow, paak or phy, tze, and nan. All the officers, civil and military, of the Chinese Empire are divided into nine orders, khiou-ping, distinguished one from the other by certain buttons, or rather balls, of the size of a pigeon's egg, which are worn above the official cap. This distinctive ball is of plain red coral for the first order, of carved coral for the second, of a translucent deep blue stone for the third, of pale blue for the fourth, crystal for the fifth, of some opaque white stone for the sixth, and for the seventh, eighth, and ninth, of gilt and wrought copper. Every order is subdivided into two classes, the one active and official, the other supernumerary; but this makes no difference in the balls. All the official personages comprised in these nine orders are designated by the generic term of kouang-fou. The term mandarin was invented by the first Europeans who visited the country, and is probably derived from the Portuguese word 'mandar,' to command. The people are all partial to honours, and ornamental arches are raised to men and women who distinguish themselves.

The punishments for crimes are very severe, many are brutal. They transport and flog for petty larceny, use torture to extort confessions; use cages, the cangue, and fetters; chain the criminal to heavy stones and to iron bars; leave the food supply to chance; cut off the ear, or cut the person to pieces at 8, 24, 36, 72, and 120 cuts; decapitate and strangle. The prisons of China may be considered as unequalled upon earth, so far as everything that is most abominable is concerned.

Races.—The great races in the empire are three, the Chinese, the Mongol, and the Manchu. These nations differ very considerably in their physical characters, although much mixture has taken place. The northern or predominant nation appears to have a fundamental tendency to an Iranian modification of the Turanian type; and the same tendency is observable amongst the Coreans and the higher classes of the Japanese, as amongst some of the American, Tangusian, and Asianesian peoples. In the south of China, the fundamental tendency is to an extreme flatness of features, the nose being often more insignificant and shapeless than in any other race, although the finer type also occurs. In the eastern maritime province, the northern type is much more common. The dominant or northern Chinese race is much less Mongolian than the S. Chinese, the Malay, and most of the intermediate ultra-Indian races. They are closely allied to the Japanese and Americans, and, indeed, are evi-

dently the same race, however much their language differs. The predominating colour of the skin of the Chinese is yellow; but yellow, brown, and sometimes a maroon tint occur. The face is broad and flat, cheek-bones projecting, irides black, eyes oblique, beard scanty, stature above that of the Malay and Tibetan, below that of the European. The Chinese head, when viewed from the front, has a strongly-marked physical relation not only to all the races of the Mongolian type, but in a much closer or more special manner to the Tibetan tribes, the American Indians, and some of the eastern Asianesian tribes, in all which one of the prevailing Chinese types may be traced. Numerous examples of the elongated head, obtusely wedge-shaped cranium, and arched nose of America and New Zealand may be seen in every assemblage of Chinese in Singapore. The occipital truncation remarked in America and Polynesia is common in South-Eastern Asia. It is very strongly marked in the Lau race. The Tibetan tribes have the rise of the skull at the coronal region, but the other characteristics are wanting. The heads of the American men of Dr. Prichard's Natural History of Man resemble those of the Chinese. The prominent lateral expansion of the zygomæ is comparatively rare in the Chinese as in the Americans. The Sumatra Malays have much more frequently the typical Mongolian head, as have also the allied tribes of the Irawadi basin, with whom they are most nearly connected, and whence they have undoubtedly derived their physical stock.

The sea-coast people are skilful and enterprising, with that self-reliance which enables nations to emigrate; and we find them swarming in the Malay ports, in Singapore, Borneo, and the Philippines; numbers are in Australia, the West Indies, Sandwich Islands, and Western America, particularly California. But, except in Buddhist Burma, they are not settlers, only forming temporary connections, sending all their savings, and looking forward to return, to their native land. Next to the Malay, this people have been the most formidable pirates of the eastern seas. Their rapid and wide diffusion is one of the most remarkable of the events of modern history, and is likely to exercise a great influence on the future condition of man. For the Chinese do not migrate to mingle with and be absorbed among other tribes and peoples: they preserve their own language, their one nationality, their own costume and religious usages, their own traditions, habits, and social organization. Though they intermarry with the races among whom they dwell, the Chinese type becomes predominant, and the children are almost invariably educated on the father's model, the influence of the mother seeming almost annihilated. And though the Chinese frequently acquire large fortunes, great influence, and sometimes high rank as a consequence of their prosperity, the ties that bind them to their country seem never to be broken, and the tides of population flow Chinaward with every south-western monsoon, to be replaced by a stronger stream when the monsoon of the north-east sends the junks on their wonted way towards the south. It is estimated that in the kingdom of Siam there are more than a million and a half of Chinese settlers; in the city of Bangkok alone there are supposed to be two hundred thousand. In fact, all the active business appears to be in their hands. Nine out of ten of the floating bazars which cover for miles the two banks of the Meinam, are occupied by Chinamen; very many of them are married to Siamese women, for a Chinawoman scarcely ever leaves her country. But the children are invariably educated to the Chinese type; the tail is cultivated if it be a boy, and the father alone seems to model the child's nature and education. Yet that strong parental affection which has been remarked as one of the characteristic virtues of the Chinese, is almost invariably exhibited. Fathers are constantly playing with and carrying about their children, encouraging their gambols, and teaching them to observe.

Several estimates of the population of the country have been attempted since the latter part of the 16th century. Captain Gill, a traveller in the 19th century, and who, in 1882, was murdered by an Arab shaikh, is of opinion that they have all been too high. Famines, with rebellions of the Tae-ping and of the Mahomedans in Kwei-chow and Yunnan, are supposed to have reduced the nation to 250 or 300 millions.

1570? 307,467,000 in the reign of Kien lung Wong.
1743, 200,000,000 Grosier.
1813, 360,000,000 Census.
1842, 414,686,994 ,,

According to Mr. Knowlton, the census of 1839, as given by M. Sacharoff of the Russian embassy in Pekin, made a population of 415,000,000. A census was found in Governor Yeh's Yamun at Canton; and the Chinese commissioners at Tien-sing, in 1859, stated the population at 400,000,000, which is a fourth of the human race, twice the population of British India with its feudatories, and seven times that of Russia. China proper has 280 to the square mile, while that of Britain and Ireland has only 260.

Tribes.—The various types of race on the mountain frontier of China, Burma, and Tibet, possess the highest interest for all ethnographical students. Of the aboriginal inhabitants of China, the Kwei people, remnants are to be found to this day in Northern Cambodia. These Kwei, whom M. Terrien de la Couperie conjectures to have been an Aryan people, possessed a literature to which the term Kwei shoo or 'Kwei Books' probably refers.

The country at the mouth of the Amur in 1842 was ceded to Russia by the Chinese, but members of the *Aino* family are settled there, and due north of Pekin is a Mongol tract which nearly separates the true Tungus part of Manchuria.

The *Hakka* inhabit Loong-Moon, Toong-Koong, T'seng-shing, and other districts. They eat dog's flesh.

The *Tan* are a race of Chinese boatmen dwelling in their boats in all the Chinese rivers, similar to the Yao and Man tribes. Their physique is vastly superior to that of the house population, who designate them *Suee Ki*, or waterfowl.

The *Ng-'Tsock* are a tribe in China who undress and bathe and re-clothe the dead. They are deemed unclean, and are not permitted to worship in the temples; their sons are not allowed to become candidates for literary degrees. They resemble the pollinctores of the ancient Romans.

Miau-tsi is a term applied to the hill tribes of China. They seem to be in small clans; no less than 82 of them residing in the small province of

Kwei-chu. Some of their names are appellatives,—Sang, wild; Heh-sang, black wild; Heh-kioh, black foot; Yan-jin; and others are the Nung, the Lo-Lo, and Yau in the mountain ranges of S.W. China. The *Miau-tzi*, on the south of Sze-chuen, are said to be wild mountaineers, but much connected with them is obscure. Friar Odoric noticed the differences between the races on the two sides of a great mountain. Polo also speaks of savage cannibals with blue-painted (*i.e.* tattooed) faces in Foh-kien; and some observations of Sir John Davis corroborate this (Polo, 178; Chinese Supp. p. 260). In the modern Chinese census, one class of the population in a district of the province of Canton appear as blacks (Chin. Mod. p. 167). Indeed, Semedo (about 1632) says there was still an independent kingdom, presumably of the Miau-tsi, in the mountains dividing Foh-kien, Canton, and Kiang-si, viz. those of which Odoric speaks (Rel. Della China, p. 19), certain F'ung people who once visited the court of the Chinese emperor, and delighted him by their dancing and singing. These F'ung people still exist in South-Western China.

Its Army, of 800,000 men in four divisions, is made up of 68,000 Manchu, 80,000 Mongol, and 625,000 Chinese. The bannermen of the Mongols are the *élite* of the dominant Manchu. The Chinese soldiery are in two bodies, one of which, about half a million in number, is designated soldiers of the green flag, and receive pay of four silver tael (27s.) per month; the other portion are a militia, holding lands for service, and drilled for a month once a year. Since the year 1878, they have obtained from Europe, swift, heavily-armed gunboats. Military Feudatories of the empire are scattered through the regions known to the Chinese geographer as Inner and Outer Mongolia, Uliasutai, and Tsing Hai or Koko-Nor; but there are also the troops of Tibet, under the resident minister of that country. The tribes acknowledging the sway of China are divided into Inner and Outer Mongolians. The former occupy the region to which their name refers them; the latter, all the other tracts and districts above mentioned.

Inner Mongolia, lying between the desert of Gobi and the continuous frontier of Manchuria and China, was occupied, in 1812, by 24 tribes, differing in name, irregularly ranged under 49 standards, and divided, in uneven proportions, into 6 chalkan or leagues.

The *Outer Mongolians* were,—1st, four tribes of Kalkas of different names, under khans, which, with two fragmentary tribes attached to them, formed four leagues; they numbered in all 86 standards, and resided in the territory north of the desert of Gobi, geographically named Outer Mongolia. 2d, Eleven tribes, not in leagues, under 34 standards, scattered to the west of the Holan mountains, in the S.W. of Inner Mongolia, to the south of the Altai, and to the north of the Tengkiri ranges. 3d, Two tribes of Mahomedans, under 2 standards, at Hami and Turfan, within the provincial boundaries of Kansuh, south of the Celestial Mountains; and 4th, Five tribes under 29 standards, round Koko-Nor, called by the Chinese Tsing-Hai, or Azure Sea. Colonel Gordon, who had taken a prominent part in suppressing the Tae-ping rebellion, recently returned to China to advise the great viceroy, Li-Hung-Chang, regarding the Chinese forces. The occasion was the retention by Russia of the town and district of Kuldja, and war appeared possible. He urged them to avoid pitched battles, to cultivate skirmishing, to throw up earthworks, to harass the enemy by irregular warfare, and form a fleet of small and cheap ships.

Religions and Philosophies.—The Chinese have acquired, in the course of their long existence, more than one different kind of philosophy; that is to say, there exist in China several radically different ways of viewing the nature of the inanimate world and of man. The philosophic systems of Lao-tsze, of Kung-tsze, of Choo-tsze, of Mang-tsze, and of Buddha, take the place of religions, but none of these are pure philosophies; those recognised by the state being Taoism, Confucianism, Buddhism with its form Lamaism, and Mahomedanism. They are systems of morality.

There was a long struggle for mastery among the adherents of these three systems,—a struggle which expressed itself in mutual proscriptions and persecutions; but the Confucian (Kung-tsze) always succeeded in maintaining for itself the greatest ascendency, except during some comparatively short period, and it became definitively paramount fully ten centuries ago. From that time to this it has continued dominant in the country. It has been the philosophy and morality of all the great historians of China, and has formed the basis of her peculiar national system of legislation and administrative procedure. It may be described as the assemblage of those fundamental beliefs which are entertained by all cultivated Chinese on the phenomena of animate and inanimate nature. The literature in which it is set forth, and which it has moulded, whether notological, psychical, ethical, legislative, or historical, is that exclusively an intimate and extensive acquaintance with which has for many centuries been made indispensable to the passing of the public service examinations, which are, for the talent and ambition of China, far more than the hustings, the avenues to church preferment, and the bar all combined, are for the talent and ambition of Britain. Hence Confucianism is, and has long been in the fullest sense of the terms, the national, orthodox philosophy and morality of the Chinese people. Taoist and Buddhist temples exist all over China, and in latter centuries Mahomedan mosques have been erected in many of its cities; but the dominant Confucianism merely endures Taoism, Buddhism, and Mahomedanism as erroneous and superstitious systems of belief, prevalent among, because most suited to, people of uncultivated or weak minds, whether rich or poor; but which find most acceptance among the poorer and therefore unlearned and unenlightened classes. They have no influence on the national polity. The people are in nowise prohibited from worshipping in the Buddhist and Taoist temples; in other words, they may regulate their purely religous life by the tenets of these, or indeed of any other sect. But where Taoism or Buddhism would leave the region of religion, and, in the form of philosophy or morality, extend their direct influence into the domain of the social science and art, there Confucianism peremptorily and effectually prohibits their action. Not only are the national legislation and administration formed exclusively on Confucian principles, it is by them also that the more important acts of the private life of the Chinese are regulated, as for

instance marriages. The cause of the prevalence of Mahomedanism in China, in spite of discouragements, lies in the fact that Confucianism says little or nothing of a supernatural world or of a future existence. Hence it leaves almost unsatisfied those ineradicable cravings of human nature, the desire to revere and the longing for immortal life. That it has, notwithstanding its want of these holds on the human heart, maintained itself not simply in existence, but as the ruling system, is a fact that must, as soon as it is perceived, form for every true thinker a decisive proof of the existence of great and vital truths in its theories, as well as thorough soundness and wholesomeness in the practical rules which it dictates. By Chinese philosophy must be understood Confucian philosophy; and by Chinese morality, the moral principles rooted in that philosophy.

In order to get a distinct general conception of the Chinese philosophical literature, two epochs must be specially kept in mind. The first began with Confucius (Kung-tsze), who was born B.C. 551, and ended with Mencius (Mang-tsze), who died about B.C. 317. The second began with Chow-leen-ke or Choo-tsze, who commenced his labours about A.D. 1034, and ended with Choo-ke or Choo-tsze, who died in A.D. 1200. The first lasted for seven generations. It was separated by an interval of thirteen hundred years from the second, which lasted for five generations. Both were periods of revival of ancient learning and of further development. Both embraced several celebrated philosophers besides those mentioned, but in each case it was the originator and closer of the epoch who became most celebrated. The writers of the second epoch are often mentioned as the philosophers of the Lung dynasty; which latter was established in A.D. 960, about 70 years before Choo-tsze's labours began, and continued in possession of the sovereignty till A.D. 1271, about 70 years after Choo-tsze's labours closed. Confucius, though his name in the west became identified with Chinese learning, was by no means its originator. Authentic, though not full records, embodying ethical and political doctrines, extended back to B.C. 2357, or to about eighteen hundred years before Confucius; while the Chinese philosophy originated with Fuh-he, who lived, according to tradition, some twenty-three generations before the exact chronological era, which latter took place B.C. 2637 with the institution of the national cycle of sixty years. Allowing thirty years to a generation, this would place Fuh-he about B.C. 3327. It was he who substituted writing for the knotted strings that had previously formed the only means of record; and it was he who first established marriages and separate families. To him are also ascribed some civilisation labours of lesser but still great importance,—the division of the day into twelve She-shin, or watches, of two hours each. Fuh-he is therefore the founder of Chinese civilisation generally. But he is perhaps best known as the originator of the natural philosophy, and in particular as the author of the 'Eight Diagrams.' He constructed these after a careful and extensive survey of nature and its varied phenomena, as exhibited in the departments which we call astronomy, meteorology, physical geography, and natural history and after reflection on his own nature, physical and mental, and on the nature of men generally, as manifested in the events of the social life around him. The Eight Diagrams consist alternately of whole and broken lines. They have never been read, but they have not the less been made the basis of an ancient system of philosophy and divination. Fuh-he's diagrams, as re-arranged, together with the short explications of the first monarch of the Chow dynasty and his son, form the basis or text of the first of the Chinese Sacred Books, the Yih-king. After an interval of six centuries, Confucius edited the Yih-king, and appended those annotations which have given the work its subsequent value. What philosophical views may have been attached to the Yih-king of Wan-wang and Chou-kung by the contemporaries of Confucius, we know not. That work, together with the other three works edited or compiled by Confucius, viz. the Shu-king books and the Le-ke, constitute the whole of the ancient literature of China which has come down to posterity, and who have it only, as it was explained, arranged or modified in passing through his hands. It is well known that he expressly repudiated portions of it, as containing doctrines adverse to the views which he held and strove to diffuse. The names only of some celebrated ancient books, one dating from the times of Fuh-he himself, have been preserved. It is these circumstances which constitute the labours of Confucius the commencement of a distinct literary epoch. Apart from the labours of Confucius himself, the permanent literary results of this, the first of the two great epochs to which attention has been directed, are contained in the collection of works called the Four Books, composed by different members of the school which he founded. The last contains a record of the ethical and political teachings of Mencius (Mang-tsze), who died about B.C. 317, and closed the first epoch.

Choo-tsze was the originator of the second epoch of philosophical development. To him is ascribed the merit of having revived that distinct knowledge of the greatest truths, which had been lost to the world for the thirteen centuries that had elapsed after the death of Mencius; and he regained that knowledge by the independent efforts of his own mind, unaided by any master. Only two of his works have been preserved, the Tea-heih-too-shwo and the Tung-shat. He died in A.D. 1200; and in A.D. 1241 an imperial rescript ordered his tablet, with those of four of his immediate predecessors whose works he had annotated, to be placed in the temple of Confucius, which is to be found in every district city throughout the empire. From that time his views of philosophy, morality, and politics have been supreme in China. His commentaries on the Yih-king and the Four Books are learnt by heart by millions of Chinese, with the text of these works. The public service examinations cannot be passed unless this be done.

The fact is, however, that though the authors of the first and second epochs, Confucius himself included, professed to teach only what was contained in pre-existing sacred books, and though they possibly themselves believed that they did only teach what was virtually contained in such pre-existing books, they nevertheless did, in each case, originate some entirely new views and doctrines.

The Yuen dynasty, which succeeded the Sungh in A.D. 1271, were Mongols, immediate descendants of Chengiz Khan, who adopted Chinese civilisation only in a very slight degree, and were consequently soon expelled again. Choo-Yuen-Chang, the first emperor of the native dynasty, the Ming, which succeeded them in A.D. 1368, though a promoter of literature, was himself illiterate, having been a servant in a monastery. But the third sovereign of the line, who began to reign A.D. 1403, had a splendid library formed, and several encyclopædiac works compiled. He published an edition of the Sacred Books, which is known by the affix to their title of 'Tatreuen,' in full completeness.

Religion.—Mahomedanism was introduced by an Arab, Wos-Kassin, said to have been Mahomed's maternal uncle; but the Mahomedans are neither zealous in the propagation of their doctrines, nor over strict in the observances of their religion. They are perpetually rising against the Government. In 1863 those living in the north went into open revolt, and spread a ruin and devastation not yet (1882) remedied.

Christianity penetrated into China as early as the 5th and 6th centuries; in the 13th it was very flourishing, and there existed at Pekin an archbishop with four suffragans. The general who conquered Southern China is stated to have been a Nestorian Christian, and to have built a church at Nankin for those of his own faith. Marco Polo, a Christian, was in high favour. We learn from the Mahomedan travellers, who visited China as early as A.D. 850, that when Canton was taken and sacked in A.D. 877 by a rebel army, as many as 120,000 Mahomedans, Jews, Christians, and Parsees perished in the sack (Prinsep's Tibet, Tartary, and Mongolia, p. 10). The Chinese have also books of Christian doctrine, composed by ancient missionaries, and which, even in a purely literary point of view, are much esteemed in the empire. The Chinese designate the Christian religion as the religion of the Lord of heaven (Huc, i. xv. p. 68). A French missionary, who had been very much in the interior of China, stated the total number of native Christians at 500,000. M. Huc's estimate is 800,000, scattered over all China proper in small communities. They differ from their own countrymen in many of those social and domestic customs and in all those mental peculiarities which constitute the special nationality of the Chinaman. Dr. Knowlton has stated that if the present ratio of conversions goes on as it has for some years back, 'by the year 1900 the native Christians in China will number over two millions!' (Huc, Chinese Empire, i. p. 16). A popular uprising began in 1848. It originated in 1830 in the teachings of Mr. Roberts, an American missionary, and those of an earnest Chinese disciple. It became blended with the national struggle of the Tae-ping, or the votaries of 'the divine kingdom of eternal peace.' According to the writings of Hung, once a schoolmaster, but afterwards the 'Heavenly Prince' and acknowledged head, the convert, on coming to baptism, pronounced a solemn vow to take the belief in the Father, Son, and Holy Ghost for his rule of life, and to dedicate this life to God, in love to the brethren; while visits to the tombs of ancestors were enjoined, in gratitude for the release of their immortal souls from this troublesome life, and to renew the vow of life-long devotion to the cause of God and the brethren. The Bible was the word of God, the Ten Commandments the moral law, and opium-smoking a sin equal to adultery (Bunsen, God in Hist. i. p. 272). Chevalier Bunsen was of opinion that the Chinese worship of the dead is the sole connecting link between them and a future state. In their disbelief of immortality and of God, Quinet doubts if they have, in the past 5000 years, lived a single day (Bunsen, God in Hist. i. pp. 265–7). But the nation believe in spirits or disembodied beings, and Chinese officials address letters to their deities, which they despatch in a fire sacrifice. Their philosophies are noticed above.

Throughout China some vague idea is entertained by the people of the existence of one great being, whom they usually designate as Shang-ti, the Supreme Ruler, the Supreme Sovereign, or whom they call Tien, Heaven; and believe that he, by a fixed destiny, controls all affairs; and as such, Tien is taken to be an appellation of the godhead of men. The learned among the Chinese speak of him, as he is represented in their most ancient classics, as having no form, nor sound, nor savour, nor tangibility; and to their minds he appears divested of all distinct personality. The spiritual ministers of heaven they call Shin, expansive spirits, or Shin-ming, illustrious spiritual beings. They divide them into two large classes, of which one is the Tien-shin, or heavenly. But the whole number of these spirits are dependent upon, and ruled by, Tien, or the Supreme Ruler of heaven. They rarely build any temple for the worship of Shang-ti. Still the people universally pay to Heaven, or to Heaven's Lord, a sort of homage daily. Every Chinese house has a lantern suspended outside the street door, and directly over the middle of the doorway, which they call Tien kung-tang, Heaven's Lord's lantern, or simply Tien-tang, Heaven's lantern. These lanterns are all lighted up, and incense is burnt for him during a short time every evening. Also, one day in every year they profess to devote to his honour, the ninth day of their first month, which they call his birthday! Then they have plays acted to please him!

They have an idol. Choo-tai-tsoo, the founder of the Ming dynasty, ordered the manufacture of a metallic figure of a man, 15 inches high, attired as a Taoist priest. This is carried in procession on the installation of every Chinese emperor. Three fingers of the left hand are placed in its mouth; and in the hand is a tablet inscribed, 'Fast for three days.'

The inferior state deities are—

Kwan-te, a distinguished general, the protector of the peace, who is now their god of war.

Lung Wong, or the Dragon King, a rain god.

Yuh Wang-te, or the Pearly Emperor, another rain god.

Mang-Chang, worshipped by schoolboys and collegians; god of learning.

Shing Wong, the protector of walled cities.

Hung Sing Wong, the deity presiding over the Southern Ocean.

Pih-te or Pak Tai, the great deity of the north.

Five genii preside over the five elemental substances, fire, earth, water, metal, and wood.

Tien How, queen of heaven.

Koon Yam, the goddess of mercy.

Kum Fa, the tutelary goddess of women and children; the Venus genetrix of the Chinese.

Shay Tseih, god of the land and of the grain.

Fung Fo Shan, the wind and fire gods.

Too Tee, the god of wealth.

Wang Teen is a deity to whom the Shu-king and She-king ascribe the attributes of omnipotence, omniscience, and immutability.

Poon Koo Wong, with the Chinese, the first parent, a division of the mundane egg. He breathed on gold and on wood, and from the vapour produced a son and daughter, Yong-Yee and Cha-Noee. Poon Koo Wong has many temples, and his image is carved in wood or clay.

Their chief festival occurs on their new year; their festival of Too-tee, of middle heaven, of Th'shat-t'sic, of the sun, of Wa-kwong, the god of fire, of Ching-yaong, the emperor's birthday.

Shu Yee is a Chinese festival of burnt-offerings to the souls of paupers.

San Lin is the new year festival; it is their bacchanalia. The new year commences with the new moon nearest to 15° of Aquarius, into which sign the sun passes in the month of January. They also hold as festivals the 1st and 15th day of each month. These bear some resemblance to the Mominia, or feasts observed by the Hebrews, Egyptians, Persians, Greeks, and Romans, and seem identical with the Hindu fortnightly ceremonials.

Tuen Nin, or Wa Shun, a Chinese festival held on the 28th or 29th of the 12th month, in which thanks are given to the tutelary deity of the house.

Tien Chung Ching Sit is the Chinese feast of the middle heaven.

Th'shat-t'sic, a Chinese festival held during the 15 days' observance of the Shu Yee, burnt offerings for paupers. It is held on the 7th day of the 7th month, in honour of the seven stars which the Chinese regard as goddesses, one of whom visited earth, and was married to, and lived for a time with a cowherd.

Literature.—The greatest counterpoise of the imperial power consists of the literary aristocracy, or corporation of men of letters, an ancient institution, which has been established on a solid basis, and the origin of which is at least as early as the 11th century before the Christian era. It may be said that the administration receives all its real and direct influence from this sort of literary oligarchy. The emperor can only choose his civil agents from among the lettered class, and in conformity with established arrangements. Every Chinese may present himself for the examination for the third literary degree, and those who obtain this may then become candidates for the second, which opens the way to official employment. To fill the higher offices, the prize must be obtained in the competition for the first degree. The corporation of lettered men, recruited every year by the method of examination, constitutes a privileged class, almost the only nobility recognised in China; and it may be considered as the chief strength and nerve of the empire. The famous imperial academy of Han-Lin is composed of literary graduates. It furnishes orators for the public festivals, and literary examiners for the province, and is supposed to promote the cause of learning and science generally.

Five canonical books were written or compiled by Confucius,—

1st. Yih-king, the Book of Mystical Combinations, a mystical form of writing on divination.

2d. Shu-king, or the Book of History, descends from B.C. 2400 to 281. It is in the character of a dialogue, and contains much of a didactic nature.

3d. The She-king, or Book of Poetry, a collection of poems, songs, and odes of inappreciable antiquity, to which Confucius attached great value as a means of moulding the national character.

4th. The Le-ke or Record of Rites, a national ceremonial; and the Chinese consider the observance of its ceremonies and usages to be essential to the maintenance of social order and the promotion of virtue.

5th. Ch'un-Ts'ew, or Spring and Autumn, a history of his time, and of several reigns immediately preceding it. The first four King were compiled and edited by Confucius; the last is an original work by the sage; but the fourth contains much from later hands.

The *Shu* are three books, in which the disciples of Confucius have recorded his conversations about poetry, history, and the rules of propriety; above all, about what concerned the growth of social virtue in the individual or the state.

In the year B.C. 213, the emperor Chi-wang-ti burned all the books in his dominions, excepting those on architecture and medicine. The sixth emperor after him, King-ti, commenced the restoration of all books, which Wou-ti, who succeeded him B.C. 140, urged on. The materials he collected were put together by Sse-ma-thsian, whose work was named the Sse-ki, or Historical Memoirs. This is composed of 120 books, and embraces the history of China from the reign of Hoang-ti, B.C. 2097, to that of Hiao-wou, A.D. 122, which has been the model of all succeeding writers. It is divided into five parts, entitled the Imperial Chronicle, Chronological Tables, the Eight Branches of Science, Genealogical Histories, and Biography.

Sse-ma Ching is the next historian, also called Siao Sse-ma. He lived towards the end of the 6th century. His book is called San-hoang-pen-ki, and is half mythological.

Sse-ma Kouang flourished in the 11th century. His great chronicle is the Tseu-tchi-thoung-kian, or Mirror for the use of Governors, and consists of 294 books of text, 30 of tables, and 30 dissertations and discussions, and embraces a period of 1362 years. He had several turns of prosperity and adversity whilst alive, and after his death his tomb was thrown down; but in A.D. 1267 his honours were restored, and his name inscribed in the temple of Confucius.

Jin Kin, or Classes of Men, is a Chinese book of great authority. In it the sages occupy the first chapter, and in this Confucius is placed high above all others.

Li is a Chinese word of very extensive meaning, sometimes rendered reason, courtesy, propriety, good breeding. The saying is, Li and Wen (learning) make up the whole sum of human excellences.

Four other classics, known as the Four Books, are mostly Confucian. They are the Ta-heo, or Great Study, the Chung-yung, or Invariable Mean, the Lun-yu, or Miscellaneous Conversations, ethical and philosophical works, which are allied with those of Mang-tsze.

Kang-he-tsze-tien is a great dictionary, and Pei-wan-yun-fu, or Girdle of Literature, is another. It was published A.D. 1711, in 110 thick volumes.

The Hae-kwo-tu-che, A.D. 1840, by Lin, is a historical work.

Their most celebrated poets are Su-lung-po of the 8th, and Le-tae-pih of the 14th centuries.

Choo-foo-tsze lived about the 12th century, till lately he was looked upon almost as a second Confucius. He has left a very enduring impression upon the literature of the country.

In no other country has the Government ever made so ample a collection of popular songs as that which the Chinese authorities compiled in ancient times, in order that the character of the rule exercised in different principalities might be judged by the tone of the poetical and musical productions of their subject,—a collection from which it is believed that Confucius compiled his celebrated She-King, or Book of Poetry. Nowhere else has so vast a work ever been produced as the Encyclopædia, in 5020 volumes, which was compiled at the command of the enlightened emperor K'ang-he, and which contains articles on every known subject, and extracts from all works of authority dating from the 12th century B.C. The copy in the British Museum is almost the only complete copy existing.

The Chinese written language consists of picture words. The alphabet is a hieroglyphic system, each word having its own graphic representative. Chinese is monosyllabic; no word is allowed more than one consonant and one vowel. Hence the possible number of words is extremely small; but each word can be pronounced with various accents and intonations, of which there are said to be 450, and the number of words or ideas in Chinese is said to be 43,496. The vastness of this amount will be appreciable, by mentioning that only about 5000 words occur in the Christian Old and New Testaments. A student of average memory should be able in five years' study to store up enough to carry him through any ordinary business or official documents. M. Remusat, in his Grammaire Chinoise, notices three styles of the Chinese written language, which he calls style antique, style litteraire, and langue des magistrats, or langue mandrinique. Mr. Meadows considers (Des. Notes, p. 13) Remusat not quite correct in these definitions. Nevertheless M. Huc also says that the Chinese in their written language have three distinctions of style,—the antique or sublime style, the type of which is to be found in the ancient literary monuments, and which exhibits very rare grammatical forms; the vulgar style; and the academic style, which partakes of the two preceding, being less concise than the antique, and less prolix than the vulgar. The vulgar style is employed for light productions, theatrical pieces, private letters, and proclamations intended to be read aloud. The spoken language is composed of 450 monosyllabic intonations, which, by the very subtle variations of the accents, are multiplied to about sixteen hundred. It results from this, that all Chinese words are necessarily grouped in homophonous series, whence a great number of double meanings may arise either in reading or speaking; but their difficulty is avoided by coupling synonymous or antithetic words. In this manner the ambiguities disappear, and the conversation is no longer embarrassed. The language called Houan-hoa, that is to say, common universal language, Europeans wrongfully designate mandarin language, as if it were exclusively reserved for the mandarins or functionaries of government. The Houan-hoa is the language spoken by all instructed persons throughout the eighteen provinces of the empire, but in this a distinction is made between the language of the north and that of the south. The former is that of Pekin; it is marked by a more frequent and sensible use of the guttural or aspirate accent. It is spoken in all the provincial government offices.

The Chinese have six styles or modes of writing their characters, the most elegant being the Kiai-shoo.

The Chuen-shoo style is the ancient mode of writing, and is derived immediately from hieroglyphics, and is either a caricature or a stiff and imperfectly written character.

The Le-shoo is used by official attendants, and is written with greater freedom than that employed in books.

The Hing-shoo is the regular running hand used when quick writing is needed.

The Tsaou-tsze is a hasty and abbreviate style, used in ordinary transactions and correspondence.

The Sung-ti is the regular form of the character used in printing.

The respect which the Chinese pay to their written character amounts almost to worship. The literati employ men to traverse the streets of towns and villages to collect waste-paper from dwelling-houses and shops, lest fragments bearing Chinese characters should be trodden under foot. Each man is provided with two baskets, and at his call, 'Sow-suee-chu!' Spare the printed paper! the people rush to the door and empty their waste-paper baskets into his. When his baskets are full, he takes them to the temple or guild, provided with a furnace for the purpose of consuming such collections, and in many instances the ashes of this paper are put into earthenware vases, and flung into a tidal stream to be borne out to sea.

The essays of candidates for the various degrees must be in the best caligraphy, and the Kiai-shoo style is that adopted by them. They must have at least 360 characters in their essays, and not more than 720.

Chinese Currency.—Sycee silver, in Chinese Wan yin, is their only approach to a silver currency. In it the government taxes and duties, and the salaries of officers, are paid; and it is also current among merchants in general. The term Sycee is derived from two Chinese words, Se-sze, fine floss silk; which expression is synonymous with the signification of the term Wan. This silver is formed into ingots (by the Chinese called shoes), and by the natives of India, khuri, or hoofs, which are stamped with the mark of the office that issues them, and the date of their issue. The ingots are of various weights, but most commonly of ten taels each.

Sycee silver is divided into several classes, according to its fineness and freedom from alloy. The only coined money in China are the brass pieces with a hole in the centre. Silver is sold by the weight, and an ounce is the equivalent of from 1700 to 1800 of these brass coins, which are called 'sapek' by Europeans. They have some pieces of brass, called tsian, and in Mongol tchos,

of which the inhabitants of Siberia make tchok and tchek; they are of less value than a sapec. A kind of notes are in circulation among private persons.

Weights.—The Chinese have communicated their weights to all the adjacent countries. A pikul is equal to 133⅓ lbs. avoirdupois; and 4 lbs. being equal to 3 catties, 100 catty make a pikul.

10 cash	= 1 candarin.	16 tael	= 1 catty.
10 candarin	= 1 mace.	100 catty	= 1 pikul.
10 mace	= 1 tael.		

Calendar.—The Han dynasty of China reformed the calendar. The Chinese, like all the natives of the north-east of Asia, reckon their time by cycles of 60 years, and give a different name to each year of the cycle. The Chinese cycle of sixty years is called Hwa-kea-tsze. The year commences from the conjunction of the sun and moon, or from the nearest new moon, to the fifteenth degree of Aquarius. It has twelve lunar months, some of twenty-nine, some of thirty days. To adjust the lunations with the course of the sun, they insert, when necessary, an intercalary month. Day and night are divided into twelve periods, each of two hours. Their division of the day is therefore as simple as the British, and not much unlike it. The Chinese begin the day an hour before midnight, and divide the twenty-four hours into twelve parts of two hours each. Instead of numbering their hours, they give a different name to each period of two hours.

Tsze,	11 to 1 morning.	Woo,	11 to 1 afternoon.
Chow,	1 to 3 ,,	We,	1 to 3 ,,
Yiu,	3 to 5 ,,	Shin,	3 to 5 ,,
Maou,	5 to 7 ,,	Yew,	5 to 7 ,,
Shin,	7 to 9 ,,	Seo,	7 to 9 ,,
Sze,	9 to 11 ,,	Hae,	9 to 11 ,,

The word Keaou is added when the hour of each period is intended, and Ching for the last. Thus Keaou tsze is eleven at night, and Ching tsze, twelve at night; Keaou chow, one in the morning; Ching chow, two; etc. etc. The word K'hih, 'quarter,' is used after the hour with the numerals yih (one), urh (two), or sau (three), to subdivide the hours into quarters, which is the smallest division commonly employed: example, Ching maou yih k'hih, a quarter past six; Keaou woo urh k'hih, half-past eleven.

This division still maintains itself in legal and official language, though the practical value of the European clocks and watches, now largely used in China, is gradually substituting for it the occidental division of twice twelve hours.

Industry and Art.—The Chinese are a laborious, diligent, hearty-working and painstaking race, skilful in economizing materials, and possessed of no mean share of inventive power. Foreign nations have borrowed from China many of the comforts and ornaments of life. The very names of such aids to existence as silk, satin, and tea are in most European lands a sufficient proof of this fact, being but slight modifications of the Chinese words sze, sze-tun, and tê. Their knowledge of the magnet is supposed to have led them to a knowledge of the compass. Their ordinary ink, composed of lamp-black and glue, is sufficiently pure to be used in the arts. Their ordinary cotton-cleaning machine, for freeing the cotton fibre from the seeds, has not yet been equalled by all the mechanical skill of Europe. In all working in metals,—in ordinary blacksmith work, metal smelting, alloys, particularly their white metal of copper, zinc, iron, silver, and nickel, their sonorous gongs and bells, that of Pekin being 14½ feet to 13 feet, and their ingenious metallic mirrors, some with engravings; their manufactures of porcelain, glass, and glazes; their carving and engraving of gems, agates, and rock crystal, and on ivory and wood, have for centuries been famed, and much of it excites the admiration of Europe, as also does their varnish work. Their lacquer-ware is beautiful, though perhaps excelled by that of Japan; their excellent metallic colours, red, white, green, and violet, are used in painting their china-ware. Their porcelain long excelled that of all other countries. The gold and silver tinsel cloths of Pekin stand deservedly in high estimation; and their gold and silver filagree work equals any ever produced by ancient Venetian masters; and their chasing in silver and enamelling on silver is unrivalled (see Carving, Lacquer-ware, Colours, Ceramic Manufacture, Enamelling, Filagree Work). In weaving they are superior, in candle-making not inferior, but in painting and sculpture they do not excel. They are bold, self-reliant, skilful gardeners, and excellent farmers, and date their skill in these back four thousand years.

Husbandry and silk-weaving were the earliest of the arts cultivated by this people. The former was introduced by Shin-nong, the immediate successor of Fo-hi, and silk-weaving by an empress; and to both of these inventors the Chinese perform annual sacrifices on their festival days. Husbandry is still highly honoured; and annually, at a grand festival in honour of the spring, the emperor ploughs and sows a field. The Egyptians, Persians, and Greeks held games and festivals, mingled with religious ceremonies, at seed-sowing; and in England, formerly, the festival of Plough Monday was held, during which the plough light was set up before the image of the patron saint of the village. The Chinese, in the reign of Hoang Ti, invented the magnetic needle, the smelting of copper for making money, and vases of high art; and money seems to have been coined in gold and silver and lead so early as Confucius' time, but many payments are still made in kind or by pieces of silver. Most of their calculations are made by a reckoning board. Sir John Davis is of opinion that the art of printing, the composition of gunpowder, and the magnetic compass, which are justly considered in Europe as three of the most important inventions or discoveries of modern times, had their first origin in China. In the beginning of the 10th century printing was invented, and in A.D. 932 that mode of multiplying copies of books received the imperial sanction; a printed imperial edition of all the sacred works having been then published. The greatest of all the arts was not invented in Europe till 500 years after this. Marco Polo speaks much of the stamped paper money of the Chinese; and he must have seen their printed books. Their printing types are made from the pear-tree wood, called by them Ly-mo.

Eighteen centuries ago they had discovered the secret and means of manufacturing paper. Before that invention, they used to inscribe written characters on strips of bamboo or sheets of metal, using a style, or iron pen, for the purpose of marking the characters. Before the art of paper-

making had arrived at perfection, the Chinese had adopted the practice of writing upon white silk, or cotton, with a bamboo pen; this was found a more convenient method than writing either on strips of bamboo or sheets of metal, as the silk or linen could be folded into a small compass. Paper is manufactured from various materials, each province or district having its own peculiar manufacture. In Foh-kien province it is made from young, soft bamboo; in the province of Che-kiang it is made from paddy straw; in the province of Kiang-nan it is made from the refuse silk, and this paper is very fine and delicate, being highly valued for writing complimentary inscriptions upon. To size the paper and render it fit for ink, they make a glue, somewhat similar to isinglass, from fish-bones; these they chop up very small, and soak the mass in water, which is continually renewed. When all oily impurity is extracted, they add a due proportion of alum which has been dissolved. Over the vessel in which this mixture is, a rod is laid; a cleft stick is used for holding the sheet of paper during the process of dipping. As soon as the paper has been sufficiently saturated, it is withdrawn by gently rolling it round the stick which has been laid over the vessel; the sheet of paper is afterwards hung to dry either near a furnace or in the sun. Towards the close of the 19th century, they have thought of introducing railways, have worked their coal mines on the system followed in Europe; have formed steam-mills for spinning and weaving cotton and wool, and have established steam navigation companies and steam war-ships.

The trade of India with China ranks next after that with the United Kingdom; in the year 1878 the total value of the foreign trade of China was as follows:—Imports, 70,804,027 Haikwan taels, or, at 5s. 11½d., £21,093,670; exports, 67,172,179 taels, or £20,011,711; total, 137,976,206 taels, or £41,105,000. The customs revenue in 1878 increased to 12,483,988 taels. The total value of the trade of China with Great Britain and her possessions is set down at 64,943,997 taels or £19,347,899 imports, and 46,022,719 taels or £13,710,935 exports; making together 110,966,716 taels or £33,058,834.

Domestic and Social Relations. — Polygamy exists, and any man may have his second, third, or inferior wives. Women, even as first wives, do not take a favourable position in their households, though as mothers their condition is improved. Chinese differs from Mahomedan polygamy in this, that a Mahomedan woman can legally hold property, is the owner of her own dower, and each wife has a separate establishment and a separate allowance for herself. In China, the extent to which wives are, by law and custom, in the power of their husbands, would produce deplorable effects, but for the almost unlimited power which law and opinion give mothers over their sons of every rank and age. So also the institution of polygamy is largely counterbalanced by the desire of all the men to marry early, in order to secure a progeny of sons as soon as possible. Polygamy is encouraged by the law which compels gentlemen and tradesmen to give their slaves in marriage, and by the physiological views which compel a husband to abstain from cohabiting with his wife during pregnancy, and during all the time the child is at the breast. Wealthy Chinese are generally very careful to follow this custom. The dread of unhappiness caused by polygamy has kept many Chinese girls from marrying, and instances occur of suicide to avoid it. The imperial household is probably unsurpassed in extent, there being married to the emperor, not only the chief wife, who is the empress, but also under-wives of first, second, and third classes, on all of whom unnumbered servants wait. The imperial porcelain factories of Kin-tih-chin forwarded to the palace for their use, in the year 1877, 11,838 articles, consisting of fish-bowls, flower-vases, and ornamental jars of the first quality, and inferior products in proportion.

In China, children are married according to seniority, as in Genesis xxix. 26, and Book of Tobit viii. 1. In China, parents choose wives for their sons, as was customary with the early Hebrews, as in Genesis xxi. 21, xxxviii. 6, Deut. xxii. 16, and as still prevails with most of the Eastern races. A Chinaman cannot take as a wife a woman who bears the same family or clan name as himself; such a marriage is null. Neither can he marry his cousin on his mother's side, nor his step-daughter, nor his aunt, the sister of his mother. No lady can marry until she is fourteen years of age. Nap-pie is the presentation of silks in betrothal, as in Genesis xxiv. 22. The bride is seldom seen by the husband, until she leave the sedan chair in which she is conveyed, with her belongings, to his house. Mandarin ducks are introduced at marriages as patterns of connubial felicity. The last part of the ceremonial is for a female attendant to present to the bridegroom a small linen sheet, which he spreads on the nuptial couch, and on the following morning it is presented to his parents. In China, widow re-marriage is not respectable, and a girl whose betrothed dies is regarded as a widow.

Cosmetics are much used by Chinese ladies; they are forbidden to be used by a bride on her marriage day, and are not used in mourning.

Playactors, policemen, boatmen, and slaves must marry into their own respective classes.

As in Matthew's Gospel, xxv., lanterns are much used.

In the little feet of the Chinese women, the four smaller toes appear grown into the foot, the great toe being left in its natural position. The fore part of the foot is so tightly bound with strong broad ligatures, that all the growth is forced into height instead of length and breadth, and forms a thick lump at the ankle; the under part measures scarcely four inches long and an inch and a half wide. The foot is constantly bound up in white linen or silk, and strong broad ribbons, and stuck in a very high-heeled shoe. The crippled fair ones trip about with tolerable quickness; to be sure, they waddle like geese, but they manage to get up and down stairs without the help of a stick. The feet of their women are naturally small, but at six or nine years of age they are trained into a deformity. Long bandages of cotton cloth an inch wide are folded round the foot, and brought in a figure of eight form from the heel across the instep and over the toes, then carried under the foot and round the heel, and so on, and drawn as tight as possible. After some years, if the bandage has been well applied, the pain subsides. The tarsus is bent on itself; the back of the os calcis is brought to the ground. A large foot is a sure

indication of humble birth. It is not, however, the mark of aristocratic or wealthy station, but a Chinese as opposed to a Tartar practice, though indeed some Chinese races do not follow it. Infanticide, of which the husbands are the only perpetrators, is not uncommon; but female children only are murdered, and those immediately after their birth. This horrible crime meets with no punishment from the laws of the country; a father being the sovereign lord of his children, he may extinguish life whenever he perceives, or pretends, that a prolongation of it would only aggravate the sufferings of his offspring. Professor Douglas is of opinion that it is only abject poverty which drives Chinese parents to the rough resource of infanticide, and that in prosperous districts such primitive method of providing for children is unknown. But the stone which stands near a pool outside the city of Fu-chu, bearing the inscription, 'Girls may not be drowned here,' proves that the inestimable blessing of possessing daughters is not yet appreciated as it should be by Chinese parents.

The Chinese are not a moral, though they are a ceremonial people. Their usual salutation when meeting is Haou-tsing-tsing? Are you well? Hail! Hail! Social conversation is replete with compliments, compelling even the most egotistic talker always to speak of himself as 'the little one,' 'the mean one,' 'the stupid one,' or 'the cheap one;' and allowing such a greeting as 'I congratulate you on having acquired wealth,' to be addressed to a passing beggar. They, like most of the natives of the East, waste much time before commencing the business for which they meet. The conversation must always begin on indifferent and mostly insignificant subjects, and at the end of the visit you explain in three words what really brings you there. The visitor rises, and says, 'I have been troublesome to you a very long time;' and doubtless, of all Chinese compliments, this is the one that most frequently approaches the truth. They are not truthful. Sir John Bowring says (i. p. 105) his experience in China predisposes him to receive with doubt and distrust any statement of a nature when any, the smallest, interest would be possibly promoted by falsehood. They are largely given to the use of opium. Mr. Knowlton estimated that there are 2,351,115 confirmed opium-smokers, or one in every 170 of the population.

In ordinary quiet times they appear to maintain order as if by common consent, independent of all surveillance or interference on the part of the executive. But let them be brought into contact with bloodshed and rapine, or let them be roused by oppression or fanaticism, and all that is evil in their dispositions will at once assert itself, inciting them to the most fiendish and atrocious acts of which human nature has been found capable. Both kindliness and cruelty, gentleness and ferocity, have each its place in the Chinese character; and the sway which either emotion has upon their minds, depends very much upon the associations by which they are for the moment surrounded. When in their own quiet homes, pursuing undisturbed the avocations to which they have been accustomed, there are no more harmless, well-intentioned, and orderly people.

They are good agriculturists, mechanics, labourers, and sailors; and they possess all the intelligence, delicacy of touch, and unwearying patience which are necessary to render them first-rate machinists and manufacturers. They are, moreover, docile, sober, thrifty, industrious, self-denying, enduring, and peace-loving to a degree.

They emigrate to any climate, be it hot or frigid. All that is needed is teaching and guiding, combined with capital and enterprise, to convert them into the most efficient workmen to be found on the face of the earth.

On the pressure of want they readily part with their children, especially girls, and girls are often destroyed. On the other hand, asylums exist in China for aged men and women, for the blind, and for lepers. The aged men are treated with great respect, and are allowed to have walking-sticks, which are not used by Chinese, long-stemmed pipes being employed. Monumental arches are raised to their honour.

Food.—The great staff of life in China is rice, which is either eaten dry, or mixed with water so as to resemble a soup. Out of rice they make their chief intoxicating liquor, which, when good, is something like strong whisky, both in its colourless appearance and its smoky flavour. Several vegetables are consumed, such as the sweet potato, Barbadoes millet, peas, beans, turnips, carrots, etc. Of their fruits, the orange, lichee, loquat, and mangoes are much in use. Their favourite animal food is pork, the taste for which is national. There is a maxim prevalent among them, that a scholar does not quit his books nor a poor man his pigs. The flesh of the bullock, sheep, deer, dog, cat, wild cat, rat, and horse is eaten, but compared with that of swine these are rarities. Fish are eaten in great abundance, either fresh, dried, or salted; and they rear great quantities of ducks and various species of fowl for the table. The comprehensive principle on which Chinese diet is regulated, is to eat everything which can possibly give nourishment. Their notions as to dogs' and rats' flesh are quite fanciful. The luxuries consumed by the rich consist of the edible bird's nest, the beche de mer or sea-slug, shark fins, fish maws, cow sinews, points of stag antlers, buffalo hides, which afford the gelatinous food considered so restorative. Amongst their delicacies also are dishes made of the larvæ of the sphinx moth, and of a grub bred in the sugar-cane. In China, the various modes of catching and rearing fish exhibit the contrivance and skill of the Chinese quite as much as their agricultural operations. According to the Repository, at least one-tenth of the population derive their food from the water, and necessity leads them to invent and try many ingenious ways of securing the finny tribes. Besides fish, molluscs of every kind, crustacea of all kinds. A Chinese is prohibited by law from killing a cow. The punishment for slaughtering a draught cow or ox, for the first offence, is one hundred blows; for a second offence, the same number, and exile for life from the province.

The *amusements* of the Chinese comprise theatrical representations, pyrotechnic displays, marionettes, peep-shows, conjurors, athletes, ventriloquists, regattas, cricket fighting, quail fighting; and they are very fond of singing-birds.

The *horse* commonly seen in China is a mere pony, not much larger than the Shetland pony; it is bony and strong, but kept with little care,

and presents a worse appearance than it would if its hair were trimmed, its fetlocks shorn, and its tail untied. This custom of knotting the tail is an ancient practice, and the sculptures at Persepolis show that the same fashion prevailed among the Persians. The Chinese language possesses a great variety of terms to designate the horse; the difference of age, sex, colour, and disposition are all denoted by particular characters.

Flora.—The only trees to the cultivation of which the Chinese pay any attention, are the fruit-bearing kinds; and in some places in China there are very fair orchards, containing the mango, leechee, longan, wangpee, orange, citrons, and pumelows. The yang-mai is a scarlet fruit, not unlike an arbutus or strawberry, but having a stone like a plum in the centre. The kum-quat is a small species of citrus, about the size of an oval gooseberry, with a sweet rind and sharp acid pulp. A small quantity is sent to England preserved in sugar. Groves of the kum-quat bush are common on all the hill-sides of Chusan from three to six feet high, and when covered with its orange-coloured fruit is a very pretty object. The shaddock, plantain, and persimmon are common, and several varieties are enumerated of each; the plantain is eaten raw and cooked, and forms no inconsiderable item in the subsistence of the poor. The pomegranate, carambola or tree gooseberry, mango, custard-apple, pine-apple, rose-apple, bread-fruit, fig, guava, and olive, some of them as good and others inferior to what are found in other countries, increase the list. The whampe, leechee, longan or dragon's eyes, and loquat, are indigenous fruits at Canton. The first resembles a grape in size, and a gooseberry in taste; the loquat (Eriobotrya) is a kind of medlar. The leechee looks like a strawberry in size and shape; the tough, rough red skin encloses a sweet watery pulp of a whitish colour, surrounding a hard seed. Grapes are plenty, and tolerably good.

In China, the staple summer crops are those which yield textile fibres. The jute of India, a species of Corchorus, is grown to a very large extent, and in China is used in the manufacture of sacks and bags for holding rice and other grains. A gigantic species of hemp (Cannabis) growing from 10 to 15 feet in height, is also a staple summer crop of China, and is used in making ropes and strings of various sizes, such articles being in great demand for tracking the boats up rivers and in the canals of the country. China grass-cloth, a beautiful fabric made in the Canton province, is largely exported to Europe and America. The Urtica nivea plant, which is supposed to produce this, is also abundantly grown in Kiang-si and other provinces. Fabrics of various degrees of fineness are made from this fibre, but none are so fine as that made about Canton; it is also spun into a very strong and durable thread. There are two very distinct varieties of this plant common in Che-kiang,—one the cultivated, the other the wild. The cultivated variety has larger leaves than the other; on the upper side they are of lighter green, and on the under they are much more downy. The stems also are lighter in colour; and the whole plant has a silky feel about it, which the wild one wants. The wild variety grows plentifully on sloping banks, on city walls, and other old and ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its structure than the other kind. The cultivated kind yields three crops a year. A species of juncus is grown, the stems of which are woven into beautiful mats, used by the natives for sleeping upon, for covering the floors of rooms, and for many other useful purposes. This is cultivated in water somewhat like the rice plant, and is therefore always planted in the lowest part of these valleys. In the beginning of July, harvest of this crop commences.

Burials. — When the life has departed, the dead body is arrayed in robes of state, or in most costly apparel; ablutions are not performed, nor any unnecessary handling of the body suffered. White is the sign of mourning. The Chinese worship the spirits of the dead; and amongst that nation the desire to have a good coffin is universal. Many purchase for themselves that last tenement, and keep it by them, and it is usually substantial, of metal or wood. In Burma, where many Chinese are settled, the best block of teak is selected, and, the upper portion being sawn off to form a lid, the block is hollowed and ornamented. These may be seen in Moulmein in every carpenter's shop. In China, the coffin-makers' shops have a very gay instead of a lugubrious appearance, as the coffins are usually painted red, or some equally bright colour, and the more expensive ones are decorated profusely with gilding; these coffins are placed on shelves one above the other, and the prices vary from one dollar up to four or five hundred. They are often presented by children to parents. The funeral customs of China vary in the different districts. In Foh-kien, the body is placed in a coffin soon after death; a fan is placed in the hand, a piece of silver in the mouth, and a hole is sometimes made in the roof for the spirit to effect its exit. The tombs are on the hill-sides, where lucky spots are chosen by geomancers. Paper images of clothes, horses, and other luxuries are cast into the grave, and a sacrifice of cooked provisions is offered on the day of the funeral. Every year, in the month of April, the whole population visit the tombs and worship the manes of ancestors. Sometimes a poor family will keep the coffin for many months in their house till able to purchase a tomb, but the very poor are buried *en masse* within enclosed buildings. The dead are occasionally left exposed on the sides of hills, at the wayside, and on banks of rivers, creeks, and canals. At Nankin they are exposed in great numbers. The rite of respectful burial is, however, so revered, that burial clubs exist in all the large cities. The monumental tombs are small raised truncated cylinders. In mourning for near relations, every part of the ceremonial is exactly regulated,—even the period, manner, and degree of the mourner's grief being duly prescribed. The corpse, being dressed in warm clothes, is deposited in a substantial coffin, and kept for several days above ground, whilst the survivors express their measured grief by gesture, dishevelled hair, sackcloth, and mournful silence. When a good spot has been selected for the grave, the corpse is consigned to the earth. Building a tomb in the form of a horse-shoe, they inscribe thereon the name of the deceased, erect a tablet to his memory in the hall of his ancestors, and repair annually to the grave, in order to prostrate themselves before the manes, and to offer victuals in sacrifice to the spirits. In the temples,

divine honours are paid to their memory. To supply their full wants in the other world, they burn gilt paper, paper chariots, and houses, with every necessary article of furniture, which are supposed to be changed in the other world into real utensils; whilst the gilt paper, when burnt to ashes, becomes so much ready money. The greater the personage, the more protracted is the mourning. The emperor mourns three years for his parent, and every good subject follows his august example. Mandarins resign their office during this period of affliction; literati avoid entering the examinations; the common people abstain for some time from their labour. Sati prevailed to a considerable extent until about the 18th century. It does not appear, however, to have been regarded as a compulsory rite, but was generally the widow's own choice, to show her extreme fidelity, or to escape the hardships of widowhood, or, in the case of dutiful sons, to save the life of a parent. Fire was never used; but opium, poison, or starvation was the means of suicide employed. Yiun Chang was the first emperor who discountenanced those practices, which his immediate predecessors had encouraged; and he forbade honorary tablets to be erected to self-immolating victims. In 1792, a memorial was presented to the emperor, praying for the dedication of a tablet to a most dutiful son, who had cut out his liver in order to cure his mother's sickness. The imperial Board of Rites, after mature deliberation, respectfully observed that the practice of cutting out the liver is that of the ignorant, showing a contempt for their lives, and after all but foolish devotion; and a decree was issued discountenancing the custom.—*Williams' Middle Kingdom; Fortune's Wanderings; Maury's Physical Geography; Thunberg's Travels; Rev. This nettle grows in all the moist countries from Bengal, through Rungpore, Assam, into China, and southward all through the Malay Peninsula into Sumatra, Java, and Celebes. In Bengal and Assam its fibre has only been used for string and ropes by the fishermen and by the Dom race of Assam; but in China, where it has long been woven into the China grass cloth, it is carefully cultivated, and great care is also taken in the process of cutting down, scraping, peeling, steeping, and bleaching the fibre. These, indeed, are detailed minutely in the Imperial Treatise of Chinese Agriculture, lib. lxxviii. fol. 3. When grown from seed, a sandy soil is preferred; the ground is repeatedly dug, formed into beds a foot broad and four feet long, raked and smoothed and watered, again raked and again smoothed, and a pint of seed, mixed with four pints of earth, is scattered on the surface of six or seven beds, and left uncovered in. They are sheltered from the sun by a canopy of matting or grass, which is kept damp, and this shelter is retained till the plants be an inch or two high. The young plants are then to be transferred into a stiffer soil, which is afterwards repeatedly hoed, and top-dressings of fresh horse dung, ass, or cow dung can be used. This process is adopted only where the roots of old plants are not obtainable. The plant grows best from shoots or layers. Dr. Royle (Fib. Pl. p. 344) gives the following as the Indo-Chinese method for preparing the rheea fibre, as adopted in Upper Assam by Major Hannay:—

To cut the Rheea.—The rheea is fit for cutting when the stems become of a brown colour for about six inches upwards from the root. Hold the top of the stalk in the left hand, and with the right hand strip off the leaves by passing it quickly down to the root, and cut off with a sharp knife, taking care to be above the hairy networks of the roots, as these should be covered up with manure immediately, to ensure another crop quickly; lop off the tender top to the stalk, and make the reeds up into bundles of 200 or 250 if the stripping process is not to be carried on in the field or garden; but it is best to strip off the bark and fibre on the spot, as the burnt ashes of the stem afford a good dressing for the roots, along with dry cow-dung.

To strip off the Bark and Fibre.—The operator holds the stalk in both hands nearly in the middle, and, pressing the forefinger and thumb of both hands firmly, gives it a peculiar twist, by which the inner pith is broken through, and then, passing the fingers of his right and left hand rapidly alternately towards each end, the bark and fibre is completely separated from the stalk in two strands.

Making up into Bundles.—The strands of bark and fibre are now made up into bundles of convenient size, tied at the smaller end with a shred of fibre, and put into clean water for a few hours, which, he thinks, deprives the plant of its tannin or colouring matter, the water becoming quite red in a short time.

Cleaning Process is as follows:—The bundles are put on a hook fastened in a post by means of the tie at the smaller end, at a convenient height for the operator, who takes each strand separately of the larger end in his left hand, passes the thumb of his right hand quickly along the inner side, by which operation the outer bark is completely separated from the fibre, and the riband

of fibre is then thoroughly cleaned by two or three scrapings with a small knife. This completes the operation,—with some loss, however, say one-fifth,—and if quickly dried in the sun, it might at once be made up for exportation. But the appearance of the fibre is much improved by exposure (immediately after cleaning) on the grass to a night's heavy dew in September or October, or a shower of rain during the rainy season. After drying, the colour improves, and there is no risk from mildew on the voyage homewards (Royle, Fib. Pl. p. 344). The French have been growing China grass in small quantities ever since 1844, in which year a packet of China grass seed was sent home by M. Leclancher, surgeon to the war corvette La Favorite. The Rouen Chamber of Commerce reported that China grass fibre has an affinity for colouring matters at least equal, if not superior, to that of the very finest kinds of cotton. The plant will flourish north of Paris, and even in Belgium. Mr. Gray's process was said to produce China grass fibres almost as strong as so much silk, quite as free and unentangled as the fibres of the most perfect samples of cotton-wool, and capable of being spun into as delicate a yarn as ever was produced from the very best Sea Island cotton. It possesses a lustre far exceeding that of cotton, greatly in excess of that of native Indian grass cloth. His process was said to be practicable on any scale, and also to jute, hemp, New Zealand flax, and various other plants. Lord Mayo directed much attention to this fibre, which is said to bring prices of £60 to £120 a ton. But such prices could only be obtainable for well-prepared fibre of the finest quality. It is said to be procurable at Ningpo at £20 the ton.—*Roxb.* iii. 590; *Royle, Fib. Pl.*

CHINAKA. HIND. Brassica Griffithii; Malcolmia strigosa.

CHINAKARAM. SINGH. Alum.

CHINA-WARE, or porcelain, once so extensively exported from China, is now almost confined to the commonest and cheapest descriptions of stoneware. The patterns made by the Chinese seldom change, while the European manufacturers both consult and lead the taste and fancy of their customers; and it is owing to this, in some degree, that the demand for the Chinese finer ware has ceased, though the Mongols, Siamese, Hindus, and islanders in the Archipelago are still largely supplied from China. When the productions of the East were first carried round by the Cape of Good Hope, the porcelain of China bore an enormous price; and the profits of manufacturing it having been ascertained, the European nations began to make it, and soon outrivalled the Chinese. China-ware is sold in China in sets, consisting of a table set of 270 pieces at from 12 to 75 taels, a breakfast set of 20 pieces at 3 taels, a long tea set of 101 pieces at 11 to 13 taels, and a short tea set of 46 pieces at from 5 to 6 taels.

The Ow-mi-ew, or black China-ware ornamented with gold, is very much prized in China; to make it they mix three ounces of azure and seven of the oil of stones; this is laid on the ware, and when perfectly dry it is baked, after which the gold is laid on and the vessel is re-baked. The To-wi-kie is a porcelain prepared simply by varnishing the vessels with a whitish ash-coloured varnish, made from calcined translucent white pebbles. This has the property of marbling and veining the ware, and giving it an appearance as if it had been fractured into many pieces, which had been carefully reunited. This China-ware is highly prized under the designation of cracked porcelain.—*Compendium by Hon. Mr. Morrison.* See Ceramic Manufactures.

CHIN-CHIN. CHIN. Corruption of Tsing Tsing, a Chinese greeting, meaning, I pray you! I pray you!

CHINCHKED or Mai-ji, in the taluk of Pachora in the Bombay Presidency, has an annual fair in the 15th of the month Paosh, about the beginning of January. It originated from the circumstance of a female devotee named Mai-ji burying herself alive. She was the daughter of a man of the Firoli Kunbi caste of the village of Hewri, in the Jamner district. Being distressed by her husband's parents, she abandoned her home and studied under Goraksh Nath in the Toran Māl mountain. She finally settled at Chinchked, where she was annually provided with a house, which she every year burned, and at the close of the twelfth year she buried herself alive, about the middle of the 17th century. People made vows to her while alive, and after her death to her manes.

CHINCHONA, a genus of plants, natives of South America, several species of which are of great value in medicine, yielding 'bark' or Peruvian or cinchona bark, from which quinine is produced. See Cinchona.

CHIN-CHOO. CHIN. The true God, of Chinese Mahomedans.

CHINCHOR, a town in the Dekhan, with a temple containing an idol named Kandoba, to whom many Murli girls are devoted. See Murli.

CHIN-CHOU. CHIN. Gracillaria tenax.

CHIN-DEO, in Canara, means Jain images, and is supposed to be a corruption of Jain deo.

CHINDWARAH, in the Nerbadda division of the Central Provinces, is a district lying between lat. 21° 25′ and 22° 50′ N., and long. 78° and 79° 30′ E., with an area of 3852 square miles. It has

two distinct natural subdivisions,—the hill country above the slopes of the Satpura mountains, called the Balaghat, and a tract of lowland beneath them to the south, and called the Zer Ghat. It is a sanatorium, and there is a barrack for fifty men.

CHINESE FEET. The binding of the feet is not begun till the child has learned to walk and do various things. The bandages are specially manufactured, and are about two inches wide and two yards long for the first year, five yards long for subsequent years. The end of the slip is laid on the inside of the foot at the instep, then carried over the toes, under the foot, and round the heel, the toes being thus drawn towards and over the sole, while a bulge is produced on the instep and a deep indentation in the sole. The indentation, it is considered, should measure about an inch and a half from the part of the foot that rests on the ground up to the instep. Successive layers of bandages are used till the strip is all used, and the end is then sewn tightly down. The foot is so squeezed upward, that in walking only the ball of the great toe touches the ground. Large quantities of powered alum are used to prevent ulceration and lessen the offensive odour. After a month the foot is put in hot water to soak some time; then the bandage is carefully unwound, much dead cuticle coming off with it. Ulcers and other sores are often formed on the foot; frequently, too, a large piece of flesh sloughs off the sole, and one or two toes may even drop off, in which case the woman feels afterwards repaid by having smaller and more delicate feet. Each time the bandage is taken off the foot is kneaded, to make the joints more flexible, and is then bound up again as quickly as possible with a fresh bandage, which is drawn up more tightly. During the first year the pain is so intense that the sufferer can do nothing; and for about two years the foot aches continually, and is the seat of a pain which is like the pricking of sharp needles. With continued rigorous binding, the foot in two years ceases to ache, and the whole leg, from the knee downward, becomes shrunk, so as to be little more than skin and bone. When once formed, the golden lily, as the Chinese lady calls her delicate little foot, can never recover its original shape.

CHINESE MOSS, Plocaria tenax. See Algæ.

CHINESE TARTARY, also called Chinese Turkestan, is a great depressed valley, shut in by mountains of great height on three sides, and on the east are barren sands, which merge imperceptibly into the great desert of Gobi. It comprised two great divisions, viz. Zungar or Mughholistan, and Kashgar or Eastern Turkestan, on the N. and S. respectively of the intersecting range of the Tian-Shan mountains. The northern portion was called by the Chinese Tian-Shan Peh-Lu, and the southern, Tian-Shan Nan-Lu. The first of these has lapsed in great part to Russia. The Tian-Shan range separates it from Zungaria, the Bolor range from Transoxiana, and the Kara Koram and Kouen Lun from India and Tibet on the south. The land is clayey near the base of the mountains, but sandy in the central tracts. Rain is rare, and the air is of exceeding dryness, but the climate is temperate and healthy. It is well watered from the mountains, the waters converging towards the Ergol or Tarym. The country has gold, copper, salt, sulphur and the jade-stone. The southern line of the caravan route passes through it from Khamil to Aksu and Kashgar. From Aksu to Khokand is 800 miles. It was subject to China from the beginning of the Christian era, to the time of Chengiz Khan. After the middle of the 18th century, the Chinese power regained possession of it. Alti-Shahr, or the six cities, forms the western district, comprising Yarkand, Kashgar, Khotan, Aksu, Yanghisar, and Oosh-Turfan, with territories subordinate to each. Eastern Turkestan is eminently Mahomedan. Yarkand is the entrepot of trade between China and Bokhara. Khotan, from the time of C'tesias, has been celebrated for its mineral products, its jade and emeralds, its shawl wool, and flax. It was at one time the entrepot of a vast trade with Hindustan, and now imports largely furs, broadcloth, leather, and sugar. In the latter part of the 19th century, there was a short-lived Mahomedan uprising, from which sprang difficulties between China and Russia, the latter having taken possession of the province of Ili, and the town and district of Kuldja.

CHINGANI, a name of the Kara-chi of Central Asia, supposed to be a gipsy race.

CHINGARI. HIND. A thug; a clan of Muttri thugs assuming to be Mahomedans, and travelling as ostensible grain merchants.—*Wilson.*

CHINGERITT, a Penang wood of a brown colour, sp. gr. 2·165. A small tree, used for furniture.

CHING-HAE or Chin-hae, in lat. 29° 57½′ N., long. 121° 43½′ E., is the maritime town of the river Yung or Ningpo. The city of Ningpo is about 10 miles from the river's harbour. Ching-hae is a heen or city of the third class. It was captured by the British on 10th October 1841.—*Horsb.*

CHING-HWANG-MEAOU. CHIN. The temple in Chinese towns dedicated to the patron deity of the town. On the morning of the new or full moon, is a lecture, one of sixteen which the emperor Kang ordered to be read, but first put in practice by his son. They are practical homilies on the duties of life.

CHING-KEANG-FO, a town of China, battle of, fought 21st July 1842.

CHINGLEPUT, a town 36 miles S. of Madras. It gives its name to a revenue division which lies between parallels of 12° 13′ and 13° 54′ N. lat., and wraps round Madras. The several races of Mahomedans number 23,192, and Hindus 899,686, of the Valala, Vania, Kamalar, Kaikalar sections, and a small number of Irular and Pariahs. It is known as the Jaghir, having been, in 1763, granted as a jaghir to the E. I. Co. by the nawab Muhammad Ali, for services rendered to his father Anwar-ud-Din Khan and himself; and in 1765 the grant was confirmed by the emperor of Dehli. It was twice overrun by Hyder Ali, in 1768 and in 1780; and in 1784 many parts presented only the bones of the persons who had been massacred, and the ruins of houses made desolate. It has small rivers.

The Palar, rising in Mysore, passes Arcot, Walajahbad, and Chingleput, and falls into the sea at Sadras. The Cheyar falls into the Palar opposite Walajahbad; the Adyar falls into the sea at Madras; and the Corteliar flows into the marine lagoon at Ennore. There are four large tanks, of Chambrambaukum, Utramalur, Red Hills, and Karangoli. St. Thomas' Mount, a military cantonment eight miles south of Madras,

is the headquarters of the artillery. It has two hills rising from a level plain. One of these is St. Thomas' Mount, 220 feet high, on which in 1547 the Portuguese had built a church, and another church on the Little Mount, a rocky hill two miles nearer Madras. On the 9th February 1759, a battle was fought on this plain between the British under Captain Calliaud, and the French. It lasted from 5 A.M. to 5 P.M., and the French, under Lally, withdrew. Between 1746 and 1872, 16 disastrous cyclones swept over it.

CHINGO PANMARI, the Tibetan name of Mount Everest.

CHINGORIER, one of the thug clans.

CHINHA. SANSK. A cognisance, an emblem. Each of the Jaina thirthankara and each of the chief Hindu deities has one. The Chinha of the 24 Jaina thirthankara, are the antelope, ape, buffalo, boar, bull, cobra, chank shell, crocodile, curlew, elephant, falcon, goat, horse, lion, lotus, moon, Nandyavarta mark, rhinoceros, the Srivatsa mark, the Swastika mark, thunderbolt, tortoise, water jar, and water lily. The apostles of the Christians had emblems similarly.

CHINI, HIND., *i.e.* China, or relating to China; hence Chini, sugar-candy, first brought from China, but is also white moist sugar. Rewand Chini, HIND., is Verbascum thapsus, Eremostachys vicaryi, and Rheum emodi. Chini-kam is porcelain.

CHINI, in the Western Himalaya, is situated on the northern side of the snowy range. A few marches to the north of Chini, sharp to the left of the road, there is a grand pass from the Sutlej to the Spiti valley, 18,600 feet high, the Manee or Maneerung crest in the month of May resembling a hurricane of snow, beyond everything sublime and cold.

CHINI. PUSHTU. A China silk fabric of Yarkand.

CHIN-INDIA, a name proposed for the countries beyond the Ganges.

CHINIOT, a town in the Jhang district of the Panjab. It has the shrine of Shah Burhan, a Mahomedan saint, revered by Hindus and Mahomedans.—*Imp. Gaz.*

CHINKAH. HIND. A traversing basket-bridge.—*Wilson.*

CHINKARA, HIND., of European and native sportsmen, is the Gazella Bennettii, found generally on the plains and low open hills of India. In many parts it especially affects the nullahs and stony eminences which diversify the plain. The horns of the male are annulated, and twist back with a slight but graceful curve. They are ten or twelve inches in length. The doe has horns also, but much smaller in every way than those of the buck. They are not annulated, and are sometimes strangely distorted, without any approach to regularity of appearance. They roam in herds of six or eight, but they are more abundant in the province of Cutch than elsewhere, and the antelope is not seen there, though, across the gulf, on the coast of Kattyawar, they abound.

CHIN KILICH KHAN, of Turk origin, of respectable family, was son of Ghazi-ud-Din, who long served under the emperors Aurangzeb, Jahandar Shah, Bahadur Shah, and Farokhsir. Chin Kilich Khan also served and raised himself to independence in Hyderabad, where he was known under the titles Nizam-ul Mulk and Asof Jah. He was the founder of the Asof Jahi dynasty still ruling there, A.D. 1880, as Nizams of the Dekhan. Chin Qilich, are Turki words meaning a sword-drawer.

CHINNA. TAM., TEL. Small; hence,—

Chinna Aku, Acalypha betulina, *Retz.*
Chinna Avaguda, Trichosanthes incisa.
Chinna Botuku, Cordia angustifolia.
Chinna Dula-gondi, Tragia cannabina.
Chinna Jammi, Acacia cineraria, *Willde.*
Chinna Kala Banda, Aloe littoralis, *Kœnig;* A. Indica, *Royle;* A. perfoliatata, *Roxb.* ii. 167.
Chinna Kalinga, Dillenia pentagyna, *R.* ii. 625.
Chinna Kaliva Pandu, Carissa spinarum.
Chinna Mandula Mari, Vitis Linnæi, *Wall.*
Chinna Moralli, Buchanania latifolia, *R.*
Chinna Muttama, Sida alba, *R.*
Chinna Muttavapulagam, Pavonia Zeylanica.
Chinna Nangi, Lagerstrœmia macrocarpa, *Roxb.;* L. parviflora.
Chinna Naringi, Triphasia trifoliata.
Chinna Navuli, Niebuhria linifolia, *R.*
Chinna Nare, Eugenia salicifolia, *R.*
Chinna Nidra Kanti, Desmanthus triquetrus.
Chinna Puli, larger panther.
Chinna Ranabheri, Anisomeles Malabarica.
Chinna Rantu, Rhaphidospora glabra, *Nees.*

CHINNA KIMMEDY, a district in the N.E. part of the Madras Presidency, inhabited by Khand races, who until lately practised human sacrifices, the victims being styled Meriah. The rite is supposed to be now suppressed. In Chinna Kimmedy, 'the Meriah was dragged along the fields, surrounded by a crowd of half-intoxicated Kandhs, who, shouting and screaming, rushed upon him, and with their knives cut the flesh piecemeal from his bones, avoiding the head and bowels, till the victim, dying from loss of blood, was relieved from torture, when the remains were burnt, and the ashes mixed with the new grain to preserve it from insects.' Captain MacViccar, writing in 1851, stated that in Maji Deso, midway between Boad and Patna, 'on the day of sacrifice, after the appointed ceremonies, the Meriah was surrounded by the Kandhs, who beat him violently on the head.'

CHINNAMA. TAM., TEL. Little mother, an ordinary name for women.

CHINNA MASTAKA, in Hindu mythology, is a form of Parvati as Kali, and possibly is the sacti of Siva, in the form of Kapali. She is described as a naked woman with a necklace of skulls. Her head is almost severed from her body, and her blood is spouting into her mouth. In two of her hands she holds a sword and a skull. Mr. Ward states that this goddess was so insatiate of blood, that, not being able at one time to obtain enough of that of giants, she cut her own throat to supply herself therewith. Ward derives the name from Chinna, cut off, and Mastaka, a head. —*Cole, Myth. Hind.* p. 94. See Kerari.

CHINNERETH, called also Gennesareth, Tiberias, Galilee, and Bahr ul Tibariah, a sea or lake formed by the river Jordan. It has many fish. Its surface is upwards of 300 feet below the Mediterranean, and it is enclosed by steep hills 300 to 1000 feet high. It is 12 miles long and 6 broad.

CHINNY. TAM.? A Travancore wood of a rather dark colour, sp. gr. 0·515. From 8 to 16 feet in circumference; used for building canoes.—*Col. Frith.*

CHINRAIPATAN, a town in Mysore famed for a Jaina statue, estimated 54 to 70 feet high. It has been cut out of the solid rock.

CHIN-SAN, or Golden Island, is in the middle of the Yang-tse-kiang, river of China, where the width is near three miles. It is the property of the emperor. It is interspersed with pleasure-houses and gardens, and contains a large monastery of priests, by whom the island is almost entirely inhabited.—*Macartney's Embassy*, i. p. 27.

CHINSURAH, a neat town on the right bank of the Hoogly river, in lat. 22° 54′ N., and long. 88° 26′ 40″ E., in the neighbourhood of Calcutta. The Dutch established themselves there in A.D. 1675, but they came in contact with the British on the field of Bidera, four miles to the west, and were defeated; and finally, about 1825, they received Java for it in exchange. The college building was formerly the house of Perron, the French general and deputy of Sindia in the Doab.

CHINTA CHETTU. TEL. Tamarindus Indica, *L.*

CHINTAMANI, a mythical wish-gem of the Hindus, supposed to yield to its possessor all that he may desire. The word is Sanskrit, from Chinta, thought, and Mani, a jewel, and is the name of a romantic epic Tamil poem, representing the Jaina system in an attractive form. It is of considerable merit, and is regarded as the highest classical authority in that language, but its style is difficult. It contains 15,000 lines, and probably belongs to the tenth century. It was written by an avowedly Jaina author.

Fast-printed calicoes of different colours, impressed upon a white or light-coloured ground. The name is from chinta, a spot, or spotted. In the Madras Presidency, the principal sites of this manufacture are the towns of Masulipatam, Arnee, and Sydapet. Those of Masulipatam are called Kalam-kari, literally firm colour; they are of various hues. Each piece is 2 cubits in breadth and 12 in length, priced at from 4 to 12 rupees each; and it is used for under-garments by Hindu women. Those of Arnee and Sydapet are 8 by 2 cubits, sold at 1 to 3 rupees each; they are used for pillow-covers and other purposes, as well as the under-garments of humbler native women. Some of the chintzes of Masulipatam and of the south of India are as beautiful in design as they are chaste and elegant in colour. — *M'Culloch; Mr. Faulkner; M.E.J.R.; Dr. Watson.*

CHINVAT, of the Parsee religion, is a mythological bridge. On a death occurring, a dog is brought to look at the corpse, that its passage over Chinvat may be secured.

CHINWA. HIND. Panicum miliaceum.

CHIN ZOOAY. BURM.? Meaning elephant's teeth, a wood of maximum girth 1½ to 2 cubits, max. length 10 feet, abundant on the hills inland, always on rocky, barren ground, in mountainous or hill districts, all over the Tenasserim provinces. When seasoned, sinks in water. This wood is the hardest and strongest known in these latitudes, perhaps anywhere in the world. It is only procurable in such rocky spots as no other tree will grow in. It cuts up, as yendaik and other hard woods do, with huge cracks through it; but is valuable for the edges of phillester planes, for spokeshaves, and for purposes in which much scantling is not required.—*Captain Dance.*

CHIOCOCCA JAVANICA, the Java snowberry, a parasitical shrub, found on the mountains of Java upon trees.—*Eng. Cyc.*

CHIONANTHUS, a genus of trees. Ch. albidiflora, *Thw.*, the taccada gas, grows up to 3000 feet in Ceylon. Ch. intermedia, *Wight* (the Lenociera inter., *Wight*), grows on the Animallay at 5000 feet. Ch. ramiflora, *Roxb.*, is a tree of the Moluccas; and Ch. leprocarpa, *Thw.*, is a small tree growing at 3000 to 4000 feet in the Central Province of Ceylon.—*Thw.*

CHIONE, a genus of molluscs, of which many species occur in Indian seas.

CHIPPEVADU, Chippiga. TEL. A tailor.

CHIPPI, a beggar's bowl made of the shell of the sea, or double cocoanut, Laodicea Seychellarum.

CHIPULU GADDI. TEL. Aristida setacea, *Retz*; Chætaria set., *Beauv.* The words mean broom or sweeping-grass, from the use to which it is applied.

CHIPURA TIGE. TEL. Cocculus villosus.

CHIR, in Chamba, Armeniaca vulgaris, apricot; Prunus Armeniaca. In the N.W. Himalaya, Pinus, *sp.* Dar chir, P. excelsa. Drab chir, P. longifolia.

CHIR. HIND. Phasianus Wallichii.

CHIRA of the Periplus, an ancient kingdom that seems to have been formed out of the Pandya dominions. The Chira seem to have possessed also Kerala, and to have sent an embassy to the Romans, to whom the Chira prince was known as O Kerobothras. See Chera.

CHIRAGADAM. TEL. Batatas edulis, *Ch.*

CHIRAGH. PERS., HIND. A lamp. Ba-charagh, an inhabited house or town. Be-charagh, in ruins. Chiragh ka tel, lamp oil. In Southern India, oil of large-seeded Ricinus communis. In N. India, poppy and other oils are used for lamps.

CHIRA KURA. TEL. Amarantus polygonoides.

CHIRA MELLA. HIND. Phyllanthus longifolius.

CHIRAN. HIND. Prunus Armeniaca.

CHIRANJI. TEL. A dyeing root of Rubia cordifolia, in the bazars of the Northern Circars.

CHIRA SAMUDRA. SANSK. In Hinduism, the sea of milk on which the serpent Sesha rested when Vishnu was reposing. See Balaji.

CHIRATALA BODA. TEL. Dalbergia scandens, *R.* iii. 232.

CHIRAULI. HIND. Buchanania latifolia.

CHIRAUNDA. HIND. Adelia serrata.

CHIRAYIT. HIND. Agathotes chirayta.

CHIRCHA or Chirtsa. CAN. Felis jubata.

CHIRCHIRA, also Chirchitta. HIND. Lycium Europæum, also Achyranthes aspera, resembling the Penicillaria spicata; the people believe if a person eat one chitak of its grain, he will not be hungry for 21 days.

CHIRETTA. HIND. Creyat root.

Chiretta, or chirayta, or kriat, for all these pronunciations are in use, is the name given to several plants, all of them closely allied in medicinal properties to gentian, for which several of

them are perfect substitutes. Like gentian, chiretta promotes digestion, improves the appetite, and gives a tone to the system, without producing much stimulant effect, or causing constipation. It contains a resin and yellow bitter matter, on which the activity of the plant depends. Its use is admissible in all inflammatory states of the intestinal canal, and in febrile diseases. The chiretta of the bazars is the produce of the several following plants:—

Adenema hyssopifolia, the chota or small chirayta, is common in various parts of Southern India, is very bitter, also somewhat laxative, and much used by the natives as a stomachic.

Agathotes chirayta, *Don.*, Ophelia chirayta, *Grissbach*, Gentiana chirayta, *Fleming*, north of India, and Morung hills. All parts of the plant are extremely bitter, and are identical in composition with the common gentian. It is highly esteemed as a tonic and febrifuge all over India. It is a common and abundant plant in the bazar, supplied chiefly by the lower ranges of the Himalaya.

Andrographis paniculata (Justicia paniculata, *Roxb.*), Kalamegh, Beng. Kalupnath or Maha tita, Hind., is the genuine or original chiretta.

Chironia centauroides of Roxburgh (Erythræa Roxburghii, *Don.*), is another and powerfully bitter plant found in India.

Cicendia hyssopifolia (syn. Exacum hyssopifolia), common in various parts of the East Indies; the whole plant is bitter and somewhat laxative; is used by the natives as a stomachic.

Exacum bicolor grows rare on the Neilgherries below Kotagherry, and abundant a mile below Nedawuttum, where it flowers during the autumnal months. This species enamels the swards of the Western Ghats with its beautiful blossoms, has the same bitter stomachic principles for which the Gentiana lutea is so much employed, and, it is believed, may be used with advantage in lieu of gentian for medicinal purposes. The infusion is a mild pure bitter. It is known in Mangalore as country creat, and sold there at 1 anna 6 pie per pound.

Exacum tetragona is another species of this genus, and is called Ooda chiretta, or purple chiretta.

Ophelia angustifolia, *Don* (O. Swertia, *Royle*), is called pukarree chiretta, and is substituted for the true chiretta.

Ophelia elegans, *Wight*, grows plentifully in several parts of the Madras Presidency; is considered febrifuge by the native physicians, who prefer it to the Himalayan chiretta. It grows plentifully in the Jeypore zamindari of Vizagapatam, and is annually exported, as Silaras or Selajit, to the value of about Rs. 2500. The infusion of O. elegans has a powerful bitterness.

Ophelia alata and Ophelia chiretta seem to be used similarly; they grow in the Himalaya.

Villarsia Indica, V. artistata, and V. nymphæides occur in every part of India.

Chiretta may be regarded as a type of the simple bitters, so many of which have been employed in Europe as febrifuges. For such purposes it is employed in India, and it will do whatever a simple bitter can in stopping intermittents. Chiretta is of much service in convalescence from fever. It is one of the few articles of the Indian Materia Medica which is in every respect an adequate substitute for the corresponding European article. Chiretta is a useful vehicle for other remedies. It is the basis of the celebrated drogue amere, a compound of mastic, frankincense, resin, myrrh, aloes, and creat root, steeped in brandy for a month, and the tincture strained and bottled. Chiretta is met with in a dried state, tied up in bundles, with its long slender stems of a brownish colour, having the roots attached, and which have been taken up when the plant was in flower. It is procurable in all native druggists' shops. The extracts of chiretta agree in being valuable bitter tonics. Both these and gentian contain a peculiar principle, termed the gentisic acid. The dose is ten to thirty grains twice or three times daily, usually prescribed with sarsaparilla, hemidesmus, or iron (Beng. Phar. p. 290). The wine of chiretta is cordial bitter and tonic in a dose of two fluid drachms. A compound tincture of creat is prepared by creat root six ounces, myrrh and aloes each one ounce, French brandy two pints; macerate for three days, and strain. This preparation is equivalent to the celebrated drogue amere. Its effects are tonic, stimulant, and gently aperient. It is a valuable preparation in the treatment of several forms of dyspepsia and torpidity of the alimentary canal, in a dose of one fluid drachm to half an ounce. —*Faulkner, Beng. Phar.; On Chiretta, by Dr. Cleghorn; Dr. J. L. Stewart.*

CHIRGHA, a Pukhta war-cry. Chirgha wal, a fighting man.

CHIRI. Sansk. Wrightia antidysenterica; Memusops hexandrus.

CHIRI. Tel. A term applied to several plants resembling others:—

Chiri alli, Villarsia cristata, *Spreng.*
Chiri annem, Briedelia scandens, *Willd.*
Chiri benda, Sida cordifolia, *L.*
Chiri bikki, Gardenia gummifera, *L.*
Chiri chatarasi, Dentella repens, *Forst.*
Chiri dudduga, Alphonsea lutea, *H.*

Chiri giligichcha, Crotolaria laburnifolia, *L.*
Chiri gummudu, Batatas paniculata, *Ch.*?
Chiri jeguru, Cluytia, *sp.*
Chiriki, Sansk., fruit of Buchanania latifolia.
Chiri koti goru, Pterolobium lacerans, *R. Br.*
Chiri kura, Amarantus polygonoides.
Chiri malla, Jasminum angustifolium, *Vahl.*
Chiri manu, Conocarpus latifolia.
Chiri nanupala, Euphorbia, *L.*
Chiri palleru, Tribulus lanuginosus, *L.*
Chiri piaz, Hind., Allium rubellum.
Chiri sanagalu, Ervum, *sp.*?
Chiri teka, Clerodendron, *sp.*
Chiri teku, bastard teak, Erythrina Indica, Wormia bracteata.
Chiri tummi, Leucas, *R. Br.*
Chiri vanga, Solanum melongena, *L.*, small var.
Chiri veru, Oldenlandia umbellata, *L.*
Chiri ulava, Rhynchosia rufescens, *D.C.*

CHIRIA. Hind. A bird; hence Chiriya-Mar, a bird-catcher, a low caste fowler.

CHIRIMI. Malay. Cicca disticha, *Linn.*

CHIRITA SINENSIS, the manneen-chung of the Chinese, a dwarf species of Lycopodium, highly prized by that people. —*Fortune's Tea Districts*, p. 8.

CHIRIT MURAL. Malay. Caoutchouc.

CHIRIYA-GHAS. Beng. Helopus annulatus.

CHIR-MITI. Hind. Abrus precatorius seeds.

CHIR-MUTTI. Hind. Leptropus cordifolia.

CHIR-NATH. Hind. Fir cones of Pinus longifolia and P. Gerardiana.

CHIRNDI. HIND. Litsæa, *sp.*; Adelia serrata.
CHIRNDU, Eleodendron dichotomum.
CHIR-ODHELI or Chir-vadhal of Dehra Ghazi Khan (hills), obtained from the tamarisk (F. furas or F. dioica), said to be called pinjwa in other parts. This occurs in nodules, highly friable, of a granular texture.—*Powell's Handbook.*
CHIROLI. HIND. Prunus Armeniaca.
CHIRONIA CENTAUROIDES. *Roxb.* Erythræa Roxburghii, *Don.* | Nye, ... HIND.
This plant grows in several parts of India; its leaves and stalks are powerfully bitter, and are found in the bazars as one of the chirettas.—*O'Sh.*
CHIROR. HIND. Mahonia Nepalensis.
CHIRRU. HIND. Xanthium strumarium.
CHIRU DEKHU. TAM. Clerodendron serratum, *Blume.*
CHIRUGU CHETTU. TEL. Caryota urens.
CHIRUNJE. HIND. A red dye from Buchanania latifolia.
CHIRU NUTI. BENG. Amarantus polygonoides, *Roxb.*; Oxystelma esculentum, *R. Br.*
CHIRU-PARAM. TAM. Riedleia corchorifolia.
CHIRUTA-ITA. TEL. Phœnix farinifera.
CHIRWI, in the Multan division and Derajat, means the best kind of split and dried dates of the Phœnix dactylifera; the word seems from chirna, HIND., to split.
CHISHTI, a tribe of Arab descent in Multan, and at Bijapur in the Dekhan. Those on the banks of the Sutlej river are peaceful and industrious, but strict and bigoted.
CHISHTIAH, a sect of Mahomedan fakirs.
CHIT. HIND. Chintz; sprinkled, hence,—
Chit-Abra, a printed cotton.
Chit-Pattu, a woollen wrapper with a chit or print pattern.
Chit-Rahdar, a print with a striped pattern.
Chit-Bundri, spotted print.
Chit-Butidar, sprigged print.
Chit-Marpech, spriggled print.
Chit-Shakargah, print with figures of animals.
Chit-Nakl-irani, a kind of Persian print.
CHIT, in the doctrines of the Sri-Sampradaya sect of Hindus, means the spirit of Vishnu; this, with Achit, or matter, and Ishwara, or god or ruler, being the three predicates of the universe. In their views, Vishnu is Brahma, before all and creator of all. See Sri-Sampradaya.
CHITA. See Cheeta.
CHITA. BENG., HIND. Plumbago rosea; P. Zeylanica, *Linn.*
CHITA BAGNU. HIND. Populus alba.
CHITA BANSA. HIND. Ipomœa turpethum.
CHITAK, a measure of weight equal to 914 grains.
CHITAL, Chitra, Chitri. HIND. Axis maculatus, *Gray.*
CHIT-AMINDALU NUNA. TEL. Oil of small-seeded Ricinus communis, castor-oil plant, used medicinally.
CHITANA. HIND. Pyrus Kumaonensis.
CHITANKALOO. TEL. Wrightia tinctoria.
CHITA-PULI. TEL. Felis jubata, *Schreber.*
CHITA-RATHI. MALEAL. Alpinia racemosa.
CHITARKOT, a hill in the Banda district, N.W. Provinces of India, with the Paisuni river at its base. There are thirty-three Hindu shrines; and many pilgrims still visit them, and circumambulate (pradakshana) the hill.—*Imp. Gaz.*
CHITAS. PORT. Chintz.
CHITA SINJI. HIND. Melilotus leucantha.
CHITAWALA. HIND. Senecio angulosus.
CHIT BATTO. HIND. Trifolium pratense.
CHITE ANKALU. TEL. Wrightia tinctoria.
CHITES, also Zaraza. SP. Chintz.
CHITIJARI. HIND. Aconitum heterophyllum.
CHITIKESWARUM. HIND. Poinciana elata.
CHITIMIRK, HIND., also Chiti-phul, Heliotropum brevifolium.
CHITI-MORT. HIND. Desmodium argenteum.
CHITI MUTI. TEL. Sida acuta, *Burm.*
CHITI SIRIN. HIND. Cedrela toona; C. serrata.
CHITKA. BENG. Bauhinia acuminata.
CHITKABRA. HIND. Uraria chetkubra.
CHITKAN of Hazara, an ear-ring.
CHITKEE. HIND. Snapping the fingers.
CHITLINTA KURA. TEL. Marsilea Coromandelina; M. minuta, *Heyne*, 54; also Riedleia corchorifolia.
CHITONIDÆ, the Chiton family of molluscs.
CHITOOA-BORA. BENG. Polypodium glabrum.
CHITPATRA. HIND. Marlea begonifolia.
CHITPEKALARA, in Arakan, slaves who had been taken in battle.—*Wilson.*
CHITRA. HIND. Staphylea emodi; Drosera muscipula. Lal chitra is Plumbago Zeylanica.
CHITRA, also written Chaitra, and Chaitram, the first month of the Tamil solar year, answering to the Hindu Vaisac'ha, when the sun is in the sign Mesha. But this name is also that of the last month of the Hindu solar year, used everywhere (excepting in the Tamil country) when the sun is in the sign Min, answering to the Tamil Pungoni. Lastly, Chaitra is the name of the first month of the luni-solar year, which begins on the new moon preceding the sun's entrance in the sign Mesha. This variety of significations of terms so nearly resembling each other requires the greatest attention, when adverting to dates, and reading books written in different countries.—*Warren.*
CHITRA. BENG. Cucumis Madraspatanus; also HIND., Berberis lycium, B. Asiatica or B. aristata.
CHITRAGUPTA, pronounced Chitrgoputr, the registrar of Yama, the recorder of the dead. When Yama sits in judgment on the dead, Chitragupta examines the register in which the good and bad deeds of men are recorded. From Chitru, to write, and Goopta, hidden. He had several sons, from whom the different tribes of Bengal Kayasths derive their origin,—Sribastab, Ambashtha, Karan, Bhattanagar, Gaura, Valmika, Mathur, Saksena, Aithana, Kulasreshtha, Nijam, Suradhwaja.—*Dalton, Ethnol. of Bengal*, p. 313.
CHITRA INDICA, one of the Chelonia or tortoises. It inhabits India.
CHITRA JAVANIKA, a painted cloth, a screen or veil suspended in a temple before the adytum; according to Malanka, it is rather arras or tapestry; he describes it as cloth covering the walls of a temple.—*Hind. Theat.* ii. p. 74.
CHITRA KOOTA. SANSK. From Chitra, speckled, and Koota, the peak of a hill or mountain. An isolated hill on the bank of the Pisani river, 50 miles S.E. of the town of Banda in Bundelkhand, in lat. 25° 12′ N., and long. 80° 47′ E. The whole neighbourhood is Rama's country during his exile. Every head-

land has some legend; every cavern is connected with his name. It is a sacred spot; crowded with temples and shrines of Rama and Lakshmana. Many thousands annually visit the spot, and round the hill is a raised footpath, on which the devotee with naked feet treads, full of pious awe. It was the seat of Valmiki, the sage and poet, author of the Ramayana. The hill is crowded with monkeys. The river is lined with the landing-places called ghats, and flights of stairs for ceremonial ablutions.

CHITRAL, or Little Kashgar, is beyond the Belut Tagh mountain. See Bucharia; Eastern Turkestan.

CHITRA-MUL. HIND. Thalictrum foliosum.

CHITRA-MULAM (Tella, Nalla, and Erra, white, black, and red). A generic name for species of plumbago.

CHITRA-RAT'HAN, the chief musician of Indra, who rides in a painted car. On one occasion it was burned by Arjuna, the confidential friend and agent of Krishna, or the sun.

CHITRA VANI. SANSK. Plumbago Europæa.

CHITRI CHIRUYA. BENG. Urochloa panicoides.

CHITRIKA. TEL. Limonia pentagyna, *R.*

CHITTA-AMADUM. TEL. Castor-oil.

CHITTA-BURKANI, also Chittaganda. TEL. Leggada lepida, *Jerdon.*

CHITTABUTE of Murree, Abelia triflora; also Buddlea crispa.

CHITTA-DUDAGA, Guatteria cerasoides, *Dun.*

CHITTAGONG, or Islamabad, a town which gives its name to a district of British India along the N.E. coast of the Bay of Bengal. The town is built on the bank of the Karnaphuli river, in lat. 22° 21′ 3″ N., and long. 91° 52′ 44″ E. The district is bounded on the N. by Tiperah, S. by Arakan, E. by the Yomadoung mountains, and W. by the Bay of Bengal, and has an area of 2322 square miles, and a population of 1,006,422 souls. It is a low strip of coast about 165 miles long, with many large tidal creeks; and the central parts opposite the islands of Mashkal and Kutabadia much resemble the Gangetic Sunderbuns. Since historic times it has been subject successively to Tiperah, to the Afghan rulers of Bengal, to the raja of Arakan, to the Dehli empire; and it was ceded to the British East India Company in 1760. The Portuguese descendants are known as Feringhi. They were 854 in 1872; the Nat, 949; the Magh, 30,026; and the Rajbansi, 10,852; Brahmans, 22,657; and Kayasths, 68,916. The Lascars of the coasting and foreign-going ships are largely from Chittagong. The Rajbansi are the offspring of Bengali women and Burmese husbands. 70·5 per cent. of the population are Mahomedans, the Hindus 26·7 per cent.—*Imp. Gaz.*

CHITTAGONG HILL TRACTS are a portion of the great chain of mountains running from Assam southwards to Cape Negrais, and the Blue Mountains, on the frontier of Chittagong, rise 8000 feet above the sea. Several rivers rise in these mountains, amongst others the Karnafuli, which flows into the Bay of Bengal. The hill tribes of Chittagong call themselves Kyoung-tha, or sons of the river, and Toung-tha, or sons of the hills. The latter, to which the Lushai belong, are the more savage and independent, and speak different languages. The former have a written language, and even possess several copies of the Raja wong, or History of the Kings of Arakan. They are of Arakanese origin, speak the Ra-khui dialect, and are Buddhists. All are Mongolian in physique. They have an honest, bright look, with frank and merry smile, and their look is a faithful index of their mental characteristics. They live in bamboo houses raised above the malaria of the ground. They practise Jum, Cheena, or Kumari cultivation, burning down the jungle to prepare the soil for mixed seed scattered broadcast, and moving off to a new site next season. And they have a mild form of debtor slavery, which Captain Lewin thinks the British too suddenly interfered with, so that the hillmen fall victims to the usurer.

The Kyoung-tha, or Jumia Magh, have 15 clans, who dwell in village communities under a Roājā, or village head.

The Toung-tha tribes, a wilder and less civilised group, are the Tiperah, Mrung, Kumi, Mro, and Khyeng, Bangi, Pan-kho, Lushai or Kuki, and the Shindu, the last four being independent. Their villages are generally situated on lofty hills. They worship the elements.

The Chakma (Tsak or Tsakma, or in Burmese Thek) is the largest of all the tribes. It has 40 clans. Their habits are similar to those of the Kyoung-tha. The tribes all practise the Jum or Kumari form of agriculture; and rice, cotton, tea, tobacco, and potatoes are their chief crops. The elephant, the rhinoceros, the tiger, and the leopard are numerous, with the Malay black bear, the wild buffalo, the sambur (Rusa Aristotelis). The python grows to a large size.

Among the independent tribes beyond the British border, prisoners of war are sold like cattle. Raids are caused by the usage of wehrgeld, which they call goung hpo, or the price of a head; for when a villager dies, his friends charge the village which he may have last visited with his death, and demand a price for his life. Raids for women seem to keep up the necessary supply. Chastity is enforced only after marriage. All the unmarried lads sleep in one house in the village, under the care of a 'goung' or headman. The merry-makings and customs which are connected with this 'bachelor's hall,' as Colonel Dalton calls it, are the same as in the Kol and Gond countries. In the hills marriages are unions of affection, not of convenience or interest. Girls marry at 16, lads at 19. The most favourite offering to a sweetheart is a flower; and the lover will often climb the hills before dawn to procure the white or orange blossom of some rare orchid for the loved one's hair. One of Captain Lewin's police sought a week's leave of absence on this ground: 'A young maiden of such a village has sent me flowers and birnee rice twice as a token, and if I wait any longer they will say I am no man.' Among the Kyoung-tha, a leaf of pawn, with betel, and sweet spices inside, accompanied by a certain flower, means 'I love you.' If much spice is put inside the leaf, and one corner turned in a peculiar way, it signifies 'Come.' The leaf being touched with turmeric means 'I cannot come.' A small piece of charcoal inside the leaf is 'Go, I have done with you.' The love songs are as pure as they are pretty, and no improper ditties are allowed in the hearing of the village maidens. As the lads and lasses work in a crowd at harvest times, they respond in chorus, or, when the leader has finished, the whole party break out into the hoia or hill

call, like the jodel of Switzerland, and the cry is taken up from hill to hill, till it dies away in the distant valleys. In their mode of kissing, instead of pressing lip to lip, they apply the mouth and nose to the cheek and give a strong inhalation. They do not say, 'Give me a kiss,' but 'Smell me.' The religion of these tribes is a mixture of Buddhism and nature-worship. At the Maha Muni temple in Arakan, the bamboo is adored by some as the impersonation of the spirit of the forest. But wherever, as in the case of the Chakma, the tribes come into contact with the Bengali, they show a tendency to gravitate towards Hinduism, the caste of which would soon kill the joyousness and check the freedom of their life. The Khumia and Kuki tribes occupy the hills of Sylhet, Tiperah, and Chittagong; the Kuki at the tops of the hills, and the Khumia on the skirts. The Kuki are the ruder or more pagan race, though also tinctured with Hinduism. They term their chief deity Khojein Putiang, to whom they sacrifice a gyal; and to an inferior deity, named Shem Saq, a rude block of wood put up in every quarter of a village, a goat is offered; and they place before it the heads of the slain in battle, or the heads of animals killed in the chase. The Kuki say that they and the Mug are the offspring of the same progenitor.—*Captain Lewin.*

CHITTAGONG WOOD, Chickrassia tabularis, is used at Madras for furniture. It is light, cheap, and durable.

CHITTAK. HIND. An Indian weight, equal to 914 grains = 2 oz. 39½ grs. avoir.

CHITTA LINNY. TAM.? A Travancore wood of a red colour, sp. gr. 0·847, 1 to 1½ feet in circumference; used for furniture.—*Col. Frith.*

CHITTAMANAK YENNAI. TAM. Castor-oil. Chittamudapu, TEL., Ricinus communis, the small variety, from the seeds of which only the medicinal castor-oil is expressed.

CHITTAMATTA. TEL. Gardenia gummifera.

CHITTA-RATTA. MAL. Alpinia galanga.

CHITTA-ROHI, in Northern India, sand with salt efflorescence.

CHITTA TUMIKI. TEL. Diospyros tomentosa.

CHITTA YELKA. TEL. Leggada lepida.

CHITTEDURU. TEL. Vanda Roxburghii.

CHITTENTA KURA. Riedleia corchorifolia.

CHITT'HI. HIND. A note, a letter, an order or demand; hence Chit-navis, a note-writer.

CHITTI ANKUDU. TEL. Wrightia tinctoria. Chitti Benda, Pavonia odorata; Chitti Gara, Capparis brevispina; Chitti Papara, Citrullus colocynthis.

CHITTI-PHUL. HIND. Heliotropium brevifolium.

CHITTITA CHETTU. TEL. Phœnix farinifera.

CHITTORE or Chetur, a town in Rajputana, in the kingdom of Mewar. Its dynasty are Rajput, and claim to be descended from Lob, the eldest son of Rama, of the Solar dynasty. They say that they were first ruling at Balabhipura, a city in the gulf of Cambay, but their capital was laid waste by a son of Nushirwan of Persia, in A.D. 524. The Rajput queen escaped the general destruction, and gave birth to a son, named Goho, from whom the rajas of Udaipur are descended. Goho established the kingdom of Edur, and eight princes succeeded him on the throne. The race seem to have remained in the desert till the middle of the 8th century, but in A.D. 727 Bappa took Chittore. Shortly afterwards Bappa proceeded to Saurashtra, and married the daughter of Esupgole, prince of the island of Bunderdhiva. With his bride he conveyed to Chittore the statue of Vyan-mata, the tutelary goddess of her race, who still divides with Eklinga the devotion of the Gehlot princes. The temple in which he enshrined this islandic goddess yet stands on the summit of Chittore, with many other monuments assigned by tradition to Bappa. Bappa is not a proper name, it signifies merely a child. He is frequently styled Syeel, and in inscriptions Syeel Adhes, the mountain lord. The Mori prince from whom Bappa took Chittore was of the Tak or Takshak race, of whom Nagnecha, Nagani Mata, was the mother, represented as half woman and half serpent, the sister of the mother of the Scythic race, according to their legends. Many rites of the rana of Mewar's house are decidedly Scythic. According to Sir H. Elliot, however, when Mahomed bin Kasim, the general of Walid, overran Gujerat about A.D. 718, and advanced to Chittore, Bappa met and entirely defeated him, and after this Bappa was raised to the throne of Chittore. After a long and prosperous reign, Bappa abdicated and departed to Khorasan, Tod says to Scythia. In the reign of Khuman, his great-grandson Mahmun, governor of Khorasan, invaded Chittore, but was defeated and expelled by Khuman after twenty-four engagements. Baber, 1527, sustained a great defeat at Futehpur Sikri at the hands of the Rajput Rama Singha, chief of Chittore; but in 1527 Baber led his army a second time against the Rajput prince, whom he overthrew, and completely broke his power. While ruled by Oody Singh, Chittore was invested by the emperor Akbar, and captured after a prolonged siege. Oody Singh, at the approach of the imperial army, withdrew to the Aravalli hills, and left Jeymul, the Rajput chief of Bednore, to defend his kingdom; Jeymul, with 8000 of his men and women, perished on the occasion, and 74½ maunds of plunder were taken away by the army of Akbar. The capture of Chittore was regarded at the time by the Rajput race as the greatest of misfortunes, and they have perpetuated the remembrance of it by impressing on all their correspondence the figures 74½. Oody Singh did not re-occupy Chittore, but founded Udaipur, which he made his capital.—*Elliot's Hist. of India; Tod's Rajasthan*, i. p. 594; *Elphinstone.*

CHITT-PAWAN. MAHR. A Konkanistha Brahman.

CHITTULDROOG, a hill fort which gives its name to a town and district in the Nagar division of the Mysore kingdom, 120 miles N.W. from Bangalore. It gets its name Chutta thul droog, or the Umbrella Hill, from its shape. The district has an area of 4471 square miles, and a population in 1871 of 551,360. It is a sterile tract, with little rainfall. It was long held by a Polygar chief of the Beder race, and the present non-Aryan races are the Beder 90,050, the Wakkaliga 69,735, Golla 46,296, and the Kuruba 35,459, with out-castes 58,245, and wandering tribes 44,142. The Mahomedans are 18,068, and the Siva Chaktars or Lingaet, 44,142. The district in the early years of the Christian era was largely of the Jaina faith; and there are many

inscriptions of the Chalukya, Ballala, and Vijayanagar dynasties, and there are now several maths or Hindu monasteries. Here, on the 6th August 1809, East India Company's officers induced the native soldiers to mutiny, but they were attacked and defeated by detachments of the British army. —*Imp. Gaz.*

CHITTUR, a town and fort in the N. Arcot district, 98 miles west from Madras, and 1100 feet above the sea. It is in lat. 13° 14′ N. The hills are rugged and barren; they are intersected by a vein of iron ore. It is built on the south side of the Pooney river, which runs through the valley, and joins the Palar.

CHITTUR DULLA. Sansk. Marsilea quadrifolia.

CHITULIA, a genus of water-snakes of the order Hydridæ. C. mornata and C. fasciata inhabit the Indian Ocean.

CHITZ. Mahr. Tamarindus Indicus.

CHIU. Hind. Rhododendron arboreum, also Euphorbia Royleana.

CHIUN, of the prophet Amos, v. 26, is supposed by Calmet to be Bal-peor, Chivin, or Siva.

CHIURACY? a Penang wood of a brown colour, sp. gr. 1·081; used for beams.

CHIVAN AMELPODI. Maleal. Ophioxylon serpentinum, *Linn.*

CHIVATI. Maleal. A small coasting vessel of Malabar.

CHIVENDI. Tam. A Ceylon timber tree, about 8 inches in diameter and 20 feet in height; used in housework.—*Edye, Ceylon.*

CHIVES, Allium schoenoprasum, a variety of the onion, held in estimation for its leaves and small bulbs, and used in soups and salads. Propagated either by slips, or dividing the roots at any season, but best after the rains; 9 or 10 inches of space must be allowed between each bulb. Requires plenty of water, and protection from the vertical rays of the sun.—*Riddell.*

CHIVIKI VELAMA. Tel. Eleusine coracana.

CHIWANA. Hind. A place for the cremation of the Hindu dead, called also Chihaee and Chihanee. These three terms are derived from Chaee, ashes. Marg'hat, Bhoeedugdha, and Smusan or Samsan (in Benares), are also employed to signify the burning place.

CHLIATÆ or the Kallat, with the Kankli, Kapchak, and Kharlik, are four Turkish tribes descended from the Oguz Khan.—*De Guignes*, ii. p. 9; *Yule, Cathay*, i. p. 165.

CHLORANTHUS BRACHYSTACHYS, one of a genus of plants belonging to the natural order Chloranthaceæ; is a native of the coast of Java. Its properties are like those of C. officinalis.

CHLORANTHUS INCONSPICUUS. *Smith.*

Chu-lan, ... Chin. | Ki-chau-lan-hwa, . Chin.

Its small flowers, along with those of Aglaia odorata, are mixed with certain kinds of tea, called after the plant, Chu-lan-cha. This is the scented caper of commerce, a very excellent but expensive tea.—*Smith.*

CHLORANTHUS OFFICINALIS, a smooth shrub 3 to 4 feet high, a native of Java, in the moist woods 1500 feet above the sea. All the parts are powerfully aromatic. The roots, if quickly dried, retain their properties for a long time; and the mountaineers employ them in infusion as a remedy for spasms; also, united with anise or Ocimum, in small-pox. In fevers it is said to be of great service. It is a powerful and active stimulant.—*Engl. Cyc.*

CHLORIDE OF ZINC. Captain Keppell believes Sir William Barnett's solution of chloride of zinc, properly applied, the only composition yet known that will preserve anything from the white ants.—*Keppell's Ind. Arch.* ii. p. 189.

CHLORITE is found in connection with tin. Portions of the clay-slate east of Tavoy contain chlorite slate. The Moongnee stone of Orissa is said to be chlorite slate.

CHLOROXYLON SWIETENIA. *Roxb.*

Swietenia chloroxylon, *Roxb.*

Satin-wood, . . . Eng.	Porasham, . . . Tam.
Bhiree, ... Mahr.	Kodawah porasham, ,,
Mal burute, or flowered satin; Buruta, Singh.	Billuda, ... Tel.
	Billu chettu, . . . ,,
Mududa, ... Tam.	Bilugu? . . . . Uria.
Vum-maai, . . . ,,	Bhayroo, ... ,,

The satin-wood tree grows in Ceylon, chiefly in the eastern districts, where it attains a large size, and is esteemed next to the Calamander in value. It grows in Coimbatore, in the Animallay hills, where Dr. Wight got planks 15 inches broad. Indeed, some of the finest satin-wood to be anywhere seen is to be met with near the foot of the Animallay, though even there this valuable wood was rapidly disappearing under the cultivator's axe. It grows at Gokak; but Dr. Gibson had never seen it reach beyond the size of a small tree, which, when straight (seldom the case), would afford a log squaring 3 inches. It is found only in the Padshapoor jungles, and in those of the upper Mool, in the Ahmadnaggur collectorate. In Ganjam the tree is not so common as in Bodo godo; and it is said to be still more plentiful in Mohery and other taluks to the south. It is a most serviceable hard wood, well suited for naves of wheels, and, were it procurable in any quantity, for all framework requiring strength and and durability. The Peradenia bridge, a single arch of 205 feet on the road to Kandy, was designed for and principally executed in this wood. The wood is very close-grained, hard, and durable, of a light orange colour, takes a fine polish, and is suited for all kinds of ornamental purposes, but is somewhat apt to split. For picture frames it is nearly equal to American maple. The timber bears submersion well; in some instances it is beautifully feathered, and flowered or feathered satin-wood, when first polished, is one of the most beautiful woods in the world. Mr. Rohde had seen specimens surpassingly beautiful; but the valuable logs are not distinguishable from ordinary satin-wood till sawn, and twenty or forty may be cut without one of any beauty being found. The feathered satin-wood seems very liable to sever when dry and old. Articles of satin-wood get darker and lose much of their beauty by age, unless protected by a coat of fine varnish. A cubic foot weighs 55 to 57 lbs. It is used for axletrees, oil-presses, posts, bed-posts, rafters, and the handles of axes; and in the Madras Gun Carriage Manufactory, for naves of wheels, also for fuses. The wood is excellent for agricultural implements, internal decoration and furniture, brushes and turnery.—*Drs. Roxb.* ii. 400, *Gibson, Wight, Cleghorn; Mr. Rohde; Mr. Mendis; Hartwig; Thw.*

CHO, or Chor, are vast and continually encroaching beds of sand left by the torrents that rush down from the low hills of the Siwalik range. The rapid increase of the area thrown out of cultivation by

being covered with barren sand, has been a source of continual trouble and anxiety to the revenue officers of the district; and the increase of the sand area is being continually accelerated by the destruction of forests on the outer hills. These hills are composed chiefly of an exceedingly soft sandstone. When once its surface is laid bare by the destruction of the grass and brushwood that once covered the hills, it is very readily swept away by the heavy rainfall. The vertically falling rain at once penetrates it, down almost to the level of the plain, and excavates a narrow gorge with perpendicular sides extending far into the hills, but with the bed of the stream sloping very gently until it terminates in a vertical wall at the upper end. The rush of the water over this precipice, every time a shower falls, disintegrates a quantity of the rock, and helps to extend the area of loose sand on the plain below. The sandstone in its natural state is not unfertile; it is easily penetrated by the roots of plants, and contains a considerable admixture of lime and clay. Moreover, patches of ancient forest are still occasionally to be found on the hills.

CHO. HIND. Pyrus malus.

CHOAR KULLI MARAM. TAM. Soymida febrifuga? yields clear, transparent gum, slightly tinged with red, and with a slight dash of bitter in the taste.

CHOASPES, the ancient name of the river on which Susa, in Khuzistan, was built. It is the modern Kerah river, near which are the ruins of Susa.—*Williams' Essays*, p. 13.

CHOB. HIND. A stick, a pole, timber, a mace. Chob-dar, a mace-bearer. The chob or mace is made of silver, ivory, or wood. It is probable that the office of gold stick, adopted in the British Court, was borrowed from the East. Most men of rank in India—Hindu, Mahomedan, or British—retain this class of attendants, mostly, however, bearing a silver baton, but having the common name of chob-dar, or staff-bearer. The chob or baton is about five feet long, with a head, and as thick at the upper end as one's wrist, or as a constable's staff.

CHOB, a strong fibre of Chutia Nagpur, made into ropes.

CHOBA, a dish of polao, mixed with slices of cocoanuts, dates, and almonds.

CHOB-CHINI. HIND. Smilax China, China root.

CHOB-i-PAU. PERS. Fothergilla involucrata.

CHOB-KUT. HIND. Costus root.

CHOBS. —? Campanula edulis.

CHOCHENA. URIA. ? A tall tree of Ganjam and Gumsur. The bark is used medicinally in fever, and the milk is given to children in a wasting disease there, called 'dūbli.'—*Captain Macdonald.*

CHOCHHI. HIND. ? A tree of Chutia Nagpur, yielding a harsh, reddish-grey timber.—*Cal. Cat. Ex.* 1862.

CHOCOLATE, a nutritious article of diet manufactured from the nuts of the Theobroma cacao and T. bicolor. It reaches India in the various forms of chocolate nibs, flake chocolate, soluble chocolate, and flake cocoa. T. cacao is now seen to a small extent in the S. of the Peninsula of India, and in British Burma, but is grown chiefly in Trinidad, Guiana, and Brazil. The husk contains a number of the seeds, very closely packed in a little pulp. These, after being dried, roasted, and ground, constitute cocoa; if merely broken up after roasting, cocoa nibs; mixed with starch and very finely ground, soluble cocoa of the shops. Chocolate consists of the same, made up into a paste, and flavoured. In 1870 nearly 15,000,000 of pounds of cocoa were imported into Great Britain, more than 6,000,000 being entered for home consumption.—*M'Culloch.*

CHODA of Hazara, Pyrus baccata, crab apple.

CHOD-TEN, in Tibetan, is the chaitya of the Sanskrit, a Buddhist monument numerous in Tibet, dedicated to the celestial Buddha.

CHOERADODIS, a genus of Mantodea common to India and tropical America.

CHŒTOCARPUS CASTANOCARPUS, *R.*, is Adelia castanicarpa, *Roxb.*; Ch. pubescens, *Thw.* A tree of Ceylon, variable in size, common in the Ratnapura and Ambagamowa districts; also found in Sylhet, Khassya, Burma, etc. The timber is very hard, and in use for building purposes. Chœtocarpus coriaceus, *Thw.*, is a moderate-sized Ceylon tree, common.—*Beddome, Fl. Sylv.* p. 284; *Thwaites.*

CHOGA, a loose cloak worn by the Afghans, not unlike the dressing-gown of European nations. It is made of a fabric woven of camel's hair or of the fine wool of the rufus sheep, or of that which grows at the roots of the hair of the goats in the northern parts of Afghanistan. That of camel's hair cloth costs up to £20; it is called Shutri choga. From Barrak, the cloth made from the rufus-woolled sheep, is made the Barraki choga. Kurk cloth, made from the wool of the highland goat, is used for the Kurki choga. Kurk resembles the pashmina or woollen cloth of Kashmir, but is of denser texture. They are made chiefly near Herat and in the Hazara country. Those of Kashmir are famous. A choga of British broadcloth, lined with the fur of the sambur deer, costs £60 to £80; but the fur of the ermine, squirrel, and fox are also used.—*MacGregor*, p. 50.

CHOGOD. HIND. An owl; also pronounced chuhat.

CHOGU. HIND. Taxus baccata.

CHOHAN or Chahuman, one of the four Agnicula tribes, which formed a dynasty that reigned at Ajmir and Dehli, and afterwards at Kotah and Bundi. Ajipala, one of this dynasty, founded Ajmir in A.D. 145; and it was afterwards lost to the Mahomedans by Dola Rai. Harihara Rai defeated Sabaktagin. The race has been conspicuous for bravery during two thousand years. The leading individuals have been—

Anhul or Agnipala, 'offspring of fire,' the first Chohan; probable period 650 before Vikrama, when an invasion of the Turshka took place; established Macavati nagri (Gurra Mundilla); conquered the Konkan, Aser, Golconda.

Suvatcha Mallan. In all probability this is the patriarch of the Mallani tribe.

Gulun Soor; Ajipala, 'Chukwa,' or universal potentate; founder of Ajmir, some authorities say in 202 of the Vikrama, others of the Virat-Samvat. The latter is the more probable.

Dola Rai, slain, and lost Ajmir on the first irruption of the Mahomedans, S. 741, A.D. 685.

Manika Rai, S. 741, founded Sambhur; hence the title of Sambri-Rao borne by the Chohan princes, his issue.

Hursraj, S. 827, defeated Nazir-oo-din (qu. Subaktagin), thence styled 'Sultangraha.'

Beer Beelundoo or Dharmaguj, slain defending Ajmir against Mahmud of Ghazni.

Beesuldeo (classically Visaladeva); his period, from various inscriptions, S. 1066 to 1130.

Anah, constructed the Anah Sagar, Ajmir; still bears his name.

After Anah were Jeipal, Ajeydeo or Anundeo, and Someswar. Someswar married Rooka Bae, daughter of Anung Pal Tuar, king of Dehli, and their son Prithi-raj succeeded to the throne of Dehli, and is said to have been slain by Shahab-ud-din S. 1249, A.D. 1193. His son Rainasi also fell. Vijaya raj, son of Someswar, whose name is on the Dehli pillar, was a nephew of Prithi-raj, and was adopted as his successor. His son Lakunsi had twenty-one sons, seven of whom were legitimate, the others illegitimate, and founders of mixed tribes. From Lakunsi there are twenty-six generations to Nonud Singh, a late chieftain of Neemana, the nearest lineal descendant of Ajipal and Prithi-raj. The genealogical tree of the Chohan tribe exhibits thirty-nine princes, from Anhul, the first created Chohan, to Prithi-raja, the last of the Hindu emperors of India. Mahomedan historians say that Prithi-raj was killed at the battle of the Cuggur, or shortly afterwards; but Chand, or rather his continuator, represents him as dying in captivity at Ghazni, and the bard would gladly have concealed so humiliating a fact if he could. Several Chohan sepoys, after the capture of that fortress, sought out and professed to find the Ch'hatri of their ancestor, where they showed their devotion to his memory, by presenting their humble offerings in honour of the champion of their faith. The desert tribes in the Chohan territory, the Sahrai, Khosa, Koli, Bhil, were till lately predatory. The western Chohan are said to be free from infanticide. They do not wear the zonar, nor form a circle (choki) in cooking, and their cooks are usually of the barber caste. The Chohan and Gehlot were neighbours, and on friendly terms, but the Rahtor and Tuar were often at war, though only separated by the Kali naddi. The Chohan territory on the S.E. has Koliwara, on the W. the desert Dhat, on the S. the Rin. It has two divisions,—Vira Bah on the E., and across the Looni on the W. is Parkar, the Naggur Parkar of the maps. Bundi and Kotah are the most celebrated of the existing Chohan. Twelve branches of the Chohan became Mahomedans.—*Prinsep's Antiquities by Thomas*, p. 248; *Tod's Rajast.; Elliot, Supp. Gloss.*

CHOHAR or Choar, a tribe of mountaineers in the hills of Ramgarh, etc.—*Wilson.*

CHOI, also Jira. HIND. A hole in the bed of a river, to get water; the outer leaf or spathe of the sugar-cane.—*Elliot.*

CHOIGYAL. TIB. Dharmaraja, the judge of the dead. Shin-je, TIB., is also said to have the same meaning.

CHOIL. PANJABI of Cis-Sutlej. Low, swampy, undrained land.

CHOITRO, a Hindu month corresponding to the latter half of the month of March and first half of April. The full moon of Choitro, therefore, corresponds with the full moon of Easter. It was in this month that the devotees formerly engaged in the ceremonies of the Charakh puja, the swinging sacrifice.

CHOK. HIND. Gmelina arborea.

CHOKA. HIND. Rumex vesicatoria.

CHOKA. DUKH. Piper nigrum.

CHOKHA, the root of a plant that is brought from Dehli to Ajmir. It is heating, taken internally as a narcotic; is bitter. It is chiefly used, mixed with sulphur and oil, to cure the itch in camels.—*Gen. Med. Top.* p. 131.

CHOKI. HIND. Custom-house. A circle drawn round the spot on which Hindus cook their food. The interior area is holy. No stranger must step within or over it; with the Sri Vaishna of the Ramanuja followers, no strange eye must look on it. Such occurring, the food is thrown away, no matter how long the abstinence had been.

CHOKIDAR, in India, a watchman, a policeman. The Chokidar or Ich Agasi of the Pashalic of Baghdad is one of the pages of the pasha's presence.—*Mignan's Travels.*

CHOKLU. HIND. Rhus succedanea.

CHOL. TURK. Desert.

CHOLA, an ancient dynasty in the south of the Peninsula of India; the Sorai of Ptolemy. Their several capitals were Arcot, Conjeveram, then Wariur, near Trichinopoly, Combaconum, Gongadaram, and lastly Tanjore. At the beginning of the Christian era they seem to have been ruling over all the countries speaking the Tamil language; and Mr. Ellis was of opinion that in the 8th century its princes were occupying large portions of Karnata and Telingana, and ruling over as much of the country up to the Godavery as lay east of the hills at Nundidrug. They seem to have been first checked in the 12th century, and ultimately driven back within their ancient frontiers. In this state they continued to subsist either as independent princes or feudatories of Vijayanagar until the end of the 17th century, when a brother of Sivaji, the founder of the Mahratta state, who was at that time an officer of the Adal Shahi government of Bijapur, being detached to aid the last Chola raja, supplanted him in his government, and was the first ruler of the Mahratta government of Tanjore. The capital of the Chola for the most part was at Kanchi or Conjeveram. They must have been exercising sovereignty in the time of Ptolemy, who makes mention of 'Arcati soren;' and in the Mahawanso frequent references to transactions with the Chola occur during the earliest periods of the Singhalese annals. The Tamil traditions abound with stories of Adonda Chakravarti, who appears to have been the subduer of the aboriginal or Curumber tribes; yet no trustworthy records of his origin and actions are forthcoming, neither have authentic accounts of the overthrow and extinction of any of the great southern states been yet obtained. The Chola kingdom at one time reached as far as the river Kistna. The Ceded Districts formed part originally of the kingdom of the Chola, with whom they were occasionally disputed by the Kalyan Chalukya; and ultimately they constituted the principal portion of the kingdom of Bijanagar or Anegundi. The capitals of the latter power were successively Bijanagar on the Tumbudra, Penaconda, and Chandragiri.—*Elphinstone.*

CHOLA-MANDALOOR, supposed to be the source of the term Coromandel, applied to the east coast of the Peninsula of India, the Carnatic below the ghats. It was the country of the rajas of the

Chola dynasty Choran, who seem to have been coeval with the Cheran and Pandyan dynasties.

CHOLAY of Nepal, Capra hircus, *Linn.*

CHOLERA, also called Cholera morbus, a disease which has been reappearing at intervals in British India, certainly since the latter part of the 17th century. In its attacks only one in two or three recovers. It has spread to most countries, and seemingly has Lower Bengal as an abiding place. Cholera reappeared at Negapatam in October 1781. A third time it appeared in 1786, and a fourth time in 1817. It appeared amongst the native troops, who marched from Bengal 5000 strong in February 1781, and they arrived near Madras in August, reduced to little more than 2000. It broke out near Ganjam in March 1781, and lasted about six weeks.—*Hough.* p. 115.

CHOLI. HIND. A bodice worn by most of the women of British India. It is of various shapes, but generally of coloured materials; in Sind, under the shift, of cloth called kanjari, the choli or gaj conceals the bosom. When it passes round the side like a bodice, and is fastened behind, its name is puth. The Marwari and Brinjari women have the latter form. In Sind, over the choli or angia bodice is a light muslin shirt, which continues below the waist, called a koortni; and over all a scarf of white or coloured muslin of fine texture, do-patta, passed once round the waist, and thence across the bosom and over the left shoulder and head, like the sari, completes the costume.—*Watson; Burton's Scinde*, p. 301.

CHOLI. DUKH. Portulaca quadrifida, *R.*

CHOLLA. TEL. Eleusine coracana, *Gærtn.*

CHOLUM. TAM. Sorghum vulgare.

CHOMONDRI or Chalembry. TAM. A Ceylon tree; wood of a very dark colour, and durable. It grows to between 12 and 20 inches in diameter, and 20 feet in height. It is used by the native carpenters for general purposes. It produces a fruit which is used as medicine.—*Edye, Ceylon.*

CHOMORERI LAKE, according to Major Cunningham, is slightly saline. It has evidently had an outlet at its southern extremity, where it is only separated from the valley of the Parang river by a very low range of hills. The outlet of the little salt lake of Thogji has evidently been near its north end; and its waters, previous to the change in the state of the country which interrupted their exit, in all probability flowed into that tributary of the Zanskar river which runs to the eastward of the Lachalang pass. A goddess, Mo, is said to have haunted this lake Chu, and while flitting over it used to call out incessantly, 'Ree, Ree!' thence Choo-moree-ree! It is on the lofty platform of Rupchu, which extends from the Parang pass across the main chain of the Himalaya to the adjacent head of the Zanskar valley. The lake is 15,200 feet above the level of the sea.—*Mrs. Hervey's Adventures*, i. p. 148; *Hooker and Thomson.*

CHOMPRENG. MALAY. A river cargo boat. The prahu boat, called Sekong, is made of one log of wood, very sharp fore and aft, with long outriggers to prevent it upsetting.—*J. I. Arch.*

CHONDROPTERYGII, a sub-class of fishes. The skeleton is cartilaginous, and skull without sutures; body with medial and paired fins, the hinder pair abdominal; caudal fin with produced upper lobe. Gills attached to the skin by the outer margin with several intervening gill-openings; rarely one gill-opening only. No air-bladder. Embryo with deciduous external gills; males with prehensile organs attached to the ventral fins. In the family Carcharidæ the eye has a nictitating membrane, and the mouth is crescent-shaped and inferior. The families Amnidæ, Rhinodontidæ, Notidanidæ, Scylliidæ, and Pristiophoridæ, have no nictitating membrane. In the saw-fish family Pristidæ, the snout is produced into an exceedingly long flat lamina, armed like a saw with a series of strong teeth along each edge. The electric organ of the family Torpedinidæ is composed of vertical hexagonal tubes between the pectoral fins and the head. The ray family, the Rajidæ, have a broad rhombic disc, generally with asperities or spines, and the pectorals extend to the snout. The pectorals of the Trygonidæ are similarly prolonged, and they have a long and slender tail. The pectoral fins of the Myliobatidæ are greatly developed; they leave the head free, and reappear at the extremity of the snout as a pair of detached (cephalic) fins.—*Gunther, Catal. of Fishes.*

CHONDRUS CRISPUS. Carrageen moss.

CHONEMORPHA MACROPHYLLA, one of the Apocynaceæ. It takes its name from Chone, a funnel, and Morpha, form. A very handsome climbing shrub, with large white flowers, well adapted for a screen or covering a wall.—*Riddell.*

CHONEMORPHA MALABARICA. *Don.*
Echites Malabarica, *Lam.* | Pul-valli, . . MALEAL.

A Malabar plant. Its leaves, rubbed up in rice water, are applied to carbuncles; and its root is used in fever, with dried ginger and coriander seed.—*Useful Plants.*

CHONG, an infusion or fermented liquor, made by the Lhopa of Bhutan, from wheat, barley, or rice, which is boiled and strained. Afterwards, one ball, size of a nutmeg, to each pound of grain, of the blossom of the Cacalia saracenica (Bakka), is crumbled and strewed over the grain. It is then pressed in baskets lined with leaves. To use it, a portion of the digested mass is put into a vessel, boiling water poured over it, and infused. It is now the Chong, and it is a grateful beverage, slightly acid, and not powerfully alcoholic.

CHONG, a hill tribe on the side of the Mei-kong basin, but towards the sea, between lat. 11° and 12° N. They preserve more of the Australo-Tamulian character than any of the neighbouring tribes. Their hair, instead of being stiff or harsh, as in the Mongolian, Tibetan, and prevalent ultra-Indian and Malaya-Polynesian race, is comparatively soft; the features are much more prominent, and the beard is fuller. The Moi or Ka-moi, who, on the opposite side of the Mei-kong, occupy the broad expansion of the Annam chain towards Kamboja, and appear to extend northwards along these mountains, marching with the Lau on the westward, are said to be black savages, with Negro features. The Kambojans style them Kha-men. They are the Kho-men of Leyden, and the Kha-men of Gutzlaff.

CHONG-MON-GO. HIND. Nepeta floccosa.

CHONTI. HIND. Amongst Hindus, a tuft of hair left unshaven on the top of the head. It is also called Choti, also Chonda and Chuda. Mahomedan boys sometimes retain it, as a votive offering to some saint. All Mahomedan women of the Peninsula dress their hair with the chonti, or tail, hanging behind, and largely added to by

their hair that has been combed out. Tufts of hair are left on children's heads unshaved, dedicated to saints. See Chuda-Karanam.

CHOOA, HIND.; also Battoo, also Marsa. Amarantus oleraceus, *Elliot.*

CHOOA, an oil of Cuttack, distilled from the jhoona resin, a few fragrant substances, as sandalwood and khus-khus, being mixed with the compound. It is used as an unguent in cutaneous diseases. The best sort sells at 5 lbs. weight per shilling.—*Local Committee, Cuttack.*

CHOOARA. From Chooara to Sungla of Tookpa, three passes cross the top of the Himalaya range in Kunawar—Neebrung 16,035 feet, Goonas 16,026 feet; Goosool, 15,851 feet, all crossing the top within half a mile of each other.

CHOOBOO, a hybrid between the yak and the Indian cow.

CHOO-FOO-TSZE, the Coryphæus of Chinese philosophy; one of China's greatest writers, the most prominent of all the authors of the middle age period in that country. Until recently he was considered as almost a second Confucius.—*Dr. Edkins.*

CHOOHA. DEKH. The rat; Mus decumanus.

CHOOKEH, also Chooko-Palung. BENG. Rumex vesicarius; sorrel.

CHOOKRA, the lowest class of village servants, the Kummalu, Bhungee, Hulal khor, and Khakrob. The head of the race is called Mihtar (Persian, a prince), and his perquisites are Mihtarai.—*Elliot.*

CHOOKUL or Choput. HIND. A leaf cloak in general use amongst the natives in Manbhum during wet weather.

CHOOLA, a tribe of Tuga in Baghput, so called from having come from Chooloo or Chooro in Bikanir.—*Elliot.*

CHOOLAEE. HIND. This name is indifferently given to Spinacia tetrandra and Amarantus polygamus. The former is a common sort of native greens, and when boiled resembles spinach; it is procurable nearly all the year round. The latter is much cultivated by the natives. It is sown broadcast in beds from June to March. The leaves are sold in the bazar at one pice the seer. Used as greens and also in curries.—*Riddell.*

CHOOLI. HIND. A whirlpool; also stones rounded by attrition in running water, called Rori and Binlung. They are used by Saiva Hindus as the lingam emblem of Siva. See Rohri; Chuli.

CHOOLI. BENG., HIND. Villarsia Indica.

CHOOMLI KOL, a branch of the Kol race, also called Mullar and Panburri. This branch is respectable, and is employed in every Dekhan village as a member of the third division of the Balottah, and supplies water to travellers, wearing on his head the choomli or twisted cloth, on which to rest the pot; hence the name.

CHOONA. HIND. Quicklime, mortar; in Tamil, Chunam or Chunamboo.

CHOONCHA. BENG. Country sorrel.

CHOONDUREE. Once a year, on a festival day, amongst Hindus, sons visit and pay adoration to their fathers. The diet that day is chiefly of vegetables and fruits. Brahmans, with their unmarried daughters, are feasted, and receive garments called choonduree from their chiefs.

CHOONEA. A Kafir tribe. See Kafiristan.

CHOONGGAY. HIND. Fried cakes made of wheat flour, sugar, and ghi.

CHOONGUL. HIND. Also Khonch. A handful of anything.—*Elliot.*

CHOONJERMA, a pass in Nepal, in lat. 27° 33′ N., long. 88° 1′ E.; crest, 16,000 feet; temperature, 24° at 5 P.M.

CHOON-KHURKEE. BENG. Apluda aristata.

CHOOPREE ALOO. HIND. Dioscorea globosa. Tubers roundish, very large, white inside, and much esteemed; the skin thin and smooth like a potato. The stems require strong sticks to creep over. It bears a large roundish fruit, like an oak-apple in appearance, which is also edible. The words seem to be correctly Safri-alu.—*Riddell.*

CHOORA and Thaori were, in Colonel Tod's time, in Rajputana castes of robbers,—the former from the Lakhi jungle, the latter from Mewar. Most of the chieftains had a few in their pay, entertained for the most desperate services. The Bahaderan chief had expelled all his Rajputs, and retained only Choora and Thaori. The Choora were highly esteemed for fidelity, and the barriers and portals throughout this tract were in their custody. They enjoy a very singular perquisite, which would go far to prove their being the aborigines of the country, namely, a fee of four copper coins on every dead subject, when the funeral ceremonies are over.—*Campbell.*

CHOORA-KARANA. SANSK. From Choora, the bunch of hair on the crown of the head, and Kree, to do. See Chonti.

CHOORAY-KAI. TAM. Calabash.

CHOOREEAN. HIND. Bracelets worn by fakirs.

CHOORWAY. HIND. A dish prepared from parched rice.

CHOO-TAI-TSOO, founder of the Ming dynasty.

CHOOTA-PUSHPA. BENG. Melastoma aspera.

CHOOTRA-PHUL, a Nepal tree, not unlike the barberry; the wood is of a strong yellow colour, but does not afford a permanent dye. Nepal women use it instead of sandal for tracing the tilak on their forehead.—*Smith's Nepal.*

CHOP. CHIN. A brand, a stamp, a seal.

CHOPADA. SUM.? Artocarpus integrifolia.

CHOPANDIGA. HIND. Achillia millefolium.

CHOPAR. HIND. Hiptage madablota.

CHOPAT. HIND.? Part of the potter's wheel.

CHOPRA. HIND. Adelia serrata.

CHOPRA, a tribe of the Barajati class of the Khatri. See Khatri.

CHOPUT. HIND. Chess-cloth.

CHOR, a mountain 25 miles S.E. of Simla. It rises to a height of 11,982 feet above the sea.

CHOR. HIND. Coriaria Nepalensis.

CHOR or Chur. HIND. A sandbank or island in a river bed.—*W.*

CHORA, in Kaghan, Quercus dilatata, Q. ilex; in the Simla hills, Angelica Archangelica.

CHORA. GUJ. Dolichos catiany.

CHORAIL. — ? An evil spirit.

CHORASMIA or Khwarizm, the country on the east of the Caspian Sea, the capital of which was Gurganj. The Arabs wrote the name of the country Jurjan, and that of the capital Jurjaniya. The Mongol form of the name was Organj. Noshtigin, a Turkish slave of Malik-Shah Saljuk, was made governor of the province, and contrived to secure his independence. His son, Kutb-u-din, extended his dominions, and acquired the title of Khwarizm-Shah, a name which had been borne

by the rulers of the country before the Mahomedan sway. This empire of the Khwarizm kings rose upon the ruins of the Saljuk dynasty, and their territories extended from Azarbaijan and the Caspian Sea to the Indus, and from the Persian Gulf to above the Jihun or Jaxartes. A succession of nine princes reigned for 138 years, from 491 to 628 Hijira (1097 to 1230 A.D.); but in 618 H., the last of them, Jalal-ud-din Mankburni, was driven by Chengiz Khan beyond the Indus, and he was killed in Mesopotamia ten years afterwards, stripped of all his dominions.

CHORBAT. This district is a dependency of the government of Iskardo, which, like that of Leh, is subject to that of Kashmir. The desert country by which Nubra and Chorbat are separated, has for the present acted as a barrier to the further extension eastward of the Mahomedan religion, which is now universally that of the people of the whole of the Iskardo (or Balti) district, as well as of Dras. On the Indus and in the valleys south of it there is no uninhabited tract between the two, so that the Mahomedan and Buddhist population are in direct contact. The result is that Mahomedanism is in that part gradually, though very slowly, extending to the eastward. — *Dr. Thomson's Travels in Western Himalaya and Tibet*, p. 204; *Tibet*. See Maryul.

CHOR-CHITTI. HIND. Deed of relinquishment.

CHOR-DEO, an evil spirit; literally, thievish god.

CHOR-GANGA in A.D. 1131 invaded Orissa, and established the Ganga Vansa dynasty, which lasted till A.D. 1451. See Chur-Ganga; Orissa.

CHOR-HULDEE, a Mahomedan ceremony so called.

CHORI AJWAIN. DUKH. Seeds of Cleome viscosa.

CHOR-KANTA. BENG. Andropogon aciculare. Spear-grass.

CHOR-KONDA. a glacier in Balti, in lat. 35° 36′ N., and long. 75° 58′ E., and 16,900 feet above the sea.

CHOR-KULLI. HIND. Soymida febrifuga.

CHORO-CADAMBOO? TAM. A Travancore wood of a yellow colour, specific gravity 0·529; used for packing-cases.

CHOROLI KI BHAJI. DUK. Portulaca quadrifida.

CHOR PATTA or Surat, Urtica crenulata, a gigantic stinging nettle, a native of the hills and valleys on the east of Bengal, Luckipore, Pundua hills, and Assam. It affords a fine white fibre, but of no great strength, and not durable. The hill tribes fabricate it into coarse cloths.—*Royle*.

CHOR-SACI, a term by which the Scythians designated the ancient Persians. See Kurmsaq.

CHORTEN, in Hinduism, a pile dedicated to the five elements. It seems to be the Buddhist chod'ten, or relic receptacle.

CHOR-UTAR, in Mewar, a grant of land by the sovereign, resumable at pleasure.

CHOSA. SANSK. Papaver somniferum; poppy.

CHOSROES, in Persian, Khusru, Kasru, or Kasra. Two Persian kings of this name of the dynasty of the Arsacidæ. Chosroes I., styled Nushirwan, A.D. 531 to 571, was defeated on the plain of Melitene by Justinian, the general of Tiberius Constantine. Amongst the plunder obtained was his drinking-cup, of gold and paste jewels, which is now in the Bibliothèque Impérial of Paris. He was succeeded by Hormuzd. Chosroes II., or Khusru Parvez, A.D. 591, reigned till A.D. 623, when he was put to death by Kobad. He was grandson of Chosroes I. He married a daughter of the emperor Maurice, and this lady is generally supposed to be the heroine of the eastern romances Khoosroo and Shireen, and Farhad and Shireen. Near Baghdad is an arch, known as the Tak-i-Kasru, or arch of Chosroes, which marks the site of the ancient Ctesiphon.—*Mordtmann; Smith; Prinsep by Thomas*. See Greeks of Asia; Kasr.

CHOT, also Ghoonghi. HIND. A blanket, cumbli, or sheet, folded or tied at one end to form a cloak.—*Elliot*.

CHOTA. HIND. Pyrus Kumaonensis.

CHOTA. HIND. Small, little; Choti, fem.; and Ch'hoto or Choto, BENGALI; hence,—

Chota-bish-tarik, Ipomœa speciosa.
Chota-chand, Ophioxylon serpentinum.
Chota-chirayta, Cicendia hyssopifolia.
Chota-dhaon? Grislea tomentosa.
Chota-gul-khairu. See Khabaji.
Chota-jam, Eugenia caryophillifolia.
Chota-karoonda, Carissa spinarum.
Chota-koksun, Vernonia cinerea.
Chota-kanoor, Aloe litoralis.
Chota-okra, Zapania nodiflora.
Chota-pind-alu, Dioscorea aculeata.
Chota-sundhi, Nymphæa edulis.
Choti-al, Rheum emodi.
Choti, Corchorus olitorius.
Choti-sim-ki-phalli, Dolichos lablab, native bean. This is a smaller species of the D. lablab; the legume and seeds are both eaten; it is sown in the rains, and sells from one or two pice a seer.
Choti-ilachi, Elettaria cardamomum.
Choti-mai, galls of Tamarix orientalis.
Choto-phutika, Osbeckia aspera.
Chota-akunda, Calotropis herbacea.
Chota-al-ki-pat, Morinda umbellata leaves.

CHOTA NAGPORE, properly Chutia Nagpur, is the country on the eastern part of the extensive plateau of Central India, on which the Koel, the Subunreka, the Damuda, and other rivers have their sources. It extends into Sirguja, and forms what is called the 'Upar-ghat' or highland of Juspur, and it is connected by a continuous chain of hills with the Vindhyan and Kymor ranges, from which flow affluents of the Ganges; and with the highlands of Amarkantak, on which are the sources of the Nerbadda. The plateau has an area of about 7000 sq. miles. It is on all sides difficult of access. It is a well wooded, undulating country, diversified by ranges of hills, and has a genial climate. The population at the 1872 census was 3,825,571, and is formed of a number of non-Aryan tribes who had fallen back to that refuge from the plains, more than half of them being of the race known to Europeans as Kol. On the south-west frontier of Bengal, besides Chutia Nagpur, are Sirguja, with Palemow, Ramgurh, Hazaribagh, Mynpat, and Amarkantak. The elevation of Chutia Nagpur is 2000 to 3000 feet, with hills running E. and W., but of little height; Sirguja is mountainous, rising 600 to 700 feet above the level of Chutia Nagpur. Mynpat is a table-land about 30 miles S.E. from Sirguja town, and about 3000 or 3500 feet high. Palemow district is very mountainous. Hazaribagh town, lat. 24° N., long. 85° 54′ E., is 1750 feet. Slope of the country is south towards Sumbulpore; N. and E. parts of district very mountainous, but level and even depressed towards the Mahanadi.

Sumbulpore town, only 400 feet. Orissa table-land then rises on the southern side of Mahanadi, in some places to 1700 feet, backed by the chain of E. Ghats. Amarkantak jungle table-land, lat. 22° 40′ N., long. 81° 5′ E., 3500 feet. The soil in the plains is generally fertile, producing abundant crops of wheat, barley, rice, pulse, excellent vegetables, cotton, and sugar-cane. The cultivated parts are overrun with a coarse grass.

There are 21 mahals, which form the S.W. frontier of the Bengal province, and which may be classified in four groups, the Sumbulpore, Patna, and Sirguja groups, and Singbhum.

The Sumbulpore and Patna groups are in the circle of the Cuttack Tributary Mahals. Singbhum was never Mahratta; and in 1857 its chief, the raja of Poorahat, joined in the rebellion, many of the Larka Kol following him. A Christian mission went to Chutia Nagpur in 1845, and has made much progress amongst the Dhangar race. In Chutia Nagpur, in which are the districts of Manbhum and Singbhum, the mortality from the famine of 1866 fell on the population about the same as in Orissa. More than half of the population are aborigines or semi-Hinduized. The fourteen Kolarian tribes being the Asur, Bhumij, Birhor, Ho, Kharria, Kora, Korwa, Muasi, Mundah, and Santal, who speak the Mundah, or a language closely allied; with the Cheru, Kharwar, Kisan, and Saont, who have lost their own primitive speech. The Dravidian tribes are the Bhuiher, Binjhia, Gond, Khand, Kaur, Mal, Oraon, Rautia, Sabar, and many others. The census of 1872 showed as under:—

Asur, K.,	2,567	Ho or Kol,	292,036
Bhuiher.		Tamaria,	3,016
Boyar.		Korwa,	17,564
Bhumij,	128,287	Kur, Kurku or	
Binjhia.		Koraku,	2,458
Birhor,	393	Muasi.	
Cheru, Cherwa,	17,632	Mal.	
Gond,	65,069	Naiya or Naik,	2,324
Kaur,	27,508	Kisan, Nagesar or	
Kharria,	26,393	Naksia,	22,934
Santal,	220,096	Oraon or Dhangar,	208,343
Bhuiya,	184,089	Pakaria,	511
Chik (weavers),	19,585	Rautia,	24,633
Ghasi (scavengers),	32,258	Bhar; Raj Bhar,	17,091
Khaira,	11,804	Ghatwal,	31,366
Kharwar;	137,055	Mahali,	20,285
Kolitan.		Sukiar,	8,980
Panda,	5,478	Kurmi,	250,000?
Surak,	9,986	Koeri,	53,638
Christians,	14,226	Kora,	11,505
Mahomedans,	169,000	Kewat,	2,660

The Asur or Agaria are wild, uncivilised iron-smelters. The Bhuiher and Boyar are supposed to be the same tribe, to be identical with the Parheya, and allied to the Gond. They are also called Beoriha, from practising the kumari or jhūm form of cultivation.

The Bhumij (128,287) are in Dhalbum, Manbhum, and Orissa, and, under the name of Chuar, were formerly known for their daring exploits.

The Birhor, a very small tribe, who claim alliance with the Kharwar. They used to practise cannibalism; a Birhor whose end was approaching, would invite his relatives to come and feast on his body.

The Kaur claim descent from the Kaurava race.

The Korwa are a very wild tribe of Kol, but agricultural.

The Oraon, and those of the Oraon tribe called Dhangar, are a merry, light-hearted people, very fond of dancing, but given to excess in eating and drinking.

The Santal are most numerous in Manbhum, Singbhum, and Chutia Nagpur.

The Bhumi form the majority of the population in all the estates of the Manbhum district to the south of the Kassai river. As they approach the confines of Chutia Nagpur, they appear to be called indifferently Mundah or Bhumij, and they intermarry. More to the east, the Bhumij have greatly assimilated to the Bengali; many have acquired estates and influence as Sirdar Ghatwali, the hereditary guardians of the passes. They tenaciously cling to their national songs and dances. Bhumij are to be found in Mohurbunj and Keonjur, and it is this branch of the Mundah race which has spread farthest in an eastern direction. The Bhumi of the lower part of Singbhum and Manbhum are tolerably civilised. All the wild tribes of Central India worship relatives immediately after death; and the Bhunjia, Bhumij, and Kol tribes or clans practise the ceremony whereby the soul of a man just deceased is attracted or conjured into some tangible thing, which is brought back into the house soon after the funeral, apparently that the soul may thenceforth be worshipped as a household spirit. Traces of this superstition may be found all the world over. It is practised by Hindus; Herodotus and Homer show its antiquity. Captain Burton mentions it in Africa. — *Cent. Ind. Prov. Com. Rep.* pp. 5-9; *Dalton*, pp. 147-156; *Campbell*, p. 33; *Aitcheson; B. As. Soc. Jo.* 1866; *Bengal Census Report.*

CHOTA SUR. HIND. Porculia salvania.

CHOTI-PHUL of Shahpur, a flat, shield-like ornament worn on the top of the head by Arora women. It is also in the form of a round spherical boss, different in form from the ornament of the same name in the Jach Doab.

CHOTRA. HIND. Berberis aristata.

CHOU. HIND. Four; softened from Char, four, from which are many compound words.

CHOUBE or Choubay, a class of Brahmans who originally received their name from reading the four (chou) Vedas, as Doobe was derived from reading two, and Tribedee from reading three, of the Vedas. Choube are numerous in Muttra, where they claim the exclusive right of worshipping in the temples of Krishna. They are of large physical frame; and the Choubni women have a commanding style of beauty.

CHOUBEESA, from Choubees, 24, is a term applied to a tract of country containing that number of villages in the occupation of a particular tribe. There are several of them scattered over the provinces, but they may perhaps be more frequent in the neighbourhood of Muttra than elsewhere.

CHOUDHARI, an overseer, commonly written Chowdri. In Hindustan the choudhari is the revenue officer of a district, called desmukh or desai among the Mahrattas. He is also a head of a division, or sect, or gang. In many Hindu cities, the different classes of the community of every rank still acknowledge certain of their members as their hereditary headmen or provosts. These are the Sartavaha of the Brahmans, and Sirdar of the Mahomedans. The chowdrani is usually a woman overseer. Many of the Hindu temples of the south of India are pyramidal,

but in successive tiers, four-cornered, each tier or platform being upheld by two men at the corner; these are the choudhari, though in reality there are eight for each tier.—*Wilson, Hind. Th.*

CHOUDWAN, a tract of country in the district of Dehra-i-Ismail Khan.

CHOUGH, the Cornish chough, Fregilus graculus, inhabits the more elevated regions of the Himalaya, and of all high middle Asia, also stated to have been obtained in the vicinity of Calcutta.—*Cal. Rev.*

CHOUGHAN, in Rajputana, the Rajput champ-de-Mars. See Dard.

CHOUK. HIND. A market-place. Chouki, a custom-house, a police station. Choukidar, a policeman.—*Elliot; Wilson.* See Choki.

CHOUKA. HIND. Tetraceros quadricornis.

CHOUKANDI, or Luri-ka-kodan, so called from the leap from its top of an Ahir, by the name of Luri. It is in the town of Sarnath, and is a lofty mound of solid brickwork, surmounted with an octagonal building. Hiwen Thsang describes this tower to have been no less than 300 feet in height.—*Tr. of Hind.* i. p. 295.

CHOUK MARAM. TAM. Casuarina muricata.

CHOULA, also Choura. HIND. Dolichos Sinensis; a pulse commonly cultivated in Hindustan; also called Ruwas and Rumas, and in Persian Lobia.

CHOULAM. At five months of age, a Hindu ceremony called Choulam occurs, and the lobes of the ears are pierced with a small thin gold ring.

CHOU-LEEN-KE, or Chow-tsze, commenced his labours about A.D. 1034. He died A.D. 1100? From 1241, his views of philosophy, morality, and politics have been supreme in China.

CHOULTRY.

Chattar, Chattram, H., TAM. | Chawadi, ... TEL.

In the Madras Presidency, a resting-place like the Mahomedan sarai; a police-station, a post-house.

CHOUMASA. HIND. The Indian seasons are, according to the Shastras, six in number, each comprising two months. The common people are content to adopt the more definite division of three. Choumasa, or Bark'ha, constitutes the four months of the rainy season. The rest of the year is comprised in Seeala, Jara, or Mohasa, the cold season; and Dhoobkala, or K'hursa, the hot season.—*Elliot.*

CHOU-MURTI MAHADEVA, a name of the four-faced lingam, one of which is in one of the Ellora caves, others in the Burabur caves, and many in the Gyah district. The meaning is, as an ordinary lingam can be worshipped only looking in one direction, this four-faced one can be looked to from four sides.

CHOURA-DADUR, a plateau in Central India, which has an area of about 1000 sq. miles. It is covered with jungle.

CHOURAGARH, the highest summit of the Mahadeva hills, has an altitude of 4200 feet above the sea; the usual height of the range, which, entering the Nagpur territory from Gawilghur, passes by Dewaghur towards Shiwani, is not above 2000 feet, though in the east of the same chain, where it goes under the name of the Lanji hills, some of the peaks attain an elevation of 2300 and 2400 feet. At Nagpur, the country falls to a level of 1000 feet. On the west, however, it immediately rises by 200 or 300 feet in a succession of eminences. — *Carter's Geological Papers*, p. 248.

CHOURASSI, HIND., literally, eighty-four, is a revenue term applied to a subdivision of a pargana or district amounting to 84 villages. Tod, in his Annals of Rajputana, where the chourassi are numerous, remarks that they are tantamount to the Saxon Hundreds (i. p. 141). The Chourassi, eight-four [townships] of Ruttungurh Kheyr, was in S. 1828 (A.D. 1772) assigned to Madaji Sindia to pay off a war contribution; and until S. 1832 its revenues were regularly accounted for. It was then made over to Berji Tap. Chourassi also is supposed to be the number of solar months in the year, multiplied by the number of days in the week, $12 \times 7 = 84$.—*Tod's Rajasthan*, ii. p. 637.

CHOUREEONA. URIA.? A tree of Ganjam and Gumsur. The bark is used medicinally for rheumatism. The flowers are worn.—*Macdonald.*

CHOURPUT. HIND. A fine and light fabric, used as a blanket in Northern India. It is made of the inner coat of the yak or chowri ox.

CHOU-SINGHA. HIND. Tetraceros quadricornis, *Jerdon.*

CHOUTAL. MALAY. A Canara tree 40 feet high, and its wood is used by the native coopers in preference to other woods of the country, for casks, vats, tubs, etc.—*Edye, M. and C.*

CHOUTH. HIND. A fourth part, implying the fourth part of the revenue, which was the war-tax imposed by the Mahrattas on all the countries that they conquered. It was a permanent contribution of one-fourth of the revenue, and its exaction formed a peculiar feature of the policy of the Mahrattas during their ascendency. It was first exacted by Sivaji, A.D. 1676, when he ravaged Kandesh. Payment of it exempted the districts that agreed to it from plunder, so long as it was regularly paid. It was taken from the Hyderabad state and other Dekhan kingdoms; also in A.D. 1735 from the emperor of Dehli.—*Elph.* p. 559.

CHOVANNA MANDARI. MALEAL. Bauhinia variegata; B. purpurea.

CHOW. In China, a district. A Chow is similar to a Ting, as also a Heen, but each is a smaller division; each Fu, Ting, Chow, or Heen has one or more towns or walled cities under its guidance, one of which takes its name and rank, as Kwang-Chow-Fu and Shang-Hae-Heen, which latter, although of that subordinate rank, is the largest maritime city in the empire, and the greatest resort of the native ships or junks. — *Forbes, China*, pp. 10, 11; *Sirr*, i. pp. 211, 223.

CHOWAT KURNAT. MALAY. A fibrous material from the Baram river, supposed to be from a species of Artocarpus; its bark and bark cloth were sent to the Exhibition of 1851.—*Royle.*

CHOW CHOW. CHIN. Mixed preserves.

CHOW-GHURRAY. HIND. A small box with four partitions, for holding spices, etc.

CHOWHATTIA, a head of a clan of the Miana race. The Miana of Mallia in Mucha Kanta, on the banks of the Muchu river, are the real masters of Mallia. They have a thakur, but own allegiance only to their own chowhattia. The Miana are turbulent, used to take service in the neighbourhood, and in every boundary fight a Miana or two were killed.

CHOWK BYTHNA. HIND. To sit in a circle; a technical phrase among fakirs.

CHOW-LE, a classical author of China.

CHOWLI. DUKH. Portulaca quadrifida.

CHOWNSUT KHAMBEH, or Chownsat Satoon, as it is commonly called, is a singular structure quite close to the tomb of Nizam-ud-Din Aoleea, near Dehli. As the name implies, it is composed of 64 pillars. They are of white marble, supporting a square roof of the same material, which occupies a tolerably wide area. It is a building of great purity, its pale aspect of white throughout being interrupted by no other colour. The lattice-work that surrounds it is of very delicate execution, and well polished. This building seems to be erected to the memory, if not actually over the remains, of a celebrated poet and historian, Amir Khūsrū, a native of Samarcand, and a prince. He was a contemporary and friend of Shaikh Nizam-ud-Din Aoleea, not far from whose tomb this building is raised.—*French's Tour*, p. 13.

CHOWR, Chamara, or Chaunri. HIND. A whisk, made sometimes of peacocks' feathers, sometimes from the tail of the yak, sometimes of spill shavings of sandal-wood, of ivory, or of horse hair, or of grass, and used for the purpose of driving away flies, mosquitoes, and other insects. They are usually seen in the hands of the attendants of the gods. The chamari or chouri from the white bushy tail of the yak or Tibet cow, was in ancient India fixed on a gold or ornamental shaft between the ears of the horse, like the plume of the war-horse of chivalry; the banner or banneret, with the device of the chief, rose at the back of the car; sometimes several little triangular flags were mounted on its sides. 'The waving chowri on the steed's broad brow points backwards, motionless as a picture.'—*Coleman*, p. 376; *Hindu Theatre*, i. p. 199.

CHOWRA, a dynasty that ruled at Anhilpura in Gujerat from A.D. 746 to 942, when they were dispossessed by Mul Raj, a Solunki Rajput. The Chowra dynasty is usually known as the Saura; the natives of the S.W. of India change s into ch.

CHOWRI. TEL. (Chavadi.) A caravansary, a choultry, a chattram.—*Wilson.*

CHOWTHEE. HIND. The bridal ceremony of untying the kunggun on the fourth day after the shabgasht; a Mahomedan ceremony.

CHOW-YU. CHIN. Dioscorea batatas.

CHOZAN TARTARS were Israelites professing the Jewish religion, and practising circumcision.

CHRIST, from the Greek word Christos, equivalent to the Hebrew and Arabic Massiha, from Mas'h, anointed. The Christ is Jesus of Nazareth, called Jesus and Jesus Christ, also the Messiah. The Mahomedans' designation is Isa Masiha, Jesus the Anointed; they also entitle him Ruh Allah, the Spirit of God, as Moses is known as the Kalam Allah, the Speaker with God, and Abraham as the Khalil Allah, or Friend of God. Christians and Mahomedans believe him to have been born of the Virgin Mary.

CHRISTIANITY.

Chrétien, ...	FR.	Cristiano, . . .	IT., SP.
Isawi, ...	HIND.	Christan, . . .	TAM.

Christians in Southern and Eastern Asia are in many sects, and are the converts to this creed from many races, and since the earliest days of the Christian era. Arabia seems to have early adopted the Christian faith. The Eastern Churches believe that St. Thomas preached in Arabia Felix and Socotra, on his way to India, where he suffered martyrdom about A.D. 50; and it is said that the rudiments of this religion were first implanted amongst the Himyarites by St. Bartholomew. It is also recorded that St. Pantenus was sent by Demetrius, Bishop of Alexandria, to preach in Arabia Felix, and there he found traces of St. Bartholomew,—amongst others, a copy of St. Matthew's Gospel, written in the Hebrew character, which he brought away with him to Alexandria. In the reign of Tobba, son of Hasan, from A.D. 297 to 320, Christianity became more generally known in Arabia, and extended to Abyssinia, where the people, though surrounded by Mahomedan and pagan tribes, continue Christian till the present day. Subsequently, in A.D. 326, Frumentius was elected by Athanasius, Bishop of the Indians, and he is said to have contributed much to the propagation of the Christian religion, but whether Arabia or Abyssinia was the scene of his labours is disputed. In A.D. 342, Theophilus Indus, a native of Diu, obtained permission to build churches in Yemen, one of which was erected in Aden (Playfair). The Arab conquerors' first emigration from Arabia is supposed to have taken place about 700 years before the time of Solomon, and the Abyssinians appear to be of Arab descent. They were converted to Christianity in the fourth century of the Christian era, and in the sixth they re-crossed over to Arabia to avenge the persecution of Christians by a Jewish ruler, conquered Yemen, and marched to the gates of Mecca, where they were overthrown, two years before Mahomed was born. St. Thomas is believed to have become a martyr near Madras, at the Little Mount, half way between St. Thomé or Mylapur and St. Thomas' Mount. The first historical record of Christianity in India shows that its followers were Persians, followers of Mani. Cosmas Indicopleustes, who travelled in India A.D. 530–550, and afterwards became a monk, mentions the presence of Christians.

Alfred the Great, in A.D. 883, sent Sighelm as an ambassador to the Christians at Mylapur, but there is no authority for his having reached India.

Christianity in Arabia at the time of Mahomed was in a grossly corrupt state. The heresies of Ebion, Beryllus, Nazaræan, Collyridians, and Miriamites were current.

At present, in Arabia, there are two sects which have attracted the notice of travellers, because of their names. One of these, the Salebi, from Saleb, a cross, which they reverence; the other are the Sabian sect, who are known to Europeans as the Christians of St. John. But the Salebi seem to be homeless and migratory dwellers in tents, and many races have used crosses; and the Sabians are a sect who have adopted portions of the Jewish, the Christian, and the Mahomedan beliefs. The Kaldi, however, of Mesopotamia are Christians, and have been styled Nestorian Christians, a term which they do not recognise. Throughout those regions, Christians of the Armenian, Romish, and Protestant forms have scattered representatives.

Christianity, according to tradition, was introduced into Armenia by St. Jude or Thaddeus, one of the twelve apostles of Jesus, who converted King Abgar. The Armenian Church separated from the Greek Church of Constantinople in the sixth century, on a dispute concerning the nature of Christ,—the former holding the Jacobite doctrine of his divine and human nature being monophysite,

or united in one; while the latter, like most other Christian churches, holds his divinity to be distinct from his humanity. Persian Christians are chiefly Nestorians, whose evangelical views have sometimes caused them to be termed the Waldenses of Asia. They trace their origin to the labours of the apostle St. Thomas. About 1870 they sent a deputation of two of their chief ministers, named Deacon Abraham and Deacon Marcus, to Britain to solicit aid from British Christians. In that region, the several sects have long been agitated by questions of belief and of church government. The Chaldæan Patriarch at Mosul, after the middle of the 19th century, consecrated a bishop for Malabar. The Oriental Catholic Church of the Armenians has entirely separated itself from the papal chair. The United Chaldæans are said to intend to break off all connection with Rome, and the Copts are ready to do the same, and withdraw, like the Maronites, Syrians, and Greek Melchites, from communion with Rome.

The British Indian Government provides funds for army ecclesiastical services of the Episcopal, Presbyterian, and Romish forms, costing in the three presidencies about three lakhs of rupees. The British Government has not alienated revenue for the support of the religions of the country, but maintains what was alienated by their native predecessors. In some cases the land has been resumed and cash payments substituted; but the grand result is as follows in the Madras Presidency: Payments in cash to native religious institutions, per annum, Rs. 8,68,000. The assessment of lands alienated, less quit-rent, equals Rs. 2,30,32,000. The total, therefore, is Rs. 3,20,00,000. This is exclusive of enormous grants of land revenue to Brahmans and others. In 1871 the total acreage for Hindu religious purposes was 1,347,000 acres, assessed at Rs. 22,23,100. The acreage for Mahomedan religious purposes was 137,000, with an assessment of Rs. 2,63,000. The acreage for Christian religious purposes was 2600 acres, and the assessments Rs. 5000. Consequently the total area and revenue alienated was little less than 1,500,000 acres, assessed at twenty-five lakhs.

On all the sea-coasts of the south and east of Asia, and on the great rivers, the people are largely fishers. Those along the coasts at Madras became Christians early; indeed, from the southern outskirts of the town at St. Thomé to its northern village of Ennore, nearly all the fishermen are earnest Christians of the Roman Catholic persuasion. The Koli tribe of fishers in Bombay are nearly all Christians, though they have occasionally wavered. There is something remarkable in the circumstance of the fisher races being amongst the earliest and most eager converts to Christianity in India,—so much so as to render it questionable whether it be only an accidental coincidence, or the result of some permanent and predisposing cause. The Parawa, or fishermen of Cape Comorin, were the earliest proselytes of St. Francis Xavier; and they have still a pride in alluding to the fact that they were the first, as they have since been the most faithful and abiding, of his converts. It was by the fishermen of Manaar that he was invited to Ceylon in 1544; and, notwithstanding the martyrdom inflicted by the raja of Jafna, and the persecution with which they were visited by the Dutch, that district and the adjacent boundary of the Wanny has to the present day been one of the strongholds of the Roman Catholics in Ceylon. Amongst the Parawa, or fisher caste of the Singhalese, the Roman Catholics have at all times been most successful in their efforts to proselytize.

There were many Christians in Ceylon in the 9th century, and in the 16th century St. Francis Xavier is said to have converted the inhabitants of Manaar. The king of Jafnapatam put 600 of the converts to death; to revenge which, Constantine de Braganza in A.D. 1560 invaded Jafnapatam, destroyed many villages, and is said to have carried off and destroyed the celebrated tooth of Buddha. Throughout the entire of the British territories in Southern Asia are small bodies of Nestorian, Armenian, Romish, and Protestant Christians, of Persian, Armenian, Portuguese, Dutch, Danish, English, and French descent. The census of 1871 showed 896,658 of Christians in British India, as under:—

Bengal,	90,763	Berar,	903
Assam,	1,947	Mysore,	25,676
N.W. Provinces,	22,196	Coorg,	2,410
Ajmir,	249	British Burma,	52,299
Oudh,	7,761	Madras,	533,760
Panjab,	22,154	Bombay,	126,063
Central Provinces,	10,477		

Besides these, there are numbers in the native States of India, and the total may be about 1½ million. The Œcumenical Council at Rome, however, obtained a statement of the numbers in India of the clergy and professing Catholics. It showed an archbishop of Goa, 19 bishops, who are vicars-apostolic, and 815 priests, besides the clergy resident in the island of Goa; and the laity were stated at 1,076,102. The Protestant missions of India, Burma, and Ceylon are carried on by 35 missionary societies, in addition to local agencies, and in 1873 employed 606 foreign missionaries in 3022 principal and subordinate stations. The Romish clergy of British India are almost fully occupied by the duties relating to their respective charges, but the Protestant missionaries are zealous educationalists and propagandists. In India in 1871-72 there were 25 Protestant mission presses. During the ten years between 1852 and 1862 they issued 1,634,940 copies of the Scriptures, chiefly single books; and 8,604,033 tracts, school-books, and books for general circulation. During the ten years between 1862 and 1872 they issued 3410 new works in 30 languages, and circulated 1,315,503 copies of books of Scripture, 2,375,040 school-books, and 8,750,129 Christian books and tracts. But throughout the S. and S.E. of Asia, and in the Archipelago, there may, in the latter third of the 19th century, be about ten millions of Christians, amongst about six hundred millions of Buddhists, Hindus, Mahomedans, and Shamanists, amongst Aryan, Semitic, Mongoloid, and Negro races. In proselytizing, much success has attended the efforts of the Portuguese and Spaniards in India and the Archipelago; and the same may be said of the labours of Dr. Mason and other Baptist missionaries amongst the Karens and other uncivilised tribes of Burma; also of those of Bishop Caldwell amongst the Shanar and other ruder Tamil races of the extreme south of the Indian Peninsula; and of others amongst the Kolarian and Dravidian races of the Central Provinces, and in the Chutia Nagpur province of Bengal. Mahomedans in S. Asia, of Arab and Persian and Moghul descent, adhere to the religious instruction

of their childhood, and very few Hindus of Aryan descent have accepted the Christian doctrines. They have not, however, been quiescent, but, rejecting their own polytheist legends, they have been, from time to time, following monotheistic reformers, and in the 19th century have been trying to construct, under a church, council, or society, bearing the designation of Brahmo Somaj, an unrevealed code, in which they recognise a first principle and the teachings of morality. In British India, amongst Hindu races, the educational efforts of the British Indian Government have been on the largest scale; but over-education has unspiritualized the educational efforts of Christian missionaries, and created a desire for mere worldly advancement, which has killed in some hopeful cases the inner life.

In Cochin and Travancore there have been Jews from prehistoric times, and Christians from the earliest years of the era. Some of them have adopted the Latin hierarchy, others serve under the rule of the Patriarch of Antioch, others under the Patriarch of Mosul, and others, again, are designated Nestorians. The disputes there led to, and followed, the arrival of the Patriarch of Antioch, and on the 4th March 1876 the Travancore Government issued a proclamation, declaring all matters connected with the churches to be adjudicable by the ordinary courts of the country. The Syrian Christians in Travancore are styled Nasrani Mopla, also Pullen Kar; and Mahomedans are Iona Mopla. The Palaya Kar is a convert from the Syrian sect to that of the Romish Church.

The seaboard regions of the Peninsula have many Christian sects meriting notice. One part of these, the Travancore state, is in alliance with the British Indian Government. Its population in 1875 was 2,311,379 souls, of whom 468,000 were Christians, 63 per cent. being Syrians, in part Roman Catholics of the Syrian rite, and the rest Nestorians; Roman Catholics of the Latin rite were 24 per cent., and the remainder Protestants. The Syrian Christians on the Malabar coast date from the earliest centuries of the Christian era.

Cochin is another tributary state on the Malabar coast, with a population over half a million, of whom 140,262 are Christians and 1278 Jews. The Christians belong for the most part to the Romano-Syrian Church, under the Archbishops of Malabar and Goa. The Jacobite and Nestorian Churches were established long before any European settlements there, and they acknowledge the Patriarch of Antioch as their head. The Christians are almost all fishermen and boatmen.

Tinnevelly is a British district in the extreme south-east of the Indian Peninsula. In 1871 it had a population of 1,693,979, 102,576 or six per cent. of whom were Christians, mostly of the Parawa race, and those of the Romish and Protestant persuasions were in nearly equal numbers. It was on the Tinnevelly coast that St. Francis Xavier landed in 1542, after a short stay at Goa. He found there a small body of Christians; but since his time their numbers have largely increased in Madura and along the coasts of Tinnevelly and Ceylon. They have not been free from persecution. In 1549 Father Antonio Criminale became a martyr at Punnākayal. In 1693 John de Brito fell a martyr at Madura; and after the middle of the 18th century (1773) the Portuguese suppressed the Jesuits in their own dominions, and greatly oppressed the Eastern and Italian missions. Robert de Nobili, in 1607, founded the missions at Madura. Early in the 18th century, Father Beschi, a great Tamil scholar, lived for some time at Kayatar. In 1846 was formed the vicariate-apostolic of Madura, including Tinnevelly. Beschi died in 1746. The Protestant missionary Schwartz was in Tinnevelly in 1770, Jænicke from 1792 to 1800; after him came Gericke, J. Hough, 1816, with Rhenius, a man of great ability, Schmid, Dr. E. Sargent, and Dr. R. Caldwell, all of them men of great intellectual ability.

Christianity made much progress in Japan from the time of Xavier and his fellow-labourers. Louis Almeyda, a Portuguese Jesuit, was everywhere welcomed among the territorial princes of Kew-sew. Sumitanda, prince of Omura, became a convert. In A.D. 1582, four noble Japanese went to Rome on an embassy to Pope Gregory XIII., from the princes of Bunga, Aroma, and Omura, and were for eight years absent from Japan. But the secular emperor, Tyco-sama, repressed the movement, and his successor, Eyayyes, issued an imperial edict, A.D. 1638, expelling and exterminating the Christian religion and foreign races. In 1638, 4000 Japanese Christians were thrown into the sea from the Papenburg rock near Nagasaki.

The first missionaries to China were Italians. In the middle of the 17th century, workmen at Sen-gan-fu, in the N.W. of China, found a Syrian inscription, which had been sculptured by the missionaries of the Nestorian Church in the 7th century, and native scholars regard it as a most valuable specimen of the caligraphy and composition of the Tang dynasty. Christianity seems to have penetrated three times into China, the first time in the 5th or 6th century. We learn from the Mahomedan travellers, who visited China as early as A.D. 850, that it then prevailed; and that, when Canton was taken and sacked in A.D. 877, by a rebel army, as many as 120,000 Mahomedans, Jews, Christians, and Parsees perished in the sack. The general who conquered Southern China is stated to have been a Nestorian Christian, and to have built a church at Nankin for those of his own faith. Marco Polo was himself in high favour, though a Roman Catholic. In the 13th it was very flourishing. At this epoch there existed at Pekin an archbishop with four suffragans. The Chinese have also for a long time had at their command a precious collection of books of Christian doctrine, composed by the ancient missionaries, and which, even in a purely literary point of view, are much esteemed in the empire. These books are diffused in great numbers throughout all the provinces. Chengiz Khan's wife was a Christian. She was the mother of his four sons, and he was liberal-minded in religious matters. Christianity was encouraged at the Moghul court during the reign of the emperor Jahangir. But Bernier mentions (i. p. 198) persecutions there. Père Ricci went from Macao into the interior of China in A.D. 1585, and established himself in the first instance at Nankin. He removed, after a few years, from Nankin to Pekin, where he was well received, and his doctrines made an impression on some nobles of the court. He lived there for many years, the recognised head of several missionary establishments

located in different parts of China, making many converts, and respected by all, until his death, which occurred at the age of fifty-seven, in the year 1610.

A popular uprising began in 1848. It originated in 1830, in the teachings of Mr. Roberts, an American missionary, and of an earnest Chinese disciple. It became blended with the national struggle of the Tae-ping, or the votaries of 'the divine kingdom of eternal peace.' According to the writings of Hung, once a schoolmaster, but afterwards the 'heavenly prince' and acknowledged head, the Tae-ping convert on coming to baptism had to pronounce a solemn vow to take the belief in the Father, Son, and Holy Ghost for his rule of life, and that he was resolved to dedicate this life to God, in love to the brethren; and visits to the tombs of ancestors were enjoined, in gratitude for the release of their immortal souls from this troublesome life, and to renew the vow of life-long devotion to the cause of God and the brethren. The Bible was their word of God, and the ten commandments the moral law; opium-smoking, a sin equal to adultery. The Chinese designate the Christian religion as the religion of the Lord of Heaven; and M. Huc observes that every one must be struck with the new doctrines with which the proclamation and manifestoes of the pretender and his generals have been filled. He styled himself Tien-ti, or Celestial Virtue. The unity of God has been distinctly expressed; and around this fundamental dogma have been grouped a number of ideas borrowed from the Old and New Testament. War was declared at the same time to idolatry and to the Tartar dynasty. A French missionary, who had been very much in the interior of China, states the total number of native Christians at 500,000. M. Huc's estimate was 800,000, which, as he correctly observes, is a mere nothing in the enormous population of the country. These Catholic Christians are, however, not collected in one place, but live scattered over all China proper in small communities, called by the French Chrétientes. The members of these Christianities are educated and trained as Christians from their infancy, being either foundlings or of Christian Chinese parentage. They are Chinese in the outward and more obvious characteristics of dress and features, but in other respects are more like Bavarians or Neapolitans than their own countrymen, from whom they differ in many of those social and domestic customs, and in all those mental peculiarities, which constitute the special nationality of the Chinaman.

The portion of India under British rule is divided by the Church of Rome into vicariates-apostolic, each under a vicar-apostolic, who is also a bishop *in partibus infidelium*. The Madras vicariate contains thirty-seven churches, sixty-seven chapels, and thirty-four priests are engaged at work in it. A very successful college in Calcutta, for the education of Europeans and natives combined, is one which belongs to the Jesuit sect of Christians; and there is a similar college at Bombay. At Negapatam, the Jesuit Fathers have a college which is worthy of being spoken of. This college, dedicated to St. Joseph, was founded in 1846 by the Jesuits in charge of the Madura Mission (attached to the province of Toulouse in France), and at a time when education was little appreciated by the people of India. It occupies the site of the Government House and compound of the Dutch governor, who resided in Negapatam prior to 1781, when the town was occupied by the British under Munro. The library of the college contains nearly 3000 volumes, comprising works in English, French, and other European tongues, Sanskrit, Tamil, and various vernacular languages, and a fair collection of ancient and modern writings in Latin. There is a printing office and a good laboratory. The chapel of the college, dedicated to the Sacred Heart, is a fine vaulted edifice, but rather small for its present requirements. The Catholic parish church near to the jetty at Negapatam is one of the most remarkable structures in the town. These buildings, together with others belonging to the mission, have been erected entirely under the direction of the Jesuits. The vicariate of Pondicherry has 68 European and 26 native priests. It contains 182,126 Christians. The French Government support a college at Pondicherry; and St. Joseph's College at Cuddalore is year by year rising into importance as an educational institution.

Romish, Armenian, Presbyterian, Episcopalian, Baptist, and other Christian sects have cathedral and other churches in every district of British India and the feudatory states, and British, French, Italian, German, and American missions are spread through the country.

The following table gives some interesting facts. We exclude Ceylon, but include Mysore, Pondicherry, Travancore, Hyderabad, and all the Madras Presidency:—

Priests,	.	1858, 689	1878,	810
Populations,	,,	668,689	,,	877,315
Pupils in school,	,,	4,936	,,	27,233

A French mission has settled in Perak, in the Malay Peninsula.

The Protestant Christians, early after the Reformation, sent missions to Ceylon and the south of India. Ziegenbald was the first arrival, followed by Schwartz, Gericke, Kohlhoff, Fabricius, Plutschau, and others. In 1705 Ziegenbald began at Tranquebar; in 1726 the Christian Knowledge Society made a settlement at Madras, under Schultz and Sartorius, Lutheran missionaries; in 1740 Kiernander arrived at Cuddalore, and in September 1758, at the request of Clive, he left Tranquebar to open a mission at Calcutta. Indeed, the missionaries from Europe of the past four centuries, who have devoted their lives to the diffusion of the Christian doctrines, are many,—St. Francis Xavier, Bartholomew Ziegenbald, and also Henry Plutschau Danes at Tranquebar, 1705; John Ernest Grundler at Tranquebar, to whom George I. of England addressed a complimentary letter of 23d August 1717; Schwartz at Trichinopoly and Tanjore; Schultz at Madras; Rottler, Dubois, Rhenius in the S. of India; John Anderson at Madras; Bishop Caldwell in Tinnevelly; Ward, Carey, Marshman, Duff, Brown, Buchanan, Thompson, Henry Martyn, Wilson, with Bower, Ellis, Hough, Marks, Mason, Miller, Pallegoix, Winslow of Bengal, Bombay and Madras Christian missionaries, pioneers of civilization, education, human progress and improvement, scientists, ethnologists, and philologists.—*Tennant's Ceylon; Meadows' Chinese*, pp. 52–337; *Prinsep's Tibet; Bunsen's God in History; Huc, Chinese Empire; Bishop of Victoria in Japan; Travancore Administra-*

tion Report; Playfair's Aden; Lane's Koran; Simmonds; Lord Lawrence, Lord Napier, Sir Bartle Frere, Sir R. Temple.

CHRISTIE, DR. TURNBULL, of the Madras Medical Service, gave the first account of porcelain clay at Mangalore, in Bl. As. Trans. 1841, x. part 2, p. 967. Also wrote on the Mineralogy and Geology of the Southern Mahratta Country, Mad. Lit. Trans. iv. pp. 135, 452, which was reprinted from Edin. Phil. Jl.; Instructions for Meteorologists, Observations on and Plan for New Instruments, ibid. ii. pp. 41, 70; Observations on the Geology of the Hyderabad Country, ibid. 1827. See memoir of, in Edin. Phil. Jl. xv. p. 165, and Mad. Lit. Trans. xv. p. 150.—*Dr. Buist's Catalogue.*

CHRISTOLEA CRASSIFOLIA, the Shangsho of Ladakh, grows at from 10,000 to 15,000 feet in Ladakh; is browsed by goats, but little by the yak.

CHRISTOPHER, CAPTAIN W., of the Indian navy, author of Memoir of the Maldive Islands, in Bom. Geo. Trans., reprint, i. p. 54; Account of Adam's Bridge and Ramiseram Temple in Ceylon, ibid. vii. p. 130; Account of Haines River and the adjoining Country, ibid. vi. p. 375; On a Voyage up the Indus and Sutlej, ibid. viii. p. 144; Journal of Ascent up the River Chenab, ibid. p. 236. He discovered the Haines River in 1842. He was mortally wounded by a cannon shot before Multan in 1848, and died on the 8th October of that year. —*Dr. Buist's Catalogue.*

CHROME IRON ORE, or chromate of iron, is a compound of oxide of chrome with protoxide of iron. It is met with massive, and in octahedral crystals of a blackish colour, and imperfect metallic lustre. It is found in Unst in Shetland, France, Baltimore in America, and in the Madras Presidency, in Salem and Vizianagram; but, as yet, nothing has been done in India to turn this mineral to useful account on a large scale, from the want of proper appliances. The consumption of this substance in Europe is in the manufacture of bichromate of potash for dyes, the chromates of lead for painting, and chromic acid for colouring pottery, porcelain, and glass. Chrome ore in Salem is abundant, but the raw material will not pay the expense of freight. It is of a dark-greenish or nearly black colour, granular. To decompose it by nitrate of potash requires more than a red heat; by caustic potash it is more readily acted on. Chrome yellow, or chromate of lead, is used in dyeing. Chromate of potash is a crystallized yellow salt of a bitter, disagreeable taste, used by calico printers.

CHRONOLOGY. The greater periods employed in the computation of time by the Hindus, though founded on astronomical data, are purely mythological. A complete revolution of the nodes and apsides, which they suppose to be performed in 4,320,000,000 years, forms a Kalpa or day of Brahma. In this are included 14 Manwantara, or periods, during each of which the world is under one Menu. Each Manwantara is composed of 71 Maha Yuga, or great ages, each of four Yuga, or ages of unequal length. These last bear a resemblance to the golden, silver, brazen, and iron ages of the Greeks. The Hindus are laboriously exact in astronomical observations and calculations, but have neglected history.

The only cycle in use among the Turanian races, in old India and Tibet, was that of 60 years, and in the form 12×5. In the Chaldee chronology, a cycle of 60×10 years was employed (10 Sossi being equivalent to 1 Saros); and Josephus styled the epoch of 600 years which grew out of it, the great patriarchal year. The earliest Chinese chronology rests upon a conventional basis peculiar to itself, that of limiting the lunar year of a cycle of 600 years, which was common to the whole of Northern Asia and the Chaldæans, and probably (as it is also met with in India) to the Bactrians also. This basis is historical. The communication took place before the Chaldees invented the cycle of 600 years. The Chinese observation is based upon the use of the Babylonian (Bunsen). The Chinese, from the time of the emperor Yaou, B.C. 2000, had a lunar year and a solar year.

The Saka, Kaliyuga, and cyclic years of the Hindus commence together about March, and terminate almost simultaneously.

The beginning and end of the day has varied. Among the Greeks and Etruscans the day began at noon; among the Romans, as with the British, at midnight; among the Persians, at sunrise; but among the Jews and Egyptians, as now with Hindus, Mahomedans, and Parsees, it began at sunset.

Three great epochs have been recognised, viz.:

In the history of Babylonia, the fixed point from which time was reckoned, was the era of Nabonassar, B.C. 746.

Among the Greeks, the reckoning was by Olympiads, the point of departure being the year B.C. 776, in which Corœbus was victor in the Olympic games.

Roman chronology started from the foundation of the city, B.C. 753 (various dates).

Of the writers who framed chronological lists, the earliest was Berosus, a priest of Belus, living at Babylon in the 3d century B.C., and who added to his historical account of Babylonia, a chronological list of its kings.

Manetho, a priest of Lower Egypt, gave an account of thirty dynasties of its sovereigns.

Eratosthenes, in the latter half of the 2d century B.C., was keeper of the Alexandrian library, and wrote an important work on geography, and a treatise on chronographia. This was the first attempt to establish an exact scheme of general chronology.

The great cuneiform inscription at Behistun, discovered in 1835 by Sir Henry Rawlinson, and subsequently copied and translated by him, threw a flood of light on some obscure passages of Persian history. And, in the year 1862, Sir Henry Rawlinson published the Assyrian Canon.

The authorities quoted below will show that the chronology of the south and east of Asia has received much attention in the later years of British supremacy; but on the plan of this Cyclopædia, the dates of battles and wars, of events in British India, the advent of reformers and learned men with their literature, will be found alphabetically, and the notice here is restricted to dynasties and eras:—

DYNASTIES, alphabetically.

Adal Shahi of Bijapur, A.D. 1489 to 1579.
Aindra or Vrispala of Andhra, B.C. 21 to A.D. 428.
Arsacidæ (Parthia), B.C. 255 to A.D. 235.
Arsacidæ (Armenian), B.C. 130 to A.D. 450.
Asof Jahi of Hyderabad, A.D. 1717, still reigning.

Bactrian monarchy, from the reign of Antiochus II., third of the Seleucidæ, B.C. 313?
Bahmani kings of Kulburga, A.D. 1347 to 1526.
Balabhi dynasty of Saurashtra, A.D. 0 to 523.
Belal rajas of Dwara Samudra, A.D. 984 to 1268.
Bengal rajas, A.D. 1378 to 1573.
Berid Shahi of Beder, A.D. 1498 to 1609.
Bharat Khandy dynasty, B.C. 915.
Bikanir, A.D. 1458, still reigning.
Bundi, a Chohan dynasty, A.D. 1578 to 1819.
Ceylon, B.C. 543 to A.D. 1798.
Chalukya of Gujerat, Kandesh, Kaliani, Warangal. See Chalukya.
Chera or Kong, ended A.D. 894.
China, Manchu, 1616, still reigning.
Chohan, at Ajmir, Dehli, Kotah, and Bundi, B.C. 700 to A.D. 1192, when Prithi-raj was slain. Rainasi, successor of Prithi-raj, was slain in the sack of Dehli.
Chola, ended A.D. 1407.
Delimi, A.D. 932 to 1055.
Faruki of Kandesh, A.D. 1370 to 1596.
Ghor, A.D. 1186 to 1206.
Gujerat kings, A.D. 1396 to 1572.
Ghazni, A.D. 961 to 1186.
Hara, a Chohan dynasty of Harauti, A.D. 1024 to 1575.
Imad Shahi of Berar, A.D. 1484 to 1568.
Irak Atabeks,—
  Mosul branch, A.D. 1127 to 1259.
  Aleppo branch, A.D. 1127 to 1197.
Jeysulmir, B.C. 94, still reigning.
Juanpur, A.D. 1394 to 1457.
Kandesh, A.D. 1399 to 1596.
Kashmir Musalman kings, A.D. 1326 to 1588.
Khalifs, A.D. 632 to 1242–43,—
  5 Abubakr, Usman, Umar, Ali, and Hasan, A.D. 632 to 661.
  15 Ommiades, A.D. 661–2 to 744–5.
  37 Abbassides, A.D. 749–50 to 1242–3.
Khorasan of Merv, Nishapur, Bokkar, A.D. 747 to 818.
  Tahirides, A.D. 819 to 862.
  Safarides, A.D. 873 to 900.
Kutub Shahi of Golconda, A.D. 1512 to 1580.
Lodi, A.D. 1450 to 1526.
Mahratta Governments,—
  Sivaji, 1644 to 1818.
  Hereditary Peshwas, 1740 to 1818.
  Bhonsla rajas of Nagpur, 1732 to 1818.
  Sindia, 1724, still reigning.
  Holkar, 1724, still reigning.
  Gaekwar, 1720, still reigning.
Malwa kings (Pr.), A.D. 1387 to 1568.
  ,, ,, (Cl.), A.D. 1401 to 1512.
Marwar or Jodhpur, 1210, still reigning.
Maurya dynasty, B.C. 315.
Mewar or Udaipur, A.D. 727, still reigning.
Moghul of Tartary, A.D. 1206 to 1226.
Moghul Tartar or Il-Khani of Persia, A.D. 1259 to 1346.
Moghul Sultans of Khorasan, A.D. 1393 to 1505.
Mohul Emperors of Hindustan, A.D. 1494 to 1857.
Mysore, A.D. 1530, still reigning.
Nayak dynasty of Madura, A.D. 1530 to 1731.
Nepal, B.C. 3803 to 3281.
  Kerrat tribe, B.C. 3240 to 1739.
  Suryavansa, B.C. 1658 to A.D. 27.
  Ahir, A.D. 43 to 178.
  Neverit, A.D. 218 to 1749.
  Gurkhali, A.D. 1768, still reigning.
Nizam Shahi of Ahmadnaggur, A.D. 1490 to 1607.
Oudh Nawabs and kings, A.D. 1756 to 1847.
Pandu dynasty of Magadha, B.C. 1400 to 915.
Pathan Ghori Sultans of Hindustan, A.D. 1193 to 1555.
Pathan Sultans of Bengal, A.D. 1203 to 1573.
Peshdadian dynasty, mythological.
Samanian dynasty of Bokhar, Khorasan, and Persia, A.D. 874–5 to 999.
Sassanian monarchy of Persia, A.D. 223 to 636.
Seljuk of Iran or Persia, A.D. 1037 to 1175.
Seljuk dynasty of Kerman, A.D. 1041 to 1169.
Seljuk dynasty of Rum or Anatolia, capital Iconium, 1077 to 1283.
Sesunaga dynasty, B.C. 777 to 415.
Sikh Government of Lahore.
Sind, Arab governors, A.D. 711 to 750.
  Sumera Rajputs, followed by the Sumera, Sama Rajputs, and the Afghans, till Akbar's time.
Slave Kings, 1206 to 1288.
Sofarides, A.D. 872 to 903.
Sufi Kings of Persia, A.D. 1499 to 1797.
Sunga dynasty, 110 years, B.C. 178.
Syria, Seleucidæ, B.C. 334 to A.D. 65.
Taghalaq, 1321 to 1412.
Tahirides, A.D. 820 to 872.
Tibet, B.C. 962.
Vijayanagar, A.D. 1034 to 1756 and 1829.

ERAS, chronologically.

Constantinople era, still used in the Greek Church, dates from the creation of the world. The Incarnation falls in the year 5509.
Kali Yuga, commenced B.C. 18th February 3102.
Era of Nabonassar, began B.C. 26th February 746.
Building of Rome, or Roman era, 752 (various).
Olympiads, year begins 1st July 776.
Jain era of Mahavira, B.C. 629.
Buddha's nirvana, B.C. 543.
Burmese sacred era, B.C. 543.
Era of the Seleucidæ dates from the time of the occupation of Babylon by Seleucus Nicator, B.C. 311.
Vikramaditya era derives its name from a ruler of Malwa, and is reckoned from B.C. 56. The term Samvatsaram (contracted to Samvat), meaning simply a year, is used for the Vikramaditya era.
Christian era. Its epoch or commencement is the 1st of January in the 4th year of the 194th Olympiad, the 753d from the foundation of Rome. It was A.M. 4004.
Java era, A.D. 74.
Salivahana era, called the Saka or Shuk, begins A.D. 78, and was so named from a prince who is supposed to have reigned at that period in the kingdom of Narsinga.
Bali era, A.D. 81.
Second of the Seleucidæ year begins B.C. 1st September, but according to the Arabs 1st October, 312.
Balabhi Samvat, March, A.D. 318.
Hijira year begins 16th July, A.D. 622, the day following Mahomed's flight to Medina, which took place on the night of Thursday, 15th July. Hijira begins Friday, 16th July, A.D. 622, according to the Hilali, or practical calculation. By the Hisabi, or astronomical calculation, the era commenced one day earlier.
Yezdejird era, or Parsee or Jalali era, commences with the elevation of Yezdejird III. to the throne of Persia, 16th June, A.D. 632.
Sur San, Soor San, or Arabian era, commences in the 13th year of the Hijira. It is a solar sidereal year. It is also written Suhur and Shuhur, all of them Mahratta corruptions of the Arabic shahr, a month. It was introduced A.D. 1344.
Kollam Andu era of Quilon commences about September. It is only used in the S. Tamil country and in Travancore, A.D. 824. A.D. 1800 was the 976th of the Kollam era. It is usually called the Parasurama sakam era.
Parasu Rama cycle of 1000 years. 1st year of 4th cycle, Sept. A.D. 825.
Nepal Newar era, A.D. 870.
Vrihaspati cycle of 60 years, established A.D. 966.
Jalali of Malik Shah, March, A.D. 1079.
Fasli San is four years behind the Hijira era, and is supposed to have been imposed on the people of India by the Mahomedan conquerors. The Hijira year 1200 was 1196 Fasli, and 1187 Sur San.
  Fasli of Hindustan, established A.D. 1556.
  Fasli of Peninsula, established A.D. 1638.
Bengali San and Valaiti of Orissa, 1556.
Julian era, invented by Joseph Scaliger, 1582.
Tarikh-i-Ilahi of Akbar, A.H. 992, A.D. 1584.
Jalus San of Bijapur of Adal Shah II., 1656.
Raj Abishek of Mahrattas, 1664.
Epoch of the Indian cycle of 90 years, or Grahaparivrithi, begins with the Hindu solar year 24. The first year of the 21st cycle was A.D. 1777.

—*Sharpe's Hist. of Egypt*, i. p. 58; *Lieut.-Colonel John Warren's Kala Sankalita; Bunsen's Egypt; Burnell's Indian Palæography; Prinsep's Useful Tables and Indian Antiquities; Cowasjee Potell's Chronology; C. P. Brown's Cyclic Tables and*

Carnatic Chronology, 1863; *Robert Sewell's Chron. Tables for S. India, from the 6th Century* A.D.; *Dictionary of East Indian Dates; T. M'Cudder's Oriental Eras; Bombay Chronological Tables; Chronology of the Hindus*, Cambridge, 1820. See British India.

CHRYSANTHEMUM ALBUM. Peh-kiuh-hwa, CHIN. The ashes of the flowers are said to destroy insects. The Chrysanthemum genus of plants belongs to the natural order Compositæ, and the sub-order Corymbiferæ or Asteraceæ. The species are very numerous in the temperate parts of the earth (Eng. Cyc. p. 1058). The name is from two Greek words, Chrysos, gold, and Anthos, flower. —*Smith.*

CHRYSANTHEMUM INDICUM. *D. C.* Guldawadi, HIND. Grows in several parts of India, and is used medicinally in calculus.—*Drury.*

CHRYSANTHEMUM PERUVIANUM turns continually towards the sun. As a general rule, however, all plants turn towards the sun. Hypochæris radicata and Apirgia autumnalis are seen in meadows turning towards the sun, and species of Melampyrum and Narcissus turn similarly.—*Winslow on Light.*

CHRYSANTHEMUM ROSEUM. *Adam.* Pyrethrum roseum, *Bieb.* A perennial herb of S.W. Asia, with C. coronopifolium, *Willdenow*, yields the Persian insect powder.—*F. von Mueller.*

CHRYSANTHEMUM ROXBURGHII. *Desf.*

C. senecioides, *Dun.*	Pyrethrum Indicum, *Roxb.*
Matricaria oleracea, *Buch.*	Pinardia Roxburghii, *Less.*
Glebionis Roxburghii, *Cass.*	
Bagaur, . . . CHENAB.	Gendi, ... HIND.
Christmas flower, . ENG.	Kalzang, . . LADAKH.
Gul dawadi, . . . HIND.	Chamanti, ... TEL.

The plants commence flowering generally in November, and continue for several months. The colours are mostly yellow, orange, and a purplish colour mixed with white. They are made into garlands, and offered at the shrines of Vishnu and Siva. They are commonly cultivated in gardens in the plains of India, in Kashmir, Upper Chenab to 9200 feet, and in Ladakh at 11,300 feet.—*Ainslie; Dr. J. L. Stewart.*

CHRYSANTHEMUM SINENSE is extensively cultivated in European gardens, and is the Chinese gardener's favourite winter flower, although it is generally past its full beauty at the Chinese new year. There is no other plant which he takes so much pains with or which he cultivates so well. His camellias, azaleas, and roses are well grown and well bloomed, but in all these the people of Britain excel him. In the cultivation of the chrysanthemum, however, he stands unrivalled. It is in great request among the people, and is used in the decoration of courtyards, halls, and temples. It is everybody's plant, and blooms alike in the garden of the lowly Chinese cottager as in that of the red-buttoned mandarin.—*Eng. Cyc.* p. 1052; *Fortune's Tea Districts*, p. 125.

CHRYSE, 'the gold land' of the Periplus, has been supposed to be Pegu, the Suvarna Bhumi or Golden Land of the old Indian Buddhists. Sonaparanta, a term of like meaning, is still the sacred or classical term for the central territories of Ava. Gold-scatterer, Zar-afshan, is applied by the people of Central Asia to the head-streams of the Oxus and Jaxartes ending in the inland sea of Aral.—*Periplus of the Erythræan Sea; Yule, Cathay*, i. p. 114.

CHRYSIDIDÆ, or golden wasps, do not sting, but possess the power of rolling themselves up into a ball, which is almost as hard and polished as if really made of metal. They are all adorned with the most gorgeous colours.

CHRYSOBALANACEÆ of *Lindley*, the cocoa-plum tribe of plants, has the genera Chrysobalanus and Prinsepia. Roxburgh mentioned C. racemosa of the Moluccas. C. icaco, the cocoa-palm tree of the West Indies, has been introduced into India.

CHRYSOBERYL, or prismatic corundum, is found among the Tora hills near Rajmahal, on the Bunas, in irregular rolled pieces, small, and generally of a light green colour. These stones are considered by the natives as emeralds, and pass under the name of 'punna,' but the natives are aware that they are softer than the real emerald.—*Gen. Med. Top.* p. 160.

CHRYSOPHYLLUM ROXBURGHII. *G. Don.*

C. acuminatum, *Roxb.*, star apple.

Hali mara, . . . CAN.	Tarsee phal, . . MAHR.
Pita-kara, . . . HIND.	Lawooloo-gass, . SINGH.

This tree, one of the Sapotaceæ, grows to thirty feet or more. In Canara and Sunda, it is very common in the jungles near the ghats above, particularly to the south. There are some trees in the Residency garden at Hyderabad. The wood seems straight and good, but the tree is chiefly noticeable from the gutta-percha-like incrustation common on the fruit. Fruit, about the size of a large crab-apple, ripens in October, and is edible but insipid. Not uncommon in the warmer parts of the island of Ceylon.—*Gibson; Thw.* iii. 174.

CHRYSOPOGON ACICULARIS. *Host.*

Andropogon aciculare, *R.*	Rhaphis trivalvis, *Lour.*
Gnung-myeet, . . BURM.	Lampa, ... HIND.
Spear grass, . . . ENG.	Shunini, ... SANSK.
Chor-kanta, . . HIND.	Katl-chettu, . . . TEL.
Soorwala, . . . ,,	Katle-gaddi, . . . ,,

Abundant in barren land; troublesome to the feet of those who walk among it; eaten by cattle when other grass is not to be had. Its seed stick in the stockings, and produce a disagreeable itching. A longer variety, known solely as 'soorwul,' is an excellent grass for cattle.—*Mason; Genl. Med. Top.* p. 176.

CHRYSOPRASE, from Chrysos, golden or beautiful, and Prason, leek, is a rare, pale apple-green chalcedony, which owes its colour to the presence of the metal nickel. It is found in many parts of India, in Upper Silesia, and Vermont.

CHRYSORRHŒA, or 'Golden Stream' of the ancient geographers, is the Barrada river of Damascus, which, so soon as it issues from the cleft in the mountains, is immediately divided into three smaller courses. The largest, which is the middle one, runs directly to the city, and is there distributed to the different public fountains, baths, and cisterns; whilst the other two, branching off right and left, contribute mainly to the luxuriant vegetation which adorns the environs. South-east of the city their scattered waters unite again into one channel, and, after flowing towards the eastern hills for two or three hours, are finally lost in a marsh which, from one side view, appears like a small lake. Well may Damascus be called Sham-i-Shereef, the noble and beautiful.—*Robinson's Tr.* ii. p. 115.

CHU, or Chu-ma, or Tchou-ma. CHIN., Bœhmeria nivea; China grass.

CHU. TIBETAN. Water. In Scythian, Ku; Assyrian, Hu; Greek, Eu.

CHUA. HIND. Rosa Webbiana. In Kulu, an amaranth cultivated for its grain; Amarantus oleraceus.

CHUAL. HIND. Staphylea emodi, also Euonymus fimbricata.

CHUAN-YUAN, in the classical education of the Chinese, is the highest in the annual examination,—the senior wrangler and senior classic from amongst 400 millions of people.

CHUBIRI. MALAY. Chillies.

CHUBREI. HIND. Dactyloctenium Ægyptiacum, also Eleusine flagellifera.

CHUCH. HIND., Juniperus communis. TURK., a thorny shrub in Balkh, grazed by camels.

CHUCH, a valley near Attock, on the Indus, where gold is washed.

CHUCHI. HIND. Polygonum polystachyum, also Rheum emodi.

CHUCHO. MALAY. Leaves used by the Jakun for thatch.

CHUCKERBUTTY, a class of Brahmans in Bengal, so called by the British in India. The word is a corruption of Chakravarti, meaning a prince or ruler over a large circle.—*Wils. Gloss.*

CHUCKLER. ANGLO-TAM. From Tamil, Chakili, a shoemaker, a tanner.

CHUCKOONDA. HIND. Beta vulgaris; beet.

CHUCKRANKETAM, also called Moodra dharanam; amongst Vaishnava Hindus, the rite of stamping with a hot iron stamp the emblem of Vishnu on the arm of a Vaishnava lad or man. It is equivalent to the confirmation of Episcopal Christians; it is an initiatory rite.

CHUCKRATA, a hill station in the Dehra Doon division, 1119 miles from Calcutta, 38 miles west of Mussoori.

CHUDA KARANAM. BENG. The ceremony of shaving a Hindu boy's head between the third and fifth year, leaving a single lock on the scalp, called Chuda, Chura, Chula, or Chonta.

CHUDDER, properly Chādar. HIND. A blanket, sheet, or shawl. Those of Rampur are famous. Also a dam across a river, as the Chadrghat.

CHUDRA KANTA KARI. BENG. Solanum jacquini, *Willd.*

CHUEN-SEE, taken 7th January 1841.

CH'UEN TSIAU. CHIN. Xanthoxylon alatum.

CHUHA. HIND. A rat. Kan-ka-chuha, the large-eared rat of Kaghan, the marmot or arctomys.

CHUHA, a people in the Chuha district on the river Hub, which falls into the sea at Cape Monze. They are said to be of Sumrah or of Brahui origin.

CHUHARA. HIND. Apricot; also Phœnix dactylifera.

CHUH-HWANG. CHIN. Tabashir.

CHUHRA. HIND. The humblest village servants, Bhangi, Halal-khor, Mihtar, etc.—*Wilson.*

CHUI. BENG. Piper chaba. Chui, of Chamba, Pyrus malus, apple tree.

CHUI SHUPA. Juniperus communis.

CHUJ. HIND. Fraxinus xanthoxylloides.

CHUK. HIND. A plantation, a reserve.

CHUKA. GUJ., rice. MALEAL., vinegar, sorrel. HIND., Sida cordifolia; Rumex vesicarius.

CHUKAN PALLAM. TAM. Bryonia, *sp.*

CHUKA-ZUM, a chain bridge stretched over the Tehintchieu river, a short distance above the castle of Chuka.—*Turner's Embassy*, p. 54.

CHUK DAR. HIND. A wooden frame sunk as the foundation of a well.

CHUKE, Chabai, Beya, and Sambutan are Malay customs.

CHUKKADUMPA. TEL. Habenaria platyphylla, *Spreng.* Chukka kada, Bigelowia lasiocarpa.

CHUKKALI CHETTU. Epicarpurus spinosa.

CHUKKAR or Chakra, a Sikh weapon resembling a quoit in size and shape, thrown from the finger with a rotatory motion.—*Herklots.*

CHUKKEE, a hand-mill. Chukkee nama, a song sung while grinding at the mill; at weddings.

CHUKMA, a race, in number 28,000, occupying the Toonia Joom mahals, a forest tract in the hills of the Chittagong district, along with Mug, Reang, and Tiperah races, all more or less nomadic. Some one of these hill races till lately performed human sacrifices annually, and in the year 1852 several were tried for murder by sacrificing. The place of sacrifice was a cleared district in the jungle, and staked round with bamboos about six feet high. The sacrificial pole was a Phula bans bamboo, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. During the celebration of these sacrifices at Agartollah, a gun was fired every evening at sunset, when every person hurried to his home.

CHUKOTARA. HIND. Citrus decumana.

CHUKRI. HIND. Rheum emodi, also R. palmatum; a powder of the dried acid stalks of the rhubarb.

CHUKUDDI PATTA. TEL. Cassia absus.

CHUKUL MORA. CAN. Acacia elata.

CHULA. HIND. Euphorbia Royleana.

CHULA or Chulla. HIND. A fire-grate made of mud or bricks; a fireplace, a hearth, and equivalent to the English hearth as a home. A native of India wishing to express his poverty, would say there was no fire in the hearth; or to indicate the number of his divided family, would observe that three fireplaces are burning.

CHULAH. HIND. A tribe of Taga in Baghpat.

CHULAI. HIND. Spinacia tetrandra; also Amarantus polygamus, *Linn.*

CHULCHILHERA, a lichen of the Himalaya, the Borrera ashneh, *Royle;* with ammonia it gives a reddish-brown colouring matter, and is used accordingly as a dye-stuff. Dr. O'Shaughnessy examined this and several other Indian lichens, but without success in the production of any valuable colour. It means, in the Panjab, a mixture of lichens employed for dyeing, contains Parmelia Kamtschadalis, Parmelia perlata and its variety sorediata, Usnea florida, Ramalina calicaris, and fragments of Physica leucomela.—*—O'Shaughnessy*, p. 672.

CHULI, a whirlpool. In the stream of the Chambal near Berolli, the whirlpools and eddies have given a sacred character to it, like the Nerbadda, at the whirlpools of the great god Chuli Maheswar. A multitude of round stones are found in these vortices, where they have been rounded by attrition into a perfectly orbicular form, are consecrated, and smeared with red lead, and are then called Bhyru, the god of war, the eldest son of Siva. The round stones of the Nerbadda whirlpools are called Ban-Lang, or whirlpool lingam, and Rori at the temple of Berolli. See Binlang.—*Tod's Travels.*

CHULI. HIND. Prunus Armeniaca, also Prunus padus and Villarsia Indica.

CHULI, a Mahomedan of Malabar; amongst the Malays, any native of S. India. The Chulia and Kling comprehend the traders and settlers, both Mahomedans and Hindus, from the Coromandel coast. These names have been given to them by the Malays from the earliest times of the ancient commercial intercourse subsisting between this part of Asia and India. Kling is from Kalinga, or is a corruption from Teling or Telinga; Chulia may be derived from the ancient Chola kingdom of the Peninsula.—*Newbold's British Settlements*, i. p. 8.

CHULLA, also Charz. HIND. Sypheotides auritus, *Latham;* the lesser florikin.

CHULU. HIND. Of Himalaya, Armeniaca vulgaris, *Lam.;* the apricot.

CHUM. HIND. Euphorbia Royleana; also Morus serrata; also Fraxinus xanthoxylloides.

CHUMANG, a low or out-caste race in the non-Bhot districts of Kunawar, with dark skins. The people of the lower hills call them Koli, and the Rampur people, Chamar. They till the soil and weave.

CHUMAYAN, a Gujar clan occupying twelve villages in Paniput Bangur.—*Elliot.*

CHUMBA. HIND. Artemisia sacrorum.

CHUMBA-GUDDEE, a race in the Chumba hills, in the Himalaya. They say they are Rajputs, and of the Guddee-jat. They are somewhat short, but strong, and cleanly in their habits. They are sharp, and able to impose on their less knowing neighbours. Most of the witch-finders are of the Chumba-guddee race; and the race may always be known by their peculiar conical caps, with lappets to turn down over their ears, like an English travelling cap. When Europeans made their first appearance in the Kangra valley, these men had very slight notions of caste, and would eat or drink anything the Europeans gave them, but since their contact with the natives of the plains they have become as bigoted as any Hindu.

CHUMBARA. MAHR. Premna tomentosa.

CHUMBELI. HIND. Jasminum grandiflorum.

CHUMBI SAG. HIND. Amarantus polygamus.

CHUMBRANUK, a single valve of the mussel shell without the mollusc, used in Ajmir as an aphrodisiac.—*Gen. Med. Top.* p. 132.

CHUMBUL, a tributary to the Jumna. It rises in Malwa in lat. 22° 26′, and long. 75° 45′, 8 or 9 miles S.W. from Mhow, which is 2019 feet above the sea. It rises on the cluster called Janapava. It runs north 105 miles, N.W. 6 miles, S.E. 10 miles, N.E. 23 miles, S.W. 25 miles, north to junction with Kalee Sind, N.E. 145 miles, S.E. 78 miles to Jumna; length, 570 miles; described in a form nearly semicircular, the diameter being only 30 miles. It receives the Chumbela, 70; Seepra, 120; Parbati, 220; Kalee Sind, 225; Banas, 320; Chota Kalee Sind, 104 miles. About 56,000 square miles drained. The average declivity of its bed, 2 feet 5 inches per mile. Its average volume of water is so considerable, that at its junction it has been known to raise the united stream 7 or 8 feet in twelve hours. The nominal source of the Chumbul is in a part of the Vindhya range, 9 miles S.W. of Mhow; but this part of the river is dry in the hot season, during which it owes its waters to other tributary streams. The current is in most parts gentle, its bed rocky, and its course through Malwa much obstructed by shallows; but, after entering Harrowtee by an opening in the Mokundra range, it becomes a fine and deep stream. The course of the Chumbul, not reckoning the minor sinuosities, is upwards of 500 miles; and along its banks nearly every race now existing in N.W. India may be found,—Sondi, Chunderawut, Sesodia, Hara, Gore, Jadoon, Sikerwal, Goojur, Jat, Tuar, Chohan, Bhadoria, Kutchwaha, Sengar, Boondela, each in associations of various magnitudes, from the substantive state to the little republic communes between the Chumbul and Cohari. The Chumbul runs through the territories of Sindia and Holkar, viz. Gwalior and Indore, and passes near Kotah.—*Tod's Rajasthan*, i. p. 16; *Rep. Royal Com.*

CHUM GADHAL. HIND. One of the Cheiroptera, the flying-fox, species of Pteropus.

CHUMIAH, a race to the north and east of Chittagong, dwelling in the lower hills between the Kuki and the plains. The Chumiah and the Kuki are described as having flat noses, small eyes, and broad round faces, and to differ from the Naga race both in appearance and customs.

CHUMIARI. PANJ. Cerasus puddum.

CHUMKI. HIND. Coloured and striped satins, red, white and red, and blue and red, value 1 rupee to 2½ rupees the yard.

CHUMLA, a valley near the Bunair or Bunnoor country in Afghanistan. The valley and the central plain of the Yusufzai are commanded by hills that descend from the Hindu Kush.

CHUMPA, properly Champa or Champaka, the Michelia champaca, *Linn.* The flower of the champa is one of the five with which Kama, the Hindu god of love, tips the arrows he uses.

CHUMPADA. MALAY. The small jack-fruit.

CHUMPA NUTIA. BENG. Amarantus polygamus.

CHUMPARUN, a town in the Patna division of Bengal.

CHUMPOUTE, the berry of a small plant, brought to Ajmir *via* Pali, used in perfumes and also in medicine; one seer is sold for one rupee.—*Gen. Med. Top.* p. 131.

CHU-MURTI, a Chinese district bordering on Ladakh.

CHUMWA, a tribe in Assam, exempt from manual labour.—*Wilson.*

CHUNA. BENG. Also Chuna-batoola and Chunai Butkale, Cicer arietinum, *Linn.* It is the Bengal gram of Europeans in India. Through the Italian cece and the French chicker comes its English name 'chick-pea.' The term 'arietinum' is derived from the resemblance of the seed to a ram's head. The word used by Europeans in India is gram, or Bengal gram, of which the origin has been much disputed, but is supposed to be from grana.—*Elliot.*

CHUNAM. ANGLO-TAMIL.

Chunna; Chunnam, HIND. | Sunamu; Choonnoo, TEL.
Chunambu, . . . TAM. |

Chuna or Chunam is a term applied to quicklime made from nodular limestone, from limestone rock, from marble, or from calcined shells; also applied to plaster and mortar. The chunam plaster of Madras, long famed for its marble-like polish, is prepared either from shells or limestone. The shells generally used at Madras are both recent and fossil, but the latter, of recent species, are found in extensive beds a few feet below the surface, on the banks of the Pulicat lake and other low marshy places on the sea-coast, which are covered by the sea at high water.

The shells are calcined with charcoal, one parah of charcoal being allowed to every two parahs of chunam. The kilns generally used are calculated to hold altogether 60 parahs, that is, 40 of shells and 20 of charcoal. A small arch, 1 foot 3 inches in height, the same in breadth, and raised 5 feet above the surface of the ground, runs longitudinally through the kiln; the top of this arch is a grating of brick on edge, which is partially covered with broken tiles, so that neither the shells nor charcoal can drop through them, but small apertures are left for the escape of the ashes and for the necessary circulation of air. Over this bed a layer of charcoal is first placed throughout, about 3 inches in thickness, and fire applied. When sufficiently kindled, the mixed shells and charcoal are laid in small heaps of not more than $\frac{1}{8}$ of a parah each at about 1 foot 6 inches apart, and when the fire has been communicated to them, the intermediate spaces must be filled up with more shells and charcoal to a level; and when the fire has thoroughly extended to them also, another row is to be laid in a heap upon this mass, as was done in the first instance; and in the subsequent operations are to be repeated in the same manner until the kiln is filled. The transverse arches are to promote the requisite current of air, and the windward ones are invariably to be kept open, whilst those on the opposite side must be closed. The kilns used at Madras are built of brick or clay, and require renewal every three years. The shells will be sufficiently calcined in 12 hours, and 24 more are required to cool them, so as to admit of their being moved and the charcoal sifted from them. It is found that chunam thus prepared and slaked to a powder is increased to double its original bulk when in the form of shells.

For plastering with chunam at Madras, if for one coat, the plaster is composed of one part of chunam and one and a half of river sand, thoroughly mixed and well beaten up with water. This operation is usually performed by women, who stand round a small stone trough prepared for the purpose, into which the ingredients are thrown and gradually moistened with water, as the process of mixing proceeds. The women use wooden pestles shod like a rice-pounder. The plaster, when mixed, is taken out of the troughs and made into conical heaps, where it remains till required, and may be kept without injury for several months; but when left for any time, a small cistern or hollow is made at the top of the heap, into which water is occasionally poured. Before applying the plaster, the wall is trimmed with a trowel and swept perfectly clean, and then slightly sprinkled with water. The wall being ready, the plaster is put into small wooden boxes at convenient places among the bricklayers, by whom it is mixed up with jagari water, $\frac{3}{4}$ lb. of jagari or coarse sugar being allowed to every parah of quicklime, until it is brought to the required consistency; it is then laid on with a trowel above half an inch thick, and levelled with a flat wooden rule, being afterwards smoothed with a wooden rubber till it acquires an even surface. During the process of rubbing, the plaster is occasionally sprinkled with a little pure white lime mixed with water, to give it a hard surface. If for two coats of chunam, the first coat is applied as already described, with the exception that the surface is left rough, and no pure lime is applied during the process of rubbing. A day or two after the first coat is applied, and while moist, the second is laid on. The plaster used for the second coat consists of three parts of lime and one of white sand. These are mixed as before, and afterwards ground by women on a flat stone with a small stone roller, till they are reduced to a fine paste. This is laid on a wooden rubber, and applied with care over the first coat about $\frac{1}{8}$ of an inch thick. It is then rubbed down perfectly smooth with a small trowel, and afterwards polished with a crystal or smooth stone rubber, and as soon as it has acquired a fine polish, a little very fine potstone (Ballapum) powder is sprinkled on it to increase the whiteness and polish, and the polishing continued. The second coat ought to be applied and finished in one day, for it usually hardens too much during the night to be polished the following day, except in damp weather. The practice is to continue polishing the plaster until it is quite dry, and a number of bricklayers are employed, in order that it may be well polished the first day. Moisture continues to exude from the plaster for some days after it is completed; this must be carefully wiped off with a soft cloth, and the wall kept perfectly dry till the moisture entirely ceases. For three coats of chunam, the first coat is as above, but it is left a fortnight or three weeks to dry before the second coat is applied. The plaster for the second coat consists of one part of lime and one of fine river sand, freed from the coarser particles and clay by sifting. It is well mixed and beaten up in a clean trough, and applied over the first coat about $\frac{1}{4}$ of an inch in thickness, the first being previously moistened with a little water. It is next rubbed down in the same manner as the first coat, but acquires a much smoother surface, the plaster being of a finer quality. A day or two afterwards, when it has had time to dry, the third coat is applied. It consists of four parts of lime and one of fine white sand. These, after being well mixed, are reduced by grinding to a very fine paste, quite free from grittiness. This is put into a large earthen jar, of the size nearly of half a hogshead, and mixed with the white of eggs, sour milk (tyre), and ghi, in the proportion of 12 eggs, $1\frac{1}{2}$ measures of tyre, and $\frac{1}{2}$ lb. of ghi to every parah of plaster. These are all thoroughly mixed, and rubbed between the hands till the ingredients are thoroughly incorporated, and the composition reduced to a uniform consistent paste a little thicker than cream, and perfectly free from grittiness. The plaster is now fit for use, and is put on with a wooden rubber about $\frac{5}{8}$ of an inch thick, and gently rubbed till it becomes perfectly smooth. Immediately after this, another coat of still finer plaster is applied, consisting of pure lime ground to a very fine powder, and afterwards mixed with water in a clean tub, till it is of the consistency of cream. This is put on about $\frac{1}{16}$ of an inch thick with a brush, and rubbed gently with a small trowel till it acquires a slight degree of hardness. It is then rubbed with a rock-crystal or stone rubber till a beautiful polish is produced, not forgetting to sprinkle the wall with fine potstone (Ballapum) powder during the process of polishing. If the plaster is not entirely dry on the second morning, the operation of polishing ought to be continued until it is quite dry. The moisture, as above directed, must

be carefully wiped off, and the wall kept quite dry till all appearance of moisture cease. The result of the process depends chiefly on the plaster for the upper coat being reduced to a very fine paste perfectly free from grittiness, and on its being, after it is applied to the wall, rubbed constantly with great care till it is quite dry and has acquired a very fine polish. The wall ought then to be frequently wiped with a fine clean cloth to remove the moisture, and it may be occasionally dusted with Ballapum powder. The stone used in polishing it is rock-crystal or a white quartz pebble about 3 inches long and 1½ broad, the face of which has a very fine polish. The wall is rubbed with this for one or two days, the moisture being carefully wiped off every morning, and potstone (Ballapum) powder sprinkled on it several times during the day. When the lime is prepared from sea-shells, these are first cleaned and washed, and then calcined with charcoal, care being taken to exclude everything likely to injure the whiteness of the lime; very white sand only is employed, as common sand destroys the brilliancy of the plaster. When white sand is not procurable, white rock-crystal or quartz pebbles reduced to a fine powder may be substituted. Mortar for building consists of one part of chunam and two of sand. Immediately before being used, the mortar is mixed with jagari water, 1 lb. of jagari being allowed to every parah of lime. It is used in a much more fluid state than is the practice in Europe. When shell-lime is used in situations requiring a hydraulic cement, it should be mixed with burnt clay in powder; fresh burnt tiles more or less broken are in general conveniently procured. In building the pier at Masulipatam, Captain Buckle employed a cement consisting of one part of lime, one of the tile dust, and two of sharp river sand, and it appeared to answer well. Jagari was used in the usual proportion of one pound to a parah of chunam. Limestone abounds in most districts of Southern Asia, but the qualities of the different varieties are best ascertained by experiment. When found in large blocks of very compact stone, the breaching of it forms a considerable item in the expense. Such stone as yields very hydraulic lime is not suited to the purposes of ordinary building, unless the precaution is taken of keeping the work constantly wet. The best form of kiln for burning stone with charcoal is given by Captain Smith in his translation of Vicat, plate 1, fig. 11 and 12. When wood is used, the spheroidal form of kiln is recommended. It will be found to facilitate the expulsion of carbon, if the stone is well moistened in water previous to placing it in the kiln. It should be remarked that nothing but clean sand should be added to the hydraulic limes; such limes should be used immediately after slaking. When used in situations requiring hydraulic cement, no more water should be used in slaking it than is sufficient to reduce it to a fine dry powder. Magnesian limes have been found at Salem and in the Tanjore district, where it was used with success by Captain Cotton in forming the anicuts; the cement formed with it was stronger than that formed with other lime. It should not be immersed immediately on being used. Much controversy has occurred in regard to the advisability of using the lime while hot; the generally received opinion is that it should be so used; but in regard to the pure limes, free from clay and iron, that is, without hydraulic properties, this course is questionable. It was not permitted in Rome; and lime mortar kept moist has been found suitable for building after the lapse of several hundred years; lime used hot is seldom thoroughly slaked. A common practice in India is to mix the slaked lime and sand, form it into heaps, on the summit of which is formed a hollow, which is kept constantly filled with water. Shell-lime, so kept and subjected to the usual beating when used, seemed to Mr. Rohde at least as good as when at first burned; hydraulic limes, including of course all which become hard under water, ought no doubt to be used hot. At Ternate, and other coral islands, coral is largely burned into lime for mortar.—*Rohde, MSS.*

CHUNAR or Chanar, an ancient rock fortress in the Mirzapur district in the valley of the Ganges. It is perched on the crest of a limestone spur that rises to the height of 150 feet abruptly from the edge of the stream, on the right or south bank. It fell to the British in 1764. The treaty of Chunar between the subahdar of Oudh and Warren Hastings was signed on the 19th September 1781. In the fortress is a state prison in which Trimbukji Danglia pined away his last days, hopeless of ever being able to give a second slip to his enemies.—It is 17 miles W. of Benares, and 490 miles from Calcutta.—*Trav. of Hind.* i. p. 132.

CHUNAR. HIND. The Platanus orientalis. Char-Chunar lake, the Shalimar garden, was one of the great works of Jahangir.—*Baron Hugel.*

CHUNARU, also Chunari. HIND. Lime-burners, or workers in lime, as plasterers.

CHUN-CHU. CHIN. Ailanthus fœtida and A. glandulosa; but also Cedrela odorata and species of Dryandra and Fraxinus.—*Smith.*

CHUND, a Hindu poet and religious reformer, but now known only in the former character. He lived in the time of Prithi-raja, the last Hindu king of Dehli. He was a monotheist, and, after having separately invoked the three persons of the Hindu triad, says that he who believes them distinct, 'hell will be his portion.' His work is a general history of the period in which he wrote. It consists of 69 books, comprising 100,000 stanzas, relating to the exploits of Prithi-raja; and every noble family of Rajasthan finds in it some record of their ancestors. It is accordingly treasured amongst the archives of each race having any pretensions to the name of Rajput. From this he can trace his martial forefathers, who 'drank of the wave of battle' in the passes of Kirman, when 'the cloud of war rolled from Himachil' to the plains of Hindustan. The wars of Prithi-raja, his alliances, his numerous and powerful tributaries, their abodes and pedigrees, make the works of Chund invaluable as historic and geographical memoranda, besides being treasures in mythology, manners, and the annals of the mind. They are entirely heroic; each book a relation of one of the exploits of Prithi-raja.—*Tod's Rajasthan*, i. p. 98, ii. p. 254.

CHUNDA. MALEAL. Solanum Jacquini.

CHUNDA GUDDA. TEL. Tacca pinnatifida, *L.*

CHUNDAO, Chundul, or Chandal. HIND. Antiaris saccidora.

CHUNDA SAHIB, a Mahomedan ruler with whom the French sided in their efforts to establish

themselves in the south of India. In the beginning of the 18th century, Saadut Allah was ruler of the centre of the Karnatic, from 1710 to 1732, and was succeeded by his nephew, Ali Dost. Ali Dost was killed in battle against the Mahrattas, and was succeeded by his son, Safdar Ali. Of his two daughters, one married Chunda Sahib. Chunda Sahib seized on Trichinopoly in 1736, but the place was besieged and taken by the Mahrattas, and Chunda Sahib was made captive, and lingered eight years in prison at Tanjore, where he was murdered by the raja. Safdar Ali was assassinated by his brother-in-law, Murtuzza Ali, leaving a minor son; but this youth also was assassinated while Anwar-ud-Din was his guardian, and Anwar-ud-Din succeeded to the throne as nawab of the Karnatic, but fell at the battle of Ambur, and is buried in the Jamma mosque of Hyderabad.

CHUNDEE-MANDAPA. SANSK. From Chundee, the goddess Chundee, and Mandapa, a house. This is a kind of temple, with a flat roof. It is often erected by rich Hindus adjoining to their houses, and is designed for the image of Durga or Kali. It is built on four sides, with an area in the middle.—*Ward's Hindus*, ii. p. 3.

CHUNDEKIA or Soondekia. TAM. Solanum pubescens.

CHUNDEL, a tribe of Rajputs scattered in various parts of the N.W. Provinces, who came from Mahoba in Bundelkhand. Before the Mahomedan conquest, Mahoba appears to have been the capital of a principality that extended to the Narbadda, and included the province of Chunderi, which is called after their name. They are styled Sombansi, but they are not considered to be of pure descent, and their sons are carefully excluded from marriages with the higher clans. This tribe expelled the Baland tribe from Ajori, Burhur, and Mirzapur.—*Elliot.*

CHUNDELI, a very fine cotton fabric of India, so costly as to be used only in native courts. It is made from Berar or Amraoti cotton. The chief care is bestowed on the preparation of the thread, which, when of very fine quality, sells for its weight in silver. The weavers work in a dark, underground room, the walls of which are kept purposely damp to prevent dust from flying about, Umraoti cotton is alone used.—*Elliot.*

CHUNDER KOOP, three hills in Las, of extremely light-coloured earth, which rise abruptly from the plain. The largest is 400 feet high, another about 200 feet, and the third is a broken cone. The last encloses a basin of liquid mud about 250 yards in circumference, in which the mud heaves and bubbles up continuously. They are called the basins of Raja Ram Chunder. The Koops are said to be altogether 18 in number, viz. seven in the neighbourhood of Kattyawara, and eleven between Kej and Gwaddel in Mekran.

CHUNDIGAR. GUJ. A bracelet maker; one who makes armlets of glass or ivory for married women.

CHUNDOO. HIND. Fried mince-meat.

CHUNDOO. HIND. A hanging lamp, made of bamboo framework covered with mica.

CHUNDOO LAL, a Khatri, who succeeded Mir Alam as Peshkar-i-Diwan, of the Hyderabad state. He was unsuccessful as a financier.

CHUNDRA, Soma, and Indu are epithets for the moon.

CHUNDRA or Chundraka. BENG. Ophioxylon serpentinum.

CHUNDRAGHERRI, a town and fortress 11 miles W.S.W. of the Hindu temple of Tripati, which seems to have been founded about A.D. 1490, by Narsing'ha, a raja of Vijayanagar of the Vaishnava sect. It was occupied as a seat of Government in 1570 by a successor, Timma raja, but in 1644 the ruling sovereign, Sri Ranga Rayel, who in 1640 had granted the site of Madras to the English, was driven from his throne by the Bijapur army, and in 1646 took refuge with a former feudatory at Bednore, and with him the last of the Vijayanagar dynasty disappeared.

CHUNDREE. HIND. A printed fabric of silk or cotton, made in Kutch, Kattyawar, and Gujerat. The design is stamped on the cloth, and is caught up and tied with a continuous thread, and the piece of cloth is then dyed of the wished-for colour.

CHUNDROOS. HIND. Copal resin. Fine shavings of it are used to stop hæmoptysis, made up into a medicine called 'Khairwa.' It is much used in varnishes.—*Gen. Med. Top.* p. 132.

CHUNDRUHASA. BENG. Solanum ferox. Chundru-moola, Kæmpferia galanga. Chundru mullika, Pyrethrum or Chrysanthemum Indicum.

CHUNDUN, Chandan, or Chandana, also Ghundasaru. DUKH. Sandal-wood. Safed chandan is sandal-wood. Lal-chandan is the red sanders wood, Cæsalpinia sappan.

CHUNDUNA SUN. HIND. Corchorus olitorius. Chundun-betoo, Chenopodium album. Chundun-moolee, Urtica tuberosa.

CHUNDUN HAR. HIND. A necklace, neck ornament.

CHUNDUS, a scented wood used for the mala or chaplets of Hindus.—*Tod's Rajasthan.*

CHUNDWASSA. Close to this place are the Buddhist caves of Dhumnar, with a Hindu temple behind. About 40 miles from Nemuch.

CHUNE. MALEAL. Cathartocarpus fistula.

CHUNERIA. HIND. An embroidered net fabric.

CHUNG. HIND. Hordeum hexastichum, also Pyrus malus; in Pangi and Chenab, Boucerosia edulis, also Salix alba, white willow.

CHUNG, a border race between Nepal and Sikkim. They are also called Limbu, Chung being the name given to them by the Lepcha. They are a hardy, hard-working tribe. They cultivate grain, and rear cows, pigs, and poultry. Their huts are made of split bamboo, and thatched with the leaves of the wild ginger and cardamom, guyed down with rattans. They drink to excess. —*Latham.*

CHUNGAR, a wandering houseless race in the Panjab, probably the same as the Chinganeh of Turkey, the Italian Zingaro, the Spanish Gitano, and the English Gipsy. About Dehli the race is called Kunjur,—a word which, in the Panjab, properly implies a courtesan or dancing girl.

CHUNGHA, also Chun. HIND. Euphorbia Royleana.

CHUNGI. HIND. Boucerosia aucheri.

CHUNGI. HIND. A tax gathered daily from grain merchants, being as much grain as a man can hold in his hand.

CHUNG-PEH-LAH. CHIN. Wax insect.

CHUNGSAKHAGO, a pass in Kunawar leading from Chetka to Neilung, on the Jankee or

Jannubee branch of the Ganges. It is a lofty pass, probably not under 18,000 feet.

CHUNG-TSEW. CHIN. The Chinese festival of middle autumn.

CHUNI-BADLI. HIND. A scarf of gold muslin.

CHUNNA, Bengal horse gram, Cicer arietinum.

CHUNNI-MARAM. TAM. Acalypha betulina.

CHUNNI-SAFAID. HIND. Abrus precatorius seeds.

CHUNSER. HIND. Cress, garden cress; Lepidum sativum.

CHUN-SHAW-CAP. CHIN. Manis Javanica.

CHUNUMEA, a tribe of Chanderbansi Rajputs in Jonpur, Azimgurh, and Gorakhpur.—*Elliot.*

CHUPAO. PERS. A foray; a charge of cavalry.

CHUPATHI or Chapatti. HIND. An unleavened wheaten cake. Chapathi-ki bhaji, Marsilea quadrifolia.

CHUPEIN. HIND. Potamogeton gramineus.

CHUPRA, the chief civil station of Sarun. It is on the left bank of the Ganges, in lat. 25° 45′ N., and long. 84° 48′ E., 30 miles above Patna, and 370 miles from Calcutta.

CHUPRI ALU. HIND. Dioscorea globosa; properly Safri-alu.—*Roxb.*

CHUPTA-LAC or Chapta-lac. HIND. Shell-lac.

CHUR. HIND. of Kishengunga. Quercus ilex.

CHUR, in the Panjab, the sweeper caste, many of whom have become followers of Nanak, and are commonly called Rungretha Sikh or Mazhabi Sikh. See Chura.

CHUR. HIND., BENG. Properly Chor. The shifting alluvial deposits of a great river are so called in Bengal.—*Yule's Embassy*, p. 26.

CHUR, one of the spurs of the Himalaya, 12,500 feet in height, composed chiefly of mica schist and clay-slate, with intrusive dykes or seams of granite. Boulders of the same rock are abundant in the valleys. The summit of the mountain is composed entirely of granite.—*Adams.*

CHUR or Churi. HIND. A crest, a top-knot, a tuft of hair.

CHUR. BALUCH. A small defile.

CHURA; Churi. HIND. A knife, a dagger.

CHURA, of the Panjab, are serfs. They are the direct descendants of the Chaura or military out-castes of the Mahabharata.—*W. W. Hunter.*

CHURA, a tributary state in Gujerat, with a population of 13,793 souls.

CHURA, a caste of sweepers; one of the Ghair Mulazim castes in a village.

CHURA. BENG. Xyris indica, *Linn.*

CHURA. HIND. Commelyna Bengalensis; also Angelica glauca.

CHURA and Tirah are fertile and well-peopled valleys, enjoying a cool climate; and it was not unusual for the Peshawar sirdars and others, who had an understanding with the inhabitants, to pass the warm weather in the former of these places, which also frequently became a place of refuge to the distressed. At Chura resided Khan Bahadur Khan, Afridi, who attained immense influence amongst his tribe from the circumstance of his attendance at court during the sway of the Sadozai. Shah Shuja married one of his daughters, too, and on more than one occasion found an asylum with him.

CHURAL. HIND. Lathyrus sativus.

CHURANG or Chor Ganga, the founder of the Gangavansa dynasty of Orissa. His name is also written Saranga-deva. He invaded Orissa in A.D. 1131, and his dynasty ended with raja Narsinh-deo, who in 1217 built Kanarak, the Black Pagoda. Churang was a benefactor to Jagannath, adorned it, and peopled its neighbourhood.

CHURAYKAI. TAM. Cucurbita lagenaria.

CHUR-CHE, of early European travellers, are the Yu-che or Niu-che of the Chinese, the ancestors of the modern Manchu.

CHURGH, the female; Churghela or Churghlo, the male bird. Hunting hawks, natives of Cuthee, black-eyed; fastens on the antelope, and also kills the 'tuboor,' a kind of florikin.

CHURI. DUKH. A bird; hence Khan-churi, a house-sparrow. Churi-mar, a bird-catcher.

CHURI. HIND. Bracelets of glass, or lac, or metal. Chur, Chura, or Churi, the bracelet put on a newly-married bride, which she wears till widowhood. Churgar, ivory bracelet maker.

CHURIAL. HIND. Aralia Cachemirica.

CHURI KI BHAJI. DUKH. Amarantus campestris, *Linn.* Churi-saroch, Artemisia scoparius; also Asparagus Punjabensis and A. elegans.

CHURKA or Charkha. HIND. A cotton-cleaning jin. It is worked by two people. Two men working day and night can clean about 160 lbs. each.

CHURMA. MALEAL. Phœnix dactylifera.

CHURO. SIND. An unleavened cake of wheaten flour made into dough with clarified butter, and mixed with brown sugar; supposed, in Sind, to increase the delicacy of the skin.—*Burton's Scinde.*

CHURRA, a sanatorium on the N.E. frontier of India. The mean temperature at 4000 feet is about 66°, or 16° below that of Calcutta; which, allowing for 2½° of northing, gives 1° of temperature to every 290 to 300 feet of ascent. In summer the thermometer often rises to 88° and 90°; and in the winter, owing to the intense radiation, hoar-frost is frequent.—*Hooker, Him. Jour.* ii. p. 284.

CHURWA. HIND. Bruised rice.

CHUSAN ARCHIPELAGO, including the Kweshan group, is a large assemblage of islands near the mainland of China, between lat. 29° 20′ and 31° N. The Kweshan group consists of 11 islands. Chusan island is 51½ miles in circumference, and the walled city of Ting-hae on the S. side of the island is upwards of one mile in circumference. The Chusan northern group consists of numerous islands, mostly barren or rocky. Chusan, the largest island, is the station of a sub-prefect, and, with the smaller neighbouring islands, forms a district called Ting-hae, the name by which it is always spoken of by the mandarins among themselves, and which it bears in all the works published by imperial authority.—*Horsb.; Meadows' Desultory Notes*, p. 89; *Marryat's Indian Archipelago*, p. 150.

CHUSBAL. HIND. Potamogeton crispus.

CHUSHM-i-MAIDAH. PERS. The cat's eye gem.

CHUSHUL, a place in Ladakh where is a hot spring of a temperature of 96°. The waters are without taste or smell, but are said to have medicinal properties.

CHUSSAEE. HIND. Arango, GUJ. Large rough carnelian beads of various sizes and shapes, made in Cambay, and formerly extensively used in the African slave-trade.—*Faulkner.*

CHUSSUM. HIND. Waste silk.

CHUTI. HIND. Asparagus Panjabensis.

CHUTIA, the dominant race in Upper Assam when the Ahom race from the south swarmed into the valley. The Chutia kingdom was overturned by the Ahom chief Chutupha about A.D. 1350, and great numbers of the Chutia were deported and forced to settle in other parts of Assam, as in Chutia of the Durrung district; and still a great many of the Sadya and Upper Assam population are Chutias. The Bihiya are of the same family, and, as a tribe of Lalong in Upper Assam, claim to be of Chutia descent. The Chutia, long before the appearance of the Ahom, had adopted Hindu customs. They are of a light olive complexion, but with a flatness of face and a want of sharpness in the features. The Deori Chutia are an isolated colony on the river Dihing in Luckimpur Their language contains words used by the Garo and Bodo, but their origin is unknown. They profess Hinduism, but are considered to be a low caste.—*Dalton's Ethn. of Bengal*, p. 78.

CHUTIAL. HIND. Rheum emodi.

CHUTIALLI, a plain in Cutch Gandava.

CHUTIA NAGPUR, or Chota Nagpore, is a province in Bengal and the Central Provinces, lying between lat. 21° 58′ 30″ and 24° 48′ N., and long. 83° 22′ and 87° 15′ E., with an area of 43,901 square miles, and a population in 1872 of 3,825,571 souls, two-thirds of them professing Hinduism, and upwards of a million following aboriginal faiths. The Kolarian and Dravidian aboriginal tribes number 230,034, the semi-Hinduized aborigines 101,849, and Hindus 71,749. Chutia Nagpur is on the eastern part of the extensive plateau of Central India, on which the Koel, the Subunreka, the Damuda, and other rivers have their sources. It extends into Sirguja, and forms what is called the Upar-ghat or Highland of Jashpur; and it is connected by a continuous chain of hills with the Vindhya and Kymor ranges, from which flow affluents of the Ganges, and with the highlands of Amarkantak, on which are the sources of the Narbadda. The plateau is, on the average, about 3000 feet above the level of the sea, with an area of about 7000 square miles. It is on all sides difficult of access; is a well wooded, undulating country, diversified by ranges of hills, and it has a genial climate. The non-Aryan tribes had fallen back to that refuge from the plains, more than half of them, however, being of the race known to Europeans as Kol; the other races in Chutia Nagpur and its adjoining tracts are the Larka Kol, Ho, Bhumi, Mundah, and Santal. The Kol in former times possessed the whole of Chutia Nagpur, which may now be said to be divided between them and the Dhangar or Oraon, who came from Rotasghur. The chief men in most of the villages are still, however, of the old Mundah or Kol tribe, and they do not intermarry with the Dhangar or Oraon. The greater part of Singbhum is inhabited by Kol, and they are numerous in Bamanghotty, and dispersed to the vicinities of Cuttack (Katak) and Midnapur. They are in a confused mass of flat-topped hills called pāt, capped with a horizontal layer of trap. It is arranged, for revenue and administrative purposes, into the districts of Hazaribagh, Lohardaga, Singbhum, Manbhum, and the seven small tributary states designated the Chutia Nagpur mahals are Bonai, Chang Bahar, Gangpur, Jashpur, Korea, Sirguja, and Udaipur. The chiefs are tributary. The races have a strong belief in witchcraft.—*Imp. Gaz.; Dalton's Ethnology.*

CHUTKA. BENG. Bauhinia acuminata.

CHUTNEE is a warm condiment used in every family of India, either prepared fresh daily from ripe vegetables, or preserved. The following is a recipe for the Dehli or celestial chutnee:—Take of green mangoes, raisins, mustard-seed, salt, green singer, and garlic, each one seer; onions (none or) half a seer; dried red chillies, half to one seer; moist or soft sugar, one to two seers; white wine vinegar, four bottles. The ginger, garlic, and onions are to be peeled, and, together with the chillies, are to be cut into thin slices previously to being pounded; the mustard-seed to be washed and dried, then gently bruised and winnowed; the raisins to be washed and freed from the stones; the sugar to be made into a thick syrup; the mangoes to be picked of their rinds, cut into thin slices (some boil them in three bottles of the vinegar, adding the fourth when mixing them up with the other ingredients) and pounded; the remaining articles are to be separately pounded, and then the whole is to be incorporated, put into a stone jar, well closed, and placed in the sun for a month or two. If put into a glass bottle, it should occasionally be put out in the sun. It will keep good for years.

Love-apple Chutnee. Take the love-apple (Solanum lycopersicum, *Linn.*), a large plateful, the rinds and seed to be rejected, and only the pulp used; dried salt fish cut very fine (as if rasped), a piece about two inches square; six onions cut into thin longitudinal slices; eighteen green chillies chopped fine; dried tamarind, two pice weight (or one ounce), mashed up in about three or four ounces of water (stones and fibres to be rejected); salt, a teaspoonful; ghi or butter, five pice weight (or two ounces and a half). First put the ghi into a tinned copper vessel placed on the fire; when it is melted, add the onions; and as the latter begin to assume a reddish hue, add the chillies, stirring them well for five minutes. Then add the salt fish, and continue stirring the whole; when the ghi has nearly evaporated, add the love-apple, and stir it about for a good while. Lastly, add the tamarind water and salt, and mix the composition well until it acquires a pretty dry consistence (like that of brinjal chutnee or sambal). This chutnee is only for immediate use, and will not keep above a day or two.

CHUTOOR-ANANA. SANSK. Four-faced; from Chutoor, four, and Anana, a face.

CHUTSALEE. TIBET. Coarse borax from Ruthog. Chuwa Sirsa, first-class barilla or sajji.

CHUTSAO. CHIN. Ganjah.

CHUTTUR. BENG. Lands cleared for salt-making, a salt field.

CHUYAR, a hill tribe in the range bordering Bengal on the west, in Ramgurh and the neighbouring districts.—*Wilson.*

CHU-YU. CHIN. Yam.

CHYAVANA, in Hindu mythology, is the son of Bhriga, the son of Brahma, by his wife Puloma. A Rakshasa, or fiend, attempting to carry off Puloma, the child was prematurely born, whence his name, from Chya, to fall from. Upon his birth, his splendour was such as to reduce the insulter of his mother to ashes. Having adopted a life of ascetic devotion, he was so immersed in

abstraction, that he became completely covered with the nests of white ants. Sukanya, daughter of king Sariyati, wandering in the forest, observed what she thought two lights in an anthill, and thrust in two blades of kusa grass, which, when withdrawn, were followed by a flow of blood. Much alarmed, the princess repaired to her father and related what had happened. The king, conjecturing the truth, immediately went to the spot to deprecate the wrath of the rishi, and pacified him by giving him the damsel in marriage. After being married some time, the Aswini Kumara, passing by Chyavana's residence, conferred upon him youth and beauty, in requital of which boons he gave them a share in the soma juice offered at sacrifices to the gods. The gods, with Indra at their head, opposed this grant, and Indra lifted up his hand to strike Chyavana dead with his thunderbolt, when the sage paralyzed his arm. To appal the gods, he created the demon Mada, intoxication personified, in terror of whom and of the power of the saint, the gods acceded to the participation of the Aswini Kumara in divine honours. Indra was restored to the use of his arm, and Mada was divided and distributed amongst dice, women, and wine.—*Bhavishyat Purana and the Dana Dherma section of the Mahabharat*, p. 263.

CHYCHM. EGYPT. Cassia absus.

CHYEBASSA, the chief station of Singbhum.

CIANDU or Xanadu, a place in China 150 miles beyond the Great Wall, and ten days' journey from Pekin. It was called Che-min-fu, or by the Tartars Kai-min-fu. It was noticed by Marco Polo, as there stood that magnificent park and palace of the Tartar ruler of China, the great Kablai Khan, the description of which set Coleridge a-dreaming (or dreaming that he dreamt) that wonderful poem which tells how

'In Xanadu did Kublai Khan
A spacious pleasure dome decree.'

A later traveller mentioned how this lord passed the summer at a certain place which is called Sandu, situated towards the north, and the coolest habitation in the world.—*Yule, Cathay*, i. p. 134.

A small tree, leaves pinnate, from one to two feet long, scattered about the ends of the branches. Its flowers small, and of a reddish colour. It is commonly cultivated in the gardens of India, all over the Tenasserim Provinces, and is planted by the Burmese, who value its fruit highly. It bears some resemblance to a gooseberry both in appearance and taste, and yields a roundish subacid fruit about the size of a large marble. The fruit is largely used as an article of food, raw or cooked, or in pickles or preserves. Leaves are sudorific, and seeds cathartic. Wood inferior.—*Roxb.* iii. 672; *Ainslie*, 222; *O'Sh.* 551; *Mason.*

This valuable pulse is much prized in India, and in the more northern provinces of Hindustan, where it is common. The natives use it, parched and ground, mixed with wheat flour. Split with the hand-mill and steeped, it forms there the principal food of horses and all cattle. These, and barley roasted and ground, form a mixture called suttoo, given to horses. Each pod contains a single pea. Col. Sykes counted 179 seeds on one plant. When parched it tastes not unlike the roasted cashew nut, and is often used by the people of Northern India for food. Its composition per cent. is,—moisture, 10·80; starchy matter, 62·20; nitrogenous, 19·32; fatty or oily matter, 4·56; mineral constituents (ash), 3·12. It constitutes, after wheat, the chief food of the lower class in Spain. It is grown extensively by the Burmese, especially in Burma. The fresh plant has an acid reaction; and if clothes are placed in a field of it in the dewy morning, and then wrung out, they give an acid infusion.—*Powell; Roxb.; O'Sh.; Ainslie; Mason.* See Chuna.

Chicory, ...	ENG.		

Two varieties of this are grown in many parts of India, from Cape Comorin to the Himalaya. Wild chicory vegetates luxuriantly during the summer in Kashmir, and in the Panjab during the cold season. It grows there up to 5500 feet, and in Lahoul up to 9500 feet; and the young plant is used as a vegetable. The seeds are used in medicine, and are consequently kept in the bazars. Seeds of both varieties appear to be officinal, being considered carminative and cordial. The root also is used medicinally. The roots contain nitrate and sulphate of potash, mucilage, and some bitter extractive principle. An infusion of chicory mixed with syrup causes a thickening of the liquid. The root, Bekh Kasni, HIND., is used as a tonic and demulcent in fever and dyspepsia, and is largely used to adulterate coffee in England. This and C. endivia are raised and eaten by the Chinese as pot herbs.—*Honigberger*, p. 25; *J. L. Stewart, M.D.*, p. 408; *Smith.*

CICINDELIDÆ, a family of the Coleoptera. The genera common in India are Therates, Tricondyla, and Colliuris; the two former are characteristic of a southern range, while the latter is abundant throughout the eastern continent. The most splendid of the race abound in Nepal. Cicindela

heros and C. gloriosa also occur, the latter of a rich velvety green colour.

CICONIA, a genus of birds of the order Grallatores. Ciconia alba, the white stork, occurs in Europe, Asia, North Africa; is migratory, and is common in India during the cold season in immense flocks in Lower Bengal. Ciconia nigra, or black stork of Europe, Asia, North Africa, is not uncommon in India.

Occurs in Kashmir.—*Royle*, p. 426. See Conium.

CID of Spain, the Arabic term Sayyad, lord, by which all the descendants of Mahomed are styled. It was bestowed as an honorific distinction on a brave Christian knight, who opposed the Mahomedans in Spain.

CIDER or Cyder, the wine of the apple. It is made in Britain, on the continent of Europe, and in the United States. There was a manufacture of cider by the maharaja of Kashmir upon a large scale.—*Faulkner; M'Culloch.*

CIGARS.

Chutta, . . .	HIND.	Shruttu, ...	TAM.
Rokok, . . .	MALEAL.	T'sutta, ...	TEL.

Cigars are made all over the south and east of Asia, but the most celebrated are those of Manilla, of Chinsurah in Bengal, of the islands or Lunka of the Godavery, of Trichinopoly, and of Dindigul, in the peninsula of India.

CIMERII, Cimbri, or Camri, a Getic race, who entered Europe from Asia. Herodotus (Melpomene, p. 190) says the Cimmerians, expelled by the Massagetæ, migrated to the Crimea. Here were the Thyssagetæ or western Getæ; and thence both the Getæ and Cimbri found their way to the Baltic. Rubruquis, the Jesuit traveller, describing the monuments of the Comani in the Dasht-i-Kipchak, whence these tribes came, says 'their monuments and circles of stones are like the Celtic or Druidical remains of Europe.'—*Bell.*

CINCHONA, a genus of plants of the order Cinchonaceæ, natives of South America. Joseph de Jussieu, in his history of Peru, relates that in 1600 a Jesuit, who had a fever at Malacotas, was cured by Peruvian bark. In 1638 the Countess Anna of Chinchon was suffering from tertian fever and ague at Lima, whither she had accompanied the viceroy, her husband. The corregidor of Loxa, Don Juan Lopez de Canizaries, sent a parcel of powdered quinquina bark to her physician, Jua de Vega, assuring him that it was a sovereign and infallible remedy for tertiana. It was administered to the countess, who was 62 years of age, and effected a complete cure. This countess, returning with her husband to Spain in 1640, brought with her a quantity of the healing bark. Hence it was sometimes called 'countess' bark' and 'countess' powder;' and Linnæus, long after, named the whole genus of quinine-bearing trees, in her honour, Chinchona. By modern writers the first h has usually been dropped, and the word is now almost invariably spelled in that way, instead of the more etymological Chinchona. The Jesuits afterwards made great and effective use of it in their missionary expeditions, and it was a ludicrous result of their patronage, that its use should have been for a long time opposed by Protestants and favoured by Catholics. In 1679, Louis XIV. bought the secret of preparing quinquina from Sir Robert Talbot, an English doctor, for 2000 louis-d'or, a large pension, and a title. Under the Grand Monarch it was used at dessert, mingled with Spanish wine.

The British, in British India, Ceylon, and Burma, and the Dutch in Java, have successfully introduced several of the species,—at Neddiwattam, Pykara, Kalhatti, and Ootacamund, in many private plantations, also in Wynad, in the Bababooden, and hills of Biligiri Rangam; also in Ceylon; also at Darjiling, in the Doons of the N.W. Provinces, and in Sikkim; and the Travancore Government has likewise aided in their diffusion, by selling seed and seedlings; also in Burma it has been planted near Tounghoo, at Than-toung-gyee in the Sitang division; likewise on the Khassya hills. The better known species are C. Boliviana, calisaya, condaminea, cordifolia, lancifolia, lucumæfolia, magnifolia, micrantha, nitida, oblongifolia, officinalis, ovata, Pahudiana, Peruviana, purpurea, succirubra, and scrobiculata.

The commercially valuable species are,—

C. officinalis, var. α. condaminea, var. β. bonplandiana, var. γ. crispa, crown bark; of Loxa region.
C. succirubra, *Pavon.*, red bark; west slopes of Chimborazo.
C. Pitayensis, etc., C. lancifolia, C. cordifolia, Colombian bark; Colombian region.
C. nitida, C. micrantha, C. Peruviana, grey barks; of Huanuco region in North Peru.
C. calisaya, yellow bark; in Bolivia and South Peru.

Cinchona calisaya bark, of the best kinds, of South America, yields, on the average, 3·8 per cent. of quinine. That of the variety C. Josephiana, 3·2 per cent. One variety, grown in Java from seeds transmitted by Mr. Ledger, yields nearly 10 per cent. of quinine; but in Java and Ceylon 13 per cent. of quinine has been obtained, and from Ledgeriana plants grown on the Neilgherries, 11 per cent.; and it is recognised that the yield of the plants is the sole guide in planting. The treatment of the trees, by barking, mossing, and shaving their bark, adds greatly to their yield of quinine. Up to 1880, the quantity of quinine imported into British India was about 10,000 lbs., value about £40,000. In Madras there have been the following gratifying comparisons between expenditure and revenue:—

Year.	Expenditure.	Revenue.	Profit.
1876-77, .	Rs. 1,18,742	1,18,960	218
1877-78, .	1,34,228	3,71,071	1,36,843
1878-79, .	1,44,179	4,30,908	2,86,729
1879-80, .	1,56,708	4,89,731	3,33,023

Cinchona barks imported into London from June 1879 to June 1880 amounted to 6,002,330 lbs. from Colombia, and 959,030 lbs. from all other parts of South America. India and Ceylon, 1,172,060 lbs.; Java (to Amsterdam), 70,088 lbs.; Jamaica, 21,140 lbs. In September 1882, at a sale of barks from the Madras Government plantations, the following table shows the prices realized as compared with those of the sale on 11th Jan.:—

Description of Bark.	Weight of bales—lbs.	Jan. 11. Rs.	Sept. 4. Rs.
Mossed crown,	104 to 108	343 to 345	353 to 360
Natural, . .	102 to 107	243	245 to 267
Branch, . .	104 to 111	average	60
Natural red, .	102	111 to 120	121 to 126 bale of 100lb.
Mossed red, .	100	147 to 151	158 to 182
Do. .	102	none	170 to 172
Branch red, .	102	73	73
Do.	102	81½	80

In 1881, in Ceylon, almost all estates had trees planted along road-sides, or in the midst of the coffee, or in places where the coffee trees had died out; but in other estates almost the whole acreage had been planted with them, in regular rows between the lines of coffee. They are said to grow in the Yatiyantota district on the western slope, at 500 feet; and at Kalutura, about 30 miles S. of Colombo, nearly at the sea level. The number of cinchona plants growing in Ceylon at the beginning of 1881 was estimated in Fergusson's Handbook at from 50,000,000 to 100,000,000. C. succirubra was the most numerous, being reckoned at more than one half. The remainder consists of C. officinalis and C. calisaya, with such varieties as C. Ledgeriana and C. pubescens. The export from Ceylon of cinchona bark for the eleven years 1869 and 1871 to 1880, shows an increase from 28 oz., value Rs. 50, in 1869, to 1,161,989 lbs. in 1880, value Rs. 12,00,000 :—

1869,	28 oz.,	Value, Rs. 50
1871,	80 packages,	313
1872,	11,547 lbs. and 694 packages,	64,102
1873,	44,836 ,,	32,667
1874,	40,354 ,,	25,277
1875,	19,152 ,,	17,963
1876,	14,932 ,, and 1 package,	14,720
1877,	72,127 ,, and 1 ,,	88,738
1878,	186,797 lbs.	Value, Rs. 1,71,292
1879,	507,368 ,,	5,19,086
1880,	1,161,989 ,,	(say) 12,00,000

The organic constituents of cinchona barks are,—quina, chinchonia, aricina, quinidia, chinchonidia, quinic, tannic, and quinovic acids, chinchona red, etc.; in medicinal forms, quinine, chinchonidine, quinidine, chinconine. The quill bark stripped from saplings, just as cinnamon is prepared, is found to be rich in quinine. The bark that is obtained at Sikkim is all made into a febrifuge in a factory on the estate. This febrifuge is said to be quite as efficacious as quinine, and it is much cheaper, and very easily made. The cost is Rs. 9·3·10½ per lb., or about 9 annas per ounce.

On the Neilgherries, nearly every species has been planted in the several plantations, the preference being given to C. succirubra, C. officinalis, and C. pubescens. C. lanceolata was also cultivated during 1877–80. Succirubra and officinalis were the best of the available kinds for cultivation upon the high Neilgherry plantations. On 31st March 1882, there were 183,498 C. succirubra and 551,307 C. officinalis plants in permanent plantation, 552 plants of Ledgeriana, 1874 of C. micrantha, 44 of Pitayensis, 9613 of 'hybrids and others;' only 8 left of 120 C. Carthagena, and 5 of 15 C. Santa Fé plants raised early this year.

Statement showing the Out-turn and Disposal of Cinchona Bark at the Government Plantations in India during each of the official years 1876–77 to 1881–82.

In the year 1880–81 the cinchona factory at Darjiling disposed of 8600 lbs. of febrifuge; the plantation harvested a crop of 348,560 lbs. of bark. The earnings for the year amount to 80,290 rupees, representing a dividend of 8 per cent. on the capital of the plantation; exclusive of the saving which Government derive from substituting the febrifuge for quinine in public hospitals and dispensaries. This saving Dr. King estimated at 4½ lakhs for the year,—almost the value of half the capital expenditure on the plantation. The Government encouraged competition by their free sale of seed; and in 1879–80 as much as 1711 lbs. of seed were distributed. They had 847 acres under cultivation; and at the end of 1879–80 there were 677,350 plants in permanent plantation. The people of India owe a deep debt of gratitude to Mr. Clements Markham for bringing cinchona to them, and they should exercise it while he still lives. It is one of the largest boons conferred on India and its people. He went and resided in South America. He published (1862) his travels in Peru and India, while superintending the collection of cinchona plants and seeds; and in 1880 his 'Peruvian Bark' gave a popular account of the introduction of cinchona cultivation into British India.

Cinchona calisaya is found to be a very variable species in Sikkim; and its variations are not confined to the form of leaves and flowers, but extend also to the chemical constitution of the bark, some of the varieties grown in Sikkim containing nearly eight per cent. of pure quinine, while the bark of others yields very little of quinine or of any other useful alkaloid. But the differences in external form and of richness in alkaloid are not related to each other in any very definite way; and trees, of which the leaves and flowers are so

much alike as to be undistinguishable from dried specimens, have been found to yield bark of quite different chemical composition. In Java the Dutch have a variety of calisaya, the bark of which is richer in quinine than any bark ever imported from South America; some of the Dutch samples having yielded on analysis the extraordinary amount of 13·7 per cent. of quinine. They had been raised from a parcel of seed purchased in 1866 by the Dutch Government from Mr. Ledger. Mr. Ledger got them from a half-caste, who would not tell where he collected them, and who was murdered soon after; the exact locality in Bolivia where they were gathered, therefore, remains unknown. Mr. Ledger's seed produced 6300 trees, which have since been largely propagated from. The 6300 plants all agree in being rather shabby-looking trees, averaging in height 25 feet, and girthing at 6 feet from the ground 27 inches. They have tall stems, and rather small, lax, conical heads, the branches of which are more or less distinctly arranged in tiers. The cinchonas under favourable circumstances become large trees, and have the handsomest foliage of the forest. The leaves are lanceolate, glossy, and vividly green, traversed by rich crimson veins; the flowers hang in clustering pellicles like lilacs, of deep rose-colour, and fill the vicinity with rich perfume. Nineteen varieties of cinchona were established by Dr. Weddell. The cascarilleros of S. America divide the species into a category of colours, according to the tinge of the bark; there are yellow, red, orange, violet, grey, and white cinchonas. The yellow, among which figure the Cinchona calisaya, lancifolia, condaminea, micrantha, pubescens, etc., are placed in the first rank; the red, orange, and grey are less esteemed. This arrangement is in proportion to the abundance of the alkaloid quinine, used in medicine instead of the bark itself. The following prices have been realized in London :—

C. succirubra, red bark, 2s. 6d. to 8s. 6d. per lb.
C. calisaya, C. frutex, C. vera, yellow bark, 2s. 10d. to 7s. per lb.
C. officinalis, var. (*a*) Uritusinga, Loxa bark, var. (*b*) Condaminea, select crown bark, 2s. 10d. to 7s.
C. crispa, fine crown bark, 2s. 10d. to 6s.
C. nitida, genuine grey bark, 1s. 8d. to 2s. 9d.
C. sp. undetermined, fine grey bark, 1s. 8d. to 2s. 10d.
C. micrantha, grey bark, 1s. 8d. to 2s. 9d.
C. Peruviana, finest grey bark, 1s. 8d. to 2s. 10d.
C. pabudiana.

Plants of the C. Ledgeriana from Java have been sold at 500 rupees a thousand; and price for seed paid for this variety, £226 per ounce. This seed was taken from trees of a superior kind, of a good age, the bark of which had been tested, and the firm advertised the seed in Java. The 1880–81 crop of Madras amounted to 250,271 lbs., against 183,984 lbs. in 1879-80. 234,736 lbs. were supplied to the home market, 5096 lbs. to a firm in Madras, and 2000 lbs. to the Bombay Medical Department, leaving a balance of 8439 lbs. in store. Experiments are still (1882) being made to determine the merits of the grassing and mossing systems. Low-country coolies were employed as labourers with success.

Cinchona calisaya, *Ruiz. and Pavon.*, grows on the Andes of Peru, New Granada, and Bolivia, at 5000 to 6000 feet above the sea. It attains a height of 40 feet. It yields the yellow bark, also part of the crown bark. It is one of the richest yielders of quinine, and produces, besides, cinchonidine, but yields little of other alkaloids. Its varieties do not all furnish bark of equal value. It grows under conditions more limited than those of C. succirubra, and it is not so easily propagated. The Santa Fé variety ascends the Andes of New Granada up to 10,000 feet, and produces the highly valuable soft Colombia bark.

Cinchona cordifolia, *Mutis.*, grows on the Andes of Peru and New Granada, at between 6000 and 8000 feet elevation, and yields the hard Cartagena bark, or West Pitaya bark, one extremely rich in alkaloids. It is hardy, grows with rapidity and vigour. The thickest bark is obtained in the highest altitudes, where it has the action of misty clouds.

Cinchona hasskarliana, *Miq.* In Java, some of the best results were obtained from this species, as yet not critically identified.

Cinchona lancifolia, *Mutis.*, considered by Weddell a variety of C. officinalis. It grows in places where the mean annual temperature is that of Rome, with, however, less extremes of heat and cold. It yields part of the Pitaya bark of commerce.

Cinchona micrantha, *Ruiz. and Pavon.*, grows on the Cordilleras of Bolivia and Peru to a height of 60 feet, and from it part of the grey and of the Huanuco bark as well Lima bark are obtained. It is comparatively rich in cinchonine and quinidine, and also contains quinine.

Cinchona nitida, *Ruiz. and Pavon.*, grows in the Andes of Peru and Ecuador to a height of 80 feet, and yields part of the grey and Huanuco bark, also the Lima bark. It contains predominantly cinchonine and quinidine.

Cinchona officinalis, *Lindl.*, is partly C. condaminea, *Humboldt.* It grows on the Andes of New Granada and Peru, at a height of 6000 to 10,000 feet, and yields the crown or brown Peruvian bark, besides part of Loxa bark. It is comparatively rich in quinine and cinchonidine. Superabundance of moisture is particularly pernicious to this species. The temperature of the middle regions of the Andes where this tree grows is almost the same as that of the Canary Islands. The crispella variety endures a temperature occasionally as low as 27° Fahr.

Cinchona pitayensis must also be referred to C. officinalis as a variety. It attains a height of 60 feet, and furnishes also a portion of the Pitaya bark. In Upper India it has yielded in some instances the unprecedented quantity of 11 per cent. alkaloids, nearly 6 per cent. quinine, the rest quinidine and cinchonine. This plant is now annihilated for bark purposes in its native forests.

Cinchona succirubra, *Pavon.*, a tree of the mid-Andes regions of Peru and Ecuador, yielding the red Peruvian bark, rich in quinine and cinchonidine. It attains a height of 40 feet. It is this species which is most largely cultivated in the mountains of Bengal. This has proved the hardest species in Sikkim; it grows under a wide range of conditions, and seeds freely; all its varieties produce bark of great value, yielding an average of 4 per cent. of alkaloids. Beetles (a male stag-beetle, family Lucanidæ) have been found feeding on the renewed bark (after shaving) of succirubra trees in Maskeliya. The female has much shorter mandibles, and is said to use them in forming a hole in the trunks of trees for the reception of its

eggs. Westwood says (i. p. 187) the perfect insect feeds on the honey-dew upon the leaves of the oak; they also feed upon the sap exuding from the wounds of trees, which they lap up with their finely ciliated maxillæ and lower lip. It has been supposed that the larva of this insect, which chiefly hides in the willow and oak, remaining in that state several years, is the animal so much esteemed by the Romans as a delicacy, and named cossus. The injury which it causes is often very considerable, boring not only into the solid wood, but also into the roots of the tree. The stag-beetle found in Maskeliya was a male, with immense mandibles, and greatly resembles Lucanus cervus, the common stag-beetle of Europe.—*Observer, Ceylon; Von Mueller.*

CINCHONACEÆ, the coffee tribe of plants, of which there are 233 genera and 870 species. Of these, 729 species are known to occur in the south and east of Asia, viz. in Zanzibar, Timor, Persia, Japan, each three; in Arabia four, and in India 695.

This is found in commerce, native and manufactured. It is the red or bi-sulphuret of mercury. The best native cinnabar is red, heavy, brilliant, of a high colour, and free from earthy or stony matter. It is found in various places, chiefly in quicksilver mines, being one of the ores of that metal. It occurs native in China abundantly in Shen-si; and all the quicksilver (shwin yin, water silver, *i.e.* hydrargyrum) not imported into China is there obtained from this ore, by a rude process of burning brushwood in the wells, and then collecting the metal after condensation. Cinnabar is brought from the mines of China in the form of a coarse shining powder, with a varying depth of red colour. The finest is used as a pigment, and in making red lacquer for varnishing. Cinnabar has been discovered at Bassein, in Borneo, in a mountain range called Bungo, extending between two branches of the Sarawak river. It yields 84 per cent. of quicksilver. For making artificial cinnabar, when two parts of mercury and one of sulphur are triturated together, the mercury gradually disappears, and the whole assumes the form of a black powder. When this is heated red hot, it sublimes, and if a proper vessel be placed to receive it, a cake is obtained of a fine red colour, which, when reduced to a fine powder, is known by the name of vermilion. Artificial cinnabar is largely manufactured in Calcutta, and in small quantities at Surat. It has been employed in medicine by the Hindus from time immemorial, to salivate their patients, causing them to inhale its fumes. Cinnabar is entirely volatile from a slip of talc, while the impurities remain behind. Compound cinnabar ointment is Captain Aitkin's useful ringworm ointment.—*Williams' Middle Kingdom; Mason; Beng. Phar.; Thomson's Chemistry.*

CINNAMOMUM, a genus of plants belonging to the natural order Lauraceæ, confined to Eastern and Southern Asia. The species are—

albiflorum, Nepal.
aromaticum, of China.
camphora, China, Japan.
caudatum, Nepal.
culitlawan, Moluccas, Cochin-China.
cassia, S. China.
dubium, Ceylon.
dulce, China.
eucalyptoides, Malabar.
iners, Peninsula of India, Malayana.
multiflorum, of Ceylon.
nitidum, Sumatra.
obtusifolium, of Ceylon.
ovalifolium, of Ceylon.
pauciflorum, of Sylhet.
recurvatum, China.
villosum, Ceylon.
Zeylanicum, Ceylon.

CINNAMOMUM ALBIFLORUM. *Nees.*

C. camphoratum, *Bl.*	Laurus cassia, *Roxb.*
C. tamala, *F. Nees.*	
Dalchini, Tajkalmi, HIND.	Tez-bal, Tejpat, HIND.

This tree grows in Tiperah, Nepal, Kumaon, and the Panjab; is not uncommon in the Himalaya east of the Sutlej; grows sparingly at about 5000 feet as far as the Ravi, and probably in Hazara. Part at least of the officinal bark and leaves are probably derived from this tree. The former is given for gonorrhœa, and the latter are used in rheumatism, being considered stimulant. Its timber does not appear to be valued.—*Voigt; Stewart; Powell.*

CINNAMOMUM AROMATICUM. *Nees.*

C. cassia, *Blume.*	Laurus cinnamomum, *Andr. Repst.*
Laurus cassia, *Nees*, t. 3.	

A tree of considerable size, said to grow in the dry sandy districts lying N.W. of the town of Fai-foe, between lat. 15° and 16° N. It is said to produce the cinnamon of China and Cochin-China, as also cassia bark and the aromatic fruits called cassia buds.—*Royle; Wight; Voigt.*

CINNAMOMUM CITRIODORUM. *Thw.* Pangaree Kurundu gass, SINGH. A tree of Ceylon, growing to a height of 20 or 30 feet in the Sufragam district, at an elevation of 1000 to 2000 feet. It is distinguished by the venation of its leaves, and by the truncated cup of the fruit. The bark has much of the odour of citronella oil, intermixed with something of the fragrance of common cinnamon.—*Thw. Zeyl.* p. 253.

CINNAMOMUM CULITLAWAN. *Nees.*

Laurus culitlawan, *Roxb.*	Cortex caryophylloides, *Rumph.*
L. caryophyllus, *Lour.*	

A native of Amboyna, especially in Leitimoo, near the villages of Sava Rutton and Ema. It also grows in Cochin-China. The bark when dry is aromatic like cloves, but less pungent and sweeter. It has some astringency, and owes its medicinal activity to a combination of volatile oil, resin, and bitter extractive. It is used in dyspeptic complaints, diarrhœa, etc. The natives of Amboyna use the oil in both as an internal medicine and as a stimulating liniment.—*Roxb.* iii. p. 299; *Voigt; Eng. Cyc.*

CINNAMOMUM DULCE. *Nees.*

C. Chinensis, *Bl.*	Laurus dulcis, *Roxb.*

A small tree of China, leaves and bark of a sweet aromatic taste and odour.—*Roxb.* ii. 203.

CINNAMOMUM EUCALYPTOIDES. *Nees.* Grows on the mountains of Malabar. Its leaves have a strong acrid clove-like odour, and taste somewhat tinctured with camphor. It is the Laurus Malabatharica. 'Sapor et odor foliorum fortis et acris caryophyllorum cum levi camphoræ tinctura.'—*Nees; Voigt; Roxb.; Wall. Cat.*

CINNAMOMUM INERS. *Reinw.*

Described as a tree in Sumatra, but as a small tree or shrub on the continent of India. Its flowers are small and of pale yellowish colour, and the bark is cinnamon-like in taste and odour. It is the plant which furnished the principal part of the Folia Malabathri of the old pharmacologists.—*Roxb.* ii. p. 300; *Eng. Cyc.; Voigt.*

CINNAMOMUM OBTUSIFOLIUM. *Nees.*
Laurus obtusifolia, *Roxb.* | L. Malabatharica, *Roxb.*

A tree of the mountainous countries immediately east of Bengal, with small greenish-yellow flowers. Its timber is very useful for various purposes. C. obtusifolium, C. pauciflorum, and C. tamala were found by Dr. Hooker up to 6000 feet in the Khassya mountains.—*Roxb.; Voigt.*

CINNAMOMUM ZEYLANICUM. *Nees.*
C. capparis-coronde, *Blume, Nees.*
Var. β. Multiflorum.

C. multiflorum, *W. Ic.*	C. dubium, *Nees.*
C. perpetuoflorens, *W. I.*	C. villosum, *W. I.*

Var. γ. Ovalifolium, *Wight.*

This exceedingly handsome variety of cinnamon is very abundant on the higher ranges of the Neilgherries, and in all sholas about Ootacamund, flowering in May. All the parts, when fresh, if crushed, have a powerful odour of cinnamon. The tree is very large, and has great girth. The timber is even-grained and good, but is not much in use. There are seven well-marked varieties of cinnamon found in the western (moist) forests of the Peninsula, growing up to the highest elevations. They differ much in size, and in the manner of growth of the tree itself, shape and size of the leaves, pubescence, etc.; but Colonel Beddome, after long observation, and with a very large collection of specimens, is inclined to look upon them all as varieties only of the C. Zeylanicum. They run almost imperceptibly into one another, and it is almost impossible to lay hold of any constant character worthy of a specific distinction; and many of the differences are, he believes, the effect of elevation and climate.—*Roxb.; Wight; Beddome.*

The bark of Cinnamomum Zeylanicum, *Nees*, is the true cinnamon of the shops, and the true Kinnemon of Exodus xxx. 23. Two varieties of cinnamon are known in commerce, that of Ceylon and Cayenne, and the Chinese cinnamon, which is of far inferior quality. Cinnamon is exported from China, Siam, Cochin-China, and Java; but that which is of greatest value comes from Ceylon, which has been the chief place of production from the earliest period at which any record exists concerning the use of this spice, and which extends back to the days of the Roman republic. Up to the year 1760, during the latter portion of the Dutch rule in Ceylon, cinnamon grew in a wild state amongst the thick jungles of the low and hilly country, the best always having been cut upon the light soil of the maritime provinces. The tree is found only in the western, southern, and central provinces. The peelers recognise ten varieties of Kurundu or cinnamon, viz. Naga or snake, Kapuru or camphorated, Kahate or canalle or astringent, Savell or glutinous, Dawool or drum, Nika or wild, Mal or flowering, Toupat or trefoil, and We Kurundu or white ant cinnamon. The true cinnamon is often adulterated with the inferior barks of other species; and the volatile oil, on which its virtues depend, is sometimes fraudulently extracted. Besides the oil of cinnamon, a fatty substance called cinnamon butter and cinnamon suet is expressed from the ripe fruits.

CINNAMON BUTTER, or Cinnamon Wax, is obtained from Cinnamomum Zeylanicum. By strong decoction, the fruit yields a concrete oil, used for candles, and which exhales while burning a most delicious odour.

CINNAMON STONE, a precious stone found in Ceylon. It is a variety of lime-garnet of a clear cinnamon-brown tint, commonly occurring in masses, which are full of fissures. Translucent, seldom transparent.

CINNARA, in Hindu mythology, genii; and male dancers in Swarga, the heaven of Indra.

CIRCAETUS GALLICUS. *Gm.* Serpent eagle.

Pambu prandu, . TAM.	

This is found in the south of Europe, North Africa; is common all over India and Asia; has been killed in Denmark, but never in the British Islands; prefers the open ground, questing like a harrier. It eats any creature, but snakes and lizards are its chief food. Hovering in the air, and pouncing down suddenly like a stone, it seizes the snake by the head with its talons, and the snake often twines its body around the bird, and so encumbers it that it is occasionally so caught. —*Jerdon.*

CIRCAR. In the Mahomedan land revenue system, a circar was a subdivision of a subah. The N.W. Provinces of India, excluding the Saugor and Nerbadda territories, comprised no complete subah, but only portions of the four subahs of Agra, Allahabad, Dehli, and Oudh. Each subah was divided into a certain number of circars, and each circar into parganas or mahala (which are used as equivalent expressions); and the parganas again were aggregated in dastoors or districts; and as the parganas of the same

dastoor are of course always contiguous, the dastoor statement in old registers, if copied with any regard to correctness, frequently forms a very important means of the verification of doubtful names. Subah is an Arabic word, signifying a head of money, or a granary. Circar (Sir-kar) is literally a chief, a supervisor. Dastoor, besides signifying a rule, is also a minister, a moonshee. Pargana means taxpaying land, as well as a perfume composed of various ingredients. The title of subahdar, or lord of the subah, is long subsequent to Akbar's time. Siphasalar was the only designation of the emperor's viceroy in each subah.

Circars is a political appellation of a large tract of country between lat. 15° 40′ and 20° 17′ N., running from the Chilka lake to Motapilli, along 470 miles of sea-coast, with a breadth of from 70 to 100 miles of low country, an area of 17,000 geographical miles, watered by the Kistna, the Godavery, and Gondecama; and three or four British districts have been formed out of it, viz. part of Ganjam, Vizagapatam, Godavery, Kistna, and Guntur, and part of Nellore district, between the Eastern Ghats and the bay. From the 5th to the 11th centuries, the Kesari, or Lion kings of Orissa, held sway there, followed by the Gajapati dynasty in the north, and Narapati in the south, then by the Bahmani, the Kutub Shahi, and the Asof Jahi. They were ceded to the French in 1753, and to the British E. I. Company in 1759, after Colonel Forde's successful attack on Masulipatam in April of that year. They contain the important towns of Ganjam, Chicacole, Vizianagram, Vizagapatam, Coringa, Yanoor, Masulipatam, Ellore, and Nizampatanam.—*Annals, Ind. Adm.* xi. p. 243; *Imp. Gaz.*

CIRCASSIA is the Cherkas of Asiatics. It is a mountainous country in the S.E. corner of Europe, on the northern face of the Caucasus, lying between lat. 41° 50′ and 45° 20′ N., and 37° and 47° 20′ E., about 550 miles long and 75 miles broad; area, 40,000 square miles. The highest summits for nine months are covered with snow. —*MacGregor.* In a small tract not less than seventy-two dialects are spoken. The Cherkess and the Che Cheu are the two great tribes. They take the common name of Adighe: but the Cherkess include amongst them the Khabard Abkhas, Ubiche, and other clans, and number from 400,000 to 500,000 souls. The Che Cheu number 150,000 souls. Their religion is a mixture of Christianity, Mahomedanism, and paganism. They reverence Merem, a benevolent deity, and Tschible, the spirit of thunder. There are three social classes, —Usdi or nobles, Tschfokot or freemen, and Pschilt or slaves,—and these grades are hereditary, like the castes of India. When their forts or villages have been surrounded, they have destroyed their women and children, set fire to their dwellings, and perished in the flames, rather than surrender.

Their young women are famed for their beauty, and are sought for in the neighbouring kingdoms. They are brought up in simple and domestic habits by their mothers, are taught the use of the needle in decorative works, and to make their own clothes, and those of the men of their family, and are otherwise very carefully reared. They are sold to the bridegroom and to traders.

The Cherkess or Circassians were typical representatives of the West Caucasian races. They were the most powerful and warlike of all the western nations. Since their final reduction, in 1864, by Russia, most of their lands on the left bank of the Kuban have been occupied by their conquerors, the great bulk of the Cherkess having withdrawn into Turkish territory, and dispersed over Armenia, Asia Minor, Syria, and the Balkan peninsula. Similarly, 20,000 Abkhasians migrated to Turkey at the close of the last Russian war, and both races have become predatory. Cherkess are to be found in Asia Minor, along with Lazi, where also are the Yuruk, a nomade Turk race occupying the uplands between Erzerum and the plains of North Syria. Kazzilbash also are there, and are scattered over Anatolia, Persia, and eastwards to Kābul. They call themselves Eski-Turk, or old Turks. The fertile plains of Raz Ova and Ard Ova, near Tokat, and the villages between Angora and Amasia, and between Kara Hissar and Tokat, are the Kazzilbash headquarters. They profess Islam, but avoid all inquiry into their doctrines. The Circassians and Abkhasians have never found a suitable home in Asia Minor, and are a serious disturbing element (Asia, p. 37), being indolent and predatory. The Cherkess and Abkhasians of West Caucasus are Sunni Mahomedans; the Kabard are Christians; and these three races number 138,000. In the time of Selim I., the Mameluks were all slaves of pure Circassian blood. More recently, only the Borgite Mameluks were of Circassian origin.—*Charles Tauschin, Circassians; Porter's Tr.* i. p. 141; *Lond. As. Trans.* i. p. 98; *MacGregor; A. H. Keane and Sir Richard Temple's Asia.*

CIRCASSIAN BEANS, seeds of the Adenanthera pavonina, used for ornamental purposes.

CIRCLE. Under the form of a winged circle, the Assyrians worshipped the supreme deity. The Buddhist wheel of the law, to be seen on the caves of Ellora and Ajunta, was probably borrowed from the Assyrians, as it reminds us of the wheel within wheel of Ezekiel. It is a symbol of the Hindu god Vishnu, under the Hindi term Chakram.—*Cal. Rev.* 1868. See Chakram.

CIRCUMAMBULATION.

Touaf, ... ARAB.	Parikarma, . . . HIND.
Deisol, . . . CELTIC.	Pradakshana, . . SANSK.

The circumambulation of sacred places has ever been part of the ritual of worship of Asiatic nations. The Mahomedan in circumambulation, Touaf, presents his left shoulder; the Hindu and Buddhist in Pradakshana walk round with the right side towards the fane or idol, and this would appear to be the original form of the rite. Its conjectural significance is an imitation of the procession of the heavenly bodies, the motion of the spheres, and the dances of the angels. These are also imitated in the circular whirlings of the Rafai darvesh. El Shahistani informs us that the Arab philosophers believed the sevenfold circumambulation to be symbolical of the motion of the planets round the sun. It was adopted by the Greeks and Romans, whose Ambarvalia and Amburbalia appear to be eastern superstitions, introduced by Numa, or the priestly line of princes, into their pantheism; and in Britain the processions round the parish preserve the form of the ancient rite. It is the processional of the Romish and other Christian churches, in which the clerical attendants perambulate the aisles, and is practised

in sanctifying a church or a churchyard. At the Holy Sepulchre, the Greek, Armenian, and other pilgrims circumambulate three times. In Ireland it is a very common practice to circumambulate the graveyard three times before proceeding with the corpse to the grave. See Parikarma. In Britain, at the time Christianity was established in Ireland by St. Patrick, and in the N. of Scotland by St. Columba, it was a practised rule. Hindus encircle with right hand to the shrine. The Buddhist Bhot, in passing the Mani, always leave it on the right.—*Northern Barrier; Burton's Mecca*, iii. 204.

CIRCUMCISION.

Khatna, ... ARAB.	Soontan, ... HIND.
Circoncision, . . . FR.	Circoncisione, . . . IT.
Beschneidung, . . GER.	Circuncision, . . . SP.

The Phœnicians had this rite in common with the Egyptians and the Jews, who acknowledge having derived it from the former. According to Bunsen, however (iv. p. 273), it was not followed amongst the Phœnicians. It seems to have been a Semitic rite, which Abraham revived, for he was ninety-nine years old when he circumcised himself, Ishmael his son was thirteen, and Isaac was one year old. This rite now is practised amongst all the Jewish people and most Mahomedans. With the latter the usual time is in infancy, though the poverty of the parents and other circumstances sometimes retard its performance. It is performed with some ceremonial, and in presence of the friends of the family. It was prohibited by Akbar until the age of twelve, when the person to undergo it could judge of the propriety of the rite. It is not even mentioned in the Koran. It is considered as an act of imitative practice founded on the example of the disciples, but not on that of Mahomed himself. In Oman, on the shores of the Persian Gulf, among the Christians of Abyssinia, and in Egypt among the Arabs and Copts, the custom is prevalent. At Bosra and Baghdad, all the women of Arabian blood circumcise their daughters as well as their sons. At Cairo the women who perform this operation are as well known as midwives. They are openly called into houses of the people, without any secret being made of the intention with which they are invited. This is noticed by several Mahomedan writers, viz. in the Dur-ul-Mukhtar, the Tahtavi, and Fattah-ul-Muain, and, according to the last book, it is the inner labia that are removed. The Spaniards, at the time of the conquest of Central America, found circumcision practised, and it is still observed by the Tecuma and Manaos tribes. Amongst the people in the Gulf of Carpentaria, all the males before the age of twelve or fourteen years undergo this rite. This custom is not derived from the Macassars, the latter affirming that it existed previous to the commencement of their intercourse with the coast. Flinders observed a case upon the Wellesley Islands, and the custom is also prevalent amongst the natives of certain parts of the south coast of Australia. Mr. Earl says a peculiar formation prevails among the aborigines of this part of Australia, and also of the adjacent coast of New Guinea, which renders the practice exceedingly conducive to comfort and health. — *Earl in Ethn. Lib.* i.; *Niebuhr, Travels*, ii. pp. 250, 251; *Malcolm's Hist. of Persia*, ii. p. 339; *Bunsen's Egypt*, iv. p. 273; *Herodotus*, ii. p. 36.

CIRCUS, a genus of birds of prey, known as the Harriers, found over all the world. They have a slender form, soft and downy plumage, and hence a noiseless flight. They are much on the wing, and hunt near the ground. They are of the sub-family Buteoninæ, family Falconidæ, and order Raptores.

True Harriers.

Circus cyaneus, *Linn.*

Falco albidus, *Gmel.* | F. pygargus, *Linn.*

The hen-harrier of Europe in the winter visits the N.W. Himalaya, the Panjab, Bhutan, Nepal, and Kamaon.

The marsh harrier frequents the banks of rivers, lakes, marshes, inundated fields, and wet meadow-land, carrying off frogs, fish, water insects, rats, shrews.—*Jerdon.*

CIRRHATÆ, or Cirrhadæ, or Cirrodes, of classical history, are the ancient Kirata, the modern Kirauti of Nepal. Once a powerful dominant race, they have long since succumbed first to the Makwani, and then to the Ghorkali. In the Sanskrit tale of the Hero and the Nymph occurs the word Vedhaka. In some copies Rechaka is explained to be a Kirata, a forester, and the Kirata were known to the classical geography of ancient Europe as the Cirrhadæ or Cirrodes. They were the occupants of Sogdiana, near the river Oxus. The term Kirata, however, seems to have been general, and applied to the savage mountain non-Aryan tribes, to whom the Aryan races were opposed. Some of them were in the south of the Peninsula, on the Coromadel coast.

CIRRHIPEDIA. The balanus or barnacle of this class of molluscs occurs in India.

CIRRHOPETALUM, a genus of plants of the order Orchiaceæ. In India are C. albidum, caudatum, cæspitosum, cornutum, fimbriatum, grandiflorum, Lindleyanum, Maccræi? macrophyllum, Neilgherrense, Roxburghii, Walkerianum.

CIRSIUM ARGYRACANTHUM, C. horridulum and C. lanceolatum, flowering plants belonging to the order Matricariaceæ. The roots of C. lanceolatum, the Suh-twan or Ch'uen-twan of several parts of China, are used in diarrhœa and in urinary affections.—*Smith.*

CIS, a Latin word in use amongst geographers of Europe, to indicate a country on the hither side of rivers or mountains, as Cis-Himalaya, Cis-

Indus, Cis-Sutlej, etc. Trans, another Latin word, is used to indicate the further side, as Trans-Indus, Trans-Gangetic, etc.

CISSA, a genus of birds of the jay magpies, the sub-family Garrulinæ, and order Insessores. Cissa pyrrhocyanea and C. puella, *Blyth*, occur in India.—*Tennent's Ceylon.*

CISSAMPELOS, a genus of plants of the natural order Menispermaceæ. C. convolvulacea occurs in Dindigul, Rajmahal, and Nepal; C. obtecta, of the Garhwal mountains, yields an ardent spirit in distillation.

CISSAMPELOS PAREIRA. *Linn.* Pareira.

Stems four-angled, winged, and jointed; it has all the properties of a parasite. The stems are succulent, and, beaten up into a paste, are given by the natives for asthma. The young, tender, and succulent stems are very generally eaten in India. When old this plant is deemed acrid, and a useful medicine; in Arabia it is used as an external application in rheumatic pains of the back and loins.—*Riddell.*

CIS-SUTLEJ, a political term applied in British India to the territory south of the Sutlej, occupied by Sikh chiefs during the last years of the Dehli empire, and now including the British districts of Ambala, Ludhiana, Firozpur, and Hissar, with the native states of Patiala, Faridkot, Maler Kotla, Chitrauli, Raikot, Buriya, Mandot, Jheend, and Nabha, which came under British protection in 1809. By the treaty with Ranjit Singh, of the 26th April 1809, he undertook not to make or allow any encroachment on the states on the left bank of the Sutlej. In 1849 the British abolished the sovereign powers of the various chieftains. Several states have lapsed to the British.

Patiala was formed by a Jat family of Sikh religionists, who emigrated from the Manjah about the early part of the 18th century. The area is 5412 sq. m., with a population of 1,586,000, and a revenue of Rs. 3,000,000.

Jheend has an area of 1236 sq. m., and a population of 311,000 souls, with a revenue of four lakhs of rupees. The maharaja is a Jat of the Sikh faith. In 1857 its chief was the first person who marched against the mutineers at Dehli.

Nabha territory has an area of 863 sq. m., a population of 276,000 souls, and a revenue of four lakhs. The chief is of the same stock as the maharajas of Patiala and Jheend, but is the elder branch of the family. The family behaved ill in the Sikh war of 1845–46, but did well in the revolt of 1857, and were rewarded by a grant of land out of the Jhujjur territory.

Kalsia territory has an area of 155 sq. m., and a population of 62,000 souls, with a revenue of Rs. 130,000. The family came from the village of Kalsia in the Manjah.

Maler Kotla has 156 sq. m., with a population of 46,200 souls, and a revenue of one lakh. The family came originally from Kābul.

Faridkot consists of Faridkot proper and Kotkupura; is S.W. of Firozpur, borders to the S.E. on Patiala. It has an area of 643 sq. m., and a population of 51,000 souls, with a revenue of Rs. 75,000.

Mumdote is a Mahomedan chieftaincy, and was re-established in 1863.

The minor Cis-Sutlej chiefs were deprived of their sovereign powers, and the police management of their estates was assumed by the British Government; all customs duties were abolished, without compensation, except in the case of the nawab of Konjpura and the mir of Kotahar, and the chiefs were reduced to the rank of ordinary jaghirdars. These were 80 in number, with revenues varying from Rs. 250 to 71,900.—*Imp. Gaz.*

CISTACEÆ, the rock-rose tribe of plants; one genus is the Helianthemum. Cistus creticus, of the Levant, one of the species which afforded Labdanum, collected formerly for medical use during the prevalence of the plague, by whipping the plants with leathern thongs, the resin adhering to the leathern straps. C. Cyprinus, *Lam.*, also yields this product.

CISTI TREES, the Cytinus hypocistus. See Balanophoreæ.

CISTUDO, a genus of reptiles of the family Chelonia. C. Amboinensis occurs in Amboyna, C. dentata in Java, and C. trifasciata in China.

CITHERN. ENG. A musical instrument. It obtained its name from the Sih-tara, the three-stringed lute of the East, supposed to be also the source of the word guitar.

CITRACEÆ, or Aurantiaceæ, the Citron worts, or Orange tribe, are dicotyledonous polypetalous plants, and the orange, lemon, lime, shaddock, pompelmoose, forbidden fruit, and citron are the chief fruits of the order. The wampee, a fruit highly esteemed in China and the Indian Archipelago, is produced by Cookia punctata. The fruit of Glycosmis citrifolia is delicious, and that of Triphasia very agreeable. The Ægle marmelos is used in medicine, and a perfume is made from its rind. The Indian genera are — atalantia, triphasia, limonia, glycosmis, sclerostylis, bergera, Murraya, Cookia, clausena, micromelum, paramignya, suvunga, polycyema, feronia, ægle, citrus.

CITRIC ACID, lime-juice, Acidum citricum.

Jus de limon, . . . FR.	Agro o sugo de limone, IT.
Zitronon saft, . . GER.	Jugo de limon, . . . SP.

This occurs in commerce either in the form of the pure juice of lemons and limes, or crystallized by a chemical process.

CITRON, Citrus medica, *Linn.*

Beg poora, . . .	BENG.	Ethrog, ...	HEB.

The deeply-lobed and gashed leaves, and the round fruit, with a spotted rind and a cold watery pink or white flesh, in which lie a number of black seeds, sufficiently mark this species, which is most extensively cultivated all over the tropics of Asia, Africa, and America. In the Panjab plains it is apparently wild, and covers the ground for miles in sandy deserts near Sirsa, and in the Sind Sagur Doab, ripening in the cold weather.

The seed should always be preserved from the finest and richest-flavoured fruit, and is better for being three or four years old. The green melon is the finest flavoured, although many of the others are very good. Melons grow finer in the sandy beds of rivers, the temperature being more equal about the roots than it is in beds in the garden, especially during the night.

In India it is cultivated in river beds and in alluvial deposits of lakes, tanks, etc., where abundance of water can be had ; it is used as a fruit. It is generally considered to be the melon of the Jews, mentioned in many parts of the Bible. The juice is very cooling, and is said to do well for a cooling drink in fever. The seeds are used as the source of a mild culinary oil in Western India. It is eaten in abundance during the season, which is from May to July. It is gathered when ripe or almost decaying ; the juice is expressed, and mixed with sugar and rose-water.—*Roxb.; Stewart ; Riddell ; Powell ; Eng. Cyc.; Jaffrey.*

CITRULLUS FISTULOSUS. *Stocks.*

Tind, Albinda, . .	HIND.	Dilpasand, . . .	HIND.

A small round gourd, commonly cultivated along the line of the Indus from Lahore to Sind ; said to be merely a cultivated variety of C. cucurbita. It is cooked as a gourd, and has a pleasant flavour when young.—*Stewart.*

CITRUS, a genus of plants of the natural order Citraceæ. Several species grow wild or are cultivated in the south and east of Asia, and all of them furnish useful products. C. aurantium, *Risso*, yields its fruit, the orange ; one essential oil from the rind ; another from the flowers, the oil of neroli ; and the wood is also of value in the arts. C. decumana, *Linnæus*, furnishes the pumalo or shaddock fruit ; and the cum-quat fruit of China is from C. oliveæformis. The lime fruit of the C. limetta, *Risso*, is valuable for its juice, the lime-juice, which is used as a preservative from scurvy ; and C. limonum, *Risso*, furnishes the useful lemon fruit, the rind of which yields an essential oil, or is used in cookery as lemon peel, while the juice of the fruit forms a source of the lime-juice. Independently of the historical fact that citrons and lemons at least were obtained from the Persians, it is certain, from the researches of Wallich and other Indian botanists, that it is among the lower ranges of the hills in Nepal, and extending most probably into China also, that the wild plants of the genus Citrus find a home.

The orange is not mentioned by the ancient authors either of Europe or Arabia, and is supposed to have been introduced into Europe after the middle ages. Dr. Royle states that the orange and lemon are natives of India, the orange being found on the Neilgherries, on the borders of the sal forests of Sylhet, and perhaps also in China. Mr. (Sir) W. Elliot states that a very small variety of the orange (Ida-chettu, TEL.; Chota kichili, HIND.; Kiri kittali, CAN.; which is the C. variatro of Heyne) grows both cultivated and wild in all the hilly country of the Circars, and he asks if it be the original of the cultivated Citrus aurantium. The orange tree is extensively cultivated. The finest sorts are the cintra, cowlah, and a small sweet orange which grows on a tree more like a creeper. The principal method of culture is by budding, the stocks generally being either seedlings or cuttings from the sweet lime. The best cintra, with a thin close rind, is produced upon the seedling stock ; and it is said that the fruit grown upon the sweet lime stock is generally close and soft ; this is very perceptible with some of the oranges. The best time for budding is in the cold season.

In Central India a variety is under cultivation

producing two crops a year. The blossoms of February and March yield their ripe fruit in November and December; and from the flowers of July mature fruits are obtained in March and April. To prevent exhaustion, only alternate fruiting is allowed. The leaves are rather bitter, and contain essential oil. A still more fragrant oil, called oil of neroli by the perfumers, is afforded by the flowers. The berries, while unripe, are gathered, dried, and turned in the lathe to the size of peas, and are used in issues on account of their fragrant odour. The rind or peel of the orange is bitter and aromatic, and affords a very useful stomachic tincture and syrup. The juice of the ripe fruit contains sugar, malic and citric acids, citrate of lime, mucilage, albumen, and gum. Like the lemon juice, it makes an excellent cooling drink, and is an invaluable specific in the treatment of scorbutic diseases. The seeds of the orange yield oil by expression, but not available in any quantity.

Citrus aurantium, *var.* Scabra, Hwa-kuih-hung of the Chinese, a variety of sweet orange largely cultivated in China.—*Smith; O'Sh.; Eng. Cyc.; Voigt; Elliot; Ainslie; Royle; Riddell.*

CITRUS BERGAMIA. *Ri. and P.* Acid lime.

Citrus limetta, *D.C.* | Citrus acida, *Roxb.*

Nibu, ... BENG. | Eru mitchi nara-kam, . . . MALEAL.
Than-ba-ya, Shouk, BURM. | Nimbooka, . . . SANSK.
Tan-pu-lo, . . . CHIN. | Dehi, ... SINGH.

Bergamotte lime, . ENG. | Nimma-chettu, . . ,,
Common sour lime, ,, | Jambira-nimma, . . ,,
Limu, Nimbu, . . HIND.

This is grown in Peninsular India, Bengal, Assam, the Sunda and Molucca islands. There are many varieties,—round, small, spongy, smooth, thick-skinned, and yellow-juiced. The Arab variety from Muscat is large. Bergamotte oil is obtained from the fruit rind, and also oil from the flowers. The Mellarosa variety furnishes a superior oil and exquisite compilures. Large varieties of the acid lime are diffused all over the Tenasserim Provinces; and Europeans usually call them citrons. The varieties known in Hindustan are,—

Pati neboo, common round lime.
Gora neboo, thick-skinned, small, oval lime.
Kaghazi neboo, long, small lime.
Cheena-gora neboo, China lime, yellow-juiced lime.
Kamurali neboo, large, oval, smooth-skinned lime.
Rungpore neboo, round, smooth-skinned lime.
Taba neboo, a large globose spongy-skinned lime.

—*Drs. Roxb., Mason, O'Sh.; Voigt; von Mueller.*

CITRUS BIGARADIA. *Duhamel.*

Mae fadyn, . . . ARAB. | Bitter Seville orange, ENG.
Kau-kiuh, . . . CHIN. | C. vulgaris.

The leaves differ from those of the sweet orange by the petiole only. The flowers are alike in both species. The rind of the fruit is bitter, acrid, and hot to the taste, the pulp acid and bitter, the seeds excessively bitter. The bark of the tree participates in these qualities. The rind of the fruit is used in making the celebrated Curaçoa liqueur. Its flowers yield the costly neroli oil. An acre will annually yield flowers to the value of £50. The rind is used for candied orange peel.—*O'Sh.; von Mueller.*

CITRUS DECUMANA. *Linn.* Pummalo.

The shaddock, the largest of the orange tribe, is cultivated in Southern Asia in gardens. The varieties are red and white, the former being preferred by some persons. The tree grows to a large size in a rich soil, and requires much pruning; the best time for doing this is when the crop of fruit is off. Fine fruit has been produced from the seed. The tree, when planted, should have a space of twelve feet all round it. The blossom is used for flavouring sweetmeats. It is a fine fruit, cooling and aperient, and in taste somewhat resembles a fine orange. It has been cultivated in China from the time of the great Yu, who mentioned it in his tribute roll. It flourishes near Amoy, and much pains are taken in grafting the tree upon other species of Citrus, so that the character of the fruit has been greatly improved. Its peel is very bitter, but aromatic.—*Ainslie; Riddell; Mason; Roxb.*

CITRUS DULCIS. *Volkamer.* The sweet orange. Of this are many varieties. One tree, in a sheltered place of the St. Michaels, in the Azores, has been known to bear 20,000 fruits in one year. Neroli oil is obtained from the flowers of this and other varieties. The oil of orange peel may be used for distilling with it costly odorous substances.—*von Mueller.*

CITRUS FUSCA, *Smith*, the Chih-koh or Chi-shih of the Chinese, an orange tree of several parts of China.—*Smith.*

CITRUS JAPONICA. *Fortune.* Cum-quat.

C. olivæformis.

Kin-kiuh, . . . CHIN. | Golden orange, . . ENG.
Lu-kiuh, ... ,, | The fruit—Cum-quat, CH.

The Cum-quat is extensively grown by the Chinese in pots, and at one season of the year the plant is covered with its small, oval, orange-coloured fruit. This, as well as various other species of the orange, is mixed with the forced flowers, and together produce an excellent effect. It is grown in Chusan in groves on the sides of the lower hills. The plants are all arranged in rows about four feet apart, average three or four feet high, and do not exceed six feet. It is much more hardy than any other of its tribe. It produces its flowers and fruit in great abundance. In China, all the plants of the orange tribe which bear fruit in a small state are grafted.—*Fortune*, p. 122.

CITRUS LIMONUM. *R. and P.*

C. medica, *Roxb.* | Korina-neboo, . HIND.

The true lemon. Fruit yields the lemon juice, peculiarly rich in citric acid. Its aromatic peel a volatile oil. A large variety is the Rosaline lemon.—*von Mueller.*

CITRUS LUMIA. *Risso.* The sweet lemon. It includes the pear lemon, with large pear-shaped fruit. Pulp not acid; rind thick, and peels.—*von Mueller.*

CITRUS MEDICA. *L.* Citron, common citron.

Beg-pura, ... BENG. | Leemoo, . . . HIND.

The citron was described by Theophrastus as occurring in Northern Persia (Media), and culti-

vated by the Jewish nation in Syria while under Roman dominion. Cultivated, and grows to a large size. The outer rind very rough, and covered with excrescences, and when ripe of a deep yellow colour and fragrant. Used to form a preserve, and the juice is made into lemonade. It is propagated by cuttings, layers, or seed. Essential oil and citric acid are obtained from the acid tubercular fruit. The candied thick rind of a variety is the Citrionate or Succade. Cedra oil comes from a particular variety. The variety C. digitata is cultivated in China.—*Voigt; Roxb.; Riddell.*

CITRUS MICROCARPA is the Tsing-kiuh-pi or Tsing-pi of the Chinese.

CITRUS MONOPHYLLA grows wild along the Western Ghats of the Peninsula of India.—*Riddell.*

CITRUS PLANCHONI. *F. von Mueller.*
C. australis, *Planchon.*

A noble tree, 40 to 60 feet high, in the coast forests of E. Australia. Its globular fruits, the size of a walnut, are called native oranges. Its wood is beautiful, takes a high polish, and is used for furniture. Might be introduced into India.—*von Mueller.*

CITRUS TOROSA. *Mason.* Grows at Tavoy, with a leaf that looks like two leaves joined together, the wings on the petiole being as broad, or even broader, than the leaf itself. The fruit is small, and there are two varieties,—one with a smooth and another with a rough skin. Dr. Pickering met with a similar tree on the Samoan Islands, a member of the Philippine floras.—*Mason.*

CITRUS TRIFOLIA, a native of China; fruit about the size of a marble.

CITRUS WOOD of the Romans was extravagantly prized for tables, and is supposed to have been the Callitris quadrivalvis, *Vent.*, or jointed arbor-vitæ, the conifer which yields the gum sanderach. The wood was distinguished as striped 'tigrinæ,' spotted 'pantherinæ,' or speckled 'apiatæ.' Cicero gave £9000 for a citrus wood table.

CITTURA CYANOTUS is the forest kingfisher of Celebes. Along with it occur the Meropogon Forsteni; Carpophaga Forsteni, a fruit pigeon of North Celebes; Buceros cassidix, the great hornbill of Celebes; Trichoglossus ornatus, a beautiful brush-tonged parrakeet; Corvus advena, a rare black and white crow.

The civet perfumes of commerce are obtained from two sources. One of the civets is a concrete substance obtained from two small bags in the preputial follicles of the beaver, Castor fiber, of both sexes. This is the commercial civet castor of N. America, and it is imported into India for medicinal purposes. The civet cats (Viverra), a genus of carnivorous animals, approach nearest in their form and habits to the fox and the cat. But the distinctive character of the civets consists in an opening near the tail, leading into a double cavity of considerable size, furnished with glands for the secretion of this odorous substance. When the secretion is in excess, the animal frees itself from it by a contractile movement, which causes the civet to ooze from the bag. This is carefully collected, and sold (not without adulteration with butter or oil to increase its weight) at a very high price. In Malay and Javanese this perfume is known by the names of rase and dedes, but the Sanskrit kasturi and the Arabic zabad, corrupted jabad, are also used as synonyms; and doubtless the Dakhani javad, Malay jabad, English civet, French civette, and German zibeth are all from the Arabic zabad. In the Eastern Archipelago, two species—Viverra rasse and V. zibetha—are kept in a half domesticated state for the purpose of yielding it. The first is a native of Java, and the last of the other large eastern islands, where the natives of rank are partial to the use of this perfume,—a not generally acceptable one to Europeans. A variety of this is an inferior sort of musk-bag procured from V. zibetha, found in many parts of Lower Hindustan, and called in Tamil Pullughoo poonay, and in Telugu Poonghoo pilli. The article is chiefly used by the people as a perfume, and in the preparation of certain liniments. These animals are carefully kept and tended in North Africa for the sake of the perfume. They are also common in South America and in the forests of Japan. Civet contains free ammonia, resin, fat, and extractiform matter, and a volatile oil, to which its odoriferous properties are due. It is imported into Britain from the Brazils and from Guinea. When genuine, it is worth from 30 to 40 shillings an ounce.—*Crawfurd, Dic.* p. 100; *Ains.; O'Sh.; Eng. Cyc.* See Viverra.

CIVIL SERVICE, the usual designation of the civil department of British India, including the members of it in the performance of political, magisterial, revenue, and judicial functions. There are two distinct branches, the higher being Covenanted officers, and almost all of this class are natives of Great Britain, and several of them, as Lord Clive, Warren Hastings, Sir George Barlow, Mountstuart Elphinstone, Sir Charles Metcalfe, have risen to be Governors-General of India, and Governors of Presidencies. The next grade are termed Uncovenanted, and comprise many Europeans, East Indians, and Natives, and, generally speaking, are in offices with lower powers than those of the Covenanted, as munsif, magistrate, tahsildar, mamalatdar, deputy collector, assistant commissioner, serishtadar. Many military officers have distinguished themselves as civil administrators.

CLADOBATES, found in the Malay countries, is an insectivorous genus of mammals. Several species very closely resemble squirrels.

CLADONIA RANGIFERINA. *Hoff.* Reindeer moss. See Lichen.

CLAM. ENG. A mollusc of the genus Tridacna, common in many parts of the world. There are six recent and one fossil species known, and the great clam shell of the Archipelago is used in Europe for church fonts.

CLANSHIP, somewhat resembling the form it assumed in Scotland, prevails amongst several of the Afghan and Baluch races, where the adjoining tribes have not as yet amalgamated into nationalities. Moral worth, national pride, love of country, and the better feelings of clanship, are the chief grounds upon which a great people can be raised. These feelings are closely allied to self-denial, or a willingness on the part of each man to give up much for the good of the whole. By this, chiefly, public monuments are built, and citizens stand by one another in battle; but all these are wanting from most of the races occupying British India at present. Many of the Rajput races are in clans, and Mahomedanism has given a bond, but even it is not strong; and China has three distinct races, the Chinese, the Manchu, and the Mongol, wholly separate in civilisation and in aspirations.—*Sharpe's Egypt*, i. p. 278.

CLARET, a term generally used to designate the red wines, the produce of the Bordelais. The most esteemed are Lafitte, Latour, Chateau-Margaux, and Haut-Brion. Claret is a general name for all rose-coloured wines, and in France what the English call claret is styled Bordeaux.

CLARIFIED BUTTER is the ghi of Hindustan and the yennai of the Tamil.

CLAUDIUS CÆSAR. The first authentic account of Ceylon, or Taprobane, extant, is given by Onesiculus, the Macedonian admiral, who lived B.C. 320 or 330. Diodorus Siculus, B.C. 44, gives an account of it. Strabo also mentions it; and Dionysius, who flourished A.D. 36, confirms former accounts, and alludes to its elephants. Sinbad also speaks of it in a volume, perhaps a compilation and in part a romance, as does Abdoor Razak. Ribiero also gives a notice of it. In the reign of Claudius Cæsar, a Roman publican, who farmed the custom duties of the Red Sea, was driven from Arabia by storms on to Ceylon, where he found a flourishing kingdom and an enlightened sovereign, whom he persuaded to send an embassy of four envoys to Rome, by way of the Red Sea, for the purpose of negotiating a commercial treaty.

CLAUDIUS PTOLEMY, author of the Almagest, lived A.D. 140–160.

CLAUSENA, a genus of shrubs or small trees belonging to the natural order Citraceæ. C. heptaphylla (Karan-phal, HIND.) grows in Bengal, has small flowers, greenish-yellow and anise-scented, and its bruised leaves have the fragrance of fresh anise seeds. C. nana grows in the Moluccas, C. punctata and C. suffruticosa grow in Chittagong; and the fresh leaves of C. Sumatrana, when bruised, have the fragrance of a lemon leaf. C. Wildenowii, *W. and A.*, grows near Chingleput, and C. pubescens, *W. and A.*, in the Peninsula.—*Roxb.; Voigt.*

CLAVIJO. Don Ruy Gonzales de Clavijo was appointed, A.D. 1403, by Henry III. of Castile on an embassy to Timur. He quitted Constantinople 14th November, and passed through Armenia, Azerbijan, Teheran, Damghan in Khorasan, and reached Samarcand 8th September 1404; but Timur was too ill to receive them, and they returned 21st November by Trebizond and Genoa (3d January 1406); Clavijo reached Seville in March.

CLAY, Fireclay.

Chomar, ... HEB.	Sangi-i-dalam, . HIND.
Gil; Chikni mitti, HIND.	Tannab, white clay, MALAY.

Clay is a compound, or perhaps only a mixture, of the two earths, alumina and silica, with water.

Pipe-clay, Nāmam, TAMIL, Kharra, DUKH., is of a greyish-white colour, with an earthy fracture, and a smooth, greasy feel; it adheres to the tongue, and is very plastic, tenacious, and infusible. When burnt, it is of a cream colour, and is used for tobacco-pipes and white pottery. This is found in abundance in several parts of India; and Hindus employ it for making the distinguishing marks on their foreheads, and (moistened with water) it is often applied round the eye in certain cases of ophthalmia, as well as to parts of the body that are bruised.

Potter's clay is of various colours, chiefly reddish or grey, and becomes red when heated. Mixed with sand, it is formed into bricks and tiles. It is abundant in many parts of South-Eastern Asia.

Stourbridge clay resembles potter's clay to a certain extent, but is far more refractory in the fire. It is of a dark colour, owing probably to the presence of carbonaceous matter. It is extensively used in making crucibles, glass pots, etc.

Brick-clay or *loam*, abundant in S.E. Asia, varies greatly in appearance, texture, and composition; its colour depending on the proportion of oxide of iron contained in it.

Porcelain clay, the kaolin of China, is very abundant in S.E. India, produced by the decomposition of felspar, and of binary granite.

Fireclays are procurable at Streepermatoor, Tripasoor, Chingleput, Metapolliam, and Cuddapah; indeed, are very common in many parts of India, and bricks can be made that resist the action of great heat. A clay found at Beypore, 20 to 30 feet below the surface, is used for firebricks and for lining furnaces.

Unctuous clay is excavated from a pit near Kolat'h in large quantities, and exported as an article of commerce, giving a royalty of Rs. 1500 yearly. It is used chiefly to free the skin and hair from impurities; and the Cutchi ladies are said to eat it to improve their complexions. The clay used for making pottery in Sind is obtained from situations washed over by the Indus river, 10 feet under ground. It is reduced to a fine powder, and soaked in water for 24 hours; after which it is kneaded with the hands and feet, and when it becomes dough-like, it is divided into lumps of the required shape.—*Tomlinson; Drs. Mason and Hunter; Tod's Rajasthan*, ii. p. 203.

CLEAN and Unclean, terms often occurring in Scripture, as in Leviticus xi.–xv., have reference to unclean creatures, unclean persons, and personal and ceremonial uncleanness. As in Lev. xii. 2, after childbirth a Brahman mother is unclean for eleven days, a princess sixteen, merchant's wife seventy-one, and a Vellala Sudra thirty-one days. As with the Hebrew women, the Hindu mother in her days of uncleanness cannot touch any hallowed thing nor any domestic article. When the days of her purification are over, she takes or sends an offering to the temple. In the matter of clean and unclean things and persons, Mahomedans follow the Mosaic law.

CLEARING NUT. The ripe seeds of Strychnos potatorum are dried and sold in every market in India to clear muddy water. Natives of India never drink clear well water if they can get pond or river water, which is always more or less muddy. One of the seeds is rubbed very hard for a minute or two round the inside of the vessel containing the water, which is generally an unglazed earthen one, and the water left to settle; in a very short time the impurities fall to the bottom, leaving the water clear and perfectly wholesome.—*Roxburgh.*

CLEAVELAND, AUGUSTUS, a Bengal civil servant, who in a brief space won over the wild races near Rajmahal. He died while still young; and the Government of India decreed a monument to his memory at Bhagulpur, with the following inscription:—To the memory of Augustus Cleaveland, Esq., late collector of the districts of Bhagulpur and Rajmahal, who, without bloodshed or the terrors of authority, employing only the means of conciliation, confidence, and benevolence, attempted and accomplished the entire subjection of the lawless and savage inhabitants of the jungleterry of Rajmahal, who had long infested the neighbouring lands by their predatory incursions; inspired them with a taste for the arts of civilised life, and attached them to the British Government by a conquest over their minds, the most permanent, as the most rational mode of dominion; the Governor-General and Council of Bengal, in honour of his character and for example to others, have ordered this monument to be erected. He departed this life on the 13th day of January 1784, aged 29.—*Tr. of Hind.* i. p. 101.

CLEGHORN, HUGH, M.D., a medical officer of the Madras army; a learned botanist, contributor to scientific journals of articles on botanical subjects; Conservator of Forests at Madras and Northern India, founder of the Indian Forest Department. He wrote on the Hedge Plants of India, and the circumstances which adapt them for special purposes in particular localities, Rep. Brit. Ass. 1850; on the Grass Cloth of India, ibid. 112; on the Physical Effects of the Destruction of Tropical Forests, ibid. 1851, London Athenæum 1851, p. 781; also on the Forests and Gardens of Southern India; in 1864, upon the Forests of the Panjab and the Western Himalaya; and the article Forests in the Encyclopædia Britannica.

CLEIDION JAVANICUM. *Bl.*

Lasiostyles salicifolia, *Presl.* | Rottlera urandra, *Dalz.*

This middling-sized glabrous tree is common in the moist forests on the Animallays, elevation 2000 to 3000 feet, Travancore below Ghats, in the western forests of the Peninsula, Ceylon, Bengal, Burma, Java, etc.; timber hard, and good for building purposes.—*Beddome, Fl. Sylv.* p. 272.

CLEMATIDÆ. The name is derived from Clema, a vine branch, from the climbing properties of the family. The tribe is acrid and poisonous; the leaves and fresh stem, if bruised and applied to the skin, cause vesication. Griffith notices the virgin's bower in the Tenasserim Provinces, with simple fleshy leaves. C. Gauriana is abundant among the ruins of Gaur. It forms, with Porana paniculata, extensive lovely festoons. It is the Moriel, the Indian traveller's joy; is scandent and perennial. It grows all over India, from Dindigul and the Neilgherries up to Dehra Doon, along the foot of the Himalaya. Its flowers are white at the close of the rains, and give out a very strong perfume. It is a hardy plant, and grows in any soil. C. grata, Biliri, HIND., is a plant of Kaghan and Nepal, and has small yellowish fragrant flowers; C. florida is of Japan. In France the Clematis vitalba is used by mendicants to cause artificial sores for the furtherance of their impostures. In Cochin-China, according to Loureiro, the C. Sinensis is used as a diuretic and diaphoretic. At the Mauritius, the C. Mauritiana is employed to blister the cheek for the relief of toothache. C. Wightiana, *W. and A.*, is scandent, perennial, with very soft villous leaves, coarsely serrated. It also is called Moriel, and grows common at Mahabaleshwar and the adjoining ghats, flowering after the rains. Wallich's C. grata, *Asiat. Pl.* t. 98, much resembles it, and is perhaps identical. Hedges and thickets where these plants grow have the appearance of being covered with hoar-frost, from the white feathery tails of the seeds. They are very ornamental, and worthy of a place in gardens for trellis work.—*Roxb.; Gr. Cat.; Riddell; Mason*, p. 671.

CLEMATIS VITALBA? *Smith*, the Tung-tsau or Muh-t'ung of the Chinese, is a climbing plant of Shan-si, Shen-si, China, has a yellow bitter wood, and vascular tissue arranged in plates passing from the centre to the circumference, and open enough to allow air to be blown through. The wood, root, and fruit are used medicinally.—*Smith.*

CLEODORA, a luminous mollusc, with a vitreous shell.

CLEOME, a genus of plants belonging to the Capparidaceæ or caper tribe. Species formerly placed under this genus have been transferred to the genera Polanisia and Gynandropsis. C. monophylla, *Linn.*, the C. cordata, *D. C.*, grows in Ceylon and the Peninsula, and has small, pale, rose-coloured flowers.—*Roxb.; Linn.; D. C.*

CLEOPATRA'S NEEDLE, a monolith, so called by the British; by the native ciceroni it was called Massallat-ul-Firaun, Pharaoh's packing needle. It was granted to the British nation, and in 1878 was brought to London, and erected on the left bank of the Thames.—*Burton's Mecca.*

CLEOPATRIS, an ancient town near the modern Suez.

CLEPSYDRA, the Ghatka-patra of the Mahratta race. A hollow vessel for measuring time. It has an aperture in it, and when placed in water the vessel gradually fills and sinks, and the final submergement indicates the measure of time.

CLERODENDRON, a genus of plants belonging to the Verbenaceæ. One species in the Terai forms a large shrub beneath every tree, generally intermixed with ferns, as polypodium, pteris, and goniopteris, and its sweet odour is borne far through the air. Clerodendron leaves, bruised, are used to kill vermin, fly-blows, etc., in cattle, and the twigs form toothpicks. Its flowers are presented to Siva (Mahadeo), milk, honey, flowers, fruit (ambrosia), etc. being offered to the pacific gods, as Vishnu, Krishna, etc.; while Mudar (Calotropis asclepias), Bhang, Cannabis sativa, Datura, flesh, blood, and spirituous liquids are offered to Siva, Durga, Kali, and other destroying deities. The Burmese cultivate a fragrant double clerodendron. One species, supposed by Dr. Stewart to be C. infortunatum, *L.*, called Kali basuti on the Beas, occurs in the Siwalik tract, and occasionally in the plains, and is probably the one

that Edgeworth mentions as being used in the Ambala tract to give fire by friction.—*Mason; Hooker, Him. Jour.* i. p. 387; *Dr. J. L. Stewart.*

CLERODENDRON INERME. *Gærtn.*

Volkameria inermis, *Linn.*

Ban juen, . . . BENG.	Nalla kupi, . . . TEL.
Sang-kupi, . . . DUKH.	Pisangi, Pisingha, . ,,
Nir-notsjil, . . MALEAL.	Eru-pichcha, . . . ,,
Sangam kupi, . . TAM.	

A plant of India, China, the Moluccas, and N. Holland.

CLERODENDRON INFORTUNATUM. *Linn.*

Volkameria infortunata, *R.*	C. viscosum, *Vent.*
Bhant, ... BENG.	Barangi, . . . PANJAB.
Peragoo, . . MALEAL.	Bokada, ... TEL.

A cheap and useful substitute for chiretta as a tonic and antiperiodic (?). The fresh juice of the leaves is given as an anthelmintic, also as a bitter tonic, in the malarious fevers of children of India. The bark is used by Indian and Arabian physicians. —*Beng. Pharm.; Honigberger.*

CLERODENDRON NUTANS. *Wall.*

Gan-yan-pa-too, ... BURM.

The Karen mountain glens of Tavoy and Mergui are embellished with the elegant flowering nodding clerodendron. The flowers are tinged with rose, but nearly white, growing in long panicles at the extremities of the branches, from which they make a graceful curve, and hang down perpendicularly from ten to fifteen inches, like an inverted cone, so that the soft green foliage seems canopied with rosy-white veils. It grows in Sylhet, blooms in the dry season, and rarely exceeds ten feet in height.—*Mason; Voigt.*

CLERODENDRON PHLOMOIDES. *Linn.*

Volkameria multiflora, *Burm.*

Taludala, ... TAM. | Tekkali, Tilaka, . . TEL.

Grows in the Dekhan, Coromandel, Bengal, and Lower Kamaon.

CLERODENDRON SERRATUM. *Blume.*

C. macrophyllum, *Sims.*	Volkameria serrata, *Linn.*
Jaru teka, . . MALEAL.	Brahmari mari, . . TEL.
Chiru dekku, . . TAM.	

Grows in Salsette above the Bombay ghats, in Nepal, Morung mountains. The flowers and leaves are said to be eaten as greens; but in the northern Circars the root is known as Ganta-baringa, and is largely exported for medicinal purposes, being used for febrile and catarrhal affections. The leaves and seeds are also used medicinally.

CLERODENDRON SIPHONANTHUS. *Br.*

Siphonanthus Indica, *Linn.*	Arni, . . HIND. of BEAS.
Arnah, ... HIND.	Dawa-i-mubarak, . PERS.

Grows in both Peninsulas of India, in Bengal and Sylhet. Its root and leaves are officinal; the Persian name means the blessed medicine. It is slightly bitter and astringent; yields resin. Employed in syphilitic rheumatism.—*Stewart; Voigt.*

CLERODENDRON SQUAMATUM.

Volkameria Kæmpferiana, *Jacq.*

Scarlet clerodendron. | Bu-gyee-nee, . . BURM.

The Burmese gardens are ornamented with this species, which bears a large cone of superb scarlet flowers. Although said to be originally from China, it appears to be naturalized in Burma.—*Mason.*

CLERODENDRON VISCOSUM. *Vent.*

C. infortunatum, *Linn.*	Volkameria infortunata,
C. infortunata, *Roxb.*	*Roxb.*
Bhant, ... BENG.	Bokada, ... TEL.
Bu ghyee-phyoo, . BURM.	Gurrapu Gatte aku, ,,
Peragu, . . . MALEAL.	Manduka-bramhi, . ,,
Saraswati aku, . TEL.	

Grows in both the Indian Peninsulas, also in Bengal and Oudh.

CLEYERA GYMNANTHERA. *W. and R.* A large tree of the Neilgherry hills, timber of a reddish colour, strong and durable.—*Drury.*

CLIMATE OF INDIA. The Hindu races familiar with the tropical countries in which they dwell, use 'water' as the term for describing the effects of a climate on health. In this sense it is the salubrity of a locality that is alluded to. Mahomedans of Asia treat of seven climates, the Haft aklim. This applies to the northern hemisphere, which they partition with zones of various breadth from east to west. When alluding to the salubrity of a locality, the Mahomedans of India and Persia use the words Ab-o-Howa, water and air. In Hindustan the people usually arrange the year into three periods, the Choumasa or Bark'ha, which is the rainy season, of four months' duration; after which is the Seeala, or Jara, or Mohasa, the cold season; followed by the Dhoop-kala or K'hursa, or hot season. This division indicates generally the course of the seasons in India, though in one locality the rains or the hot or cold seasons may be somewhat more prolonged. The primary divisions of continental India are four:—Hindustan, including in which term the whole Peninsula of India, and the Gangetic plain to the base of the Himalaya. 2. The Himalaya, a mountain chain which rises abruptly from the Gangetic plain, and is connected with a still loftier mountain mass (of Tibet) to the north, and beyond India. 3. Eastern India ultra Gangem, including native and British Burma and the Malay Peninsula. 4. Afghanistan. These divisions are marked out by great mountain barriers and by the ocean. The Himalaya mountains on the north are nowhere under 15,000 feet, usually exceed 17,000 and 18,000 feet, and rise in isolated peaks or groups of peaks to 21,000 and to 28,000 feet.

From the western extremity of the Himalaya, the Afghan mountains descend parallel with the Indus, with a gradually decreasing elevation from above 15,000 feet to the level of the ocean at the Arabian Sea. Throughout Afghanistan the climate is excessive. The cold of the winter is intense, the spring is damp and raw, and the summer, during which hot west winds prevail, is intensely hot at all elevations. The general aspect of the whole of Afghanistan is that of mountains with broad flat valleys. The crops are chiefly wheat and barley, even up to 10,000 feet elevation. Rice is cultivated in great quantity at Jalalabad 2000 feet, at Kābul 6400 feet, and to a considerable extent at Ghazni, 7730 feet. Poplars, willows, and date-palm trees are extensively planted, as well as mulberry, walnut, apricot, apple, pear, and peach trees, and also the Elæagnus orientalis, which bears an eatable fruit. The vine abounds as in all warm and dry temperate climates. The majority of the Afghan and Tibetan plants are also on the one hand natives respectively of the Caspian steppes and N. Persia, and of Siberia on the other.

The date is cultivated in Baluchistan up to 4500 feet; and a dwarf palm, Chamærops Ritchieana of Griffith, perhaps identical with the Chamærops humilis of Europe, occurs abundantly in many places, but with a somewhat local distribution.

The Burma and Malayan mountains, being given off from the snowclad mountains of East Tibet,

run to the south, and, though rapidly diminishing in elevation, are continued almost to the equator. The mean temperature of the Malay Peninsula is probably about 80° at the level of the sea, and in its general humidity it also approaches to uniformity; but dry and rainy weather are more distinctly separated in the northern countries than in the southern. The latter are not subject to the occasional violent rains and prolonged droughts which visit the former, and the former are not exposed to the frequent tracts of damp, foggy, rainy weather which are experienced in the latter. During the N.E. monsoon, which ordinarily blows from November to March, the weather is generally settled in the Straits of Malacca, and N. and N.E. winds prevail, particularly on the coast of the Peninsula, but are not of great strength save towards the northern end of the Straits. Breezes usually blow from the peninsular shore at night. The equable character of this season is attributable to the monsoon being broken by the mountains of the Peninsula, which stretch transversely to its direction.

The S.W. monsoon, which prevails from April to October, blows against the northern part of the west coast of both Peninsulas, and these consequently, in some measure, participate in the rainy climate which characterizes the eastern shore of the Bay of Bengal during this monsoon. Further south it is broken by the mountain belt of Sumatra, so that, in the Straits, land and sea breezes generally prevail in the vicinity of the coasts, and an equable climate is experienced. The Sumatra sides of the Straits, and the southern portion of the Peninsula, at night are exposed to occasional sudden squalls from the S.W., accompanied by lightning and heavy rains, called Sumatrans. North-westers are also experienced, but more rarely. They occur chiefly in the northern part of the Straits as far as the Arroas, but sometimes blow right through them to the Carimons. During this monsoon the east coast of the Peninsula, having a leeward exposure, and being, for the greater part of its length, protected by the double wall of the Sumatran and Peninsular ranges, is perfectly sheltered, and dry weather prevails.

The Aravalli mountains extend from Hansi and Dehli to Gujerat. The Vindhya chain stretches across the centre of Hindustan, from the Gulf of Cambay to the Ganges, and is three to four thousand feet high.

A peninsular chain, called the Western Ghats, extends from Cape Comorin to the Tapti river, for upwards of 900 miles running parallel to the coast line, and perpendicular to the direction of the monsoons. This chain divides the Peninsula into two distinct climates, of a narrow western one in Malabar and the Konkan, and a broad eastern one, in which are the Karnatic, Mysore, and the Dekhan, traversed by all the peninsular rivers.

The Travancore mountains present a striking analogy to the island of Ceylon. They are loftiest at the extreme north of the district, where they stretch east and west for sixty or seventy miles, separating the districts of Dindigul and Madura. Notwithstanding the perennial humidity, the rainfall at Courtallum is only 40 inches; on the hills around, however, it is doubtless much greater. The Pulney or Palnai mountains west of Dindigul, the Animallay south of Coimbatore, the Shevagherry mountains south-west of Madura, and the ranges near Courtallum, are all well known. The remarkable palm, Bentinckia, so common on its mountains, is, however, not known in Ceylon. The other palms are Caryota urens, an Areca, Phœnix farinifera, and one or two species of Calamus.

To the north of Coimbatore the peninsular chain rises abruptly to 8000 feet, as the Neilgherry range, and continues northward as the mountains of Coorg. The rainfall, which is great on the western coast, is less on the Neilgherries, being 100 inches at Dodabetta, and 46 inches at Ootacamund. Further north, in the Nagar district of Mysore, there are many rounded or table-topped hills 4000 to 5000 feet high, often cultivated to that height, and rising in some places to upwards of 6000 feet. The climate of the western part is very humid, and particularly so at the town of Nagar or Bednore, 4000 feet high, on a spur of the western chain, where inclement rain is said to last for nine months.

The S.W. monsoon comes from the southern ocean, and is loaded with vapour. It strikes on the W. coast of India, passes over the plains of Bengal, and strikes on the Khassya mountains and the whole length of the Himalaya, discharging itself in heavy rains. From April till August it blows from the east of south, in August S.S.E., and in September more easterly, lowering the temperature of Bengal and of the northern plains, though the plains of the Panjab continue excessively heated.

From the vernal till the autumnal equinox, the heat of a great part of India continues great; but after the autumnal equinox the great mass of the Himalaya becomes intensely cold, and the plains of India generally become cool. Where the north-east monsoon prevails, it is everywhere a land wind, except on the east coast of the Karnatic and in the Malayan Peninsula. In Malaya it blows over a great extent of sea, and is therefore very rainy; but at the Karnatic the width of sea is not great, so that the rainfall, though well marked, is less, and terminates long before the end of the monsoon, probably from the wind acquiring a more directly southerly direction, after the sun has reached the southern tropic.

The rainfall varies prodigiously in different parts of India, from almost none to six hundred inches; but the quantity affords no direct criterion of the humidity of any climate, for the atmosphere may be saturated with moisture without any precipitation taking place. Thus, while in Sikkim 1° for 300 feet is the proportion for elevations below 7000 feet, on the Neilgherry Hills it is about 1° for 340 feet, in Khassya 1° for 380 feet; and the elevations of Nagpur and Ambala produce no perceptible diminution in their mean temperature, which is as great as that which would normally be assigned to them were they at the level of the sea.

At Mahabaleshwar it amounts to 248 inches annually. In the Southern Konkan, especially in the Sawantwari district, the rains are as heavy as in Canara. At Bombay the rains last from June till the end of September, and the fall is only eighty inches, which is considerably less than at any point further south on the coast. At Tannah, however, the average fall is more than 100 inches. In the Himalaya, the truly temperate vegetation supersedes the sub-tropical above 4000 to 6000

feet, and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, humidity, and many local circumstances. In Ceylon and the Western Peninsula, whose mountains attain 9000 feet, and where considerable tracts are elevated above 6000 to 8000 feet, snow has never been known to fall. On the Khassya mountains, which attain 7000 feet, and where a great extent of surface is above 5000, snow seems to be unknown.

Sikkim occupies an intermediate position between Nepal and Bhutan, and unites the floras of Nepal, Bhutan, East Tibet, and the Khassya mountains, being hence, in a geographico-botanical point of view, one of the most important provinces in India, if not in all Asia. In Sikkim snow annually falls at about 6000 feet elevation, in Nepal at 5000 feet, in Kumaon and Garhwal at 4000, and in the extreme W. Himalaya, lower still.

East Tibet is an enormously elevated mountain mass, and many of the large rivers of Asia flow from it in several directions.

The Eastern Archipelago, from consisting of large islands separated by belts of sea, possesses a humid and equable climate; but the great continent of Australia, being a vast expanse of low land, becomes enormously heated when the sun is in the southern hemisphere, and presents extremes of climate. The common characters of Sind are great summer heat but little tempered by rain, great winter cold, a dry soil. Its flora resembles those of Egypt, Arabia, and the countries bordering on the Persian Gulf.—*Dr. Stocks; Journ. of the Ind. Archipelago*, ii., February 1848.

CLIMBING PLANTS are exceedingly numerous in the damp forests of India. At Tonglo, in Sikkim, at an elevation of several thousand feet, Dr. Hooker found great scandent trees twisting around the trunks of others, and strangling them; the latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups,—(1) Those whose stems merely twine, and by constricting certain parts of their support, induce death. (2) Those which form a network round the trunk by the coalescence of their lateral branches and aerial roots, etc.; these wholly envelope and often conceal the tree they enclose, whose branches appear rising far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are leguminosæ, ivies, hydrangea, vines, pothos, etc. The inosculating ones are almost all figs and Wightia; the latter is the most remarkable for its grasping roots.—*Hooker, Him. Journ.* i. p. 163.

The most common varieties of this cultivated flowering plant are the blue and white. They blossom all the year round, and, being shrubby twining plants, are well suited for covering trellis work. They are of easy growth. Dr. O'Shaughnessy does not recommend its use in medicine. Its flower is sacred to Durga. A variety is C. cæruleoflora.—*Riddell; Hooker, Him. Jour.* ii. p. 291; *Mason; O'Sh.; Powell.*

CLIVE, ROBERT, LORD, a Madras civil servant, who became a great military commander, was Governor of Madras and of Bengal, and Commander-in-Chief of India. Amongst the many eminent men who have served and ruled in British India, he alone has been styled 'Great;' and whether his deeds as a military commander be considered, or his successes in the civil administration of India, posterity has conceded that title to him alone. He entered the service of the E. I. Co. in 1744 as a writer, but shortly afterwards obtained an ensign's commission. In September 1748 he distinguished himself as an ensign before Pondicherry, and again in August 1749 at Devicottah. In May 1751 he was present in the fight at Volcondah, and in July defeated the French at Condore. In 1751 he laid siege to Arcot, with only 120 Europeans and 200 natives; in August, took it. Arcot fort was invested by Chanda Sahib, with an army 4000 strong, but Clive withstood and repelled all assaults, and his opponents ultimately withdrew. This defence made a powerful impression on all the native races. In November he defeated Basin Rao at Arni; in December took the pagoda of Conjeveram; in 1752 he defeated the French and Chanda Sahib at Cauverypak, destroyed the town of Dupleix Fattehabad, defeated the French army, took Covelong, and commanded the land forces against Gheriah. In 1756, after the loss of Calcutta and the imprisonment by Suraj-ud-Dowla in the guard-room, since known as the Black Hole, he left Madras with 900 Europeans, recaptured Calcutta, and made peace. But war again broke out, and Clive with 3000 British and native soldiers defeated Suraj-ud-Dowla on the 23d June 1757 at Plassey, 40 miles south of Murshidabad. Mir Jafar was then declared subahdar of Bengal, Behar, and Orissa. Clive revisited Britain in 1760, with the rank of colonel. Mir Jafar was restored in 1763. Clive subsequently returned to India, corrected abuses in the government, obtained the dewani of Bengal, Behar, and Orissa, and assumed the civil and military government of the country, as Governor and Commander-in-Chief. His retrenchments caused a mutiny amongst the officers and men, which he quelled with severe measures. He returned to Britain in 1767, and at first was well received, but was subsequently impeached before Parliament, and only escaped trial by voluntary death in November 1774. In the ungrateful and final treatment by his country, his fate resembled those of La Bourdonnais, Dupleix, and Warren Hastings. Lord Clive was the territorial founder of British India. Warren Hastings reorganized every branch of the public service, created courts of justice, and reformed the revenue collections. Lord Clive's life has had several historians, amongst whom are Caraccioli and Malcolm.

Clive, Lord, Governor of Madras in 1801, was a relative. The descendant of Lord Clive's family is now styled Earl Powis in the peerage of Great Britain.—*Malleson; Orme.*

CLOAK. Many races in the south and east of Asia wear cloaks. That of Egypt is called burnoos. The cloaks of Afghanistan are the postin, postaki, postinchi, choga, and khosai; and the aba is worn in Arabia.

CLOCK.

Uuren; Uurwerken, DUT.	Orologgi; Oriuoli, . . IT.
Horologien; Horologes, FR.	Tschasii, ... RUS.
Uhren; Grosse-uhren, GER.	Relojes, ... SP.

The clocks to be seen in the south and east of Asia are wholly of European manufacture. Prior to their introduction, the clepsydra or water-clock was in general use. These were of copper, with a small aperture at the bottom, through which, when placed in water, the clepsydra filled and sank, the sinking marking an hour. The water-clock of the Malay sailors is half of a cocoanut shell, with a small hole, through which, when placed in a bucket, it fills and sinks in an hour. Pendulum clocks were invented about A.D. 1260. —*M'Culloch.*

CLOTHING. The materials used for clothing, and the forms of dress of the peoples of the south and east of Asia, differ according to the climate, the pursuits, and the customs of the races. Through a thousand years, seemingly, the south-eastern races continue to wear clothing similar to what their forefathers put on; but Andamanese live wholly without apparel, and Chinese dress in a very elaborate manner. Hindu men and women, until the middle of the 19th century, wore only cloths without seams; and even yet their women's bodice (choli) and the men's jacket (angrika) alone are sewed, the lower garment of both sexes being cloths which are wrapped round the limbs, and often as neatly so as sewn trousers. In this form Hindu clothing is not called clothes, but cloths. Most Hindus wear trousers when on horseback; but the prevailing Hindu custom illustrates Mark x. 50, where mention is made of the blind man throwing off his upper garment, which was doubtless a piece of cloth. It is not considered at all indelicate among the Hindu people for a man to appear naked from the head to the waist, and servants thus attired serve at the tables of poor Europeans. In Arabia, a coarse cloak of camel or goat's hair is generally worn, often as the sole attire. It is called an aba, and its material is cameline. Amongst men of the very humblest classes of Southern India, at work, the simple loin-cloth is the sole body clothing; but almost all have a sheet, or a cumbli, or coarse blanket of wool or hair, as a covering for warmth. The Nair women move about with the body uncovered down to the waist, as an indication of the correctness of their conduct. The women of the Patuah or Juanga, in the Denkenāl district of Orissa, also called Patra-Sauri or Leaf-Sauri, till 1871 wore a covering of a bunch of leaves, hanging from the waist, both in front and behind. Forest races in Travancore also wear leaves as covering. Hindu children, both boys and girls, up to three or four years of age, have no clothing; the Abor young women have a string of shell-shaped embossed bell-metal plates, and Miri women wear a small loin kilt made of cane. Throughout British India, however, almost every Hindu and Mahomedan woman, however humble in circumstances, is wholly covered, from the neck to the ankles, with choli and gown or trousers, or cloths of kinds. This seems to have been the practice from remote antiquity. In Vedic times the women seem to have dressed much like the present Rajputni. They had a gogra or petticoat, a kanchali or corset, and a do-patta or scarf. In the Rig Veda there is an allusion to Indrani's headdress as being of all forms, and several passages are indicative of considerable attention having been paid to personal decoration (Calcutta Review, No. 109, p. 30). Weaving is frequently alluded to in the Vedas. The Yajur Veda mentions gold cloth or brocade as in use for a counterpane. In the Ramayana are mentioned the wedding presents to Sita as consisting of woollen stuffs, fine silken vestments of different colours, princely ornaments, and sumptuous carriages. The Mahabharata mentions furs from the Hindu Kush, woollen shawls of the Abhira of Gujerat, cloths of the wool of sheep and goats, etc.; and weaving and dyeing are repeatedly mentioned in the Institutes of Menu.

The best representations of ancient costumes in India are the celebrated fresco paintings in the caves of Ajunta, some of which are still very perfect, and in the Buddhist caves of Ellora some paintings in a similar style had been executed. It is difficult to decide the date of these paintings, which represent scenes in Buddhist history; and the series may extend from the 1st or 2d century before Christ, to the 4th and 6th century of this era. In either case they are upwards of a thousand years old, and as such are of much interest.

One very large picture, covered with figures, represents the coronation of Sinhala, a Buddhist king. He is seated on a stool or chair, crowned with a tiara of the usual conventional form. Corn, as an emblem of plenty and fertility, is being poured over his shoulder by girls. He is naked from the throat to the waist. All the women are naked to the waist; some of them have the end of the cloth or sari thrown across the bosom, and passing over the left shoulder. Spearmen on foot and on horseback have short waist-cloths only.

In another large picture, full of figures, representing the introduction of Buddhism to Ceylon, and its establishment there, all the figures, male and female, are naked to the waist. Some have waist-cloths or kilts only, others have scarfs, or probably the ends of the dhoti, thrown over their shoulders. Female figures, in different attitudes around, are all naked, but have necklaces, ear-rings, and bracelets, and one a girdle of jewels round her loins.

Some writers have maintained that the ancient Hindus were ignorant of the art of preparing needle-made dresses. It has even been said that there is no word for tailor in the language of the Hindus; but there are two—one, tunnavaya, which applies to darning, and the sauchika, which applies to tailoring in general. The Rig Veda mentions needles and sewing, and the Ramayana and Mahabharata allude to dresses which could not have been made otherwise than with the aid of needles. In the ancient sculptures at Sanchi, Amraoti, and Orissa, several figures are dressed in tunics which required needles. Amongst these garments are discoverable what may be called the ancestors of the modern chapkan and jama. The dress differs so entirely from the chiton, the chlamys, the himation, and such other vestments as the soldiers of Alexander brought to India,

that they cannot be accepted as Indian modifications of the Grecian dress. In many ancient sculptures of Buddhist times, queens, princes, and ladies of the highest rank are represented without any garments; and it has been suggested that there prevailed either a conventional rule of art, such as has made the sculptors of Europe prefer the nude to the draped figure, or a prevailing desire to display the female contour in all its attractiveness, or the unskilfulness of early art, or the difficulty of chiselling drapery on such coarse materials as were ordinarily accessible in this country, or that a combination of some or all of those causes exercised a more potent influence on the action of the Indian artist than ethnic or social peculiarities in developing the human form in stone.

Allusion is made to 'saffron-tinted robes' and to 'red-dyed garments' in occasional passages of the early writings, but even these are comparatively rare as regards men, and there is little more in respect to women. In the drama of Vikram and Urvasi, written probably in the reign of Vikramaditya, B.C. 56, Puraravas, one of the characters, says of Urvasi, a nymph who has fainted,—

'Soft as the flower, the timid heart not soon
Foregoes its fears. The scarf that veils her bosom
Hides not its flutterings, and the panting breast
Seems as it felt the wreath of heavenly blossoms
Weigh too oppressively.'—Act i. Sc. 1.

Again,—

'In truth she pleases me: thus chastely robed
In modest white, her clustering tresses decked
With sacred flowers alone, her haughty mien
Exchanged for meek devotion. Thus arrayed,
She moves with heightened charms.'—Act iii. Sc. 2.

In the drama Mrichchakati, attributed to king Sudraka of Ujjain, who reigned, according to the traditional chronology, in the first century before the Christian era, and is certainly not later than the 2d century after Christ, Act iv. Sc. 2 says,—

'*Maitrena.* Pray who is that gentleman, dressed in silk raiment, glittering with rich ornaments, and rolling about as if his limbs were out of joint?
'*Attendant.* That is my lady's brother.
'*Maitrena.* And pray who is that lady dressed in flowered muslin?—a goodly person, truly,' etc.

The following passage, taken from the Uttara Rama Charitra, by the same author, affords an idea of the costume of a warrior race. Janaka, the father of Sita, the heroine, in describing the hero Rama, says,—

'You have rightly judged
His birth; for see, on either shoulder hangs
The martial quiver, and the feathery shafts
Blend with his curling locks. Below his breast,
Slight tinctured with the sacrificial ashes,
The deer-skin wraps his body, with the zone
Of Murva bound; the madder-tinted garb
Descending vests his limbs; the sacred rosary
Begirts his wrists; and in one hand he bears
The pipal staff, the other grasps the bow.
Arundati, whence comes he?'

The clothing of the Mahomedan races, who came from the north-west, has been of wool and of cotton, to suit the changing seasons, and the articles of dress were cut out and sewed in forms to fit the body. The Rajput and other martial races have always dressed similarly.

Most of the Hindu women of the present day appear in public, and at their numerous religious festivals opportunities for seeing their holiday clothing are numerous. On such occasions the wealth of the mercantile classes admits of much display. In Bombay, a brilliant and picturesque array of women drifts along the streets and ways. The large and almost bovine Banyan and Bhattia women roll heavily along, each plump foot and ankle loaded with several pounds' weight of silver. The slender, gold-tinted Purbhu women, with their hair tightly twisted, and a coronal of mogra flowers, have a shrinking grace and delicacy that is very attractive; and, barring the red Kashmir chadar, their costume is precisely that in which an artist would dress Sakuntala and her playfellows. The Marwari females, with skirts full of plaits, tinkling with hawk-bells, their eyes set in deep black paint, and the sari dragged over the brow so as to hang in front, are very curious figures, seldom pretty. Sūrati girls, with their drapery so tightly kilted as to show great sweeps of the round, brown limbs, smooth and shapely, that characterize those Venuses of the stable and kitchen, stride merrily along, frequently with a child on their rounded hips. There is a quaint expression of good-humour on their features, which have a comely ugliness unlike that of any other race. Then the trim little Malwen girls, who are already growing fairer and lighter in colour from their confinement in the cotton factories, sling quickly along with a saucy swing of their oscillant hips; and the longer-robed Ghāti, scarcely to be distinguished from women of the Marathi caste, go more demurely. The Brahman woman is best seen at Poona, Wye, and at Nasik. In Bombay she is scarcely distinguishable from Sonar, Sontar, and others. Those odd, gipsy-like wenches, the Wagri beggar women, each provided with a plump baby, carried in a tiny hammock slung on a stick, and handed to the spectator as if it were something to buy or to taste, are to be seen in numbers, sometimes twanging on a one-stringed sitar, but more often playing the tom-tom on their plump forms, with that frank simplicity of pantomime which is the supreme effort of Hindu eloquence, and the art of suiting the action to the word. Gosains, with their little stalls of shells, brass spoons, bells, and images. Everybody very happy, and all differently clad.

In the present day, before a Hindu puts on a new garment, he plucks a few threads out of it and offers them to different deities, and smears a corner with turmeric to avert the evil eye. The Cloth of a married Hindu woman has always a border of blue or red, or other colour. The dress of a Hindu widow is white.

Arab (men's) dress has remained almost the same during the lapse of centuries. Over the shirt, in winter or in cool weather, most persons wear a *sudeyri*, a short vest of cloth without sleeves; *kaftan* or kuftan of striped silk, of cotton or silk, descending to the ankles, with long sleeves extending a few inches beyond the finger-ends, but divided from a point a little above the wrist or about the midde of the forearm. The ordinary outer robe is a long cloth coat of any colour, called by the Egyptians *gibbeh*, but by the Turks *jubbeh*, the sleeves of which reach not quite to the wrist. Some persons also wear a *beneesh* or benish robe of cloth, with long sleeves, like those of the kuftan, but more ample. It is properly a robe of ceremony, and should be worn over the other cloth coat, but many persons wear it instead of

the gibbeh. The Farageeyeh robe nearly resembles the beneesh; it has very long sleeves, but these are not slit, and it is chiefly worn by men of the learned professions. In cold weather, a kind of black woollen cloak, called *abayeh*, is commonly worn. Sometimes this is drawn over the head. The abayeh is often of the brown and white striped kind.

In British India the ordinary articles of clothing of Hindu and Mahomedan women comprise *the bodice*, called choli, angia, kachuri, koortee, and kupissa; *the petticoat*, called lahunga, luhinga, ghagra, and peshgir; and the *sari*, or wrapping loin-cloth.

Men's clothing consists of—

Loin-cloth, dhoti or loongi;

Trousers, called paijama, izar, turwar, gurgi, and shalwar;

Jacket, *coat*, and *vest*, called anga, angarka, chapkan, dagla, jora, koorta, kuba, kufcha, mina, mirzai, jama, labada;

Skull-cap, topi, taj;

Head-dress, pagri, turban (sir-band), shumla or shawl turban, rumal or kerchief, dastar;

Kamrband or waist-belt, sash.

The women of Burma wear a neat cloth bodice, and, as an under garment, a cloth wrapped tightly round from the waist downwards; but so narrow that it opens at every step, and all the inner left thigh is seen.

Fabrics used for the clothing of the masses of the people of India are plain and striped dooria, mulmul, aghabani, and other figured fabrics have established themselves; the finest qualities of muslins must necessarily be confined to very rich purchasers.

Long cloths or panjams of various qualities were formerly manufactured to a great extent in the Northern Circars, as well as in other parts; the great proportion consisted of 14 panjam or cloths containing fourteen times 12 threads in the breadth, which varied according to local custom from 38 to 44 inches. 14 lbs. was considered the proper weight of such cloths, the length 36 cubits, half-lengths being exported under the denomination of salampores. The manufacture of the finer cloths, which went up to and even exceeded 50 panjam, has long been discontinued.

Other articles of dress of *women of Bombay* are the bungur-kuddee, chikhee, choli or khun, choonee or head-cloth, doorungu-pytanee, guj (covering for breast), guzzee or long robe, izarband, kempchunder (widows), kurch-chunderkulee, peshgir, paijama, saris of kinds, silaree.

In *Cutch*, the khombee, sadlo, for women; for men, pairahan, paijama, izarband.

Other articles of dress of the *men* of Bombay,—angarka, chaga, dhoti, izarband, koortah, labada (in Baluchistan), pairahan, paijama, turban, ujruk or coloured sheet (in Sind).

Men's Cloths are manufactured all over British India, and those of the Madura district have lace borders; they are sold as high as 70 rupees for a suit of two pieces. Conjeveram is noted for its silk-bordered cloths, which are sold for not more than 15 rupees a pair.

Women's Cloths of cotton form an article of manufacture in every district. Madras manufactures a nicely coloured women's cloth called oolloor sailay, sold for 7 rupees and upwards. Arnee is noted for its manufacture of a superior quality of white cotton cloths of various patterns. Those of Sydapet, in the outskirts of Madras, are of ordinary quality, and of different colours. Ganjam also fabricates a common sort, with a few of more value worked with lace borders, but not sold for more than 50 rupees.

Women's Silk Cloths.—The principal places for the manufacture of native female silk cloths are the towns of Benares, Berhampore, and Tanjore. Those of Benares are generally of superior quality, with rich lace borders, and they are sold at from 50 to 350 rupees or upwards. Berhampore cloths are wholly silk, but nicely finished. Tanjore cloths are also neatly finished, with nicely-worked borders, both of lace and silk, of various colours; they are sold at from 15 to 150 rupees.

Silk Cloths, called pethambaram, are chiefly brought from Benares and Nagpur; they are also made at the town of Combaconum. The Benares cloths are highly prized for their superior quality; they measure 12 by 2½ cubits a-piece; two pieces make one suit of an upper and under garment. Hindus wear these cloths during their devotions and holiday time. They are sold from 50 to 350 rupees, or even more. The silk fabrics of Combaconum are good, although not equal to those of Benares.

White Cloths were manufactured all over Southern India, but those of Manamadu, in the district of Trichinopoly, were very superior in quality, and used by the more respectable of the inhabitants as clothing, under the name of Manamadu sullah. That at Arnee, in the district of Chingleput, known as Arnee sullah, is of different quality.

Women's coloured cotton Cloths.—These coloured cotton cloths are largely made in the Madura district. They are of various sizes, with or without lace-worked borders. Those with lace vary in price from 15 to 200 rupees each; they are generally purchased by the wealthier natives, by whom they are highly prized. These fabrics are known in the market as vankey, thomboo, joonnady, and ambooresa, all of them lace-bordered.

Women's silk Cloths are made chiefly in Benares and Nagpur; but they are fabricated also at Berhampore, Tanjore, Combaconum, and Conjeveram, in the Madras Presidency. Those of Benares and of the Mahratta countries are celebrated for their superiority, and are highly prized for their lace borders; their size is 16 by 2¼ cubits, and they are sold at 50 to 300 rupees and upwards; those made at Berhampore, Tanjore, and Combaconum are not equal to the Benares cloths, but are well made, and sold at from 15 to 70 rupees each. The women's cloths of Tanjore and Madura manufacture, and men's head-cloths, also from Madura, will compete with the production of any other loom in the world.

Printed Cloths are worn occasionally, as in Berar and Bundelkhand, for sarees; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the humbler classes in Upper India; but the greatest demand for printed cloths is for palempores, or single quilts.

In the costlier Garment Cloths woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the

saree or women's cloths, those made at Benares, Pytun, and Burhanpur, in Gujerat, at Narrainpet, and Dhanwarum, in the territory of His Highness the Nizam, at Yeokla in Kandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black shot with crimson or yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of, or approach to, glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the country; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair—as any lady of Britain or France. Another exquisitely beautiful article of Indian costume for men and women, is the do-patta scarf, worn more frequently by Mahomedan women than Hindu, and by the latter only when they have adopted the Mahomedan lunga or petticoat; but invariably by men in dress costume. By women this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head; by men, across the chest only.

Do-pattas, especially those of Benares, are perhaps the most exquisitely beautiful and prized of all the ornamental fabrics of India; and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and ductile description imaginable, woven in broad, rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns, of the ribbon borders, or broad stripes. How such articles are woven with their exquisite finish and strength, fine as their quality is, in the rude handlooms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colours,—the creamy white, and shades of pink, yellow, green, mauve, violet, and blue, are clear yet subdued, and always accord with the thread used, and the style of ornamentation, whether in gold or silver, or both combined. Many are of more decided colours,—black, scarlet, and crimson, chocolate, dark green, and madder; but whatever the colour may be, the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing; but the dyers and scourers of India have a process by which the former colour can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The do-pattas of Pytun, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Dekhan,—not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares.

Scarfs are in use by every one,—plain muslins, or muslins with figured fields and borders without colour, plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called sehla in India, are in everyday use among millions of Hindus and Mahomedans, men and women. They are always open-textured muslins, and the quality ranges from very ordinary yarn to that of the finest Dacca fibres. The texture of the dhotees, sarees, and loongees manufactured in Britain and sent to India, is not that required by the people, nor what they are accustomed to. It is in general too close,—too much like calico, in fact,—which of course makes the garment hot, heavy in wear, and difficult to wash. Again, the surface becomes rough, and, as it is generally called, fuzzy in use, while the native fabric remains free.

Few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But all classes wear coloured cloths,—black, red, blue, occasionally orange and green, violet and grey. All through Western, Central, and Southern India, sarees are striped and checked in an infinite variety of patterns. Narrainpet, Dhanwar, and Muktul, in the Nizam's territories; Gudduk and Bettigerry in Dharwar; Kolhapur, Nasik, Yeokla, and many other manufacturing towns in the Dekhan; Arnee in the south, and elsewhere, send out articles of excellent texture, with beautifully-arranged colours and patterns, both in stripes and checks. For the costly and superb fabrics of cloths of gold and silver (kimkhab), and the classes of washing satins (mushroo and hemroo), even if European skill could imitate them by the handloom, it would be impossible to obtain the gold and silver thread unless it were imported from India. The native mode of making this thread is known, but the result achieved by the Indian workman is simply the effect of skilful delicate manipulation. The gold and silver cloths (kimkhab) are used for state dresses and trousers, the latter by men and women; and ladies of rank usually possess petticoats or skirts of these gorgeous fabrics. Mushroo and hemroo are not used for tunics, but for men's and women's trousers, and women's skirts; as also for covering bedding and pillows. They are very strong and durable fabrics, wash well, and preserve their colour, however long worn or roughly used; but they can hardly be compared with English satins, which, however, if more delicate in colour and texture, are unfitted for the purposes to which the Indian fabrics are applied. For example, a labada or dressing gown made of scarlet mushroo in 1842, had been washed over and over again, and subjected to all kinds of rough usage, yet the satin remained still unfrayed, and the colour and gloss as bright as ever. Many of the borders of loongees, dhotees, and sarees are like plain silk ribbons, in some instances corded or ribbed, in others flat. The saree, boonee, bafta, jore, ekpatta, gomcha, etc. of Dacca, have latterly been made of imported British yarn. Fabrics of a mixed texture of cotton and silk, are in Dacca designated by various names, as nowbuttee, kutan, roomee, apjoola, and lucka; and when embroidered with the needle, as many of them frequently are, they are called kusheeda. The silk used in their manufacture is the indigenous muga silk of Assam and Sylhet, but the

cotton thread employed was lately almost entirely British yarn, of qualities varying from Nos. 30 to 80. These cloths are made exclusively for the Jedda and Bussora markets, and a considerable stock is yearly imported in the Arab vessels that trade between Calcutta and these ports. Pilgrims, too, from the vicinity of Dacca, not unfrequently take an investment of them, which they dispose of at the great annual fair held at Meena, near Mecca. They are used by the Arabs chiefly for turbans and gowns. The golden colour of the muga silk gives to some of these cloths a rich lustrous appearance; pieces made of native-spun cotton threads and of the best kind of muga silk, are admired.

The export trade of the Madras Presidency in madapollams and long cloths has been annihilated by the goods laid down by the British manufacturer in all the bazars of India.

The dress of *Hindu* men is of white muslin or cotton cloth, and their upper coat is now generally sewed. The under garment for the lower part of the body, the *do-wati* or *dhoti*, is a loose unsewed wrapper or Cloth. Hindu women of all classes mostly wear unsewed Cloths of green, red, or yellow-coloured cotton, edged with silk or gold embroidery, and a bodice of cotton or silk.

The dress of the *Bhattia* men consists of a jama or tunic of white cloth or chintz, reaching to the knee; the kamrband or cincture, tied so high as to present no appearance of waist; trousers very loose, and in many folds, drawn tight at the ankle; and a turban, generally of a scarlet colour, rising conically full a foot from the head. A dagger, shield, and sword complete the dress. The Bhattiani wears a fine woollen brilliant red *gogra* or petticoat, and scarf thirty feet in width. They also wear the *chaori*, or rings of ivory or deer-horn, which cover their arms from the shoulder to the wrist, of value from sixteen to thirty-five rupees a set; and silver *kurri* (massive rings or anklets) are worn by all classes, who deny themselves the necessaries of life until they attain this ornament.

John xix. 23 says, 'Without seam, woven from the top throughout;' and the clothes of a Hindu, who is not employed in the service of Europeans or Muhammadans, are always without a seam; have neither buttons nor strings, being merely cloths wrapped round the upper and lower parts of the body. A Brahman, strict in his religious observances, would not on any account put on clothes which had been in the hands of a Muhammadan tailor.

The *angarkha* or undress coat, and the *jama* or dress coat, are worn only by men.

The *anga* is a sleeveless vest.

Buchhanee, in Dharwar, is commonly worn as a waist-cloth by children of respectable people; also worn by adults of the same class while sleeping. Price one rupee two annas.

Chādar is a sheet. A chadar made to the order of Kunde Rao, the Gaekwar of Baroda, for a covering of the tomb of Mahomed at Medina, cost a kror of rupees. It was composed entirely of inwrought pearls and precious stones, disposed in an arabesque pattern. The effect was highly harmonious.

Chanduse, a cotton scarf, coloured border and ends, used in Khyrpur.

The *Choli* or bodice of women is of silk or cotton, and is usually fastened in front. Many women of Gujerat also wear a gown. The choli is an under-jacket worn by women. The thans or choli pieces of Dharwar, of a description used by women working in the fields, cost three annas for each choli, or twelve annas the piece.

Cumbli are blankets of goats' hair or wool. Every labouring family in the Peninsula has them. They cost from one to three rupees.

Kamrbands are sashes worn by men. They are of cotton and of silk.

The *Dhotee*, a flowing cloth for the body, from the waist to the feet, is worn by men, and is generally bordered with red, blue, or green, like the toga prætexta (limbo purpureo circumdata). Dhotees are usually worn so as to fall over and cover the greater portion of the lower limbs. One of a coarse cotton, commonly worn by cultivators and labourers in the field, may cost about two rupees.

Izarband is of silk or cotton, and is a tie for trousers.

Khess, a chintz scarf in use in Hyderabad (Sind).

Labada, a dressing-gown.

Loongee, or scarf of cotton, of silk, and of silk and cotton, is worn by men. Where of silk, it is usually enriched with a border of gold and silver.

Mundasa, a cloth worn by the poorer classes in Dharwar; costs $1\frac{1}{4}$ rupees.

The *Paijama*, or trousers, is worn both by men and women.

Panchrangi of Dharwar has a warp of silk and weft of cotton, worn ordinarily by dancing women, not considered proper for respectable women; 1 than, 1 rupee 12 annas.

Panjee of Dharwar is a cloth used by well-to-do people to dry themselves after bathing, but also worn as a waist-cloth by poor people.

Patso of Burma is a cloth worn by men of all classes. In Akyab it is worn by the Mug race.

Pitambara means clothed in yellow garments. Hindu hermits, and many of the Hindu and Buddhist ascetics, are required to wear clothes dyed of an ochrey yellow.

The *Rumal* or kerchief, the *kamrband* or waist-belt, and the *do-patta* or sash, are men's garments.

Salendong, a silk scarf of Singapore.

Salimote, a silk scarf of Singapore.

Saree, the Hindu woman's lower cloth, costs from two rupees and upwards. Each woman generally has a new one once a year. It is often used also as an upper garment, in the form of a scarf for enveloping the person, one end being usually brought over the head as a covering. The saree, as used by women to cover the whole body, is the kalumma of Homer.

Selya, in the south of India, is a sheet or body covering in use amongst the poorer classes, cultivators, and labourers, wrapped round their shoulders and body when employed in the fields. Their usual cost is about $1\frac{1}{4}$ to $1\frac{3}{4}$ rupees. In Dharwar one is always presented to the bridegroom by the relations of the bride, together with a turban.

Turbans of all kinds are worn by Hindus and Mahomedans, and known as dastar, pagri,—turban being from the Persian words, Sir-band, head-binder. The Arabs and Turks call it Imamah. The other head-dresses are the rumal, the taj, and the topi. — *Ward, Hindus*, iii. 186; *Drs. Taylor and Watson, Ex. of* 1862; *Calcutta Review; Pioneer Newspaper.*

CLOTHS manufactured in India:—

Cotton fabrics of Bombay comprise the bafta, bochun, carpet, chadar, chael, chandni, choli, do-patta, dhota, dhoti, dungaree, dustoorkhana, horni, khes, khoji, khurwa a coarse red cloth, kurchar, loongee, mussoti, pagga, peshgir, phatka, pichoree, quilt or razai, rumal, saree, soussee, soot, soojunee, tablecloths, table napkins, towels, turbans.

Silk fabrics of Bombay are,—bochun, bulbuls, cholepun, doorungee-pytanee, gul-badan, gown pieces, hemroo, karrah, katchia, khun, khudruf, kootnee, kud, kunawaz, meenia-sari, mukhmul, petambar-zanani, petambar-mardana, paijama, rowa, rumal, senna, shalwar, tasta, uddrussa, yeolah.

Silk and cotton made fabrics of Bombay are the dariyai-sari, ghaut, khunjree, lake, lake-meenia, loongi, luppa, with silk and gold and silver embroidery, mukhtiar-khunee, meenia-ghaut, mushroo.

Bhangarah, a very coarse and strong sackcloth, made from the inner bark of trees, and much used in Nepal as grain sacks.

Bhim Poga of Nepal, a fabric, half woollen, half cotton.

Changa, a coarse cotton cloth manufactured by the natives of Newar.

Chintz (Chinti, HIND., a drop) or pintado, printed calicoes.

Dalmiyan, or net.

Dariyai, plain silk.

Deogun, a coarse cloth of silk, with gilt tissue.

Elaicha, a fabric of mixed cotton and silk.

Susi and *Khesi*, striped calico, woven with coloured thread. The silken *khesi* is also edged with gold or silver.

Kashidas-tussur, embroidered muslins made at Dacca, and largely sold in India, Persia, Arabia, Egypt, and Turkey.

Kassa, a Newar imitation of the Indian malmal, used for turbans.

Khadi, a coarse cotton cloth.

Kurchar, felt for pillows.

Kimkhab, or gold and silver brocaded silk; a silk brocade. The kimkhab brocades are distinguished as suneri or golden; ruperi or silvery; chand-tara, moon and starry; dup-chan, sunshine and shade; maz-char, ripples of silver; palimtar-akshi, pigeons' eyes; bulbul-chasm, nightingale eyes; mohr-gala, peacock's neck; par-i-taos, peacocks' feathers.

Malida, red woollen cloth, woven like shawl cloth.

Mushroo, a fabric of cotton mixed with silk, with a cotton warp or back, and woof of soft silk in a striped pattern, having the lustre of satin or atlas.

Muslins, the finest or malmal-i-khas of Dacca were known as ab-rawan, running water; baft-howa, woven air; shabnam, evening dew.

Malmal-i-khas means special (king's) muslin.
Doria or striped muslin.
Charkhana or chequered muslin.
Jamdani or figured muslin.
Chikan or embroidered muslin.

Mundel, a cloth of cotton and gold, obtainable in Kutch; costs Rs. 8·4·11.

Nimbu, a woollen pile fabric.

Palampore (palang-posh), or bed-covers.

Panchan, white woollen cloth.

Pankhi, woollen twill.

Paranda, a silk material used as a hair ornament in Lahore.

Pashmina, or woollen fabrics.

Punika of Nepal, an imitation of the Dinapur tablecloth.

Purbi-khadi, a coarse cotton cloth manufactured by the Khassya hill tribes (Purbi, eastern).

Putasi, a blue and white check worn by Newar women.

Sianah, a woollen stuff of Nepal.

Sufi is the striped (gulbadan) silks, called also Shuja khani of Bahawulpur. They differ from mushroo in having no satiny lustre, and look like a glazed calico. They can scarcely be distinguished from sufi, and are glazed with a mucilaginous emulsion of quince seed. Mushroo and sufi are made plain, striped, and figured.

Tafta, a fabric of twisted thread.

Tappu, coarse cotton cloth of Nepal.

Tasar, *Tussar*, *Tassah*, eria and munga, are made of wild silks.

Tusa, a coarse woollen fabric.

CLOVE, Mother clove.

Polang, . . . MALAY.	Ibu-changke, . MALAY.

'Mother clove' means seed-clove, clove fruits that have been allowed to grow to full maturity.

CLOVE BARK of eastern commerce is the bark of several species of cinnamon trees.

CLOVE OIL.

Huile de girofle, . FR.	Warala-tel, . . . SINGH.
Lavang ka tel, . . HIND.	Lavangoo tailam, . TAM.
Oleo de garafano, . IT.	Kirambu tailam, . ,,
Minak-changke, MALAY.	Lawanga tailamu, . TEL.

This is obtained from cloves by distillation. When new it is of a pale reddish-brown colour, which becomes darker by age. It is extremely hot and fiery, and sinks in water. The smell is agreeable, and not unlike that of koolfa, or Malabar cassia oil. The kind met with in Bombay is chiefly made at Surat.—*Faulkner*.

CLOVE PEPPER. Allspice, clove-pepper, or pimento, are Pimenta vulgaris berries, gathered while still green and dried in the sun; this well-known spice is also called sometimes Jamaica pepper, from its cultivation being chiefly confined to that island. The ripe berries, when dry, are almost devoid of flavour.

CLOVER, or trefoil, a name given to several species of the genus Trifolium grown in Europe. In India, a species of Hedysarum supplies the place of the species of Trifolium and Medicago in Europe.

CLOVER SEED.

Klaver-zaad, . . . DUT.	Trifolium, ... LAT.
Semence de trefle, . FR.	Trilistnik, ... RUS.
Kleesaat, Klee, . . GER.	Trebol, ... SP.
Trifoglio, ... IT.	

Red and white clover seed, Trifolium pratense, *L.*, and T. repens, *L.* Upwards of 155,000 cwts. were imported in 1870. Frequently adulterated with old and dead or kiln-dried seed, and with the cheaper hop clover, T. procumbens, *L.*, etc.

In a law passed by Aurelian the First, in A.D. 175 and 180, cloves are mentioned. The cloves of commerce are the unopened flower-buds of the clove tree, Caryophyllus aromaticus, which was originally a native of the Moluccas and of China, but is now cultivated in Penang, Sumatra, S. India, Bourbon, Zanzibar, Guiana, E. Africa, and the West India Islands. The clove tree may be seen in a few gardens on the Tenasserim coast, and in Travancore, Tinnevelly, Canara, Cochin, and near Oodagherry, 1800 feet above the sea. They have the form of a nail, and when examined are seen to consist of the tubular calyx with a roundish projection, formed by the unopened petals. The flowers, produced in branched peduncles at the extremity of the bough, are of a delicate peach colour. The elongated calyx, forming the seed-vessel, first changes to yellow, and when ripe to red, which is from October to December, and in this state it is fit to gather. If left for a few weeks longer on the trees, they expand, and become what are termed 'mother cloves,' fit only for seed or for candying. In the gathering, the ground under the tree is first swept clean, or else a mat or cloth is spread. The nearest clusters are taken off with the hand, and the more distant by the aid of crooked sticks. Great care is taken not to injure the tree. The cloves are then prepared for shipment by smoking them on hurdles near a slow wood fire, to give them a brown colour, after which they are further dried in the sun. They may then be cut off from the flower branches with the nails, and will be found to be purple-coloured within, and fit to be baled for the European market. In some places they are scalded in hot water before being smoked, but this is not common. The tree begins to bear from the seventh to the fifteenth year, and is fruitful till it is 75 or 150 years old. The annual yield of a good tree is about 4½ lbs.; and the annual crop from Amboyna, Haruku, Saparna, and Nasalaut, was 350,000 lbs. of Amsterdam (Bikmore, p. 154). The companions of Magellan loaded two ships with cloves at the single island of Tidor, after a stay, from their arrival to their departure, of no more than forty-four days. The Portuguese made their first appearance in the parent country of cloves in the year 1512, and, until expelled by the Dutch in 1605, they had the principal share of the clove trade for 93 years, a period of rapine, violence, and bigotry. The main object of the Dutch was the exclusive monopoly of spices, by the expulsion of all rivals. They extirpated the clove trees in their native islands, and endeavoured to limit their growth to the five Amboyna islands, in which the clove is an exotic. Periodical expeditions for the extirpation of young plants, that might spontaneously have sprung up, or been propagated by birds, formed part of that system. The periodical exterminating expeditions became merely nominal after the year 1820, and have been discontinued. —*M. E. J. R.; Bikmore, Archip.* p. 115; *Simmonds, Com. Prod.; Crawfurd's Dictionary; M'Culloch's Dictionary.*

CLUB-WOOD of Tahiti, Casuarina muricata.

CLUPEIDÆ, a family of fishes of the order Physostomi, placed by Cuvier between the Salmonidæ and the Gadidæ, and they form the fifth and last division of his section 'Malacopterygiens Abdominaux.' The family contains the following eighteen genera, the number of species of which are indicated :—

Cetengraulis,	2	Pristigaster,	7
Engraulis,	37	Chirocentrodon,	1
Coilia,	10	Spratelloides,	3
Chatoessus,	10	Dussumiera,	2
Clupea,	61	Etrumeus,	2
Clupeoides,	3	Albula,	1
Pellonula,	1	Elops,	2
Clupeichthys,	1	Megalops,	2
Pellona,	14	Chanos,	2

There are about 100 recognised and doubtful species of clupea. They inhabit every part of the globe, and several are found in the seas of south and east of Asia. One species in Ceylon is called the poisonous sprat. C. pilchardus, the pilchard, frequents the coast of Japan in the latter part of the month of June and commencement of July. They are taken by the seine nets. When fresh, they are sweet and nutritious; but they are chiefly valued for their oil, to obtain which they are piled up in heaps for twenty-four hours, are then boiled for some time in sufficient water to prevent their burning, then ladled into strong square presses, and the lever action of a lid presses out the oil. The oil after cleaning is used for lamps, and the refuse for manure.

CLUPEONIA PERFORATA, *Cantor*, inhabits the seas of Penang, Malayan Peninsula, Singapore, and Sumatra. Total length, 5¾ inches. They are of delicate flavour, and pass in the Straits Settlements as sardines, in imitation of which they are sometimes preserved in oil. The general form, the yellow dorsal fin with a small black spot, give this species a certain resemblance to Meletta venenosa (C. et V. xx. 377). In 1822, at Sumatra, great numbers of what was supposed to be this species, presented the unusual appearance of having red eyes. Many natives, having eaten these fishes, were suddenly attacked with violent vomiting, which, in cases where remedies were not immediately applied, was known within an hour to terminate fatally. At the same time, the fishes with the ordinary silvery eyes were, as formerly, eaten with impunity. This phenomenon recurred at Bencoolen during the seasons of 1823 and 1825, but not of 1824. It was surmised that the poisonous fishes had fed on a gelatinous substance which at that season exudes from the beautifully-coloured coral reefs on that part of the coast of Sumatra. It is, however, more probable that the poisonous fishes were shoals of Meletta venenosa, an inhabitant of the Seychelles and the neighbouring seas, which happened in those seasons to visit Sumatra. M. Valenciennes describes this fish as being poisonous, and producing effects as noted above. In the Straits of Malacca, Clupeonia perforata has never been known to produce bad effects.—*Cantor.*

CLUSIACEÆ, one of the orders of plants according to the natural system of Lindley. The genera, Garcinia, Mammea, Mesua, Calophyllum, and Kayea are now usually arranged under Garciniaceæ. The genus Clusia was named after Charles de l'Ecluse, or Clusius, one of the most celebrated botanists of the 16th century. C.

flava, the yellow-flowered balsam tree, the mountain mango or wild mango of Jamaica, might well be introduced into India.

CLUYTIA COLLINA. *R.* Amanoa collina, *Baill.*

Madara-gass, . . SINGH.	Vodisa, ... TEL.
Woadugu maram, . TAM.	Kurseea, ... ,,
Wodisha, Kadishen, TEL.	Kursee, ... ,,

A small tree of the Euphorbiaceæ, of Ceylon and the Peninsula of India, frequent in the Walliar jungles of Coimbatore; flowers in the hot season; seeds ripen in December and January. Bark or outer crust of the capsule said to be exceedingly poisonous. Wood red-coloured, exceedingly hard and durable, but of small size. Notwithstanding its hardness, being very even-grained, it is easily worked, and is, from its fine close grain, a pretty wood.—*Roxb.; Mr. Rohde's MSS.; Wight; O'Sh.; Thw.*

CLUYTIA OBLONGIFOLIA. *Roxb.* A tree of Assam and Sylhet; wood hard and durable.—*Roxb.; Voigt.*

CLUYTIA PATULA. *Roxb.*

Amanoa Indica, *W. Ic.*	Cleistanthus patulus, *Muller.*
Bridelia patula, *Hook.*	
Pala, ... TAM.	Jegura, ... TEL.

A tree of Southern India; grows to a large size, and logs measuring four to five feet in girth are purchasable in the market. The wood is pale red, the colour of dried rose-leaves, hard and durable, very brittle, sp. gr. 75·8, and when broken the fracture seldom shows a fibre. It is used for rulers, knobs, handles for tools, such as chisels, etc., and in turnery. It flowers during the hot season.—*Roxb.; Mr. Rohde's MSS.; Voigt.*

CLYDE, LORD, longer known as Sir Colin Campbell, whom Sir William Napier styled the war-bred Sir Colin. He was a military officer of the British army, and commenced his career as a volunteer with the 9th Regiment of infantry in the British army, which he accompanied to Portugal. He afterwards served in Holland at the disastrous expedition to Walcheren, and again in the Peninsula under Sir John Moore, and he was present at Vimiera, Corunna, Barossa, Vittoria, and San Sebastian, at the siege of which he led the storming party, where he was again severely wounded, having been previously wounded at the passage of the Bidassoa. He was in the expedition of 1814 and 1815 to America. In 1842 he served in the war of China. In 1848 and 1849 in the Panjab campaign, at the passage of the Chenab, at Chillianwalla and Gujerat, and he was engaged against the hill tribes up to 1852. In the war in the Crimea he commanded the Highland Brigade, and to him was due the success of Alma; and he preserved Balaclava against an attack of the Russian forces. The triumphal termination of his long career of war, however, was in India, to which he was sent in 1857, when the Bengal native army revolted, and much of Northern India was in rebellion. He gathered troops about him until he could advance, and he did so without a single check. He died at Woolwich at the close of the mutiny. A statue has been erected to his honour in Waterloo Place, London. See Battles of India; British India.

CLYPEA GLABRA. *W. and A.* This is the Cissampelos glabra, *Roxb.*, and Cocculus Roxburghianus, *D. C.* It is a native of Sylhet; root large, acrid, and used medicinally.

CLYPEA HERNANDIFOLIA. *W. and A.* This is the Cissampelos Hernandifolia, *Willde.*, and C. hexandra, *Roxb.*, the Nimuka and Nimi muka, HINDI. It is a valuable diuretic.

COACH. Conveyances of kinds have been used from very early times in Tartary, Southern and Western Asia, in Hindustan, Asia Minor, Northern Africa, and Europe. See Carriage.

Coal differs considerably in its physical properties, and its varieties obtain various names in the markets. The mineralogist generally classes it as coal without bitumen, and coal with bitumen. The first variety is known by the general name of anthracite. It is sometimes very hard, has a high lustre, and is often iridescent. It is used for fuel, but it is often made into small inkstands, boxes, and other articles of use. This is more especially the case with the anthracite of America. Anthracite is the most common form of coal in the Welsh beds. The kinds are known in commerce as splint, caking, cherry, cannel, and brown or wood coals, also lignite and jet.

Coal was worked in Bengal in 1774 by Messrs. Heatly and Sumner of the Bengal civil service, who obtained a monopoly. Their operations were in the Raniganj coal-field, but they found it unprofitable, and the mines remained unworked till 1815, when Mr. Jones commenced operations. He too was unsuccessful; and in 1820 Messrs. Alexander & Co. undertook them. From that date collieries increased in number; and in 1859 so many as fifty were at work, employing 27 steam-engines, producing then 304,094 tons of round coal. During 1878 and 1879, in the Raniganj fields, 388,931 men and 196,627 women, with 27,277 children, were supported by mining operations, the out-turn of coal being 528,001 tons (Tr. of Hind. i. p. 170). The quantity of coals brought down in 1840 was about 15 lakhs of maunds. In 1850 it was nearly its double, and in 1860 it had become its quadruple. The supply and the consumption of coal in India during ten years was as under, in maunds of 80 lbs.:—

	Coal raised in all India.	Coal raised in Bengal.	Coal imported into Calcutta.	Total consumption in Bengal.
1859	99,61,928	99,61,928	12,29,160	1,11,91,088
1860	1,00,88,113	1,00,88,113	4,96,585	1,05,84,698
1861	78,06,252	77,85,085	12,85,203	90,70,288
1862	86,43,843	86,30,843	6,76,687	93,07,530
1863	95,12,174	95,04,975	10,36,407	1,05,41,382
1864	90,46,147	90,32,405	18,18,132	1,08,50,537
1865	88,37,953	88,10,425	16,16,143	1,04,26,568
1866	1,08,34,551	1,07,90,035	9,14,427	1,17,04,462
1867	1,18,61,031	1,18,47,178	11,46,734	1,29,93,902
1868	1,35,62,274	1,34,65,829	19,28,591	1,53,94,420

Of the coal raised in 1868, almost the whole was from the Raniganj field. One-half of the supply was consumed by the East Indian Railway, and was used for locomotives as far as Ambala.

Coal of British India occurs in the lower Gondwana system, palæozoic rocks, in which three series have been recognised, viz.,—

(*a*) Damuda, Raniganj, or Kamthi.
(*b*) Ironstones, shales, and Barakar.
(*c*) Karharbari and Talchir.

The Karharbari group yield coal, but, except in some of the eastern fields of the Damuda valley series, the Barakar group includes all the valuable coal of Peninsular India. In the Jhariah coal-field its thickness is estimated at 3800 feet, and at Raniganj 2000 feet.

The Raniganj group consist of sandstones, carbonaceous shales, and coal. The coal is of good quality, and comparatively uniform in composition and in the closeness of it seams.

In the rocks of the Kamthi group coal rarely occurs.

The areas of the 37 separate Indian coal-measures and associated younger rocks, which may conceal coal-measures, have been drawn up by Mr. Hughes as under, total 35,000 sq. m.:—

	sq. m.		sq. m.
Godavery and affluents,	11,000	Nerbadda and affluents,	3,500
Sone,	8,000	Damuda,	2,000
Sirguja and Orissa,	4,500	Rajmahal area,	300
Assam,	3,000	Unsurveyed, etc.,	2,700

The rocks which in Peninsular India probably correspond, as regards the time of their formation, to the true carboniferous rocks of Europe, are not coal-bearing; and the oldest coal-measures in British India belong to a period which is well included within the limits of the upper palæozoic or permian and the lower jurassic formations.

The separate coal-fields are :—

(*a*) North of Damuda river, in Bengal, viz. Birbhum, Deogarh, Karharbari, and Rajmahal hills.
(*b*) Damuda valley, viz. Bokara, Jhariah, N. and S. Karanpura, Ramgarh, and Raniganj.
(*c*) West of Damuda valley, viz. Aurunga, Chopé, Daltonganj, Hutar, and Itkuri.
(*d*) Sone and Mahanadi valleys, viz. Bisrampur, Jhilmilli, Lakhanpur, Raigarh, and Hingir; Rampur, S. Rewa and Sohagpur; Udaipur and Korba, Tattapani; and in Orissa, Talchir.
(*e*) Central Provinces, viz., (1) Satpura region, Mopani, Pench, Tawa; (2) Godavery valley, Bandar, Kamaram, Singareni, Wardha or Chanda.
(*f*) Sikkim.
(*g*) Assam, in valley of Brahmaputra, viz. Disai, Jaipur, Jangi, Makum, Nazira.

There are other places in the N.W. Provinces, Assam, and Burma, where tertiary coal occurs, but it is not in sufficient quantity to constitute workable coal-fields. Of the above 37 separate coal-fields, five only (Raniganj, Karharbari, and Daltonganj in Bengal, and Mopani and Wardha in the Central Provinces) are at present (1881) worked with regularity.

Rajmahal hills form a series of low plateaus, which are situated at the point where the Ganges turns southwards to form the head of its delta. The coal-measures are exposed over 70 sq. miles, at Hura, Chuparbhita, Pachwara, Mhowagarhi, and Brahmani, but doubtless extend over a vastly greater area underneath the younger formations. —*Ball*, p. 68.

Birbhum and Deogarh have small detached basins in which coal occurs, but it is of little economic importance.

Karharbari has a field of coal of 11 square miles. It occurs in three principal seams, which have an average total thickness of 16 feet, spread over an area of 8½ square miles. The amount of coal is estimated at 1,360,000,000 tons, and the available portion of it at 80,000,000 tons. It is worked by three companies.

Raniganj coal-field, of 11,200 sq. miles, is on the rocky frontier of W. Bengal, 120 to 130 miles from Calcutta. The coal is in five groups, viz.,—

	sq. m.		sq. m.
Upper Panchet or Mahadeva,	500	Ironstone shale,	1,400
Panchet,	1,500	Barakar,	2,000
Raniganj,	5,000	Talchir,	8,000

It is the largest and most important of the areas in which coal is worked in India. It is worked by several European companies.

Jhariah coal-field is in the valley of the Damuda river. It is 16 miles west of the Raniganj field, and has an area of 200 sq. miles. The estimated available coal here is 465,000,000 tons.

Bokara coal-field is in the valley of the Damuda. Its area is about 220 sq. miles, and the estimated available coal is 1,500,000,000 tons. One seam is 88 feet. Its position renders it difficult to be worked.

Ramgarh coal-field, in Damuda valley, has an area of 40 sq. miles. The coal is mostly of poor quality, and the field is unfavourably situated.

Karanpura coal-fields, S. and N., are at the head of the Damuda valley, and have areas of 72 sq. miles and 472 sq. miles respectively. The estimated amount of coal in N. Karanpura is 8,750,000,000, and in S. Karanpura 75,000,000 tons.

Chopé, on the Hazaribagh plateau, 2000 feet above the sea, has a small coal-field of less than one square mile.

Itkuri coal-field, 25 miles N.W. of Hazaribagh, has a few seams of inferior coal.

Aurunga coal-field, in Lohardagga district, W. of the sources of the Damuda, in the valley of the Koel, a tributary of the Sone, has numerous seams of coal, some of large size, estimated to contain 20,000,000 tons.

Hutar coal-field, in the Koel valley, has an area of 78·6 miles.

Daltonganj coal-field, in the valley of the Koel, in the Lohardagga district, has an area of 200 sq. miles; has a few coal-seams, estimated to contain 11,600,000 tons.

At Tattapani there is some coal, also a remarkable series of hot springs.

In S. Rewa and Sohagpur, a tract in the Sone valley, covering 8000 sq. miles, coal occurs; also at Jhilmilli (35 sq. miles), at Bisrampur, a land-locked site in the central basin of Sirguja, its area being 400 sq. miles, and 1800 feet above the sea. Lakhanpur is S. of Bisrampur, and Rampur adjoining it.

Raigarh and Hingir, Udaipur, and Korba are in a wide extent of coal-measures, which cover an area of 1000 sq. miles, in a country difficult of access, with seams up to 168 feet thick.

Talchir coal-field is in the valley of the Brahmani river, a tributary of the Mahanadi. It has an area of 700 sq. miles in extent, but the coal is of inferior quality, chiefly carbonaceous shale.

In the Satpura region, some good coal has been found at Mopani, and has been worked for the railway; and coal also occurs at Tawa and Pench.

In the Godavery valley, there are coal-fields at Bandar, in the Chanda district at Wardha; and Mr. Hughes gives the following estimate :—

	Actual Quantity. Tons, in millions.	Amount available. Tons, in millions.
Warora basin,	20	14
Ghugus,	90	45
Wun,	2100	1500
Between Wun and Papur,	105	50
Between Junara and Chachole,	150	75
Sasti and Paoni basins,	60	30

And there are small areas at Dumagudium and Mudavaram.

At Kamaram, 40 miles N.E. of Warangal, is a small field; also at Singareni, 30 miles S.E. of Kamaram.

In the Darjiling district in Sikkim is a crushed coal, not of promising character; one seam is 11 feet thick.

In Assam, coal-fields have been explored at Makum, Jaipur, Janji, Nagira, and Desai. The coal is of good quality; and it has been discovered in the Khassya hills.

The coal of Dundeli, in the Jummoo territory, has proved to be like the rest of Eocene origin among nummulitic limestones. A large lump of it was in the Lahore Museum, and might pass for 'Wallsend,' so good is its appearance.

Coal at Bunnu, from the Waziri hills, has been mentioned with some hope.

Coal of good quality is obtained from the Koh-i-Meeriah, a hill a day's journey north of the Oxus.—*Wood.*

The coal-fields of China occupy 400,000 sq. miles, and of Australia 240,000 sq. miles.

Messrs. Medlicott and Blandford describe as follows the coal-fields of British India, according to the epochs at which they were deposited:—

Jubbulpur has jet coal.

Rajmahal hills, Hura, Chuparbhita, and Brahmani coal-fields have occasional beds of inferior coal, poor and shaly, though of considerable thickness.

Tangsuli, carbonaceous shales of no economic value.

Kandit Karaya field, thin 14-inch seams of coal.

Jainti or Karaun field, some thin coal-seams.

Karharbari, coal seams of variable thickness; coal equal to the best Raniganj coal; is the main supply for the E. I. Railway.

Raniganj coal-field, rich in coal-seams, some 20 feet thick. Jhariah coal-field, 13 to 16 miles from Raniganj, large quantity of very fair coal. Bokara, 2 miles W. of Jhariah. Raniganj coal is composed of layers alternately bright and dull, as in the Barakars. The Bokara coal-field is near Hazaribagh. Ramgarh coal-field, 3½ miles S. of Bokara. The S. Karanpura fields, W. of Bokara and Ramghar. Karanpura field is second only to the Raniganj field.

Chopé, a small coal-field on the top of the Hazara plateau.

Itkuri coal-field, 25 miles N.W. of Hazaribagh; inferior coal.

Daltonganj or Palemow coal-field; coal formerly worked and sent down the Sone.

Latiahar, 26 miles S.E. of Daltonganj; a little coal.

S. Rewa coal-field.

Jhilmilli field, a very thin seam of good carbonaceous coal; several seams.

Bisrampur field, coal seams in several places, not very promising, 5 or 6 feet thick.

Lakhanpur field has several seams of coal, the best 5½ feet thick; part of excellent quality.

Chutia Nagpur, at E. Sirguja, Palemow, Jashpur, Udaipur, Khurea.

Korba (Bilaspur), an immense seam of coal, and in many places on the Mand and near Udaipur.

Raigarh-Hingir field, formerly called the Gangpur field, shaly beds, with coal-seams.

Talchir coal-field, on the Brahmani river, some beds of inferior coal.

Lametaghat.

Satpura basin; useful coal in the upper Tawa, the Kanhan and Pench valleys, in thin seams, and at Mopani on the Sita.

Bandar coal-field, 30 miles N.W. of Wardha, in the Chanda district, has three seams of coal, with 38 feet of maximum thickness.

Wardha or Chanda coal-field, in the basin of the Wardha, Pranhita, and Godavery; has a seam of coal and shale between 30 and 50 feet thick, but rising up to 90 feet, with thinner seams, from which efforts have been made to supply the E. I. P. Railway.

Godavery valley has the Madaveram coal-field below Bhadrachelam, also the Bedda-danol field, 35 miles N.E. of Bhadrachelam, and N. of Ellore; some poor coal has been discovered by boring.

Kamaram coal-field, 40 miles E. from Warangal, has beds of coal, with coal of fair quality, in seams 6 to 9 feet thick.

Singareni coal-field, 25 miles N. of Khamamet, in the Godavery valley, has seams of coal, one of them 21 feet thick.

Ranikot group, in the Laki range, in Sind, has a bed of coal nearly 6 feet thick, but poor, with pyrites liable to spontaneous combustion, in cretaceous rock.

The Salt Range, amongst jurassic rocks, has thin strings and seams of tertiary lignite at Bhaganwala, Pid, and Samundri.

Suliman range, thin layers of coal of no economic value.

Sabathu, in the Lower Himalaya, carbonaceous shale, has 25 per cent. of fixed carbon, and 11 per cent. of volatile matter partly hydro-carbon.

Khassya hills area, Cherrapunji plateau, amongst cretaceous rocks is a thick seam of bright coal, found in little basins near Cherra.

Garo area, cretaceous series, has coal of serviceable quality and thickness, immediately W. of Jadu Kata, in Umblai, in the Hublang, Garo hills, and in the coal basins of Rongreng and Darang, on the Upper Sumesari, of valueless coal; also at Salkura, Champagiri, and Mirampura, S.E. of Singmari.

Assam coal-fields are in the form of basins in the low Tipan hills, alternating shales, sandstones, and coals, known as the coal-fields of Jaipur, Makrum, and Nazira. There is a seam 100 feet thick, containing at least 75 feet of solid coal, a true coal of superior quality.

Tenasserim, on the Len-Ya river, is a bed of coal of a laminar structure, containing amber-like mineral resin. The coal is in thin laminæ in isolated basins at Thathay-kyoung and Hein-lap, on the Great Tenasserim river, at places 7 feet thick of workable seam, and of fair quality, and 8 feet thick at Kau-ma-pying. It is also found 3 feet thick on the Little Tenasserim river.

British Burma, 5 miles S. of Thayat-myo, a bed of coal of so irregular thickness as to be of no value.

Independent Burma, 50 miles above Ava, near Thinga-dau, are coal-seams 3 to 5 feet thick.

The Raniganj or Bardwan coal-field lies in the valley of the Damuda river, and is about 500 sq. miles. Some of the coal-seams are 20 feet thick, and one of the seams of the Barakar group is 33 to 35 feet; and in a section seen in the Kudia and Pasai streams, 175 feet of coal is exposed in a total thickness of 833 feet of rock, though much of it is of inferior quality. The Jeriah (Jhariah) coal-field has seams up to 60 feet in thickness.

The coal found in the Talchir group, in the Jhilmilli field in Sirguja, is a very thin seam of inferior quality; and, as a rule, the Talchir formation is marked by an absence of coal-seams, and even of carbonaceous shale. Part of the Karharbari beds rest in apparent conformity on the Talchir group. Karharbari coal is dull-coloured, and tolerably homogeneous in structure, and the coal of some of the seams in the Barakar and Raniganj subdivisions of the Damuda series is more distinctly laminated, but is equal in quality to that extracted at Karharbari.

Carbonaceous shales, and one or two thin bands of jet coal, are met with in the Jubbulpur group, but it is very different from the coal of the Damuda valley.

The principal coal tracts of the rocks in the Rajmahal hills are the coal-fields of Hura, Chuparbhita, and Brahmani. Their seams are thick, but the coals are poor and shaly.

In the Gondwana series, Tangsuli and the

Kandit Karaya field, and the Sahajori field, have small seams of coal of no economic value.

The general characters of the S. Rewa, the Jhariah coal seams, the Bokara coal-field, and the Karanpura field, are the same as those of Raniganj. The quality of the coal is very variable; some seams yield good coal, others little better than shale.

The Ramgarh coal-field lies due S. of Bokara; the coal seams are numerous, and there are some good beds, but the quality as a rule is inferior.

The Chopé, Itkuri, and Daltonganj coal-fields are in the Hazaribagh district, and the coal of Daltonganj was formerly mined, and sent down the Sone river.

Good coal has been found in a few places in the Bisrampur field, and at Lakhanpur, but that of many of their seams is poor, and the seams only 5 or 6 feet thick.

Coal occurs in Chutia Nagpur in many places on the Mand and near Udepur, of fair thickness and average quality; and a seam 90 feet thick is exposed in the bed of the Hasdo, much of it very shaly, and yielding much ash.

The Talchir coal-field is near the Brahmani river, and within the Mahanadi watershed.

In the Peninsula, the coal of the Wardha field is of rather inferior quality, giving 14 to 20 per cent. of ash. The Warora coal is of high mineral value. There may also be mentioned the Madavaram coal-field on the Godavery, and those of Kamaram and Singareni.

The coal beds of Tenasserim are not traceable continuously over any extensive area. The most important are at Thathay-kyoung and Hein-lap, on the Great Tenasserim river, the workable seam at the former place being 7 feet, and at the latter 17½ and 18½ feet thick, the quality fair; and at Kau-ma-pying, nearly a mile N. of Hein-lap, is a seam 8 feet thick. A seam 3 feet thick occurs on the Little Tenasserim.

Deposits of coal have been found along the Siamese coast from Penang to the vicinity of Junk-Ceylon. In 1836, specimens of coal were brought from Trang, one of the lower provinces of Siam; and subsequently a deposit was discovered at Tama, not Gurbie. Coal was found at Sungei-Kamuning, about 16 miles above Trang, and at a place also nearly east of Pulo Mutiara, or Pearl Island, about 12 miles to the southward of Sungei-Kamuning. It was also found at the Pulo Tiga island, lying off Purlis, on the coast of Keddah. Another coal was found in the bay north of Tanjong Bumbong, on the coast of Trang, betwixt the last place and Kamuning.

The coal in Ligor and Kedah, on the west coast of the Malay Peninsula, is identical in composition, in the proportion of volatile matter to charcoal, with some kinds of cannel coal,—sp. gr. 1·245; volatile matter, 46·746; charcoal, 52·071; ash, 1·183 = 100. That found on the southern coast of the island of Junk-Ceylon (well known for its tin), and which occurs near the bank of a river, and about two or three hundred feet from its mouth, was reported by Professor Ansted as adapted for every purpose to which coal is economically applied.

A position indicated as a deposit of coal, is in lat. 7° 44′ N., and long. 99° 15′ E., the southern point of Pulo Lontar bearing S.W. by S., Telebon S.S.E., and Tanjong Cotton N.E. by N. Some of it takes on the polish of fine jet. The Ligor specimens of this jet are the best.

In the coal of Ligor and Kedah, on the west coast of the Malay Peninsula, one portion of jet had a beautiful lustre and high polish. The fracture shows a fine velvet black or brownish-black.

On the Malay Peninsula, along the western coast at Katani, Ayer Ramni, and Bencoolen, at the entrance of the river Reteh, and along the banks in the Batang Gansal and the Ingragiri, with, it is supposed, the Kampar, coal occurs.

Coal has been found in Sumatra, Java, and Luzon, and in Borneo, of good quality, suited to economical uses. Coal found at Rettie, on the south-east coast of Sumatra, bears a strong resemblance to that from Junk-Ceylon,—sp. gr. 1·23; volatile matter, 51·43; charcoal, 48·57; ash not determined. Coal of serviceable quality exists also in Banka and Madura (New Rotterdam Courant, Sept. 23, 1851), in Borneo proper (Low, Sarawak, p. 12), on Pulo Keng Arang, near the north end of Labuan, at various places on the west, south-west, and south-east coasts of Borneo, at the Bunut, on Pontianak, the country of Banjarmassim, where immense deposits are found; Pagattan, and on the Koti river, mines are worked. A small field has been found near Macassar in Celebes, but the coal is of a worthless description (Singapore Free Press, July 19, 1850, which describes the coal treasures of the Archipelago). It is said that fine specimens have been obtained from the Philippine province of Alley (Mallat, Les Philippines, i. p. 122), but the existing notices of them are slight.

In Borneo, coal was first discovered in one of the islands in the river of Brunai, afterwards near the banks of the river, and subsequently in the island of Labuan. In these places it is mined by European skill and capital, and has been found, on ample trial, superior to any Asiatic coal hitherto tried. The coal on the left bank of the Borneo river has been traced for several miles into the interior, and on the southern coast of the island in the territory of Banjurmasin, and mined by the Dutch. These may be continuations of the same field, which would make the Borneo coal-fields the largest in the world, after those of North America. Steam navigation has given a value to the coals of Borneo, which, without it, in a country inhabited by rude people and covered with forest, might have lain for ages as useless as the lime and sandstones in which it is imbedded.

In Borneo, coal is associated at Pulo Chirmin, which is about 200 feet high, with a ferruginous sandstone, and overlaid by a mass of red sand and clay. At Pulo Kang Arang, again, the coal is overlaid by white sandstone. Borneo, as a mineral conntry, is perhaps the richest in the East, producing gold, coal, antimony, and iron; while caoutchouc and gutta-percha are amongst its vegetable products. The coal and iron fields of the Balawi or Rajang are more extensive than any yet discovered on the island. From the river Baram, coal is traced to the upper parts of the Bintulu, and thence southward to the Rajang river, on the left bank of which, at Tujo-Nang, there is a seam exposed upwards of 13 feet in thickness. At different other parts of the river, and also in several of its branches, coal is found in abundance.

In China, coal is largely used for fuel. The

boats on the north river, below Nan-hiung, lie near the mouth of a horizontal drift worked into the mine, above which the cliffs are scraped down as the shaft advances. The mountains of Shan-si and Chih-li supply large quantities of this valuable mineral; and many boats find constant employment in bringing a coarse anthracite from Kai-chan in Lia-tung to Tien-tsin. One locality of the mine in Liau-tung is about 39° 10′ N., and 121° 25′ E. Anthracite and bituminous coal have been seen in marts at the north; and coal-dust and refuse is mixed with a little moistened clay at Pekin, and made into cakes for the fires of the poor. That which is brought to Canton is hard, and leaves a large proportion of ashes after combustion; during ignition, it throws off a suffocating sulphureous smoke, which prevents the natives using it for cooking. It is employed in the manufacture of copperas from hepatic iron pyrites, according to Du Halde, but is less frequently employed in the arts than it would be if the people knew better how to use it.

Coal is found abundantly at Ke-Lung in Formosa; also in the districts around Negata in Japan. The Russians, under the command of a Russian officer, have opened coal-mines rather lower than Tonquin Bay.—*Singapore Free Press*, April 2, 1852; *St. John's Indian Archipelago*, ii. p. 349; *Colonel Low*, No. 3, *Journ. Ind. Arch.*; *Williams' Middle Kingdom*, p. 242; *Hodgson's Nagasaki*, p. 227; *M'Culloch's Dict.* p. 287; *Journ. Ind. Archip.* iii. pp. 153, 161, 738; *Eng. Cyc.*; *Calc. Rev.*; *Annals, Ind. Admin.*; *Mason; Geology of India, by Messrs. Medlicott, Blandford, and Ball; Dr. Oldham in Yule's Embassy*, p. 335; *Hook. Him. COBALT.

Ta-t'sing, ... CHIN.	Pien-t'sing, . . . CHIN.
Yang-t'sing, . . . ,,	

In China it is prepared by roasting the native arseniate of cobalt, said to come from Cambodia. It contains silica and potash, and is used in colouring glass, painting on porcelain, and glazing copper vessels, and in distemper. Cobalt ore occurs near Jeypore in Rajputana, and is used for colouring enamel. Cobalt and nickel occur in Ceylon, at Saffragam.—*Smith.*

COBRA, the ordinary Urdu name of the Naga genus of venomous colubrine snakes of the family Elapidæ. There is only one species, the Naga tripudians, which has a moderate body, with rather short tail. It has a small or moderate eye, with a round pupil, a poison fang in front of the maxillary, which is but little moveable or erectile, and only one tooth behind. The anterior ribs are elongate and erectile, and the skin of the neck is dilatable. When the cobra rises in play, or for amusement, it spreads out the skin of the neck, from which it gets the Spanish name of cobra di capello, in English the hooded snake. Its bite, if the poison be fairly in, is almost certain death. It is said that the poison can be combated by injecting potash into the veins, but, owing to the rapidity of the poison's action, this, even if true, is valueless. Several instances have occurred of grown-up men recovering from the bites of the chain, etc., or Russel's viper (Daboia elegans), simply by applying ligatures above the wound, and burning the punctures with a live coal; but the after-swelling was very painful, and lasted for some months. The cobra and chain viper are the commonest and deadliest. Notwithstanding this, the natives of Ceylon do not kill the cobra when caught, but enclose it in a mat bag with some boiled rice for food, and place it thus in a flowing stream. In Gujerat the Hindus do not kill this or any other snake. There are two varieties.

Var. *a*. The spectacled or binocellate cobra has its neck, on the steel-brown skin, marked with a white, black-edged ⊐ or ⊲ enclosing at either extremity a black ocellus. This is only seen when the hood is expanded. It is found in Southern India and in Burma (?). It grows to 5½ feet.

Var. *b*. The monocellate, or one-marked cobra, has a plain white ocellus, with black centre and margin, and grows to 4 feet in length. It is the cobra of Central India and Burma.

The fangs of the cobra are not perforated like those of vipers, but they have a groove or slit right down the anterior part of the fang, and although the sides of the groove may often meet in close contact about the anterior centre of the tooth, and form a sort of a channel, yet they never join or amalgamate together. The fangs of cobras are fixed to the maxillary bones, while those of vipers are erectile.

Permanganate of potash has been recommended in cobra bites. When permanganate was mixed with cobra poison and hypodermically injected, no fatal result followed, although a fatal dose of cobra poison was used, and the mixture injected into the vein. It is supposed that the mongoose is not affected by the cobra poison.

In the mythologies of India, the cobra figures as a protecting agent, spreading its hood over the lingam and over royalty. The cobra is worshipped by all Hindus; and its form, as an idol, with three to nine heads, in stone or brass, may be everywhere seen in India, often bending over the idol of the lingam. The cobra is often personified in Indian story. In many parts of Western India, after killing a cobra, the non-Aryan races give it all the honours of a cremation, assuring it, with many protestations, that they are guiltless of its blood; that they slew it by order of their master; or that they had no other way to prevent its biting the chickens.—*Nicholson.*

COBRA-TEL, a term applied in Ceylon to a decoction of the heads of cobras and saliva of the iguana or Kabragoya, and supposed by the Singhalese to be deadly poisonous.

COCA of the Andes and Peru is Erythroxylon coca, *Lam.*, extensively cultivated by the Indians,—the annual produce there having been estimated at 30,000,000 pounds. The leaves are either infused as tea, or, as is usual, chewed with a little unslaked lime. The immediate effect is a gentle excitement, with sensations of high enjoyment. Its use lessens the desire for food, and enables the chewer to undergo an enormous amount of fatigue, from an increased nervous energy.

COCANADA, a seaport town in the Godavery district, in lat. 16° 57′ N., long. 82° 13′ E.; population, 17,839.—*Imp. Gaz.*

COCCIDÆ of Leach, the Gallinsecta of Latreille, a family of insects placed by Latreille and others at the end of the Homoptera. See Coccus.

COCCINEA INDICA. *W. and A.*

A climbing shrub, grows all over India; in flower and fruit the whole year; green fruit used in chatni and curries; ripe fruit eaten raw, and greedily sought after by birds. The leaves are applied externally in eruptions of the skin, and the plant internally in gonorrhœa.

The juice of the leaves is used as an application to obstinate ulcers produced by the bites of animals. The fruit when unripe has a slightly acid but not unpleasant taste. When ripe, it is sweetish but insipid. It is smooth, oblong, and about an inch and a half long. It is a common troublesome weed in hedges and gardens.—*Jaffrey; Roxb.; Voigt; Stewart; O'Sh.; Ainslie.*

COCCOLOBA, a genus of plants belonging to the natural order Polygonaceæ. C. crispata, *Buch.*, grows in Nepal. Wight, in Icones, figures C. Indica, C. excoriata, C. pubescens. C. uvifera is a West Indian plant. The fruit of the last is sweetish, its wood is used for cabinet work, and it yields the Jamaica kino.—*Voigt; Eng. Cyc.*

COCCOTHRAUSTES, a genus of birds belonging to the order Insessores, family Fringillidæ, and sub-family Fringillinæ. Three species occur in South-Eastern Asia. C. vulgaris, the hawfinch of Europe, occurs in Siberia, China, Japan (C. Japonicus, *Schlegel?*).

COCCULUS, a genus of plants belonging to the natural order Menispermaceæ, consisting of climbers, whose leaves are usually more or less heart-shaped, and the flowers small, and either white or pale green, in loose panicles or racemes; in most cases they are dicœcious, and are always very minute. The species are usually powerful bitter febrifuges. The following occur in the south and east of Asia: acuminatus, calophyllus, cordifolius, crispus, hexagynus, incanus, laurifolius, macrocarpus, Malabaricus, megaspermus, oleracea, Plukenetii, tomentosus, villosus. In Arabia, an ardent spirit, called Khamr-ul-Majnun, is said to be distilled from the berries of C. Cebatha.

A valuable plant, growing in the Peninsula, of Bengal, Burma, and Assam. Its stem is succulent, twining, and perennial, running over the highest trees. The root, stem, and leaves are used in medicine in decoction. The root is large, soft, and spongy, and is given fresh in gonorrhœa; in powder, 15 to 30 grs. are emetic; the decoction is called Pachuna. An extract called palo is prepared from the stem.—*Roxb.* iii. p. 81; *O'Sh.*

COCCULUS CRISPUS. *D. C.*

Menispermum crispum, *L.* | M. verrucosum, *Flem.*

A twining plant of Sumatra, Java, and the Moluccas, with a tubercled or warted stem; it is employed by the Malays for the cure of intermittent fevers.—*O'Sh.*

COCCULUS FIBRAUREA, of Cochin-China and China, used by the Malays in agues and liver diseases.—*O'Sh.*

This is the fruit of the Anamirta cocculus, *W. and A.*, a powerful climbing plant, common in the mountainous parts of the Malabar coast; in commerce its fruit is obtained through Bombay, Madras, and Ceylon. The berry is highly poisonous, and is not used internally in medicine. Even externally, as an ointment, though useful in Porrigo capitis, its use requires great care. It is used to poison fish, and a weak decoction to destroy ticks in sheep. In 1850, 2359 bags were imported into Britain, value 19s. to 24s. the cwt.—*O'Sh.; Royle; Roxb.; Eng. Cyc.; M'Cull. Dict.; W. and A.*

COCCULUS PALMATUS. *D. C.*

M. polmatum, *Lam.* | M. columba, *Roxb.*

This plant produces the columbo root of commerce, a valuable tonic medicine. It grows in the Mozambique forests, and is cultivated in the Mauritius.—*Roxb.* iii. 807.

COCCULUS VILLOSUS. *D. C.*

C. sepium, *Coleb.*		M. hirsutum, *Linn.*

A decoction of the fresh roots is given in native medicine in rheumatism, and is considered heating, laxative, and sudorific. A curry of the leaves is used for the same object. The juice of the ripe berries makes a good, durable, bluish-purple ink. The withes are woven into small baskets, and are used for cords by the cultivators.—*Voigt*, 331.

COCCUS, a genus of insects belonging to the family Coccidæ, of the order Hemiptera. The insects belonging to this family live upon trees or plants of various kinds; they are of small size, and in the larva state have the appearance of oval or round scales. They are closely attached to the plant or bark of the tree they inhabit, and exhibit no distinct external organs. At certain seasons, when about to undergo their transformation, they become fixed to the plant, and assume the pupa state within the skin of the larva. The pupa of the male has the two anterior legs directed forwards, and the remaining four backwards; whereas in the female the whole six are directed backwards. When the males have assumed the winged or imago state, they are said to issue from the posterior extremity of their cocoon. In the spring-time the body of the female becomes greatly enlarged, and approaches more or less to a spherical form. In some the skin is smooth, and in others transverse incisions or vestiges of segments are visible. It is in this state that the

female receives the embraces of the male, after which she deposits her eggs, which are extremely numerous. In some, the eggs are deposited by the insect beneath her own body, after which she dies, and the body hardens and forms a scale-like covering, which serves to protect the eggs until the following season, when they hatch. The females of other species cover their eggs with a white cotton-like substance, which answers the same end. Of the species of this genus known in S. Asia, are the C. cacti, the cochineal insect, the C. lacca, which yields the stick-lac of commerce, and the C. maniparus of Arabia, that punctures the Tamarix gallica, and causes the exudation of the Arabian manna. There are two varieties of Coccus cacti, the true Grana fina, and the Grana sylvestris; and, after prolonged efforts on the part of Drs. James Anderson and Barry of Madras in 1795, the C. sylvestris, or wild species of the cochineal insect, was introduced into Bengal by Captain Neilson of H.M. 74th Regiment. It throve rapidly on the Cactus Indica, the indigenous opuntia, the country Nopal, and between 1800 and 1807, 74,633½ lbs. of the cochineal, amounting to 142,916 rupees in value, were shipped to England, but at a loss, as the wild species was found greatly inferior to the true. The cochineal insect was introduced into Java about the year 1825 as a Government experiment, and apparently with more success in its production than in British India, for so long ago as 1844 it was exported from Batavia to the estimated value of 93,319 guilders. The species introduced into India swarms at certain seasons, and settles on one of the species of cactus, which they immediately destroy. The whole neighbourhood of Homanabad was surrounded with prickly pear, but disappeared in 1865, under one of these swarms.

The fine cochineal insect differs from the wild not only in size, but also in being mealy and covered with a white powder; while the wild one is enveloped in a thick cottony down, which causes its value to diminish greatly, it being impossible to separate it from the insect in the preparation of the dye; the females only yield dye. It is the cottony covering which enables the wild kind to stand the vicissitudes of climate, while the fine or domesticated kind require to be kept under cover during the rainy season, and sheltered from high winds, as they early in their growth throw off the cottony covering.

The fine cochineal insect lives on several cultivated kinds of cactus without thorns, of which the Cactus cochinillifer has been introduced into India. It will not grow on the wild prickly pear.

There are three periods of life of the cochineal insect. It is viviparous, and at its birth is a mere speck, and at that time no difference can be detected by a microscope between the sexes; they are all equally active, seeming to profit eagerly of the short period during which motion is allowed them. After a few days they attach themselves to the cactus plant, and from that moment the female never quits her hold. A cottony coat grows over her, which falls off in 13 to 15 days. This is the first period.

The male also adheres to the plant, and in about 12 days becomes enveloped in a cottony cylindrical purse, open at the bottom; the insects huddle together, one upon another to appearance, so that at a little distance nothing is seen but a white patch of cotton of uneven surface; they continually increase in bulk. After remaining in this state for a month or thereabouts, the sexes become distinctly recognisable. The male becomes a scarlet fly, with two transparent wings about three times the length of his body, which exactly cover each other, when at rest appearing only as one; he is also provided with two poisers or tails and two hairy antennæ; he has six legs and six immoveable eyes. He is now again become active (particularly an hour after sunrise), but rarely takes to the wing, being easily carried away by the wind; he jumps and flutters about, and, having impregnated the female, dies in a few days.

The females go on increasing in roundness. They appear generally so enormously overgrown, that their eyes and mouth are quite sunk in their rugæ or wrinkles; their antennæ and legs are almost covered by them, and are so impeded in their motions from the swellings about the insertions of their legs, that they can scarce move them, much less move themselves, and the insect to the casual observer looks more like a berry than an animal. When they are about three months old they begin to yield their young. In this state the insect is in a torpid state, and may be detached from the plant. She had previously formed on her extremity an amber-coloured liquid globule, varying in size according to the abundance of juice in the cactus, and this is supposed to indicate the maturity of her pregnancy.

It is remarkable that from the moment of her fixing upon the plant, she loses her eyes and the form of her head; instead of a mouth, she has an extremely fine proboscis, which it is supposed she introduces into the imperceptible pores of the leaf she feeds on; and such is her excessive torpor, that once removed she will not attach herself again. After shedding the whole of her young, the mother dies, and becomes a mere shell, turning black. It is therefore at the time that the female commences to shed her young that measures are taken to remove the young to other cactus leaves. A nest is formed in the shape of a sausage or purse, of cotton gauze or other tissue pierced with small holes, in which 8 or 10 of the females are put, and the purse is fastened at the bottom of a leaf of cactus by a thorn. The young escape and spread themselves over the surface of the leaf. The mid-day is found to be the best time for this operation, to enable the newly-born insects to get rid of the glutinous matter which they bring from the parent. On this account nesting is not recommended in damp or cloudy days.

When the female insects are not required for breeding purposes, they are brushed off the cacti leaves at the commencement of their shedding their young, or immediately before that time, into baskets, and killed either by exposure to the sun or by immersion in boiling water, then dried and put into bags for dye.

As the cochineal insect is destroyed by heavy rains and high wind, they are reared outside only in the dry and cold season; during the rainy season a sufficient number of the females are either artificially kept in baskets shut out from light and heat, and so remaining torpid till the proper weather returns, or an entire generation is raised on cactus plants under cover in the house or a shed, and the fresh young ones put out on the

leaves outside when all danger from the heavy rains and wind are over.

The common belief is that the cochineal insect lays eggs; this is not the case. The young insects, whilst contained within the mother, appear to be all connected one after the other by an umbilical cord to a common placenta, and in this order they are in due time brought forth as living animals, after breaking the membrane in which they were at first probably contained as eggs. Being thus brought forth, they remain in a cluster under the mother's belly for two or three days, until disengaged from the umbilical cord. Every cochineal mother produces above a hundred young ones; but the mortality is great, and three or four mothers are required to cover one side of a cactus leaf with sufficient young for cultivation.

25,000 insects dead and dry make up one pound of cochineal, the ordinary value of which is 1 rupee 12 annas.—*Colonel Boddam; Royle, Prod. Res.* p. 57; *Crawfurd, Dict.* p. 112.

COCCUS LACCA, *Kerr*, produces the substance called lac. It inhabits India; is found on various trees in great abundance on the Ficus religiosa, F. Indica, Croton lacciferum, Butea frondosa, and Rhamnus jujuba. When the females of this coccus have fixed themselves to a part of the branch of the trees on which they feed, a pellucid and glutinous substance begins to exude from the margins of the body, and in the end this substance covers the whole insect with a cell which, when hardened by exposure to the air, becomes lac. So numerous are these insects, and so closely crowded together, that they often entirely cover a branch, and occasionally the tree is killed; and the groups take different shapes, as squares, hexagons, etc., according to the space left round the insect which first began to form its cell. Under these cells the females deposit their eggs, which, after a certain period, are hatched, and the young ones eat their way out. It is found encircling twigs and branches. The broken twigs covered with these incrustations are called 'stick-lac' in commerce. After the colour has been extracted and further purified, shell-lac results.—*Kirby and Spence*, iv. p. 142; *Eng. Cyc.*

COCCUS POLONICUS is used in dyeing a red colour. It is now chiefly employed by the Turks for dyeing wool, silk, and hair, and for staining the nails of women's fingers.—*Kirby and Spence*, i. p. 320; *Eng. Cyc.* p. 44.

COCHIN, a small feudatory state on the western side of the Peninsula of India, with a seaport capital of the same name, lying between lat. 9° 48′ and 10° 50′ N., and long. 76° 5′ and 76° 58′ E.; the area, 1361 square miles, and population in 1881, 600,278 souls. It has many marine lagoons, extending for 120 miles, and communicating with the sea; and its ghat forests have much valuable poon, angely, etc. Its rajas claim to be descended from Cheruman Perumal, who ruled over the whole country of Kerala, including Travancore and Malabar, as viceroy of the Chola kings, about the beginning of the 9th century, and afterwards established himself as independent ruler. Cochin fell to the Portuguese in the 16th century. In 1662 the city was taken by the Dutch; in the 18th century the Zamorin of Calicut held it for a short time; in 1776 Hyder Ali, and in 1790 Tipu, overran the country. On the fall of Seringapatam in the end of the 18th century, it became tributary to the British. By a treaty in 1791, the British guaranteed the integrity of the kingdom; but in 1809, after the overthrow of the Mysore government, a faction made common cause with the Travancore people, and carried on an unsuccessful war against the British, and in 1819 the British assumed all military control. The principal races are,—Maleali, 535,191; Konkani, 15,113; Tamular, 33,628; Teling, 9905. Of the population, 140,262 are Christians, 426,922 are Hindus, 12,499 Mahomedans, and 1278 Jews; the chief Hindu castes being Brahman, Kshatriya, Ambalavasi temple servants, Nair cultivators, Pillai government servants, Ottar contractors, Kanaka boatmen, Mopla polygars, Vallamar freshwater, and Marakan saltwater fishermen and artisans, Ezhuwan labourers, Cherumar predial slaves, and Kada and Maleali hillmen and Jews.

The Jacobite and Nestorian Christians are under the Archbishop of Antioch, the Romano-Syrians, under the Archbishop of Malabar, and the Romish Christians under the Archbishop of Goa. The cocoa palm is vastly cultivated; fish is very abundant; its ornamental work in metals, and its wood and ivory carving, are famed. The raja's family claim Kshatriya descent, but follow the rule of mari makatayum, or descensus ab utero, the children of sisters succeeding. If the raja's younger brother be senior to all his nephews, he becomes elliah raja, or heir-apparent; but if the raja's eldest sister have a son older than the raja's brother, the nephew ranks in the line of succession before the uncle.

The higher castes only are permitted to approach the royal dwelling, and handsome well-fed Brahmans, etc., thus form the entire population of that locality; and these are so clean and neat in appearance, and of so fair a colour, that one seems to have been transported among an entirely new and superior nation. The princesses and their ladies wear an abundance of snow-white muslin around the hips, but no upper garment. The neck is decorated with valuable ornaments, and the ears support very large and beautifully chased pendants. The hair is either worn in a large double knot on the crown, or on the right side of the head, and a band of gold strains it from off the face. The raja and all the princes are indistinguishable, in private, from the people around, for their dress consists simply of the muslin round the middle. The cocoanut palm grows abundantly, and, while yielding large returns, allows leisure for other avocations.—*Imp. Gaz.*

COCHIN-CHINA, the name given in Europe to a country occupied by the Annam people. The derivation of the European name is obscure, but Kachao is the name given by the Annam people to the capital of Tonquin; and Cochin-China is known to the Malay navigators as Kutchi. It has been supposed by D'Anville that the Sin-hoa of Ptolemy, the geographer, is Cochin-China, and that the Aureo Chersonesus of Ptolemy is the Malay Peninsula. Leaving out of view the vast unexplored region of Laos, the peninsula commonly denominated Cochin-China is now composed of Cambodia in the north, French Cochin-China in the south and west, and Annam on the eastern coast, this latter kingdom extending northwards to the Chinese provinces of Yun-nan and Quang-si, its own province of Tong-king adjoining them.

French Cochin-China, conquered or annexed from Annam, comprises an area of about 30,000 square miles, and a population estimated at some 1,750,000 persons, nearly all of them of Annamese nationality. The colony is divided into four provinces,—Saigon, Mytho, Viuh-long, and Bassac. Each of these is under inspectors and administrators, who are educated for the purpose in a college at Saigon, where they are taught the native language, characters, history, and law, and are instructed generally in the principles of executive government. They are commissioned by the President of the French Republic. The revenue for the year 1878 was estimated at 14,300,000 francs. The kingdom of Annam has a population estimated at 20,000,000 persons. There is a French resident at the Court of Hue, and also one at Hanoi, the ancient capital in Tong-king, and three ports in Tong-king have been opened under treaty. Europeans are only allowed to trade in the actual open ports, but they are allowed to pass through the country by means of the great river Sang-koi (but not to land on its banks) for purposes of trade with Yun-nan. The kingdom of Cambodia is an absolute monarchy, and has a population estimated at only 1,000,000, which gives but six to the square mile. It is under the protection of France, and that nation has an official residing at Nam-vang, the capital, with the title of Représentant du Protectorat Français. The revenue is estimated at 3,000,000 francs. There is but one port, Kampot, situated on the Gulf of Siam, its principal traffic being with Siam and Singapore by native vessels. In appearance, language, and most other characteristics, the Cambodians differ entirely from the Chinese, Annamites, and even Siamese. If there be any resemblance, it is to the latter.

Saigon, the capital of French Cochin-China, on the Saigon river, in lat. 10° 50′ N., and long. 104° 22′ E., was conquered by the Franco-Spanish fleet, 17th February 1859, by the force under Admiral Rigault de Genouilly at the close of the last Chinese war, but Lower Cochin-China was not occupied until the treaty of 1862.

About the reign of Louis XVI., the reigning emperor, Gyalong, lost his throne, and a Roman Catholic missionary, Bishop Adran, persuaded the deposed sovereign to ask the help of France, and escorted his son to the Court of Versailles. The request was granted, on condition that France should have a right of protectorate over native Christians, and the further right to occupy certain points of Annamese territory, from whence this protectorate might be better exercised. A treaty was concluded at Versailles on the 28th of November 1787, embodying these conditions, and the prince and bishop returned to the East with French officers and appliances of war, by whose aid Gyalong was restored to power, and gave him countenance and support, and the church grew and flourished; but his successors, jealous of its organization and influence, commenced a persecution.

On the 5th of June 1862 was signed the treaty which laid the foundation of French rule in Cochin-China, Annam thereby ceding the three provinces of Bienhoa, Giadinh, and Dinh Tuong, which constituted the original territory of Saigon. Twelve years later, the Duc Decazes, then minister for foreign affairs, was able to announce to the French Chamber the signature (on the 15th of March 1874) of a treaty by which the whole country was placed under the protectorate of France. It has been mentioned that in 1867, five years after the first treaty, Admiral de la Grandière, the then governor, found it necessary to occupy the three additional provinces of Vinlong, Chandoi, and Hatien, in order to protect the colony from the incursions of 'agitators' from the neighbouring territory. The kingdom of Cambodia, embedded between Siam and the new colony, fell early under its influence, and by a treaty signed in 1868, accepted the protectorate of France.

In 1866–7, under the control of M. Doudart de Lagrée, an expedition explored the course and sources of the river Mei-kong, which, taking its rise amid the mountains of Tibet, impinges on the western provinces of China, flows through the whole length of the Indo-Chinese promontory, and discharges itself, in French territory, into the southern waters of the China Sea. It was hoped that in this river might be found a channel of intercourse with the west of China, and that Saigon might by its means be made to rival or eclipse the claim of Rangoon as an outlet for the commerce of those regions. In 1881 the boundaries were, on the north the kingdoms of Annam and Cambodia, on the east and south the China Sea, on the west the Gulf of Siam and the kingdom of Cambodia, 80 leagues long and 50 broad, with a population of 1½ millions. The Mei-kong passes through French Cochin-China by two rivers, to disembogue into the China Sea. In 1880 the revenue was 18,800,000 francs. —*Chin. Jap. and Phil. Chron. and Der.*, 1881.

This valuable dye and colour material consists of the dried bodies of the female of the Coccus cacti, a native of Mexico. About 1200 tons are imported into Britain, price 3s. 6d. the pound. It forms a very fine and permanent dye of red, crimson, scarlet. It answers on wool and silk, but not on cotton. Efforts were made by the E. I. Company to introduce the insect into India, and at the close of the 18th century it was supposed that Drs. Anderson and Barry of Madras had succeeded in doing so, but it is said that an inferior variety, C. cacti sylvestre, was the one brought, not the variety designated C. cacti grana fina. Whether from the stock introduced in 1799, or from an indigenous variety, the Coccus cacti is at seasons plentiful in many parts of India. They swarm to localities where the prickly pear grows, and in a brief time the plant wholly disappears. The fine variety was introduced into Mysore from Teneriffe; and at the Madras Exhibition of 1857, the cochineal exhibited from Chittaldroog and Oossoor was said to be the silver grain, and to be procurable in several districts in Southern India; but it only destroys the plants with red flowers and few prickles, and will not propagate on the yellow-flowering prickly

pear. It has been exhibited from Java at the exhibitions in Europe. The people have also been successful in introducing it into the Canary Islands, where it has of late been much cultivated; and in 1856, 1,511,617 lbs. were exported. About 1200 tons are imported into Britain, valued at £400 the ton. The insects are about 70,000 to the pound. They are detached from the plants on which they feed by a blunt knife; are dipped in boiling water to kill them, and then dried in the sun. The female is placed on the leaf, and kept in its position by a white rag tied round the lobe. From the travels of Lieutenant Burnes and Dr. Gerard, we learn (Journ. As. Soc. of Bengal, ii. p. 652) that an insect, supposed to be of the coccus genus? is found on the root of a plant which flourishes in a marsh (near Herat), but the natives being unable to dry it, import it from Bokhara and Yarkand, paying about 32 sicca rupees per Indian seer. Coccus polonicus, the scarlet grain of Poland, is also found on the roots of a plant, the Scleranthus perennis.—*Royle; Mad. Ex.* 1857; *Powell, Panj.* p. 194; *Crawfurd's Dict.* p. 112; *M'C. This silk-cotton tree grows in Travancore, on the Coromandel coast, is common on the Arakan mountains, and occurs also in Bundelkhand, on the hills round and near Adjigurh and Kalingur, as well as on those near Hurdwar and the Kheree pass. The leaves are used for the curious rude leaf-bellows with which the natives of the hills near the Assam valley smelt iron. It has curious thick branches, which spread out somewhat awkwardly, each tipped with a cluster of golden-yellow flowers, as large as the palm of the hand, and very beautiful. The bark abounds in transparent gum, of which the white ants seem fond, for they kill many trees. This is the gum katira of the N.W. Provinces of India, and is substituted for tragacanth. Wood soft, and only used as firewood. The cotton of its pods is used for stuffing pillows, etc.—*Roxb.; O'Sh.* p. 225; *Stewart; Hooker, Him. Jour.* i. p. 53; *Voigt*, p. 91.

COCK, the male of the domestic fowl of the genus Gallus. One species of Gallus is found in the wild state in the Malay Peninsula, two in Sumatra, two in Java, and one in the Philippine Islands. But no bird of the genus in the wild state is found in Borneo, Celebes, or any island of the Molucca Seas. The two of Java are distinct species; they will pair, and the progeny is a beautiful bird, kept by the wealthy Javanese as an ornament of their poultry-yards, under the name of pakiser. The wild fowl of the Philippines are sometimes tamed, are very brave, and always come off victors with the large cocks of China; and they will contend with the famous gallant breed of the Loguno. Most of the advanced nations of the Asiatic islands are gamblers, and the favourite shape which gaming takes with them is cock-fighting. This includes the people of Bali, Lombok, Celebes, and all the Philippine Islands, the only material exception being the Javanese. The passion for cock-fighting is impressed on the very language of the Malays. Thus there is a specific name for cock-fighting, one for the natural spur of the cock, and another for the artificial; two names for the comb, three for the crow of the cock, two for a cockpit, and one for a professional cock-fighter. The passion is nowhere carried further than in the Spanish dominions in the Philippines. There it is licensed by the Government, which derives from it a yearly revenue of about 40,000 dols., or about £10,000. Nations of Central Asia seem, from time immemorial, to have used the cock in sacrifice, being especially sacred to the sun in Sabæan worship. And this still continues. It is offered in sacrifices on the new-year's day by the old Parsee fire-worshippers. The Aryan Hindu and the non-Aryan races all sacrifice the cock at the shrines of the earth goddesses.—*Crawfurd, Dict.* p. 113. See Birds.

COCKATOO, birds of the Moluccas and Australia, of the tribe Scansores and sub-family Cacatuinæ. See Birds.

COCOA.

Ko-ko, Kwo-kau, CHIN.	Kakao, ... GER.
Cacao, ... FR.	Cocao, . IT., PORT., SP.

Cocoa, also written Cacoa, is the nut or seed of the Theobroma cacao, a plant of the W. Indies and the continent of America. Lindley mentions also T. bicolor, and T. Guineensis. T. cacao has been introduced into India, Ceylon, the Philippines, Celebes, Amboyna, and China. The cocoa tree flourishes best in the alluvial soil of mountain valleys, though it will grow well at some elevation on mountain-sides. The varieties are numerous, some producing very superior fruit to others. The plants begin to bear at from 5 to 7 years of age; during this period the inter-spaces between the rows of trees can be rendered productive by planting yams and vegetables in them. A free ventilation of air should be ensured to each tree, and this cannot well be attained with a smaller space than 30 feet. Large forest trees of favourable sorts require to be scattered amongst them, to protect them; the tree used for this purpose in the W. Indies and S. America is one of the Bombaceæ. There are two crops in a year. The average return, when the trees are planted close together, is from 1 to 3 lbs.; but as much as from 9 to 16 lbs. may be procured by proper planting and cultivation. Great care is required in curing the cocoa, after it is separated from the pod; and on the method of fermenting and drying depends very much the production of a good or bad article. According to its preparation, it realizes from 60s. to 120s. per cwt. in bond. 17,000,000 lbs. of cocoa were imported into Britain in 1871, upwards of 7,300,000 lbs. being entered for home consumption. Cacao seeds were made use of by the Mexicans, previous to the arrival of the Spaniards, boiled with maize, and roughly bruised between two stones, and eaten seasoned with capsicum or honey. The seeds are contained in a husk 4 or 5 inches in length; and dried, roasted,

and ground, they constitute cocoa; mixed with starch and finely ground, soluble cocoa. Chocolate is the same flavoured and made up into a paste. As seen in the market, cocoa is in the form of flake, granulated, soluble, rock, dietetic, homœopathic cocoa, broma, etc., largely adulterated with 5 to 50 per cent. of sugar and starch. Flake cocoa generally contains the worthless husk, which forms about 12 per cent. of the seeds; but genuine flaked cocoa of good quality cannot be purchased under tenpence or one shilling per pound, yet it is no uncommon circumstance to see, in London shop windows, samples ticketed fivepence and sixpence per pound; such samples at this price must either be damaged or adulterated. Cocoa contains the alkali theobromine, in which there is a larger amount of nitrogen than is in theine, so that tea, coffee, and cocoa may all be regarded as containing the same nutritious principle.—*M. E. J. R.; Hassall; Simmonds; Crawfurd; Kew Museum; Royle.*

COCOACEÆ, the palm tribe of plants, the Palmaceæ of Lindley, are inhabitants of the tropics of both worlds, and hardly range beyond lat. 35° S. and 49° N. They are local plants; only Cocos nucifera, Acrocomia sclerocarpa, and Borassus flabelliformis being found in many lands. There are supposed to be about 1000 species, but scarcely a fifth part have been described. The Oreodoxa oleracea, or edible cabbage-tree of the W. Indies, has been introduced into the East. The Areca catechu is well known for its betle-nut; the Arenga saccharifera for its sago, palm-wine, sugar, and black horse-hair like fibres. Caryota urensis valuable for the immense quantity of its sap, which is fermented into toddy or palm-wine, or distilled into arrack. Canes and rattans are from the various species of Calamus. The Sagus lævis and S. farinifera yield much of the sago of commerce. The Borassus or palmyra is of great value for its palm-wine, its fruit, and its leaves, as also is the fan-palm Corypha umbraculifera, the talipat palm of Ceylon and the Moluccas; while C. taliera is of great value for its leaves, which are formed into the palm books, on which the people write with an iron style. The date fruit, on which so many of the Arabs subsist, is from the Phœnix dactylifera; the P. sylvestris of India furnishes sap which is made into palm-wine, sugar, or arrack; and the widely-spread cocoanut tree, Cocos nucifera, with its multitude of uses, all belong to this order. Recently, the following have also been noticed:—Plectocomia elongata, *Mart.*, of Java; Ceratolobus glaucescens, *Bl.*; Dæmonorops melanochætes, *Bl.*; Lodoicea Seychellarum, *Labill.*, Seychelles; Hyphæne coriacea, *Gærtn.*, of Egypt.

Cocoanut, the fruit of the Cocos nucifera, is a word supposed to come from the Portuguese term Macaco or Macoco. Its fruit-bearing power may be considerably improved by extracting toddy from the blossom shoots for the manufacture of jagari during the first two years of its productiveness, after which it may be discontinued. The subsequent annual produce may be safely reckoned at fifty nuts per annum. From ten to twelve large nuts may be seen on each bunch. In good situations, the fruit is gathered four or five times in the course of the year. The albuminous substance within the 'copra' or kernel is used as an article of food, and when dried is largely exported to other places; and the clear, sweet liquid which the nut encloses when young, is a very agreeable drink; it is the albumen in a liquid state. House plasterers attribute an adhesive quality to this, and mix it with their white and other washes, in which lime forms a chief ingredient. The full ripe nut contains a small quantity of oily milk, and is then used for making oil. Cocoanut milk is extracted by pressure, and is used in making curries, etc. It is from the husk of the cocoanut that the well-known 'coir,' khoir, or roya fibre of commerce is prepared, and used for the manufacture of coir rope, matting, brushes, etc. Cocoanut husk, from which the fibres have not been separated, is used in lieu of a scrubbing-brush for the floor, and for polishing wood; brooms, mats, and bags are likewise manufactured from it. Cocoanuts, both in the raw and dried state, form a prominent feature amongst the exports at Galle and Colombo, in value to about £14,000 yearly. Cocoanuts valued at £50 a ton are imported into Great Britain. The shell is very brittle, and its structure is somewhat fibrous; but it admits of being turned for the bodies of cups and vases, the feet and covers being made of wood or ivory. Common buttons are also made of the cocoanut shell, and are considered better than those of

horn, as they do not, like that material, absorb moisture which causes them to swell and twist. The hollow shells, called 'gari' or 'naryel,' are used for the water-holder of a particular kind of hookah. The nuts are made into hookahs, goblets, and cups, and when mounted with silver, polished and carved, are very handsome; but for everyday household use they are made into lamps, ladles, skimmers, and spoons. The shells make good lamp-black, and when reduced to charcoal and pulverized, an excellent dentifrice. The cocoanuts are hourly used as offerings for Hindu idols. The cocoanut, when fully ripe, can be hollowed and cleaned, by being filled with salt water and buried for some time in the sand, when the albumen decays, and is washed out. In the Travancore and Cochin kingdoms, the kernel is variously cut for making garlands for state occasions. The uppermost and tender shoots of the cocoanut tree, when boiled, eat like cabbage, and are much prized both by Europeans and natives.—*Ainslie*, p. 245; *Seeman; M. E. J. R.; Royle; Tredgold.*

COCOANUT CRAB, the Birgus latro, or robber crab of the Keeling islands, is a kind of intermediate link between the short and long tailed crabs, and bears a great resemblance to the Paguri. Darwin observed that they live on the cocoanuts that fall from the trees. The story of their climbing these palms and detaching the heavy nuts is merely fabulous. Its front pair of legs are terminated by very strong, heavy pincers, the last pair by others narrow and weak. To extract the nourishment, it tears off the husk, fibre by fibre, from that end in which the three eyes are situated, and then hammers upon one of them with its heavy claws until an opening is effected. It then, by its posterior pincers, extracts the white albuminous substance. It inhabits deep burrows, where it accumulates surprising quantities of picked fibre of cocoanut husks, on which it rests as on a bed. Its habits are diurnal; but every night it is said to pay a visit to the sea, perhaps to moisten its branchiæ. It is very good to eat, and the great mass of fat accumulated under the tail of the larger ones, sometimes yields, when melted, as much as a quart of limpid oil. They are esteemed great delicacies, and are fattened for the table.—*Darwin; Hartwig; Bikmore.*

COCOANUT DAY occurs on the full moon of the Hindu month, generally falling in August. Along the Malabar coast, at every seaport town, Cocoanut day is one of the great feasts. It is supposed to mark the termination of the S.W. monsoon, the date when the Hindu trader may safely trust his ships and goods to the ocean. At Bombay, the natives, clad in their holiday attire, go in procession from their houses in the town to the sea-shore, preceded by bands of music. On the beach, after numerous ceremonies, a cocoanut, generally covered with gold and silver leaf, is then cast into the sea, as an offering, by the principal person present. Every trader or boat-owner there makes a similar offering on his own account. The first boat of the season generally puts to sea directly after, gaily decorated with streamers. In former days, the chief civil functionary at the E. I. Company's factories, at such places as Tanna, Surat, and Broach, used to attend and sometimes cast in the first cocoanut; but this practice was stopped by orders from the Court of Directors.—*Mad. Lit. Jo.; Elph. Ind.* 414; *Chow-Chow*, 290.

COCOANUT, DOUBLE. The double cocoanut of the Seychelles or Mahe islands, is the fruit of the Lodoicea Seychellarum. When preserved whole, and perforated in one or two places, the nut serves to carry water, and some of them hold six or eight pints; and by slicing them in different directions they are formed into plates, dishes, drinking cups, etc., known in the French islands as Vaisselle de l'île Praslin. The half of a double cocoanut is a favourite scallop of the Mahomedan fakir in India. The crown of the trunk is eaten, like the American cabbage-palm; the down attached to the young leaves serves for filling mattresses and pillows; the ribs of the leaves and the petioles are fabricated into baskets and brooms; and the young leaves are plaited to form hats. The Lodoicea attains a height of 80 or 90 feet. It might be largely introduced into India with advantage. Germinating nuts were sold in London in 1854 at £10 a-piece.—*Seeman.*

COCOANUT FIBRE, or Coir, is obtained from the outer rind of the nut. This is bruised and steeped in water for two or three days, after which it is taken up, and the fibres separated by the fingers, scraped gently with a blunt knife, and then dried in the sun. If steeped in water too long, they get coloured.

COCOANUT MILK. To make this, the kernel is grated, a little warm water is poured over it, and the liquid is then poured through an open cloth. This milk is excellent with coffee, and is indispensable for curry.

COCOANUT OIL.

Narel ka tel,	HIND.	Kalambir,	MALAY.
Minak nur,	MALAY.	Tengai yenne,	TAM.
Minak kalapa,	,,	Tenkaia nuna,	TEL.

The kernel, having been removed from the shell and dried, is subjected to pressure in a mill, and the oil is expressed; but when prepared in small quantities, the kernel is boiled in water for a short period; it is then pounded in a mortar, taken out and pressed. The milk, as it is called, which exudes, is then boiled over a slow fire, when the oil floats to the top, and, being skimmed off, is afterwards boiled by itself. Two quarts of oil may be procured from fourteen or fifteen cocoanuts. When fresh, the oil has an excellent flavour. It is used as an unguent on the bodies of the natives after bathing, and as an oil for the hair; it is employed as a lamp oil, and is manufactured into soap, and it is said to have all the virtues of cod-liver oil. The purest oil is obtained by grating the kernel, and depositing it in some hollow vessel, to expose it to the heat of the sun during the day, and the oil drains away through hollow spaces left for the purpose. The Malabar method of making the oil is by dividing the kernels into two equal parts, which are ranged on shelves made of laths of the betel-nut palm or split bamboo, spaces of half an inch wide being left between each lath. Under these a charcoal fire is lit, and kept up for two or three days, in order to dry them, after which they are exposed to the sun on mats, and when thoroughly dried are subjected to pressure in an oil-press. The remains of the cocoanut, from which the oil has been extracted (Posknakkull, HIND.; Tenga poonak, TAM.; Tenga pindee, TEL.; Poonnak, SINGH.), affords an excellent material for feeding pigs, poultry, etc. The best oil exported is from Cochin, and the neighbouring ports on the Malabar coast. It usually

fetches 20s. per ton more than the Ceylon or Coromandel coast article. In Europe it is used for the candle and soap manufacture, for lubricating machinery, etc. In India, for making soap, for cookery, lamps, and as medicine. This oil forms the foundation of Price's patent candles. It becomes solid at about 70° Fahr. It is one of the fixed or fatty oils, and consists of solid and fluid constituents, the latter, or oleine, being separated by pressure from the solid parts, called stearine or cocein, used in the manufacture of the stearic candles. It is also much used by pomatum manufacturers. In Borneo, the only oil used by the women in the dressing of their hair is that freshly expressed from the cocoanut; and this is perfumed by allowing the flowers of various plants to remain in it. The native oil-mill is similar in shape to the mortar and pestle of the druggist, the latter being worked by a shaft, to the end of which a pair of bullocks are attached. The cattle travel in a circle of about 18 feet diameter, and make three complete revolutions in a minute. Half a hundredweight of the dried kernel is a charge for a full-sized checkoe (mortar), and a pair of stout, well-fed bullocks will get through four such charges in a day; so that twenty mills are required to get through two tons in the twenty-four hours. The man who drives has usually a boy to assist him in taking the oil, which is got out of the mortar by dipping a piece of rag into the fluid and squeezing it into an earthen vessel. The cost of the native oil-mill, with serviceable bullocks, is rather under than over Rs. 200.—*M. E. Jur. Rep.; Cal. Rev.*, Sept. 1861; *Low's Sarawak*, p. 145.

COCOANUT PEARLS, said to be concretions existing free in the interior of the cocoanut in the East Indies, particularly at Singapore, where the rajas esteem them as precious stones. Mr. J. Bacon published a notice of them in the Proceedings of the Boston Society of Natural History, U.S. It is said that they occur sometimes as large as a cherry; but Mr. Bacon's are about 2-5ths of an inch in diameter. These vegetable pearls are smooth and white, like animal ones, but are harder, and not quite so brilliant. Like ordinary pearls, also, they are composed of carbonate of lime, but have only a very small proportion of organic matter. The former contain considerable quantities of an albuminous animal substance. Examined microscopically, the cocoanut pearls are found to be composed of numerous regular concentric layers, which adhere to each other very energetically. Their origin is at present uncertain. In the analysis of the cocoanut milk, a little phosphate and malate of lime is found, but no carbonate, which hitherto has not been found in any part of the nut.

COCOANUT TODDY. Cocoanut trees of vigorous growth send forth nine, ten, and even twelve clusters of buds every year. But those on which little care has been bestowed, and which are consequently feeble, produce only four or five of these spathes, called in Tamil 'palai.' The 'Sanar,' or toddy-drawer, when accoutred, has first in importance among his appointments, the arivalpatty (lit. knife-box), made from the sheath of the spathe, and bound round tight with two binders of rattan. A strongly plaited rope is permanently fastened to one side of the arivalpatty. The short arm of it has a much smaller loop; when fastened round the waist, the longer arm is passed inside the small loop of the short arm. Through the loop of the long arm, the toddy-drawer passes the end of his waist-cloth, and ties it into a knot. Next in importance is the eropetty, into which the toddy-drawer empties the toddy collected in the pot or chatty up the tree. It is made of palmyra fibre closely plaited, and, when moistened, is water-tight. Two wooden collar shavings, about two inches broad, encircle the mouth of the eropetty, one inside and one outside; between them the plaited wicker-work is run up and made fast. To keep the eropetty in its bulged, bottle-like form, a piece of rattan about half-way down is woven in, and encircles the vessel like the hoop of a barrel. The eropetty hangs suspended over the hoop of a barrel. It takes nearly a year's practice to make a man master of the curious mode of climbing, after which the loftiest trees are ascended in a minute with surprising ease. After a hard morning's work, the left arm always aches more than the other limb, showing that there is more strain on it than anywhere else. When an accident befalls a toddy-drawer, it is usually occasioned by his left hand missing its hold on the tree and slipping aside, which brings him to the ground instantly, often with fracture or injury of that limb.

When the spathe is a month or a month and a half old, the toddy-drawer begins his labours by binding the sheath to prevent its expansion, after which he cuts about an inch off the end, then gently hammers the flowers which are thereby exposed. Finally, he binds up the end with a broad strip of fibre, and descends. This process he continues morning and evening for fifteen days, a thin slice being cut away on each occasion. During this time, also, by shaving away a little of the under part of the sheath, he trains it to bend over. It is probable that the exact term of days during which the spathe undergoes this initiatory preparation varies in different places, and depends upon surrounding circumstances. Mr. Berthold Seeman, in his Popular History of Palms, mentions five or six days as sufficient. Near Madras, a toddy-drawer gave fifteen days as the usual time; but the time when a spathe is ready to yield toddy will be easily known by the chattering of birds, the crowding of insects, the dropping of the juice, and other unmistakeable signs. When ready, the end of the spathe is fixed into a kudave or small pot, and a small slip of leaf is pricked into the flowers to catch the oozing liquor, and to convey the drops, without wasting, clear into the vessel. When the spathe begins to yield toddy, he ceases to hammer it. It will give toddy for about a month, during which time, every morning and evening, he mounts the tree, empties the toddy into his eropetty, binds the spathe an inch lower down, smears the end of it with his palai mattai, and shaves a little away, then pricks in the slip of leaf, and ties the kudave on again. The man who ascends the tree is generally a paid servant, receiving about Rs. 7 a month. He will attend to thirty or forty trees. Forty trees yield about twelve measures (Madras) of juice, seven in the morning and five in the evening. During the heat of the day the spathe does not yield so freely as in the night. Twelve measures for forty trees is at the rate of a little more than one-fourth of a measure to each tree.

A first-rate tree in a good soil, and carefully tended, will produce one measure during the night, and three-fourths or one-half of that quantity during the day; but, taking one tree with another, a quarter of a measure is a fair average. Some trees, under favourable circumstances, continue yielding at this rate throughout the year, others only for six months. It is not prudent, however, to draw all you can from them, as they will be exhausted, and become barren. Every morning and evening, when the Sanar goes to draw the toddy, a servant or some one connected with the owner or contractor for the trees, usually accompanies him with a chatty, into which is emptied the toddy from the eropetty. When all the trees have been visited, and the toddy measured into the chatty or cullu-pani, it is carried away to the bazar rented by the contractor from Government at a fixed price. In Madras there are about 58 first-class toddy shops, to each of which 330 cocoanut trees are allotted, the contractor paying daily Rs. 2·12·10 to Government for each such shop; also 63 second-class toddy shops, to each of which 247 cocoanut trees are allotted, each shop yielding daily Rs. 2·2·10 to Government; and also 205 third-class shops. There is nothing very peculiar about the habit, custom, or dress of the Sanars to separate them from other Hindu castes, apart from their occupation. Around Madras the Sanars are divided into two classes, the higher and the lower; the latter are called Pully Sanar, and permit their widows to marry.—*Dr. Cleghorn, in No.* 23, *Edinburgh New Philosophical Journal*, 1861.

COCOANUT TREE BEETLE, Butocera rubus.

COCO-MEAL is prepared in the West Indies from the starchy tubers of Colocasia esculenta, *Schl.* The labouring population of the West Indies largely depend for a supply of food on this root. Long droughts may disappoint the hope of the yam crop, storms and blight may destroy the plantain walks, but neither dry nor wet weather materially injures the coco. Previous to their emancipation, whole families of Negroes lived upon the produce of one provision ground, and the coco formed the main article of their support. Where the soil is congenial to the white and black Bourbon coco, the labour of one industrious person once a fortnight will raise a supply sufficient for the consumption of a family of six or seven persons. The coco begins to bear after the first year, and with common care and cultivation the same plant ought to give annually two or three returns for several years.—*Simmonds.*

COCOON. Indung sutra, MALAY. The covering spun by the silkworm, and in which it wraps itself.

COCOS. There are three groups of islands known by this name. The Cocos Islands, in lat. 14° 10′ N., and long. 93° 10′ E., 45 miles distant from the north-east point of the great Andaman, are two little isles. The larger of them is six miles long and two broad, the smaller two miles and a half long and nearly a mile broad. They are sheltered by the Andamans from the heavy south-west swell of the Bay of Bengal. They are unhealthy.

The Cocos, near Hog Island, in lat. 3° 6′ N., and long. 95° 30′ E., on the west coast of Sumatra, are two small islands covered with trees.

The Cocos or Keeling Islands, south of Java, lie in two distinct divisions north and south of each other. The channel between the two is 15 miles broad; the northern division consists of one island only, in lat. 11° 49¼′ S., and long. 96° 51′ E., but the islets in the southern one are numerous.—*Rec. Gov. of India*, xxv. p. 64; *Horsb.*

The cocoanut palm does not seem to have been known to the ancients, though it is said to be indigenous in the East, from which they received ambassadors; and is said by the Hindus to have been brought by Viswamitra from Ceylon to India. The first allusion to it in Ceylon is of A.D. 1153, in the time of king Prakrama I. It now grows in great abundance in the Maldive and Laccadive islands, on the Malabar coast, in Ceylon, on the eastern side of the Bay of Bengal, though scarce in Arakan, whence it ascends both the Brahmaputra and Ganges rivers to a considerable distance. It grows in the Nicobars, in China to lat. 20° N., in most parts of the Eastern Archipelago, from the Sunda to the Molucca Islands, and in those of the Pacific Ocean, and is now cultivated in various tropical parts of the New World. It grows to a height of 1000 feet above the sea, though flourishing in greatest luxuriance in the vicinity of the ocean. It rises sixty to a hundred feet high; its cylindrical trunk, three feet in diameter, is crowned with numerous waving, feathery leaves, forming an elegant object of intertropical scenery. It is self-propagating. Its keel-shaped nut, protected from the salt water by its tough and thick though light covering, sails on the ocean to barren spots, where it germinates, and causes even the smallest islets to become covered with clumps of the cocoanut palm. They are surmounted by numerous wavy leaves, called fronds by botanists, and their footstalks are often called branches by travellers. The leaves are gigantic in size, being about 20 feet in length, with a strong tough stalk, which forms the midrib, and has a number of narrow and long leaflets ranged along the two sides.

It is a tree of great value to the people, who utilize it in upwards of a hundred ways. The

wood is applied to various purposes, such as rafters, fences, shears, laths, shingles, chairs, and ladies' work-boxes, etc.; but during the period of its most abundant bearing (considered to be between ten and thirty-five years' growth), the heart-wood is of so soft and spongy a nature, that it is then merely used for fences, water-pipes, etc. Its wood is also used for reepers, for which purpose it is, however, inferior to the palmyra, though, in Ceylon and on the western coast, hard and durable rafters are procurable. The Cochin planks are prettily striped, and of remarkable size. The wood is strong and durable; a cubic foot weighs 70 lbs., and it is esteemed to last for 20 to 50 years. It is used for ridge-poles, for temporary roofs, aqueducts, etc.; for small boats; for the beams, posts, and rafters of houses; for spear handles, paling, and walking-sticks; for fancy boxes and furniture; for boats' frames, bridges, ramparts, water butts, conduits, gutters, and drums. It forms one of the porcupine woods of commerce, and is used for fancy articles. A farinaceous substance is contained in the stem, which forms a good substitute for sago. Each tree produces annually from 50 to 60 cocoanuts, but up to 300 nuts have been obtained from a single tree, but some trees never fruit at all. From the appearance of the flower until the fruit drop, a period of fourteen months elapses. These are enclosed in a thick fibrous husk, from which the coir of commerce is obtained by maceration and beating. The husk is employed as a scrubbing brush and polishing brush; it is converted into cordage of various kinds, employed for the rigging of ships, fishing-nets, matting, and brushes; and in India, in its loose state, it is the usual material with which mattresses, pillows, and sofas are stuffed. Within the fibrous husk is the shell, which is very brittle, though its structure is somewhat fibrous. Cut in various ways, it is formed into cups and drinking vessels, into pitchers, funnels, and lamps. It is susceptible of a high polish, and admits of being turned in an agreeable manner. Those shells which are tolerably circular are used for the bodies of cups and vases, the feet and covers being made of wood and ivory. Common buttons are also made of the cocoanut shell, and are considered better than those of horn, as they do not, like that material, absorb the moisture, which causes horn buttons to swell and burst. The shell forms a valuable charcoal.

In its young and green state, the cocoanut contains a clear albuminous fluid, with a sweetish taste and a slight degree of astringency, which makes it a very agreeable, refreshing beverage; and it is also used by house plasterers as an ingredient in their whitewashes made of pure lime. But as the nut advances to its full maturity, the fluid disappears, and the hollow is filled by the almond-like dried albumen, which is the germinating organ. This pulp or kernel, when young, can be easily removed by a spoon. When cut in pieces and dried in the sun, it is called copra, which forms an extensive article of commerce throughout the south and east of Asia. It is used grated in curries, or its milk is expressed from it; and from copra a valuable oil is expressed, which is employed in anointing the body, is used in lamps, is largely converted into the stearine candles of England, and forms an invaluable substitute for cod-liver oil. The refuse oilcake, 'poonac,' forms an excellent manure. The white and solid albumen is often cut into ornaments of flowers and fruits, meant to represent the garlands given to visitors of distinction. They are worn by Tanjore ladies at particular festivals.

The very young or heart-leaves of this palm are called the cabbage, and form an excellent vegetable, either cooked or dressed in stews, hashes, or ragouts. In the Laccadive Islands, the heart-leaves of the tree, just before they unfold, are cut out and plaited into mats of fine quality, which are there used as sails for the smaller boats, and are much esteemed when exported. In India, the leaves, dried, and called by Europeans cadjans, are plaited and used as thatch, and for the outer and inner linings of walls of houses. The leaves are also made into mats, baskets, both fancy and plain; into fans, combs, brooms, screens, buckets, and lanterns; into articles of dress; and into leaf-books, torches, and fuel. The footstalks of the fronds are used for fences, yokes, shoulder-poles, and fishing-rods. The midribs of the leaves or fronds are fibrous, but brittle, and are used as brooms. The roots of the tree are chewed as a substitute for betel-nut.

One of the beverages known to Europeans as palm-wine or toddy, is obtained from the flower spathes. Before the flowers have expanded, the spathes—and these are themselves astringent and used medicinally—are tied with the young leaves, and then cut transversely from the top downwards, and beaten daily with the handle of the knife or a piece of hard wood, and the sap, after a few days, exudes into a calabash or earthen pot. In the early morning this is a pleasant, refreshing drink; but it ferments towards night, and becomes an intoxicating fluid, which is largely drank, and is used as a ferment. It is to a great extent artificially brought to the vinous and acetous fermentations, and, in the former state, an alcoholic spirit is distilled from it, which forms one of the arracks of commerce. One hundred gallons of toddy produce, it is said, by distillation, twenty-five gallons of arrack: eight gallons of sweet toddy, boiled over a slow fire, yield two gallons of a luscious syrup, from which, by further boiling, a coarse brown sugar is produced, known in commerce as jagari. The net-like substance Peynadi, TAM., Jalla mitta, HIND., at the base of the petiole, when very young, is delicate, beautifully white, and transparent; but when it attains maturity, becomes coarse and tough, and changes to a brown colour. Portions of these are everywhere used as strainers and sieves, for straining fluids, sifting arrowroot, etc.; and the Tahitian fishermen convert it into a garment when fishing.

The flowers contain a powerfully astringent property, which is used medicinally; and it is from the flower and spathes, before the flower has expanded, that the toddy or palm-wine of this tree is obtained. The Tahitians extract a gummy substance, called Pia-pia, from the trunk of the tree.

George Herbert, writing of the cocoanut, has said,—

> . . . 'The Indian's nut alone
> Is clothing, meat and trencher, drink and can,
> Boat, cable, sail and needle, all in one.'

In Malabar and Ceylon, every available spot

within the influence of the sea-breeze is being devoted to the growth of the cocoanut. Along the western coast of the Madras provinces, the wavy downs near the sea borders, which have hitherto produced only a stunted and worthless crop of grass, are being everywhere levelled, broken up, and manured, so as to form the beds of future plantations. Cocoanut trees have great enemies in the shape of two beetles. One of these is a large Curculio (Rhynchophorus Sach) called the red beetle, nearly as big as the stag-beetle of Britain; the other is the Oryctes rhinoceros, so called from its projecting horn. The red beetle is so called from the red mark on the upper part of its breast. Its attacks are said to be on the nut, but those of the rhinoceros beetle are on the terminal bud of the palm stem. When so injured, the bud dies, and the crown of the leaves falling off, leave the cocoanut tree a mere bare stem. The same result occurs to other palms, the palmyra, the betle, in which the top bud, or cabbage, as it is called, is destroyed.—*Collingwood; Simmonds; Royle's Fib. Pl.; Madras Exh. Jury Reports; Seeman on Palms; Ainslie; Madras Lit. Soc. Journ.; J. Ind. Arch.; Eng. Cyc.; Elliot's Flora Andhrica; Cal. Review; Malcolm's Tr.* ii. p. 176.

COCOTIER DE MALDIVES. Fr. Sea cocoanut; Lodoicea Seychellarum.

COCOYA. Malay. Sleeping mats made from the leaf of the Pandanus odoratissimus.

COCUM OIL or Butter is obtained from the seeds of Garcinia purpurea, and used in various parts of India to adulterate ghi or butter. It is said to be exported to England for the purpose of mixing with bear's grease in the manufacture of pomatum. It is a white or pale greenish-yellow solid oil, brittle, or rather friable, having a faint but not unpleasant smell, melting at about 95 degrees, and when cooled, after fusion, remaining liquid to 75 degrees.—*Simmonds.*

In China the consumption of salted provisions is very general. Fish, cured with salt and dried in the sun, is one of their most generally used articles of food; and on salted cod being introduced for two or three years in English ships, the somewhat decayed condition in which it reached China was anything but a drawback. But this cargo, besides its disagreeable nature and the injurious effect on some delicate articles of shipment during the voyage, bred a peculiar insect, which, from the readiness with which it bored into the planks and timbers of a ship, was considered as dangerous, and accordingly the import was greatly discontinued. Cod sounds, brought into Britain in great quantities from Newfoundland, are the salted air-bladders of these fishes. They are also largely imported into England from the east coast of Scotland. Cod-liver oil is largely in use throughout the world in cases of threatened phthisis.—*M'Culloch's Com. Dict.* p. 302; *Morrison, Compendious Summary.*

CODILLA or Tow, the short fibres of hemp or flax, separated or picked out in cleaning.

CODO. Hind. Paspalum frumentaceum, *Kœn.* This is sown early during the rainy season. Its small grain frequently has inebriating properties, when made into bread. Such codo is known by the name of mutouna, from Mutt, drunk, intoxicated. In appearance it resembles ordinary codo; it is sown as ordinary codo, and comes up as mutouna, but only in those fields on which codo has been previously grown; and even in such case, only, perhaps, in one instance out of ten. These curious properties of codo have invested it with a degree of mystery in the eyes of the natives of India, and the Kakun Rajputs of Ghazipur are said to worship it as a divinity. They never cultivate or eat codo,

'Nefas violare et frangere morsu;'

and the reason assigned is that, while under the influence of mutouna, they were set upon by some of the neighbouring tribes, and thus lost the greater part of their once extensive possessions. Kisaree (Lathyrus sativus) is another grain which is found to have injurious properties.—*Elliot.*

CŒCILIIDÆ, a family of curious reptiles of the order Batrachia apoda. The family contains two genera, Cœcilia oxyura, *D. et B.*, which is found in Malabar, and the genus Epicrium, of which E. glutinosum, *Linn.*, is found in Ceylon, and E. monochroum, *Bleeker*, in Pegu. Linnæus gave to the Ceylon species the name Cœcilia glutinosa. This is an inch in diameter, and nearly two feet in length. Its eyes are so small and imbedded as to be undistinguishable to ordinary observers, who believe the reptile to be blind. Like snails, eels, and some salamanders, it secretes a viscous fluid from minute pores in its skin. The skin is furrowed into 350 circular folds, in which are imbedded minute scales. The head is tolerably distinct, with a double row of fine curved teeth for seizing the insects and worms on which it is supposed to live.—*Sir J. E. Tennant*, p. 318.

COEL. Hind. A bird of the family Cuculidæ. It is the Eudynamys orientalis, and inhabits Ceylon, India, Malay countries, and China, and is called Coel, Hind., Kokil, Beng., Chule, Malay, and Cowdecoha, Singh., all of the names being obtained from its ordinary call, which closely resembles the word Koil. Like the cuckoo of Europe, this is, in India, the harbinger of spring; and its call, though shrill and disagreeable, is associated with all the joys and labours of husbandry of that season, and is quoted in the rhymes and proverbs of the people. Thus Coel bolee, Sebundee dolee, the cry of the coel is the grief of the sebundy soldier; meaning that the disbanding of the armed men gathered together for collection of revenue depends on the coel's note,—Sebundee being a corruption of Sipah Hindee, in distinction to Moghul or foreign troops, who were always kept up. The coel, indeed, occupies much the same place in India that the cuckoo does in Europe. The European names, even, are all derived from the Sanskrit name Cuculus. Pliny says that the vine-dressers deferred cutting their vines till the cuckoo began to sing. There is the cuckoo-ale of England, which the labourers leave their work to partake of, when the first cuckoo's note is heard. There is also the vulgar superstition in England, that it is unlucky to have no money in your pocket when the first cuckoo of the season is heard; and the amorous Hobnelia tells us that in love omens its note is equally efficacious.—*Elliot.*

COEL, the ancient name of Alighur, where M. Perron built a fortress.

COELAGOERYP, a race in Cochin who make bows, arrows, shields, and other weapons. The Canniargoeryp race teach fencing and the use of weapons. The Coelady are trumpeters.

CŒLOGYNE, a genus of plants belonging to the natural order Orchiaceæ. The most gaudy of the plants of Borneo are perhaps the various species of Cœlogyne, called collectively by the natives the bu-nga ka-sih-an, or the flowers of mercy; their white and orange-coloured flowers are exceedingly delicate and beautiful, and they are all highly fragrant. About 20 species occur at the foot of the Himalaya, Nepal, the Khassya Hills, and China, namely, angustifolia, barbata, cristata, decora, elata, fimbriata, flavida, Gardneriana, interrupta, longicaulis, maculata, media, nitida, ocellata, ovalis, præcox, procera, prolifera, rigida, undulata, Wallichiana. Borneo has C. Lowii, *Paxton*, pandurata, *Lindley*, the last with large green and black flowers.

CŒLOPS, a genus of the mammalia, of the sub-family Rhinolophinæ, of the sub-order Cheiroptera or bats.

COEPANG, a Dutch settlement in the S.W. part of the island of Timor.

COFFEA, a genus of plants belonging to the natural order Cinchonaceæ. There are several species, viz. C. Arabica of Arabia, from which it has been introduced into many countries; C. Bengalensis, the Bun-kahwa or wild coffee, which grows in Assam, Nepal, and the Khassya Hills; C. elliptica, *Thwaites*, a small tree of Ceylon, growing to 10 or 12 feet high in the Hinidoon Corle; C. Guianensis, *Aubl.*, of Guiana and Trinidad; C. Mauritiana, *Lam.*, of Bourbon; C. Mexicana, *D.C.*, and C. obovata of Mexico; C. Liberica, *Bull.*, of Liberia; also C. tetrandra of the Khassya mountains; and Wight describes C. alpestris, Grumelioides, and Wightiana. The Coffea Arabica trees are now grown in Abyssinia, and in tropical Africa generally; in Arabia, on the slopes of the Neilgherry Hills, in the Peninsula of India, at Lohardugga in Bengal; in Ceylon, Siam, Burma, Sumatra, Java, Manilla; in Queensland, in the Mauritius; in the West India Islands, Central America, Brazil, and Peru. The seeds known as the bean, from the Arabic 'boon,' are the economic product of this tree, and Great Britain obtains its supply of them from many of the above-mentioned countries,—from Ceylon, British India, Brazil, and Central America. In 1880 its imports reached 1,555,939 cwt., valued £7,062,016; and 290,802 cwt. were retained for home consumption. In British India, Mysore, and Cochin, there were in 1880, 47,978 coffee plantations, with 162,373 acres under mature plants. The approximate yield is 33,100,778 lbs.; and the yield per acre of mature plants ranged up to 447 lbs., being smallest in Mysore and highest in the Neilgherries. Seven cwt. per acre have been claimed for the yield occasionally on some of the Coorg estates, but reliable information was furnished in the fifth issue of the Statistical Tables for British India. In 1879 there were 17,351 estates in British districts, with 62,729 acres under mature plants, and the average yield per acre of mature plants was 325 lbs., the greatest crop being on the Neilgherries, where 462 lbs. or 4 cwt. 14 lbs. was the average. The crops per acre in Mysore were only 14, 22, and 30 lbs. respectively in the Kolar, Hassan, and Shimogah districts. The plantations in these three districts numbered 10,965, and 44,116 acres were under mature plants. The Kadur district of Mysore had 13,802 plantations, but the other data are not given. Coorg had 4248 plantations, with 39,150 acres of mature plants, and its yield averaged 328 lbs. In the Feudatory States of Cochin and Travancore there were 140 plantations, with 16,340 acres of mature plants, yielding 246 lbs. per acre.

COFFEE BERRY.

Boon, . . AR., BOMBAY.	Bun, Kahwa, Kapi, VERN.
Kia-fi-cha, . . . CHIN.	Kafi, Kofi, . . . ,,
Eleane, ... EGYPT.	

The coffee tree is supposed to be indigenous to the mountain regions of Enarea and Cuffa, to the south of Abyssinia, whence about the 16th century it was introduced into Arabia, in the 17th century into Ceylon and Mysore, into Mauritius and Bourbon in 1718, and Batavia in 1723, and subsequently into the West Indies. Abd ul Kadar Mahomed ul Azari ul Jeziri ul Hanbali, who wrote in Egypt about A.D. 1587, relates that in the middle of the 15th century Jamal ud Din Abu Abdulla Mahomed bin Saeed ud Dubani was Kadi of Aden, and, having occasion to visit Abyssinia, he found his countrymen there drinking coffee, and on his return to Aden introduced it, whence it passed into Arabia generally. Shaikh Ali Shaduli ibn Omar settled near the sea about A.D. 1630, on the plain now occupied by the town of Mocha, and his reputation drew people around him, till a village was formed. He greatly recommended the use of coffee, and he has ever been regarded as the patron saint of Mocha, the people having, on his demise, erected over him an elegant tomb. Tavernier, in the 'Collection of Several Relations,' etc., published in London in 1680, has stated (page 64) that 'coffee grows neither in Persia nor in India, where it is in no request; but the Hollanders drive a great trade in it, transporting it from Ormus into Persia, as far as Great Tartary, from Balsara into Chaldea, Arabia, Mesopotamia, and the other provinces of Turkey. It was first found out by a hermite, whose name was Sheck Siudeli, about twenty years ago, before which time it was never heard of in any author either ancient or modern.'

Coffee has been grown in part of Mysore almost from the same time that the Arabs have known it. It was brought there from Arabia by a Mahomedan pilgrim, named Baba Booden, who formed a college on a spur of the hills now called after him, and from there the coffee plants spread. He is said to have brought with him only seven coffee beans, which he planted, and it is now one of the most valuable of the plants which have been distributed by man. Its large, pure white, sweet-scented flowers appear in March, April, and May, and it fruits in November, December, and January. Its fruit contains an active principle called caffeine, which has been found to be identical with theine; and a decoction of the roasted berries, or an infusion of the berries, is a well-known article of diet, and with tea, cocoa,

matao, Paraguay tea, guarana, and kola nuts, constitute the beverages of the European, American, Asiatic, and African peoples. Each of these plants contains the alkaloid theine. Different in botanical characters, varied in genera, yet not very unlike in flavour, they all contain this valuable active principle. The theine in dried kola nuts is about 2 per cent., coffee has 0·5 to 2·0 per cent., and tea from 0·5 to 3·5 parts in 100. The coffee berry consists almost wholly of albumen, which surrounds the small embryo of the seed, and in infusion or decoction is a stimulant. In Arabia, the decoction and infusion is often prepared from the husk and the bean, and often from the husk alone. Lane says Kahwa is an old Arabic term for wine. Dr. Shortt, in his Handbook to Coffee Planting, described the process of wine and spirit making with the fresh coffee pulp, but also from the dried husks of the fruit.

Coffea Liberica, *Bull.*, the Liberian coffee plant, is of almost arboreal growth. It has a larger leaf, and its berries also are larger, and of superior flavour to those of C. Arabica, and it is more productive. It was at one time hoped that this plant would be less affected by the Hemileia mould, known as the leaf disease, as it is said to have an immunity from the cemostoma fly.

The import of coffee into Great Britain from Ceylon and other British possessions, from Brazil, Central America, and other countries, was as under:—

Years.	Cwt.	Value.	Years.	Cwt.	Value.
1877,	1,609,717	£7,788,014	1879,	1,617,389	£7,247,568
1878,	1,273,410	6,012,977	1880,	1,555,939	7,062,016

Liberian coffee grows at elevations unsuitable to the Arabian species. At the end of 1877 there were in Ceylon about 500 acres planted with Liberian coffee. Estimates of the area under cultivation at the end of 1880 varied from 4000 to even 10,000 acres. Though not enjoying complete immunity from the attacks of leaf disease, the growth and productiveness of the trees have not so far been affected by it. London dealers are said not to appreciate its bean very highly, but it has been favourably received in America.—*M'Culloch; Waring; Royle; Birdwood; Voigt; Journ. Ind. Arch.; Statistical Tables; F. von Mueller.*

COFFEE PLANTING, as a branch of agricultural industry, although only introduced into India in comparatively recent times, has attracted many persons. The outlay has been great, but both in Ceylon and Southern India the losses have been considerable, often ruinous. In Netherlands India, coffee planting has been a Government monopoly, and there has been a large exportation of coffee from Java; but the most recent information is to the effect that the monopoly is not, or was but little, remunerative. In British India coffee is grown along the summits and slopes of the Western Ghats, from the northern limits of Mysore south to Cape Comorin; in Coorg, Travancore, in the Wynad, on the slopes of the Neilgherry Hills, and also on the Shevaroy Hills and Pulney Hills. Major Bevan introduced coffee into the Wynad about the year 1822, as a curiosity. Mr. Cannon, somewhat later, formed a plantation in Mysore; Mr. Glasson, in 1840, formed a plantation at Manautoddy; and in 1842 it was growing well at Belgaum. The extension has since been great; and in 1880, in the Cochin, Travancore, Mysore, and Madras districts, and at Lohardugga in Bengal, 412,947 acres had been taken up for coffee, of which 162,847 acres had mature plants. The yield per acre on exceptional estates, in exceptional seasons, is said to be greater. The cultivation in British India has increased in extent year by year, and the exports, chiefly to Europe, have been as under:—

Ceylon.—The coffee tree was introduced into Ceylon by the Arabs before the arrival of the Portuguese, but the Singhalese only employed its tender leaves for their curries, and its delicate jasmine-like flowers for ornamenting their temples and shrines. The Dutch carried the coffee tree to Batavia in 1690, and about the same time they began its cultivation in Ceylon, but again ceased in 1739. Its culture, however, continued to be prosecuted by the people; and, after the British occupation, the Mahomedans collected it in the villages, and brought it to Galle and Colombo, to be bartered for cutlery, cotton, and trinkets. It was extensively diffused over the country by the agency of birds and jackals. From 1821 the quantity of coffee shipped to Britain yearly increased,—native grown, badly prepared berry, and ranking below almost every other kind of coffee. In 1830 the first attempt at careful coffee cultivation and curing was made on a considerable scale by the governor of the island, Sir Edward Barnes, and the success induced others to apply for waste forest land. During 1836 and 1837 upwards of 7000 acres of Crown lands were purchased, and partly cleared and planted; and in 1836 the crop was 60,330 cwt. It had become widely extended through the Kandyan provinces. On the Himasgaria mountains, in 1840, a small plantation was formed. In 1846 there were fifty estates there, averaging each 200 acres of planted land, and yielding an average crop of 80,000 cwt. of coffee. On the 31st December 1847, there were 50,070¾ acres cultivated. The gross outlay of this is said to have amounted to £5,000,000 sterling. In the seventeen years 1855 to 1872, the extent of coffee land cultivated in Ceylon increased 175 per cent., the number of plantations rising from 404 to 1087, the crop from 374,000 to 760,000 cwts. The out-turn of produce increased 100 per cent., but the average yield per acre decreased from 5·5 cwt. to 4·88 cwt. (Standard, Nov. 17, 1873). In 1875 coffee was under cultivation in 37 districts of Ceylon, containing in all 1351 properties, of a total 481,539 acres, of which 249,604 acres were cultivated. From 1856 to 1875 the crops per acre have ranged from 2·75 cwt. in 1874, to 5·07 cwt. in 1868, the general average being rather under 4·25 per acre.

Coffee interests in Ceylon were injured by the over-eagerness of the early planters to obtain coffee property, leading them to pay unremunerative prices. The coffee crop of 1870-71 was generally a bumper. The season of 1871-72 was one of short crops, caused by irregular blossoming showers, and by the leaf disease, which then made its first appearance. From 1871 to 1878, on the average, 707,590 cwt. of coffee were exported from Ceylon, and the average production per acre was 3·79 cwt. In 1879 the export was 774,774 cwt., and the out-turn per acre cultivated was 3·60. In the three years 1878 to 1880, the average export was 658,575 cwt., and the average yield per acre was 3·01 cwt. Since these unremunerative results followed, the planters have been directing their attention to cacao, cinchona, and tea.

In *Arabia Felix* the culture is principally carried on in the kingdom of Yemen, towards the cantons of Aden and Mocha. Although these countries are very hot in the plains, they possess mountains where the air is mild, and the coffee is generally grown half-way up on their slopes. When cultivated on the lower grounds, it is always surrounded by large trees, which shelter it from the torrid sun, and prevent its fruit from withering before its maturity. The harvest is gathered at three periods; the most considerable occurs in May, when the reapers begin by spreading cloths under the trees, then shaking the branches strongly, so as to make the fruit drop, which they collect and expose upon mats to dry. They then pass over the dried berries a heavy roller, to break the envelopes, which are afterwards winnowed away with a fan. The interior bean is again dried before being laid up in store. The principal coffee districts are Henjersia, Tarzia, Oudein, Aneizah, Bazil, and Weesaf. The nearest coffee plantations are three and a half days' journey (about 80 miles) from Aden. Coffee is brought into the Sana market in December and January from the surrounding districts. The varieties are Sherzee best, Ouceaime, Muttanee, Sharrazee, Hubbal from Aniss, Sherissee from Aniss. The nearest place to Sana where the coffee tree grows is at Arfish, half a day distant. The coffee plant in Arabia is mostly grown near the sides of mountains, valleys, and other sheltered situations, the soil on which has been washed down from the surrounding heights, and carefully protected by means of stone walls, so as to present to the traveller the appearance of terraces. The plant requires a moist soil, though much rain does not appear necessary. It is always found in greater luxuriance at places where there is no spring; yet an abundant supply of water to the root of the plant seems necessary for the full growth and perfection of its bean. Mr. Palgrave says the best coffee is that of Yemen, exported from Mocha, but Arabia, Syria, and Yemen consume two-thirds of it, and the other third finds its way to Europe, to the west of Constantinople, and is used by Turks and Armenians. The rounded, half-transparent, greenish-brown berries are deemed the best. It is also exported by the Red Sea into the Hejaz and Kasim in Shimer. It was stated by Niebuhr to have been brought by the Arabs from Abyssinia to Yemen, from a country similar to their own plains and mountains; that people had for ages cultivated it in the hilly range (Jabal) in a healthy temperate climate, watered by frequent rains, and abounding in wells and water tanks.

In *Ceylon*, the coffee plant will grow and reproduce itself on a level with the sea; and at 2000 feet above it, the trees, whilst young, will have the most luxuriant appearance, come soonest into bearing, and yield the greatest measurement quantity per acre, but the bean is light, and of an inferior quality. The best Ceylon properties are situated on the mountains at from 3000 to 4500 feet above the sea, where rain is frequent, about 100 inches annually, and the temperature moderate, the maximum 80° and minimum 15°. The aromatic properties (and consequently fine flavour) of the coffee plant are best developed in Ceylon between 3000 and 5000 feet above the ocean. The higher it is cultivated, with care, below frost, the better has been the quality of the produce, although the yield is less. The appearance of high mountain beans is long, blue, the longitudinal seam curved, with its sides close and compact; its specific gravity is greater, and its aromatic principle more abundant and finer, than that produced on low lands, which is attributed to its being grown slowly in a cold climate. The best plantations are situated in the Kandyan province, where the thermometer ranges at noon about 76°, and in the morning not higher than 60°. The coffee berry in those elevated regions has therefore to be conveyed to Colombo, where a constant high temperature enables the merchant to complete the drying process, which the planter had but commenced. Coffee planting failed over a considerable portion of the southern province of the island. The temperature was found to be too equable, not descending sufficiently low at any time to invigorate the plant, which, though growing luxuriantly at first, soon became weak and delicate. The chief crop ripens in October and November, and a small second gathering is looked for in May. The following have been the average quantities and values of quinquennial exports from Ceylon:—

Years.	Cwt.	Value.	Years.	Cwt.	Value.
1837-41,	54,872	£151,320	1857-61,	600,942	£1,506,406
1842-46,	140,220	284,473	1862-66,	785,998	2,009,342
1847-51,	315,049	537,348	1867,71,	973,975	2,514,389
1852-56,	411,264	861,269	1872-76,	799,124	3,444,233

In Ceylon, suitable coffee land has been costing £8 to £20 the acre; and £25 to £30 the acre was the estimate for bringing the purchased land into bearing, and providing proper buildings, suitable paths, roads, and drains. In Ceylon it is considered better to choose an easterly or northerly aspect; for though the morning sun falling on the dew is said to injure the plant, and the setting sun to improve its fruit, the advantage of shelter outweighs these considerations. The south-west monsoon is apt to exercise a blighting influence, curling up and withering the few leaves it does not beat off the trees. In Ceylon, the best soil is of a deep chocolate colour, friable, and abounding with blocks and small pieces of stone. Such patches of land are generally found at the bottom of the escarpments of the hills, or in elevated valleys, and rarely on the slopes. Quartzose land must be carefully avoided, and clay is equally bad. A good surface soil should have at least two feet of depth, as the coffee tree has a long tap root. A nursery must be proportioned to the extent of land to be culti-

vated, and situated with regard to proximity to the extended fields. The seed-grains are sown six inches asunder; if the land become parched, it will be well to shade it with green branches, and irrigate it night and morning; should a long continuance of rain follow the sowing, the seed sometimes decays in the ground. It requires from six weeks to three months, according to moisture and warmth, before it germinates, and in four months more the seedlings are ready to be transplanted.

The labourers on the Ceylon coffee estates, about 220,000, are principally from the districts of Madura, Tinnevelly, Tanjore, Trichinopoly, and Mysore. They arrive between May and October, and return in January and April *via* Manar. Kandyans and the lowland Singhalese were found unsuitable for the work, besides being too few; and the arrivals at and departures from the ports of Ceylon of Tamil coolies, from 1841 to 1873, were—

	Arrived.			Departed.

During the years 1841-46 the Tamil labourers must have saved or remitted to their country from £385,000 to £400,000. But against this pecuniary advantage a great loss of life had to be placed. During the eight years above enumerated no less than 70,000 Malabar coolies died.

In *Southern India*, Cannon's Mysore was grown on a range of hills from 3500 to 4000 feet above the sea, having the benefit of the south-west monsoon, which very seldom fails at all, never entirely, and it has also the tail-end of the north-east monsoon. Its peculiar qualities were closeness of texture and richness of flavour. From the year 1832, Europeans entered into the agriculture, and Cannon's Mysore coffee soon attracted the attention of dealers, for it rose from 1846–47 to an average of 96 shillings the cwt., and had fetched so high as 115 shillings; and the selling price of native-grown coffee in Mysore rose from one rupee per maund of 28 lbs. to six and eight rupees per maund. The first plantations by Mr. Cannon were at Chikmoogloor, near the Baba Booden hills; the next were at the Munzerabad Ghat; and for many years the Mysore coffee districts were confined to the region of the Western Ghats and the Baba Booden hills. Attempts were made to cultivate coffee in the open country, but without success; it seemed to require forest land, and considerable elevation and moisture.

In the year 1862 the demand for coffee lands in Southern India was at its highest. Coffee plantations two years old were then selling at £12 to £14 the acre; of three years' growth, £15 to £17; of four years, £18 to £20; and in full bearing, £20 to £25,—when coffee was worth 75 to 95 shillings the cwt. From that year commenced doubts in the minds of planters, but ultimately, in some districts, the result was disastrous. From those yielding three cwt. per acre, and they were the great bulk, there were no returns. In Coorg, the enemies of the coffee tree—the bug, the rot, the borer, insufficient capital, and the want of the owner's eye—were numerous. In Coorg there were cheap labour, cheap food, and good roads, yet in the autumn of 1866 the estates were unsaleable.

In the south of India land was sold from Rs. 10 upwards to Rs. 50 per acre from Government. In 1876, some natives of Wynad asked Rs. 30,000 for 150 acres of forest land, equal to Rs. 200 per acre. In *Travancore*, in 1875-76, 7817 acres were sold for Rs. 2,14,761, or Rs. 28 per acre; the highest price in a single lot realized was Rs. 82 an acre. It was estimated that an acre of jungle on the Neilgherries could be brought into bearing for Rs. 200, including all expenses. A good dwelling-house will cost Rs. 4000; the pulping house, machinery, and godowns, Rs. 4000 more. The entire cost of bringing 100 acres into bearing was generally reckoned at Rs. 30,000.

Soil.—In *British South India* the soil recommended is a good rich garden land, the situation high, and not liable to inundation, and well sheltered from prevailing storms. A hill affording shade to the shrub has been found beneficial in all tropical climates; if grown fully exposed to the sun, the berries ripen prematurely. A beautiful species of Strobilanthes, which grows in Coorg, is called the coffee plant, because thought to indicate soil suited for coffee trees. Coffee delights in a moderately warm and moist atmosphere; but Coorg is deluged with rains during six months of the year, and scorched by the sun for the other half. In hilly country, planters protect the soil from being washed away, by terracing, and cutting level drains across the hill face. Ceylon is peculiarly adapted to the growth of coffee, being a mountainous island, with three sides open to a vast expanse of ocean. Droughts do occur, but even in the driest seasons the hills attract clouds, which frequently pour down refreshing showers. The heavy mists and dense clouds, which sometimes shut out the sun for days together, or roll sluggishly along the mountain-sides, are amongst the planter's best auxiliaries. The shrub luxuriates in a rarefied, temperate, and moist climate, and delights in frequent but not heavy rains on the slopes, where there is a good natural drainage, for any lodgment of water about its roots soon proves fatal.

Sowing.—The seed reserved for sowing must be put into the ground quite fresh, as it soon loses its power of germination. The quality of the seeds from young stems is not so good as that from stems four or five years old. Clean, well-formed berries, free from injury by insects or the decay of the pulp, should be selected. These berries must be sown in a nursery, either in small, well-manured beds (or in pots in a sheltered spot), not too close, as it is well to leave them where sown until they acquire a good growth; indeed, it is better if they are removed at once from the bed where they are sown, to the plantation. The seedlings appear in about a month after the seed is sown. Coffee seedlings from the nursery may be planted out in seven

months. A bushel will rear 10,000 plants, covering ten acres. Coffee trees should be planted in rows six or eight feet apart, in holes 20 inches deep by 18. They should be regularly lopped and pruned, so as to admit the sun to ripen the fruit on every branch. The trees are generally in bearing in the third or fourth year.

The coffee tree, if allowed, attains 15 feet in height, but to facilitate plucking it is kept down to 3 or 3½ feet above the ground. This makes the shrub shoot out laterally, and produce at least 25 per cent. more than it would do if permitted to attain its natural height and to occupy more land. In topping, care must be taken to cut off the uppermost pair of branches, as their weight when in fruit would split the head of the stem. Nature is constantly throwing out young shoots, which try to grow upwards, but they must be carefully broken off, as they are a great and useless drain on the juice of the plant. Never cut a sucker or branch off a tree, but always break it. It is necessary to protect the trees from being burned up by the sun, by planting them sufficiently close to form a good cover, and protect the soil from exhaustion by systematic weeding and substantial manuring.

The age to which the coffee tree will survive has not been ascertained. Native plantings are to be found in many parts of Ceylon, Wynad, Mysore, etc., containing trees of an age far beyond the power of the oldest inhabitant to define, and which have very probably been flourishing for generations.

Fruit.—From flowering to harvest is from eight to nine months. A field in full bloom is a beautiful sight. The clusters of white blossom contrast prettily with the deep green leaves, and the whole at a distance looks as if it had been snowed on. The flower only lasts one day. If the atmosphere be dry, the bloom is sometimes lost, as it will not set without moisture; mists and light drizzling rains are the most favourable weather at this time. The fruit grows on a footstalk of half an inch, in clusters round the joints of the lateral branches, and when of full size, but still green, resembles small olives. A month before ripening it turns yellow, and through different shades to ruby red when it is ripe, and from its likeness to a European fruit is technically called 'cherry.' During the latter part of its growth, particularly, it requires a great deal of moisture, otherwise the bean will be shrivelled, not perfectly formed, light, and of inferior quality. When the fruit becomes blood red it is perfectly ripe, and should be gathered. Once ripe, the sooner it is plucked the better. Within the pulp is the parchment surrounding the two beans, then the semi-transparent silver skin, and then the two berries,—occasionally only a single berry, generally small and deformed, called pea-berry, which realizes in Britain 10s. to 12s. per cwt. more than the best quality of the usual sort. The parchment and silver skin comprise about 1 per cent. of the fruit. The pulp has a sweet, sickly saccharine flavour. In 1875 it was proposed to ferment the pulp into a spirit.

Ceylon coffee is known in the market as washed coffee. Mocha coffee is designated husked coffee, and is perhaps a better coffee bean.

Mocha coffee is cultivated in very small fields of a few acres in extent, and on level ground; the fruit is allowed to remain on the tree until it drops or is shaken down, and is gathered from the ground. In that hot, dry climate the pulp shrinks and becomes rather hard, and then by pounding by the hand, the berries, of a light grey colour, are separated from the silver skin, the parchment, and the dried pulp, at one operation.

In *Ceylon*, after the berries are plucked and brought in baskets to the warehouse, the pulp or fleshy part is removed. The berries are placed in heaps in a loft, above the pulper. They are then sent down a shoot, into which a stream of water is conducted, and are thus washed into the pulper. The pulper is a roller covered with a sheet of copper, made rough like a nutmeg grater. The berries follow it as it goes round, but there is only room for the seed to pass, so that the pulp is squeezed off and carried away by a stream thrown of by the water wheel, while the naked coffee drops on the other side. The seeds are still covered with glutinous matter, to remove which they are washed in a cistern, the inferior ones floating, while the good ones sink. The coffee seeds are then laid out on the barbecus (which are square platforms of brick, plastered with chunam, with sides a foot high), where they dry in the sun for about three days, and are afterwards stored in godowns. In the moister parts of Ceylon, the curing process is not completed on the estate. After removing the pulp, the beans, enclosed in parchment, are dried for about three days, and are then forwarded to Colombo, where, by means of special machinery, the parchment and the silver skin are removed from the berries, which are of a bluish colour when they are ready for shipment.

The commercial value depends on the size, form, and colour of the beans, and their flavour. Apart from tasting, which should always be done when practicable, one of the best and most simple tests by which the merits of coffee may be approximately arrived at, is the amount of aroma which arises when the berries are freshly ground. In the better qualities the bean will grind with a dark appearance. In some kinds, especially those of the Mysore and Peninsular growths, the berries when roasted are perfect, owing, in a great measure, to their hardness and thickness when in a raw state, which would account for their resisting the application of heat better than the less bulky berry of Plantation Ceylon. Mocha, on the contrary, not only presents a most ragged appearance after it has undergone the process of roasting, but often exhibits many different shades of colour.

Coffee is one of those articles of which, though the inferior qualities may be unsaleable in Europe, a superior sample will always meet with purchasers about its real value, as it is consumed by a class who will have it, and who consequently must pay for it as a luxury. In 1847 and 1848, although 'Ceylon plantation' was sold from 35s. to 50s. per cwt. as a general price, a few samples from the highest estates brought 85s. and 92s.

The Abyssinian coffee berry, also excellent, is inferior in qualities to that of Yemen; it is larger. The Indian berry ranks next. In Arabia the picked berries are roasted in a ladle until they crackle, redden, and smoke a little, and are carefully withdrawn from the heat long before they are black or charred, and are then put to cool on a glass platter. They are then bruised (not powdered) in mortars, poured into hot water, and

boiled gently and not long, all the time stirring with a stick; add when boiling a few aromatic seeds, 'Heyl,' and a little saffron and cloves. The liquor is then strained.

In Ceylon and Southern India, mechanical contrivances have been largely applied in the process of preparing the coffee bean for the market. Amongst others, Mr. Clerihew's fanners and Greig's pea-berry machine may be mentioned.

Manure.—The returns obtained from manured plantations have been richly repaid by a high standard of bearing. Cattle manuring is the most generally available. A good manure is found in the decayed leaves that fall from the trees themselves, to which may be added the weeds produced in the plantation, dried and burnt. These, dug in, are always useful as a manure, and should be utilized. Cow-dung is the best manure for the seed-beds. The pulps of the coffee can be added to the fertilizing mass; indeed, rotting wood, weeds, burned dolomite, and anything which will produce ammonia, should be taken care of. But it has been supposed that many of the coffee plant enemies, fungi and insects, are germinated in the decaying manure. The manuring of a whole estate at one time is seldom required, but every part of the plantation should be brought under its operation every second or third year. One Ceylon estate, which was wholly manured without limit as to expense, is said to have returned about 20 cwt. to the acre; lime, cattle manure, and mould from the neighbouring forest were used in a compost, and the soil turned up everywhere round the plant to apply it (Coffee Planting in Ceylon, p. 52). The richest mould cannot yield crop after crop for years, unless a proportionate return be made to it. The plant and its fruits are differently composed, and it is more necessary to provide for the fruit than the stem which supports it. A large proportion of the bean is nitrogen, which science teaches may be produced by certain phosphates, etc., under particular circumstances. A chemist can in a few days and at trifling cost produce what the uninitiated might spend a lifetime and a fortune over without attaining.

About 1849, Mr. Herepath gave the following analysis of 150 grains of fine West India coffee berries, for the purpose of determining the best manure for the West India coffee estates. Deducting the carbonic acid, 100 grains of ash gave,—phosphate of lime, 45·551; phosphoric acid, 12·801; potash, 16·512; soda, 6·787; magnesia, 5·942; lime, 2·329; sulphate of lime, 1·751; with small quantities of sulphuric acid, chloride of sodium, and silicic acid.

In searching for a manure, where bone-dust, cow-dung, and wood ashes can be cheaply procured and applied, nothing can be better; a little powdered gneiss might be an improvement. Failing bone-dust and cow-dung, recourse must be had to ammoniacal manures, such as guano, and to lime. The dolomite of the interior of Ceylon contains, according to Dr. Gygax, the proper proportion of phosphoric acid, in the shape of apatite or phosphate of lime. Dolomite is plentiful in Southern India.

In a subsequent communication from Mr. Herepath, of date 13th June 1858, addressed to Mr. Walters, regarding a chemical analysis of Ceylon coffee, he reported that 1000 pounds of raw coffee berries of Ceylon plantation's growth, contained the following mineral ingredients:—Potash, 37 lbs.; lime, $2\frac{3}{4}$ lbs.; magnesia, $5\frac{3}{4}$ lbs.; peroxide of iron, $\frac{1}{4}$ lb.; sulphuric acid, $2\frac{1}{2}$ lbs.; chlorine, $\frac{3}{4}$ lb.; carbonic acid, $11\frac{3}{4}$ lbs.; phosphoric acid, 7 lbs. And he mentioned phosphoric acid, sulphate of lime, and carbonate of magnesia as the principal ingredients required for manure. About 100 pounds of Peruvian guano, with 7 or 8 pounds of ground gypsum, 10 pounds of magnesian limestone, and 1 pound of salt, mixed up with Ceylon vegetable mould or the ashes of the wood clearances and some pounded granite or quartz, would make a good manure for 1000 pounds of raw berries. (Bom. Stand. Jan. 1859.)

Profits — Losses. — In Southern India and in Ceylon there has been money made in coffee planting by Europeans, but chiefly in their land speculations. But there have been great and general losses, sweeping away the little savings of servants of Government and speculative persons, and in 1880–81 and 1882 there was a general loss. The yield of coffee varies greatly with the seasons; but the trees have insect and vegetable enemies which have caused ruin,—the white, brown, and black bug, the black and white grub, the leaf disease, the coffee rat, the mole cricket. The first regularly worked Ceylon estate was opened in 1825, but the bug does not seem to have appeared in large quantities till 1845; then, however, it spread with such rapidity, that in 1847 a very general alarm was taken by the planters, about the same time that the potato, vine, and olive diseases began to create alarm in Europe. The coffee bugs seem, however, to be natives of Ceylon, for the white bug has been found on orange, guava, and other trees, as also on beetroot and other vegetables; and the brown bug attacks the guava, hibiscus, ixora, justicia, and orange trees,—indeed, every plant and tree, and even the weeds, on a coffee estate, particularly such as are in gardens.

When a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, while the fungus, which never fails to attend on the bug, prevents restoration, by closing the stomates through which the tree breathes and respires. Bug, Mr. Nietner tells us, exists on all the estates; none are believed by Mr. Nietner to be quite free from it, and he reasonably asks, 'Am I wrong in saying that if there was no bug in Ceylon, it would, at a rough guess, produce 50,000 cwts. of coffee more than it actually does?' and that quantity represents a value of £225,000. The brown and white bug, and the black and white grub, he adds, are the only important enemies of the coffee tree, and the destruction caused by arhines, limacodes, zeuzera, phymatea, strachia, and the coffee rat appear to be of a more local and occasional nature. The three chief pests are the white bug, the brown bug, and the black bug.

The appearance and disappearance of the coffee bug is most capricious. It comes and goes, now rapidly spreading over a whole estate, now confining itself to a single tree amongst thousands; here, leaving an estate in the course of a twelvemonth, there remaining permanently; sometimes spreading over a whole estate, sometimes attacking a single field, then leaving it for another and another. But the white bug prefers dry, and the brown damp localities, the latter being found

more plentiful in close ravines and amongst heavy rotting timbers than on open hillsides, and it is probably to this predilection that the shifting of the insect is attributable. The bug seeks out the softest and most sheltered parts of the tree, the young shoots, the under-sides of the leaves, and the clusters of berries.

The injury done by the white bug seems more severe than that from the brown, but, not being so plentiful as the latter, it is of less general importance. The white bug is especially fond of congregating amongst the clusters of berries, which drop off from the injury they receive, and trees often lose their entire crop in this manner. The injury produced by the brown bug is the weakening of the tree, and is thus more general, but the crop does not drop off altogether nor so suddenly. With white bug on an estate, the crop can hardly be estimated; with brown bug it can.

The *White* or *Mealy Bug* is the Pseudococcus adonidum. The male insect is of a dirty brownish colour, and slightly hairy. It is very minute (very much smaller than the female, only about half a line long), and resembles certain small Ephemeridæ or May-flies. The female is oval, brownish-purple, covered with a white mealy powder, which forms a stiff fringe at the margin, and at the extremity of the abdomen two setæ. The larvæ and pupæ are active, and move about. The insects, in all stages of development, are found in Ceylon all the year round, chiefly in dry and hot localities, on the branches of trees, and on the roots to one foot under ground. Mr. Nietner says it is identical with the species naturalized in the conservatories of Europe. It is preyed upon by the Scymnus rotundatus, a minute beetle of the ladybird tribe, of the size of a pin's head, black and pubescent; also the yellow-coloured and common Encyrtus Nietneri and the black-coloured scarce Chartococcus musciformis, two minute Hymenoptera (wasps), only $\frac{1}{2}'''$ long, and the minute whitish mite, Acarus translucens. Of the members of this family of insects, the Coccidæ, some, as the cochineal and lac insects, are of great economical importance, but others, as the sugar-cane blight of the Mauritius, the Aspidiotus, and the coffee bug, are excessively baneful to the gardener and agriculturist.

The *Brown Coffee Bug*, Lecanium coffeæ, *Walker*, establishes itself on the young shoots and buds, which it covers with a noisome incrustation of scales, enclosing its larvæ, from the pernicious influence of which the fruit shrivels and drops off. It is a Coccus, and a number of brownish wart-like bodies may be seen studding the young roots, and occasionally the margins on the outside of the leaves. Each of these warts is a transformed female, containing a large number of eggs (700), which are hatched within it. When the young ones come out of their nest, they may be observed running about on the plant, looking like wood-lice; but shortly after being hatched, the males seek the under-sides of the leaves, while the females prefer the young shoots as their place of abode. The larvæ of the males undergo transformation into pupæ beneath their own skins, and their wings are horizontal, and their possession of wings may possibly explain the comparatively rare presence of the male on the bushes. The female retains her powers of locomotion until nearly of full size, and it is about this time that her impregnation takes place. The pest does not produce great injury until it has been two or three years on an estate; but at length the scales on the plants become numerous, the clusters of berries assume a black, sooty look, and a great number of them fall off before they are mature. The young shoots have a disgusting look from the number of yellow pustular bodies forming on them, the leaves get shrivelled, and on many trees not a single berry forms. The coffee bug first appeared in 1843 on the Lupallu Galla estates, and it, or a closely-allied species, has been observed on the Citrus acida, Psidium pomiferum, Myrtus Zeylanica, Rosa Indica, Careya arborea, Vitex negundo, and other plants, and most abundantly on the coffee bushes in moist places. It reappears though eradicated, and is easily conveyed on cloths from one place to another. Dr. Gardner, whom Sir J. E. Tennent quotes (ii. p. 246), was of opinion that all remedies had failed, and that it must wear itself out, as other blights do. The male of the brown or scaly bug, Lecanium coffeæ, is of a clear light pinkish-brown colour, slightly hairy, and very pretty. It is more delicate than the male Pseudococcus. The females when young are yellowish, marked with grey or light brown; and old individuals are light brown, with a dark margin. It affects cold, damp, and close localities, 3000 feet in height, and the propagation, as in the white bug, is continuous. The brown bug is much infected with parasites, amongst which the most common are eight minute Hymenoptera (wasps) with brilliant colours; but a mite, the Acarus translucens, and the larva of the Chilocorus circumdatus, a kind of ladybird, also feed on the bug. In the larva state, the male and female brown bug are not distinguishable. The number of eggs produced by a female brown bug is about 700. Those of the white bug are not so numerous, but their propagation in Ceylon is continuous throughout the year, and this explains their great abundance compared with cold countries, where the produce is one generation of young annually. The brown bug, particularly the full-grown female, is dreadfully infested with parasites, which thus greatly help the planter. Indeed, it is a question whether coffee planting could be carried on without their aid in the destruction of the bug.

The *Black Bug* is Lecanium nigrum, but the female only is known. In colour it is from yellowish-grey to deep brown, and almost black in age, and of a shield-like shape. It occurs alone, but also intermixed with the brown bug; but it is much less abundant, and therefore not demanding the planter's attention. Its occupation of a coffee or any other tree gives rise to the appearance of a glutinous saccharine substance, which has received the name of honey-dew. This is either a secretion of the bug, or the extravasated sap which flows from the wounded tree, or probably a combination of both. A fungus, or two fungi, the Syncladium Nietneri and Triposporium Gardneri, seem to depend on this for vegetation, as the honey-dew and the fungus disappear with the bug.

Another bug, the *Strachia geometrica*, of a yellowish colour, but marked with grey and orange on the upper side, was found at Badulla. It feeds upon the juice of the young berries, three per cent. or more of which were said to have suffered from it. It is allied to the green or fœtid

bug; but though it may occasionally cause destruction, there is no fear of it ever becoming a serious nuisance.

One of the Aphidæ, *Aphis coffeæ*, the Coffee Louse, is found in small communities on the young shoots and on the under-side of the leaves of the cocoanut tree, but the injuries it occasions are insignificant.

Several *caterpillars*, the Aloa lactinea, the Orgyia Ceylanica, Euproctis virguncula, the Trichia exigua, Narosa conspersa, the Limacodes graciosa, and a species of Drepana, are found on the coffee trees, but they do not cause much injury. Another caterpillar, however, though fortunately not abundant, the Zeuzera coffeæ, destroyed many trees, both young and old, by eating out the heart. It resembles the caterpillar of the goatmoth of England, and is as thick as a goose quill. It generally enters the tree 6″ or 12″ from the ground, ascending upwards. The sickly drooping of the tree marks its presence.

Black Grub.—The larva of the moth called Agrostis segetum is the very destructive black grub. This pest is about an inch long, and is most abundant from August to October. The caterpillar lives in the ground, but comes out at night to feed, and is very common and injurious. It attacks not only coffee trees, but all sorts of vegetables and flowers, and is very destructive to gardens and in the field, as it eats everything that is artificially raised, despising grass and weeds. It generally appears only on certain fields, and will not go over an estate. The insect is not confined to Ceylon; its ravages are well known in India, at the Cape of Good Hope, and in Europe, where it injures the grain and beetroot crops. In Ceylon it only attacks young coffee trees, gnawing off the bark round the stem just above the ground. Where the trees are very small, they are bitten right off, and the tops sometimes partially dragged under the ground, where the grubs may easily be discovered and dislodged. The damage which they inflict on plantations may be estimated, when it is mentioned that Mr. Nietner lost through them in one season, in certain fields, as many as twenty-five per cent. of the young trees he had put down.

The larva of a little moth, the Galleriomorpha lichenoides, and three caterpillars of the Boarmia leucostigmaria, B. Ceylanica, and Empithecia coffearia, are found on coffee trees and other plants from September to December.

The larva of the Gracillaria coffeifoliella mines the coffee leaves; it is very common, but of no importance to the planter.

The ravages of the large, well-known, beautiful *locust*, the Phymatea punctata, with its scarlet abdomen and yellow and bronze above, are not continuous in the coffee trees, but are occasionally very annoying. A swarm settled on a field of one-year-old coffee, and gnawed the bark off the stems, causing them to throw out many shoots, and permanently disfigured five per cent. of the trees. They do not touch the Illuk grass, Saccharum Konigii, *Retz.*, but seem only to attack cultivated plants and trees. At Tangalle they destroyed tobacco plantations, and at Matillee in Kandy the native grain crops were injured by these locusts. The larvæ and pupæ are as destructive as the perfect insects; but this seems, fortunately, the only species of locust that does any real injury in Ceylon, and this injury is in importance not to be compared with that done by other species in other countries.

White Grub.—Under this name are included the larvæ of various Melolonthidæ, the cockchafers of Ceylon, which do much harm to coffee plantations, young and old, by eating the roots of the trees. Mr. J. L. Gordon of Rambodde considered the white grub to be by far the greatest enemy of the coffee trees which the planter had to contend with, as he never knew a single tree recover after their attack; and he adds that they had destroyed, at Rambodde, in two years, between eight and ten thousand trees of fine old coffee. Mr. Gordon used to dig up the soil at the foot of the trees, and take out such grubs as he could find.

Weevils.—The family of the weevils is one of the most extensive amongst the beetles; and in Ceylon, as in Europe, many of its members do much injury to agricultural produce. Mr. Nietner had seen nearly the whole crop of sweet potato (Batatas edulis) of the Negombo district destroyed by one of them, the Cylas sturcipennis. The common rice weevil, Sitophilus oryzæ, is another instance; and one of the cocoanut destroyers of the Ceylon low country, the Sphænophorus planipennis, belongs also to this family. The Arhines? destructor, a beautiful green weevil, Mr. Nietner had not found do any injury to coffee trees; but Mr. J. Rose of Matturattee, writing to him, said, 'The mischief they do is plentiful, and if they were as plentiful as the bug, they would be the planter's worst enemies. Five or six acres were completely covered with them, and they consumed almost every leaf. Year after year they appeared upon the same place. One year they appeared upon a neighbouring estate in great force, and ran over at least forty acres. The same thing occurred on three other estates.'

The Acarus coffeæ, or *coffee* mite, is so small as to be hardly perceptible to the naked eye. It is closely allied to the Red Spider of the hothouses of Europe. Nearly all the year round, but chiefly from November to April, it feeds on the upper side of the coffee leaves, giving them a brownish, sunburnt appearance. Individual trees suffer from its attacks, but the aggregate damage from it is not great.

The *Coffee Rat* of Ceylon, the Golunda Ellioti, occasionally commits much damage, seemingly to get the bark, for they do not seem to eat the berries. With their long sharp incisors they bite off with great smoothness the smaller and younger branches, generally an inch from the stem; and should the plants be quite young, just taken from the nursery, they bite them right off a few inches from the ground, and carry them to their nests in hollow trees. They appear irregularly, at intervals, from the jungles, and there is hardly an estate in Ceylon that does not now and then receive a visit from them. The natives of Ceylon say that their food in the jungles is a species of Strobilanthes, called Nilu in Singhalese, and that the rats only issue from their forest residence and attack the coffee estates when their forest food fails.

The injuries from other animals is not serious. A *squirrel*, the Sciurus Layardi, which eats the coffee berries, is common on Ceylon estates; the pulp alone is digestible, and the coffee beans are dropped on logs of wood and on the ground. Jackals and monkeys occasionally do the same;

this is called parchment coffee. A deer will now and then come from the forest and nibble the tops of the young trees.

Mantis tricolor, *Nietner*, the Mantis of the coffee tree, is green, lower wings reddish, with large blackish spot at the posterior margin. The female is 1 inch long, with 1½ inch of an expanse of wings. The male is considerably smaller. The eggs are deposited upon coffee leaves, in cocoon-like masses of ⅝ of an inch in length, but drawn out further at each end.

And what are the remedies to all these coffee plagues?

Mr. Nietner tells us that several means of checking the extension of the bug have been proposed and tried. Amongst these, the introduction of the red ant; but their bites are so fierce and painful, that the coolies refused to go amongst the trees while the ants were there. Rubbing off the bug by hand has been tried, but it can only be attempted upon young trees without crop; and Mr. Nietner, although allowing that an immense quantity of bug is thus destroyed, is nevertheless of opinion that the effect is but trifling. He thinks that the application of tar to the roots is a good suggestion, although he is obliged to admit that hitherto no important results have been achieved by it. He adds that high cultivation seems to have the effect of throwing it off. But as the bug seems to depend on locality, Mr. Nietner does not look for any beneficial result so long as the physical aspect is unchanged. He thinks that if the open, warm, airy pattenas were cultivated, which the experiments on a large scale, tried at Passelawa, show that they can be, the brown bug, which is the great destroyer, would not find the conditions favourable to its existence; or perhaps, if estates as a rule were made smaller than they generally are, if the reduction in acreage were counterbalanced by a higher system of cultivation, universally carried out, the bug would not be so numerous as it now is.

In the southern parts of the Peninsula of India, the *Borer* is a name given to the larva of a coleopterous beetle, the Xylotrechus quadripes of Chevrolat, which injures coffee trees. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the female near the root of the tree, and the pupa borers tunnel up the heart of the plant. It does not stop short at the destruction of crop, but actually kills the trees. This enemy has been confined to the Madras Presidency and Mysore, leaving Ceylon unscathed. The borer carries on the work of destruction entirely in the interior of the stem, the wood of which it rapidly reduces to a sawdust-like powder, leaving the bark intact. At first the only signs of the presence of the foe are a few small round holes in the bark, but gradually these holes increase in number as the grubs get more numerous, the leaves get sickly and fall off, and finally the tree withers and dies. If this devastation were confined to a hundred or even a thousand or two of trees, the planter could afford to grin and bear his loss; but instances are numerous in which an entire estate has been completely denuded of trees by this tiny but formidable insect. For a time the borer seemed destined to defy all attempts to arrest its ravages; but it was observed that the beetle, which lays the eggs from which the grubs are hatched, avoided shade, and affected light and sunshine. Thus much known of the habits of the foe, the protection of the coffee plants by the shade of larger trees naturally suggested itself, and has been found a most effectual remedy.

The *Leaf Disease*, or Coffee Leaf Disease, of the coffee plant seems first to have appeared in Ceylon in 1869, and prominently in S. India in 1870. It is the Hemileia vastatrix, a fungus which fixes on the under-sides of the leaves, causing spots or blotches, at first yellow, but subsequently turning black. These blotches are covered with a pale orange-coloured dust, which is easily rubbed off. The blotches gradually increase in size, until at last they have spread over the entire leaf, which then drops off, leaving the trees in a short time perfectly bare. The trees seem to recover in the spring of the year, but the fresh foliage is in its turn attacked, and the crop falls off. The yearly crop in Ceylon is said to have diminished 300,000 cwts. since its appearance, causing a loss of about 1¼ millions sterling. The leaf disease is a true endophyte, developing in the tissues of the leaf, and expanding outwards, as is the case with red rust of corn and grapes. Sir Joseph Hooker, writing to the Colonial Office, 6th August 1874, says the Hemileia belongs to a class of most minute parasitic plants, which includes the oidium of the vine and peronospora of the potato. Recent observations appear to establish the fact that similar plants are also present in the tissues of sheep affected with small-pox, and may probably be found to be sources of some familiar diseases in man and the lower animals. Hitherto no means have been discovered of extirpating these plants, whose seeds, of inconceivable minuteness, float in inconceivable numbers in the air, and whose growing parts are of such tenuity, that they can penetrate the most delicate living tissues of plants, which they kill by feeding on their substance. The spread of some of the kinds has, however, been effectually checked by the use of flower of sulphur, which it would not be difficult to apply to the coffee plant in Ceylon.

The Hemileia vastatrix has been termed the coffee leaf disease, as it confines its depredations to the leaves of the shrub. When suffering from this, the leaves are on their upper surface speckled with brownish spots, while the under surfaces are covered with orange-coloured dust, which consists of the spores of the fungus, or bodies by which it is propagated. The fungus itself consists of fine myceloid filaments, which permeate and live amongst the tissues of the leaf. When the spores are ripe, the shaking of the leaves by the wind is sufficient to disperse them, and each spore thus liberated is capable of germinating, and may become a fresh focus of the disease. Dr. Thwaites of Ceylon watched this process of germination. For some time the presence of the leaf disease caused little or no anxiety in India; but as its disastrous effects on crops became apparent, the planters began to realize the serious character of the distemper. Nearly all are now in accord in the view that manuring is the best remedy. Confident hopes were at one time entertained that the Liberian plant, which has been recently introduced, would defy the enemy, but unfortu-

nately this expectation has not been realized. It is very destructive in localities. It comes most suddenly and unaccountably in an estate, and disappears apparently without any reason. The effects of it are obvious: the leaf of the tree alone is attacked, after a little drops off, leaving the bough bare and unsheltered. The disease does not seem to attack the health and vitality of the tree; but when the shade afforded by the leaf to the berry is removed, the bud, blossom, or fruit is unduly exposed to the scorching sun, or to the wind, and the crop is lost. The disease often affects whole plantations simultaneously. Up to 1872 the Ceylon estates had suffered but little from this fungus. In Wynad, however, scarcely an estate escaped this leaf disease, whilst in the fifty-two estates of Travancore only one suffered, and that in a most insignificant degree.

Mr. G. Anderson, writing from Munzerabad in 1880, gave the opinion that potash, magnesia, and ammonia, in the form of sulphates, check and destroy Hemileia in coffee. He said he had used it in his experiments with excellent results,—¼ to ½ potash, ¼ to ½ magnesia, and ½ to ½ ammonia,—and thinks that the cessation of growth which precedes an attack of leaf disease, is caused by a want of ammonia and other valuable food-constituents in an available form; that lime exerts a marvellous effect in setting free all the alkalies, and in converting nitrogen into ammonia; that potash, magnesia, and lime are required for the production of coffee, and are therefore removed from the soil, and that certain forms of potash and magnesia (especially those combined with sulphur) are inimical to the growth of fungi. He concludes that sulphates of potash, magnesia, and ammonia should be used immediately before the occurrence of disease; and lime should be employed early in the season to sweeten the soil, and set free its resources. He also recommends that phospho-nitrogenous manures, combined with other forms of potash, be applied to sustain and invigorate the trees.

Several learned botanists have suggested remedies for these plagues.

Baron F. von Mueller says that in 1878 the parasitic fungus growth on coffee plants in Ceylon caused a loss of £2,000,000.

In America the coffee plantations suffered not only from erysiphoid fungi, but also from the cemiostoma fly.

In the Karen hills, experimental cultivation of tea and coffee was introduced north-east of Tounghoo. Mr. J. Petley says in his report: 'Towards the end of the rains of 1880 large numbers of the Mole Cricket made their appearance, and much destruction was done amongst young tea and coffee plants, killing them by nipping off the tops, principally amongst the coffee, and boys were employed to catch and kill these destructive insects.'

Dr. Thwaites, in his report for 1874, says: 'Judicious cultivation enables the coffee tree to produce a succession of profitable crops, notwithstanding it may suffer from periodical attacks of leaf disease.' Nowhere has the disease committed such havoc as in native plantations, where cultivation is almost entirely neglected. Previously to 1870, planters were divided into two opposite camps,—the party that advocated manuring, and the party that opposed it. The inroads of leaf disease have led to the matter being speedily and practically settled in favour of high cultivation.

In Ceylon, leaf disease first showed itself in 1869, in Madulsima, in the extreme eastern division of the coffee districts. Next year it spread to the Kandy side, and in 1871 it became general. During the seven years previous to 1870, the out-turn ranged from 4·10 cwt. per acre in 1864, to 5·22 in 1869. In 1870 the export was nearly 900,000 cwt., and the average per acre 5·53 cwt. In 1871, 1873, 1875, and 1877, the export rose above 800,000 cwt.; but (1881) the average per acre has never again reached 5 cwt., while in four years it has fallen below 3 cwt. The leaf disease has undoubtedly caused a falling off of production.

Colonel Beddome, the Conservator of Forests, is of opinion that the remedies proposed by Mr. Anderson in his Essay on Fungoid Diseases might be tried on small given areas, but considers the expense attending the trial prohibitive as regards large estates.

Leaf Rot, the Kole Roga of the Tamil race, is from another fungus, to which the name 'Pellicularia koleroga' has been given. It appeared on the coffee trees of Mysore. It is an epiphyte, growing and developing upon the leaf, and only superficially attached to it. This enemy has been long in existence, although it is only quite recently that it has attracted attention. This disease is most common during the rains; and the leaves of the plants affected by it turn black and fall off, on which many of the berries also fall down, and those which remain are imperfectly ripened. On examining one of these leaves, the under surface will be seen covered with irregular greyish-white blotches, which, on being put under the microscope, are found to be filmy fungus patches, with the filaments of the fungus interwoven into a sort of web. This fungus has received from Mr. Cooke the name of Pellicularia koleroga, but it seems very doubtful whether it is not rather a result than the cause of the black rot. There can be little doubt that rot is partly caused by imperfect drainage, and overcrowding of the branches; and such being the case, the remedies will obviously be improved drainage and free pruning.

Stump.—Mr. Hull mentions that between 1860 and 1870, in Coorg, a blight appeared on the coffee plants, to which the name of stump was given, because of it being due to the stump of a particular forest tree peculiar to that district, felled in the process of clearing. Sooner or later all the coffee trees in the immediate neighbourhood of these stumps began mysteriously to die out, and the only remedy for the mischief was to remove the offending stumps as quickly as possible (Hull, p. 274). It has not been examined by any entomologist; but a great habitat of the coleopterous insects is below the bark of decaying wood, and such homes should not be left to them.

Dr. Shortt, a scientific planter, recommends carbolic acid as a protective agent against the leaf disease and other enemies of the coffee plants.

The Gardener's Chronicle also mentions having received from Dr. Thwaites of Ceylon a specimen of a minute fungus. A few trees were first noticed to be infected in May, but at the time of Dr. Thwaites' communication (24th July) two or

three acres were showing the fungus upon the leaves. These latter fall off before their proper time. Amongst more than a thousand species of fungi received from Ceylon, this does not occur; and it is not only quite new, but with difficulty referable to any recognised section of fungi. Indeed, it seems just intermediate between true mould and Uredo, allied on the one hand to Trichobais, and on the other to Rhinotrichum. Though the fungus is developed from the parenchym of the leaf, there is not any covering to the little heaps, such as is so obvious in Uredo and its immediate allies, while the mode of attachment reminds one of Rhinotrichum. A new genus for its reception was therefore proposed. As the fungus is confined to the under surface of the leaves, and the mycelium is not superficial, it may be difficult to apply a remedy; but sulphur applied by means of one of the instruments which are used in the hop grounds in Kent, or syringing with one of the sulphureous solutions which have been recommended for the extirpation of the hop mildew, has been suggested.—*Rev. M. J. Berkeley; Colombo Observer.*

The Sydney Morning Herald describes an experiment on the aphis or coffee-moth, which shows that by a very simple application coffee plants may be freed from these destructive insects. A number of the insects were placed on a leaf under a powerful microscope. A drop of a simple solution of soda in water was let fall among them. They instantly left their hold on the leaf and fell dead. Such a solution could be applied without injury to coffee plants. Sulphur has hitherto been the favourite treatment.

The following is a list by Mr. Nietner of some of the enemies of the coffee plant in Ceylon:—

1. Pseudococcus adonidum, White or Mealy Bug.
   Parasites.
   Scymnus rotundatus, *Motch. Er. Ent.* 1859.
   Encyrtus Nietneri, *Motch.*
   Chartocerus musciformis, *Motch.*
   Acarus translucens, *N.*
2. Lecanium coffeæ, *Walk. List. Ins. B. M.*, Brown or Scaly Bug.
   Parasites.
   Scutellista cyanea, *Motch.*
   Cephaleta purpureiventris, *Motch.*
   C. brunneventris, *Motch.*
   C. fusciventris, *Motch. in lits.*
   Encyrtus paradisicus, *Motch. in lits.*
   E. Nietneri, *Motch.*
   Cirrhospilus coccivorus, *Motch. in lits.*
   Marietta leopardina, *M. in lits.*
   Chilocorus circumdatus, *Schonh.*
   Acarus translucens, *N.*
3. Lecanium nigrum, *N.*, Black Bug.
4. Syncladium Nietneri, *Rabh. Dresd. Hedwig*, 1858; Trisposporium Gardneri, *Berk. J. Hort. Soc. Lond.* 1849; a fungus.
5. Aphis coffeæ, *N.*, Coffee Louse.
   Parasites.
   Syrphus Nietneri, *Schiner in lits.*
   S. splendens, *Dolesch.*
   Micromus australis, *Hag;* Verz. Wien., *Z.*, 1858.
6. Strachia geometrica, *Motch. in lits.*

Lepidoptera.

7. Aloa lactinea, *Cram. pap. ex.*
8. Orgyia Ceylanica, *N.*
9. Euprocitis virguncula, *Walk.*
10. Trichia exigua, *Feld. in lit.*
11. Narosa conspersa, *Walk.*
12. Limacodes graciosa, *Westw. Ent. cat.*
13. Drepana?
14. Zeuzera coffeæ, *N.*
15. Agrotis segetum, *Wien. V.*, Black Grub.
16. Galleriomorpha lichenoides, *Feld. in lit.*
17. Boarmia Ceylanica, *Feld. in lit.*
18. C. leucostigmaria, *Feld. in lit.*
19. Eupithecia coffearia, *Feld. in lit.*
20. Fortrix coffearia, *Feld. in lit.*
21. Gracillaria? coffeifoliella, *Motch.*

Diptera.

22. Anthomyza? coffeæ, *N. in Motch.*

Orthoptera.

23. Phymatea punctata, *D.*

Coleoptera.

24. Ancyloncycha, *spec.?* White Grub.
25. Arhines? destructor, *N.*

Aptera.

26. Acarus coffeæ, *N.*

Mammalia.

27. Golunda Ellioti, *Gray in Kel. Prod.*, Coffee Rat.

COHUNE OIL, a product of the kernel of the Attalea funifera, *Martius*, a palm tree, native of S. America. It is something like cocoanut oil, but is more oleaginous. Its introduction into S. Asia merits attention.—*Seeman.*

COILADDY. About a mile to the west of Coiladdy is a mound that prevents the waters of the Cauvery running into the Colerun.

COILGUDDY, a pagoda eight miles east of Madura.

COIMBATORE, a collectorate of the Madras Presidency, in the south of the Peninsula. Its chief town of the same name is in lat. 10° 59′ 41″ N., and long. 76° 59′ 46″ E., and is 1350 feet above the sea at the palace.

The district occupies an area of 7432 square miles, over which about 7000 villages and hamlets are spread, possessing a population of 1,763,274 human beings. It has but little rain. The produce is grains, mostly of the dry description, cotton, sugar, tobacco, and hemp. The climate is warm, and not unfrequently oppressive, being completely hill-locked. The aspect of the country is arid and unpleasant in the extreme. Its northern part, called Collegal, has numerous small jungle-covered hills; and to the west of Collegal are the Neilgherry Hills. The Animallay Hills are in the S.W. border of Coimbatore, and are richly clothed with valuable forests, with many elephants; and some of the lower hill ranges from the Neilgherries, between which is the valley and gap or pass of Palghat leading to the western coast. The Guzzlehutty pass leads up the deep valley separating the Neilgherry Hills from Collegal. The Animallay (literally Elephant Hills) are occupied by the Kader,—open, independent, straightforward men, simple, and obeying their mopens or chiefs implicitly. They are strong built, active,

with woolly hair and something of the African features, and file their front teeth to a point. The women wear enormous circles of pith in the lobes of their ears, which they distend down to their shoulders. A black monkey is their greatest dainty.

The other hill and forest tribes, chiefly residing on the Animallay, are the Malai Arasar, Irular, Pulyar, and Mandanar, subsisting precariously on wild fruits and roots, by the chase, or the sale of jungle produce. 40·8 per cent. of the population were Vellalar cultivators, 13·7 per cent. Pariahs, 8 per cent. Vannian or day-labourers, 5·3 per cent. Kaikalar or weavers, with artisans (Kammaan), Brahmans, washermen (Vannan), potters (Kusavan), fishermen (Sambadavan), barbers (Ambattan), and writers (Kanakan).

Coimbatore land is many times more valuable than it was forty years ago; and wheeled carriages, which were 603 in 1846–7, in 1867 were 4500. In Coimbatore two very different minerals pass under the common name of corundum. The one is true corundum of lamellar structure; the other softer and amorphous, but christature in its composition, apparently some form of hornblende. The mineral is abundant in the district, and easily procured at a small cost. Localities in Coimbatore supply the beryl, and are also supposed to have yielded the emerald, though Tavernier was not able to ascertain that any part of India, in his day, was yielding emeralds.—*Tavernier's Travels*, p. 144; *Lt.-Col. Hamilton, in literis.* See India, p. 324; Korumbar; Narapati.

The Hindus altogether neglected history, and, after the Greek occupation of Bactria until the advent of the Mahomedans, the coins of the rulers furnish almost the sole evidence of the dynastic changes and their individual rulers in the country of the Kophones river, *i.e.* Bactria, Asia, and Kābul. The earlier of the Greek successors of Alexander used Greek. This was adhered to by Theodotus I., B.C. 256, of the time of Arsaces I.; of Theodotus II., B.C. 240, who reigned in the Kābul valley. Euthydemus, B.C. 220, reigned in the time of the expedition of Antiochus the Great, and was defeated in battle near Merv by the united Syrian and Parthian armies. He then urged Antiochus to receive him in alliance, and so extend the Greek influence to the Indus. A peace was concluded, and Euthydemus led the Syrian army through Bactria, *i.e.* by the route north of the mountains to the Kābul valley, and across the Indus, in B.C. 206. There Antiochus made peace with Sophagasenus (Asoka), which that sovereign recorded by edicts on rocks and pillars in various parts of India, in characters exactly resembling those on the coins of Agathocles. In B.C. 205, Antiochus returned by way of Arachotia. Agathocles, B.C. 190, coined with Greek and Sanskrit; is supposed by Lassen to have ruled Kabulistan to the Indus; and Mr. H. T. Prinsep supposes him to have been the governor left by Antiochus in Kābul, after his treaty with Asoka. Pantaleon, B.C. 195, coined in Greek and Sanskrit. Eukratides, B.C. 178 (Prinsep, B.C. 181; Bayer, Wilson, B.C. 165; Visconti, Lassen, B.C. 175). He seems to have made an expedition to India in 165 B.C., and on his return from it to have been murdered by his son. Numerous of his coins have been found in Bactria and Afghanistan; and Mr. H. T. Prinsep considers that he ruled originally in Bactria, subsequently made conquests in and south of Parapamisus in Kābul, and was the first of all the Greeks who coined in the bilingual Aryan inscription. The first use of two languages, however, is also ascribed to Agathocles, who used Greek and Sanskrit, while Eukratides used Greek and Aryan. Eukratides was certainly amongst the earliest of the Greek kings of Bactria, Kābul, and Arya, who adopted bilingual inscriptions on his coins, and his so doing is supposed consequent on his conquest of the Parapamisus, after assumption of the title of Great King. On his death, his wide dominion is supposed to have been broken into several independent kingdoms. Heliocles, B.C. 155, the parricide of Eukratides, used bilingual inscriptions on coins in pure Greek and Aryan. His rule, though short, extended over Bactria and the Parapamisus. Antimachus, B.C. 150, coined with Greek and Aryan. Bactria seems to have then passed under the sway of various Saca and Parthian and so-called Indo-Scythian rulers, and during the first six or seven centuries of the Christian era it was one of the most important centres of Buddhistic monasticism. As early as the second century B.C., the coins of Eukratides had the Bactrian-Pali, a language cognate with Sanskrit, but written with characters of seemingly Phœnician origin.

On the coins of the Parthian, Sassanian, Kanerki, Bactrian, Persian, Macedonian, Syrian, Indo-Scythic or Buddhist rulers are Greek or Pehlavi inscriptions, several of them in both languages. The coins have been found of upwards of thirty Bactro-Indian rulers whose names were not Grecian, but who used Greek on their coins. They have been described in Prinsep's Antiquities, Wilson's Ariana Antiqua, and Bactrian Coins by Edward Thomas. The larger number are known as the Azes series, and the Kadphises and Turushka series.

The Hindu coins of the Andhra, Rajputana, Canauj, Indraprastha, and perhaps Magadha or Behar rulers, are subsequent to Alexander's invasion. The earliest forms in use in India and Central Asia were adopted from the Bactrian Greeks about B.C. 200. The oldest extant are the group of the Sah dynasty, B.C. 180 or 170 to about B.C. 50.

The Arabian khalifs and the governors of Persia on their coins used Pehlavi characters, and subsequently the Kufic. Their coins have been found struck at Balkh, Basra, Darabjird, Herat, Kerman, Khuzistan, Merv, Merv-ul-Rud, Nahr (van) Seistan, and Yezd.

The capital coins of Dehli, from the time of Altamsh (A.D. 1211–1236) to the accession of Muhammad Taghalaq (A.D. 1325), were a gold and silver piece of equal weight, approximating to a standard of 175 grains troy (properly 100 rati). These coins appear to have been officially termed respectively Sikka and Filizzat, but both seem eventually to have had the popular name of Tan-khwah. Sikka, a word of Hebrew origin, in India originally appears to have been a die, and applied to the coin struck. At an early date the word gave a name to the Zecca or Cecca, or mint, of the Italian Republics; thence to the Zecchino or Cecchino which issued therefrom,

and in this shape the word travelled back to the East, where the term Chickeen or Chick survived to our own day, as a comprehensive Anglo-Indian expression for the sum of four rupees. Filizzat means 'metallic.'

The coinage of British India is regulated by Acts ii. and xvii. of 1835 and xii. and xiii. of 1862. Acts xiii. of 1836 and xiii. of 1844 declared that Sicca rupees, and Benares, Farrakhabad, and Trisulee rupees, are not a legal tender. Other Acts are xxxi. of 1837, xxi. of 1838, vi. of 1847, and xi. of 1844.

The silver coins coined and current in British India are the silver rupee of 180 grains, with its portions in half, quarter, and eighth.

By Act xxi. of 1835, the copper coinage consists of a double pice or half anna, weighing 200 grains troy, a quarter anna or pice of 100 grains, a half pice or one-eighth of anna of 50 grains, and a pie, being 1·12 of anna or one-third of a pice, 33⅓ grains troy. The silver fractions and the copper coins are legal tender for fractions of a rupee. Gold has not been coined in the mints of India since the early part of the 19th century. Till then, the gold mohur, value 16 rupees, and the pagoda or hun, value 3½ rupees, were current.

All the people of the east coast of Africa, Southern India, Siam, and Japan have the cowry shell, Cypræa moneta, for small change; and the radical character in the Chinese for silver, money, riches, precious stones, expense, is 'poei,' or shell. Tavernier found pieces of twisted metal wire, called Lari (from the province of Lar, in Persia), current on the Malabar coast; and Thunberg likewise saw them current in Ceylon; and Knox tells of a coin (p. 197) 'like a fish-hook.' These have a resemblance to the Celtic rings of Britain and to the oboloi of the Greeks, which were kabab-skewers, (oboloi) ὀβολοί, a handful of which made a drachma, from ὀράττειν, to grasp with the hand.

In assay reports from the Bombay mint in 1852 on Panjab coins, the average of 190 old Mohurkee rupees was equal to 90·662 Company's rupees; that of 190 new was 88·792; 190 Gondashai rupees averaged equal to 78·961; 190 Jcobanshai, equal to 94·781; and 190 Nanakshai, equal to 92·037 Company's rupees. 190 old Farrakhabad rupees averaged 98·837, and 190 new, equal to 98·847 Company's rupees. 90 Khyrpur rupees averaged 87·123 Company's rupees, and 98 Nadri rupees 106·558 Company's rupees.

Southern India had a coinage of gold, and a small coinage of silver and copper, under the Hindus prior to the Mahomedan rule, and the maharajas of Travancore still coin in gold.

The Mahomedan silver (rupa) rupee was first struck at Dehli about A.D. 1541, in the time of Sher Shah, but was not made current in the south of India till 1654.

In 1601 the English introduced India money specially struck for India in the London mint. The coins had on them a portcullis. In 1660–61 the English established a mint at Madras. In 1770 there were in Bengal so many sorts of rupees, and rupees intrinsically of the same value differed so much in nominal value, which was regulated by the date of coinage, that no one but a siraf or money-changer could value the current coin, and the Government were forced to establish an ideal standard, called the current rupee, to which all calculations were made.

Most of the Feudatory States of India continue to coin in their own rulers' names, and under an Act of 1872 the coins of Native States of India are admissible as currency, under certain conditions. In the Hyderabad State there are several rupees, the Hali Sicca, and others, all of less weight than the rupee of British India. In Amraoti, the bankers used to pass sealed bags of money. In the Hyderabad State the copper coins in use are shapeless lumps, with some obscure marks on them. In reality these copper coins are the chief part of the currency, the value of the several silver coins being various, and each varying daily in the exchange of the bazar. The reckoning is by four, which is called a ganda.

4 cowries (gavvalu)	= 1 ganda.
14, 16, or 18 ganda	= 1 thoodi or Pisa copper.
4 thoodi or doodi	= 1 ganda of coppers.
16 or 17 copper ganda	= 1 rupee.

Nepal was conquered by the Gurkhas in the Newar year 888, corresponding with A.D. 1768. Prior to this epoch, the valley of Khatmandu was divided into three sovereignties, Patan, Bhatgaon, and Khatmandu, each governed by a raja. Hence, on the Newar coins, three series of rajas' names are found, those of Bhatgaon being generally distinguished by a shell, those of Patan by a trisul, and those of Khatmandu by a sword. The old coins of the Mal or Newar rajas are much valued for their purity, and are worn by the women, strung to necklaces or armlets, as tokens in memory of their ancestors. All money current north of the valley of Nepal, as far as the boundaries of Chinese Tartary, was formerly coined by one or more of the Nepal rajas. This was a source of considerable profit to them, the Bhutia giving them weight for weight in silver and gold-dust; but Ranjit Mal, the last reigning raja of Bhatgaon, sent them such base coins as to occasion a decrease of nearly one-half of their intrinsic value, which was no sooner discovered by the Bhutia than a desertion of the mint took place, and there has been no more Bhutia coinage made in Nepal.

The Nepalese procure all their silver from China, in the form of stamped lumps, as they are current in Lhassa, for the Tibetans generally follow the Chinese custom in their money transactions, of paying and receiving by weight, and the merchants carry scales with them for the purpose. Since the Gurkha conquest, the Vikrama era has superseded that of Newar for ordinary purposes, and the Saka, commonly used in Hindustan, has been introduced upon the Nipalese coins.

A Kashmir rupee was coined in 1849 by the late maharaja Partab Singh, bearing a Christian cross, and the letters 'I.H.S.' These were coined shortly after the annexation of the Panjab, when the maharaja was very anxious to show his loyalty in a way which he supposed likely to be most gratifying to a Christian Government.

Up to the beginning of the 19th century, the trans-Gangetic nations used lumps of silver like the sycee of the Chinese.

In the Straits Settlements the rupee is current, but there and throughout the Archipelago and the sea-coast of China the dollar is largely in use, and the Spanish dollar is the more valuable.

Chinese Currency. — Sycee silver, in Chinese Wan yin, is their only approach to a silver currency. In it the Government taxes and duties, and the salaries of officers, are paid; and

it is also current among merchants in general. The term Sycee is derived from two Chinese words, Se-sze, fine floss silk; which expression is synonymous with the signification of the term Wan. This silver is formed into ingots (by the Chinese called shoes, and by the natives of India, khuri, or hoofs), which are stamped with the mark of the office that issues them, and the date of their issue. The ingots are of various weights, but most commonly of ten taels each.

Sycee silver is divided into several classes, according to its fineness and freedom from alloy. The sole Chinese coin is of bronze, the silver and gold in China being sold by weight. An ounce of silver is the equivalent of from 1700 to 1800 of these bronze coins, which are called 'sapek' by Europeans. They have some pieces of brass, called tsian, and in Mongol tcho, of which the inhabitants of Siberia make tchok and tchek; they are of less value than a copec. A kind of notes are in circulation among private persons. In China, smooth pieces of metal, which served rather for weights than for currency, date from Kieng-Wang, who reigned B.C. 524. But the earliest known piece is attributed to the emperor Wen-ti, of the lesser Sung dynasty, A.D. 465.

The kopang of the Japanese is simply an oblong plate of gold with the angles rounded off.

In Arabia and the Persian Gulf, the silver real and the copper falus are current; but the Indian rupee and the Spanish dollar also pass current. In Arabia, the Spanish or German dollar, worth about 4s. 6d., is the silver coin; but in the exchange with India, 100 dollars range from 212 to 225 rupees. The Indian rupee also passes current everywhere. British gold is becoming well known. The copper pice of India are current, but exchange varies with the supply. Arabia has not any national coinage. According to Marsden, it was not until the khalifat of Abdul Malik, in the year of the Hijira 76 (A.D. 695), that a distinct coinage was instituted with a view of superseding the currency of Greek or Byzantine and Persian gold and silver.

The dinar, under the khalifs, was about equal to 10s. 8d. About A.D. 1440–1450, in Ibn Batuta's time, a western dinar was to an eastern as 4 to 1; and an eastern dinar seems to have been $\frac{1}{10}$th of a tankha, which, even supposing the tankha of that day to be equal to a rupee of Akbar, would be only 2½d. A dinar at Kābul in the early part of the 19th century was so small that 200 made one abassi, a coin of less value than a shilling.

The tankha in Ala-ud-Din's time is said to have been equal to 50 jital (a copper coin which some said was equal to a paisa), and in Muhammad Taghalaq's time it was so debased as to be worth not more than 16 paisa. The tankha appears to be the coin represented by the modern rupee, and perhaps, when at its proper standard, was about the same value.

The rupee of Akbar contained 174·5 grains of pure silver, and was divided into 40 dam or paisa (of 191½ grains of copper each). The dam was subdivided into 25 jital. Queen Elizabeth's shilling contained 88·8 grains of pure silver; so that Akbar's rupee was worth 1s. 11½d. of English money of his time. Akbar's standard remained almost unaltered all over the Moghul dominions, until the breaking up of the empire in the middle of the 18th century. The rupee of India now contains 176 grains of pure silver, and exchanges for 64 paisa, containing 100 grains of copper each. Akbar had a four-cornered rupee, called Char-yari by the people, this being a term applied to the four immediate successors of Mahomed, viz. Abubakr, Umar, Usman, and Ali.

The current coin of Persia is the keran, a silver coin of which 209 are equal to 100 rupees, or about 11½d. each. The gold toman is worth 10 keran. 50 copper guz are equal to one keran.

The coins of Kadphises, called Kadphises Koranos, to distinguish him from Kadaphes (Kadphises), the conqueror of Kābul, and those of Kanerki, his successor, have been found throughout the whole of Upper India; two or three of them have been obtained from Masulipatam, and one from Tanjore. In the Manikyala tope, General Ventura found shell money, the cowry, the spherical flat ingot, Indo-Scythian and Sassanian coins, all of which had been deposited at the same time. In another tope, opened by General Court, were found Roman denarii of Antony and Julius Cæsar, and coins of some Roman families associated with Indo-Scythic pieces of Kadphises. In August 1856 there was discovered a pot of very beautiful gold coins of the time of Augustus and other emperors, near Calliempootoor, in the Iyempully taluk of Madura.

Symbols.—In the south of India, the figures of animals, the dog, the fish, a serpent or eel, the lion, the bull, the elephant, the ankus or elephant-goad, also weapons, sword, bow and arrow, a mace, st'hamba or poles, were largely used on old coins as symbols. The dog is crouching on fore legs or plays. The fish was the ensign of the Pandyan dynasty, but is also found on Buddhist seals. The chakram or wheel, the chaitya, the Ficus religiosa or pipal leaf, also a bow and arrow, a hand, and the swastika cross.

The old Mada and Tankha coins are all of gold, and generally cup-shaped, the reverse convex, the obverse concave, with fine impressions in relief, or with a lotus or padma and chank or shell.

In the ancient coins of India, lead was used for smaller denominations. These have been found of all weights and sizes near Amaravati, with a lion or the tree symbol. The lion is the most favourite symbol represented on Buddhist sculptures. It forms the crowning ornament of the celebrated laths or obelisks of Northern India, the most remarkable of which are the Allahabad column, those of Bettiah, Bakra, etc. It occurs prominently amongst the ornaments of ancient and modern dehgop, and is a favourite symbol on the ancient coins of Bactria and S. India.

The elephant appeared conjointly with the lion on the Buddhist coins of Bactria and S. India; but in other S. Indian coins the elephant appears on the obverse, with some Buddhist symbol on the reverse.

The bull, both in Buddhist and Saiva mythology, is a favourite symbol with both sects on many of their coins. It was early adopted by the successors of the Greek coins of Bactria, and with the extension of the Saiva creed in India its symbolic adoption became almost general. The Indian coins with it are of lead, copper, and white metal.

The horse was a favourite symbol on Buddhist coins of S. India, of lead, and copper, and white metal.

The boar type of coins is the best known of all the old coinage of the S. of India. It was originally the badge of the Chalukya families of Kalyan and Rajamundry, from whom it passed to the later Chola dynasty, was subsequently adopted by the Rayar dynasty of Bijanagar, and is still found on the seals of some of the petty local chiefs in the Carnatic.

About 150 coins with symbols have been discovered, 27 of them have flowers (phul), dots, or stars; 14 have varieties of the lotus (padma) or trefoil; 12 have varieties of the trident (trisula) or spear (bala); 10 have flower (phul) or knot (padma phul); 4 with the barch'ha spear, or the guda sceptre or mace; 15 have the jhar or thuhar, tree or sprig; 6 the suraj or sun; 7 shamsiri dagger; 4 the katar dagger; 1 the ankus or goad; 13 with numerals or letters; and 13 with the shell, panja, or hand, the Hindu deities, Hanuman, elephant, the royal umbrella or ch'hata, or the swastika ✠ cross. — *Yule, Cathay*, i. p. ccxlvii.; *Fraser's Journey into Khorasan*, p. 74; *Elph.* pp. 420, 430; *Mr. Walter Elliot in Mad. Jour. Lit. and Sc.*, Jan. to Mar. 1858; *Mr. Edward Thomas' Prinsep's Useful Tables.*

COIR is the fibre from the rind of the cocoanut, and is a corruption either from the Tamil Kayer, a rope, or the Maldive Kaubar, the name given to the cords with which the inhabitants, according to Abul Fazl, sewed together the planks of their ships. It is largely used in India, and the exports during the years 1850–51 to 1860–61 from India ranged between 2393 and 5832 tons, value £20,909 and £57,284. Between 1868 and 1878, the exports of coir and coir rope ranged up to 10,821 tons. Coir appears in the market in various degrees of fineness, depending on the age at which the cocoanut is cut and the husk separated, and the care bestowed in steeping and cleaning. In order to remove this husk, an iron spike or sharp piece of hard wood is fixed in the ground. The nut is then forced upon the point, which passes through the fibres, and thereby separates the rind from the shell. In this manner a man can clear 1000 nuts daily. For the best coir, the outer rind of the nuts is bruised and steeped in water for two or three days, when it is taken up, and the fibres separated by the fingers and scraped gently with a blunt knife, and dried in the sun. If steeped in water too long, they get dark-coloured. Mr. Robinson thus describes the method of making coir in the Laccadives. The husk, he says, gets hard and woody if the fruit be allowed to become quite ripe, therefore the proper time for cutting it is about the tenth month. If cut before this, the coir is weak; if later, it becomes coarse and hard, and more difficult to twist, and requires to be longer in the soaking-pit, and thus becomes darker in colour. When cut, the husk is severed from the nut and thrown into soaking-pits. These, in some of the islands, are merely holes in the sand, just within the influence of the salt water. Here they lie buried for a year, and are kept down by heaps of stones thrown over them to protect them from the ripple. In others the soaking pits are fresh-water tanks behind the crest of coral. In these the water, not being changed, becomes foul and dark-coloured, which affects the colour of the coir. When thoroughly soaked, the fibrous parts are easily separated from the woody by beating. If taken out of the pits too early, it is difficult to free the coir from impurities. If left in too long, the fibre is weakened, as is said to be the case also with that soaked in fresh water. The coir from the Laccadive Islands, Kadamat, Kiltan, and Chetlat, is said to be of the best description. In the Laccadives the manufacture into cordage of the coir is entirely in the hands of the women. When soaked sufficiently long, it is taken out of the pit and beaten with a heavy mallet, and rubbed with the hands until all the interstitial cellular substance is separated from the fibrous portion. When quite clean, it is arranged into a loose roving, preparatory to being twisted, which is done between the palms of the hands in a very ingenious way, so as to produce a yarn of two strands at once. In these islands coir is one of the chief commodities of barter for the necessaries of life, as rice, salt, tobacco, etc. The coir is made up for their petty traffic in short 'kute' of a mixed length and weight, and at the end of the year these are collected and made up into lengths of 70 to 75 fathoms, as received by the Government. 40 cocoanuts are said to yield 6 lbs. of coir in Ceylon. Mr. Robinson says three large coast Laccadive nuts will yield 1 lb. of coir, measuring 22 fathoms, whereas ten small fine island nuts go to about 1 lb. of coir, but this will measure 35 fathoms. 2 lbs. of such yarn, measuring from 70 to 75 fathoms, are made up into sootie, of which there are 14 to a bundle, averaging about a maund of 28 lbs. A Mangalore candy of 560 lbs. will thus be the produce of 5600 nuts, and should contain about 20,000 fathoms of yarn. The value of the coir produce of a tree is calculated to be from 2 to 2½ annas; and that of the produce of 100 trees, from 14 to 15 rupees. The average value of the total raw produce of a tree bearing fruit would then be 7 annas to ½ rupee; and that of a plot of 100 trees, 45 rupees. The annual export of coir from the Laccadives to Madras ports is about 200 tons. In Ceylon, at Calpentyra and the Akkara-pattoo, the natives separate the coir by burying the husks along the border of the extensive salt-water lake, and when, after six months or more, they are dug out very clean, the fibres easily separate from the cellular tissue of the husk. This mode of preparing the fibre prevents the offensive smell emanated by macerating the husk, so common along the road from Colombo to Matura.

China imports coir from the Archipelago. Coir is made into cordage, both ropes and cables, for boats and ships, for which, from its lightness, it is well suited. It is largely used by upholsterers as a material for stuffing mattresses, couches, pillows; it is used as a substitute for oakum in caulking ships. The fibre is also made into brushes and brooms, as a substitute for bristles; is cleaned, curled, and dyed to resemble horse-hair; and made into matting, door-mats, and netting for sheep-folds, woven into stair carpets and floor-matting, bonnets, hats.—*Lond. Exh. of* 1862; *Royle, Fib. Pl.; Robinson's Report on the Laccadives; Hon. Mr. Morrison; Ondatjee.*

COIX BARBATA. *Roxb.*

Adavi godhumulu,	Tel.	Golive, Korimidi,	Tel.
Gila gaddi, Goli midi,	,,	Kokilakshamu,	,,

Grows in India. The Coix is a genus of plants belonging to the order Panicaceæ. Several species are known in India,—aquatica, barbata, gigantea, heteroclita, lacrima, pumila; and the following are

Burmese names for undetermined species,—Ka le pouk pouk, Ka le hmen, Ka le shee, Ka le theing, Ben wai thoo.

COIX LACRIMA. *L.* Job's tears, Coix millet.
Ka le thee, . . . BURM. | J'yi-jin, ... CHIN.

The Burmese species of Job's tears has large esculent seeds, which are parched for sale in the bazar. A great deal of coix is cultivated in the Khassya Hills about Moflong; it is of a dull greenish purple, and, though planted in drills and carefully hoed and weeded, is a very ragged crop. The shell of the cultivated sort is soft, and the kernel is sweet; whereas the wild coix is so hard that it cannot be broken by the teeth. Each plant branches two or three times from the base, and from seven to nine plants grow in each square yard of soil; the produce is small, not above thirty or forty fold.—*Hooker*, ii. p. 289; *Mason; Williams.*

COJIA, written Khojah, Cojah. See Khajah.

COLABA. In the spacious harbour formed by the islands of Caranja, Colaba, Bombay, Salsette, and the continent, several smaller rocky islands are scattered, bearing different names. Of these are Bombay, Elephanta, and a little island close to the latter that Europeans call Butcher Island, but known to the people as Depideva, Holy Island, the island of the gods. Colaba island in ancient times formed a shelter for the pirate fleets of Western India. In 1662 Sivaji fortified it; in the 18th century Angria made it his stronghold.

Colaba is also a point or spur of rock protecting the entrance to Bombay harbour on the north; it was originally a chain of islets, which have been connected with each other and with the island of Bombay. On its S. and W. are extensive and dangerous reefs of rocks, called the Prongs. It is still the scene of many wrecks.

COLA NUT of the Cola acuminata, west tropical Africa. The seeds are much esteemed by the natives for their bitter flavour, and are said to enhance the taste of whatever is eaten after them. It might be largely cultivated in India.

COLAPORE. See Kolapore.

COLAR LAKE, a marine lagoon of great extent, lying between Ellore town and the sea. Several marine lagoons, known in India as backwaters, stretch around both sides of the Peninsula of India; north of Madras are the Ennore and Chilka and Colar lakes, and there are several south of Madras and on the Malabar coast. Several streams flow into the Colar; and one, the Upputeru, is a tidal river. In the hot season, many routes are passable on foot or on horseback, which in the rainy season become part of the lake, and have to be crossed on a palmyra raft. The principal route across the lake is from Ellore to Kykalore. From these two places palmyra rafts ply regularly to convey goods and passengers. The Colar does not extend to Ellore itself, but its edge in the rainy season comes within three or four miles of the town, to which there is a fairly good road. The lake abounds with fish.

COLCHICUM AUTUMNALE. *Linn.*
Sorinjan, . . . ARAB. | Kuljikoon, GR. of ARABS.
Meadow saffron, . . ENG. | Suranjan-talk, . . PERS.

The colchicum of medicine is the cormus and seeds of C. autumnale, and is well described by Dioscorides. It was used by the Arabs, and is their sorinjan; they give kuljikoon as its Greek name. The hermodactyls of the later Greeks and Arabs, and the sweet and bitter sorinjan of the Arabs, were no doubt species of this genus, perhaps C. variegatum, *Planch.—O'Sh.; Royle.*

COLDENIA PROCUMBENS. *Linn.*
Tripunkhi, . . HIND. | Hamsa padu, . . . TEL.
Siru padi, ... TAM. | Hama padi, . . . ,,

A small plant growing in Southern India, used as a poultice fresh, also when dried, in powder with fenugreek seeds, to promote suppuration in boils.—*Roxb.*

COLE, ROBERT, Principal Inspector-General of the Medical Department of the Madras army; he wrote On the Laterite Formation, and Laterite of the Red Hills, in the Madras Lit. Soc. J. iv. 100.

COLE, COLONEL ROBERT, a military officer of the Madras army, eldest son of the above Dr. Robert Cole, author of an elementary grammar of the Coorg language.

COLEBROOKE, HENRY THOMAS, was the first to give a tolerable sketch of the character and contents of the Vedas in 1805; and in 1823–1827 he expounded the principles of the different systems of Hindu philosophy. His father, Sir George Colebrooke, Bart., was for many years chairman of the E. I. Company. Henry Thomas was born in London, 15th June 1765, and died there 10th March 1837, aged 73. He arrived at Madras in 1783, from which he went on to Calcutta, where his elder brother was established. In 1786 he was appointed Assistant Collector in Tirhut. In 1801 he attained to the judicial line as First Judge in the High Court of Appeal, afterwards called the Sudder Diwani and Nizamat Adalat, and in 1807 he became a member of Council. He left India in 1815, at the age of 50. His principal writings were,—

On the Husbandry and Commerce of Bengal, Calcutta 1795;
Hindu Law on Contracts and Successions, Calcutta 1798, and London 1818;
Sanskrit Grammar, Calcutta 1805;
Amara Kosha, a Sanskrit Lexicon, Calcutta 1808;
Translation of the Dayabhuge of Jimutavahana and Yajnyavalkya;
Two Treatises on the Hindu Law of Inheritance, Calcutta 1810;
Algebra from the Sanskrit of Brahmagupta and Bhascara, London 1817.

In the Asiatic Researches, between 1795 and 1816, he wrote on the Duties of a Hindu Widow, Enumeration of Indian Classes, Indian Weights and Measures (1798), Religious Ceremonies of the Hindus, on the Sanskrit and Prakrit Languages and their Poetry, on the Vedas, on the Jaina Sect, on the Source of the Ganges, on the Gyal, on Olibanum, on the Dryobalanops camphora, on the Indian and Arabian Divisions of the Zodiac, on the Procession of the Equinoxes.

In the Transactions of the Royal As. Society, 1823 to 1828, on the Philosophy of the Hindus, on the Jaina Sect.

He was one of the original founders of the Astronomical Society, and of the Society for the Promotion of Oriental Literature, now known as the Royal Asiatic Society. His Sanskrit MSS., which cost him about £10,000, he presented to the E. I. Co. At the time of his death he was a Fellow of the Royal Societies of London and Edinburgh, of the Astronomical, Geological, Linnæan, and Zoological Societies of London, of the Royal Academies of Paris and Munich, and of the Imperial Academy of St. Petersburg.—*Jo. R. As. Soc.* v. 1839; *Ed. Review*, 1872; *Sir J. E.*

Colebrooke's Life of H. T. Colebrooke, Lond. 1872; *Max Müller's Chips*, pp. 377–417.

COLEBROOKE, LIEUTENANT R. H., wrote on the islands Nankouree and Comarati, As. Res. iv. p. 129; Astronomical Observations in the Andamans, ib. iv. pp. 317, 385; Barren Island, iv. p. 397; Observations on the Course of the Ganges, xii. p. 1.

COLEBROOKIA OPPOSITIFOLIA. *Smith.* Pansra, HIND. A large shrub of the Siwalik hills and Salt Range, growing up to 4000 feet; wood used as fuel, also to make gunpowder charcoal; and the leaves as fodder for cattle, and are applied to wounds and bruises. C. ternifolia, *Roxb.*, grows in the Peninsula.

COLEHAN, a part of Singbhum occupied by the Ho as their proper country. The Colehan is divided into Pirhi or districts, each under a manki or chief, and each village has its mundah or headman.—*Dalton*, p. 163.

COLEOPTERA. See Insects.

COLEROON, the most northern and largest branch of the delta of the Cauvery river. The Coleroon debouches in lat. 11° 25′ 20″ N., and long. 79° 52′ 10″ E. Its entrance is marked by a gap in the trees, and by the four porticos of the pagoda of Chellambrum. The Coleroon branch of the Cauvery is separated from the Cauvery below the island of Seringham, near Trichinopoly, and after a course of 80 miles (of which it is the boundary of this district) falls into the sea near Devicottah. An anicut or dam was in the year 1836 constructed across the Coleroon, by which means a large supply of water is turned into the two southern taluks of Mannargoody and Chellambrum, and is of material service to the cultivation. The Coleroon anicuts are said to have been originally formed in the second century of the Christian era.

COLEUS AMBOINICUS. *Lour.*

C. crassifolius, *Benth.*	Plectranthus aromaticus, *Roxb.*
C. aromaticus, ,,	
Pathur chur, . . BENG.	Karpura valli, . . TEL.

Country borage is a delightfully fragrant plant of the Moluccas and the Peninsula of India, and grown in gardens. Its leaves are eaten with bread and butter, or bruised and mixed with food, drink, or medicine.—*Voigt.*

COLEUS BARBATUS. *Benth.*

Plectranthus barbatus, *An.*	P. asper, *Spreng.*
P. Forskalii, *Willd.*	P. monodelphus, *Roxb.*
P. comosus, *Sims.*	Ocimum asperum, *Roth.*

A shrubby plant, with a strong but not disagreeable smell. Cultivated in gardens all over India as greens. The roots are pickled.—*O'Sh.* p. 491.

COLEUS OSMIRRHIZON. *Elliot.*

Hrebera; Valuka, SANSK. | Iribeli Kuru-veru, . TEL.

It grows in Southern India, where it is cultivated in gardens. Hindu women use the scented roots to ornament their hair; and it is used as a drug, and as an offering to idols.

COLEWORT, a variety of cabbage, Brassica oleracea, of little value.—*Jaffrey.*

COLLADDI or Koiladdy, a fort on the island of Seringham.

COLLERI, a race occupying the country south of Trichinopoly, until the 19th century, so predatory, that in the south of the Peninsula of India, Colleri became the ordinary designation of a thief; derived from Kallara, thieves, plunderers. In ancient times they seem to have inhabited the woods from Trichinopoly to Cape Comorin. Orme describes them in the middle of the 18th century as expert thieves and plunderers; and the Jesuit Father Martin says they were very cruel. Pennant, in the 18th century, says 'the adjacent countries are covered with thick forests, and little cultivated by reason of the savage inhabitants, the Polygars and Colleries, who may be truly styled "sylvestres homines."' The Colleries, he adds, were predatory, and their government, as also that of the Polygars, feudal. The Colleries are in number thirty or forty thousand. Their country is hilly. They generally sided with Mahomedans and the British in the wars against the French in the times of Clive and Dupleix. Their chieftain is the Maharaja of Puducottah.—*Pennant's Hindostan; Orme's Hindustan.*

COLLICHTHYS PAMA. *B. Ham.* The whiting fish.

COLLOCALIA, a genus of birds belonging to the family Cypselidæ. C. linchi is the swiftlet that produces the edible birds' nests used in China as a restorative food. The other species is C. nidifica. See Birds' Nests; Birds.

COLOCASIA. RAY. A genus of plants of the family Araceæ. Several species grow in the south and east of Asia, viz. C. antiquorum, cucullata, esculenta, fornicata, odora, Indica, bicolor, arborescens, montana, mucronata, nymphæfolia, virosa, macrorrhiza of Ceylon, and C. Himalensis of the Himalaya, all of them remarkable for containing a milky juice. They are grown in S. Europe, the East and West Indies, and in Polynesia, where the leaves and roots, under the name of yam, coco, eddo, taro, are used as food. Colocasia and its allies are remarkable for the distillation of water from the extremities of their leaves. This process generally takes place at night or in a damp atmosphere, and supplements the evaporation which takes place from the surface of the leaves when the air is dry. Another curious physiological phenomenon, well shown by many Aroids, which have their numerous small flowers enclosed in a sheathing leaf (spathe), is the rise of temperature at the time of flowering in the floral organs, due to chemical changes in their tissues. In these plants the sheathing spathe prevents the dispersion of the heat, so that the temperature inside sometimes rises many degrees above that of the air outside. C. grandifolia, the great-leaved Caladium, is the Alu of Bombay.

COLOCASIA ANTIQUORUM. *Schott.*

Arum colocasia, *Linn.*	A. Ægyptiacum, *Rumph.*

There are five varieties of this plant,—

α. Goori kuchoo, BENG. β. Ashoo kuchoo, BENG.

Shema kalengu, . . TAM. Chema, Chamakura, TEL.	Chema, Chama dumpa, TEL.

These are cultivated in most parts of India and Burma. Small offshoots from the tubers are, like potatoes, planted in well-manured friable rich soil. The roots of the Goori kuchoo are taken up in about nine months, and those of Ashoo kuchoo after seven months.

γ. Kalo kuchoo. The roots send out numerous runners, but do not swell into tubers like the cultivated varieties. The leaves and petioles are used as greens.

δ. Char kuchoo and

ε. Bun kuchoo are not cultivated, and seldom

eaten. In Burma, α and β supply the place of potatoes.

Ghoya, ... HIND.	Ahan, Coco, Eddo, W. IN.

This species is cultivated in Brazil, the East and West Indies, Burma, the Archipelago, and Polynesia. The root somewhat resembles a pine-apple, but is globular. It is rather coarse; but the natives of India make use of the tubers in curries, etc. This seems to be the plant so largely used in the West Indies and Polynesia, under the names coco, eddo, and taro. It is a valuable root, shaped somewhat like a yam, and when well boiled and afterwards roasted, is not inferior to a yam in taste. It is a common food of the inhabitants of Travancore, where there is a superior variety of it, with broad, purple-coloured leaves. The Warriah (Ooriah?) in the Ganjam Circars call it Cutchoo; the Malays of the Eastern islands hold it in high estimation. Niebuhr says it is produced in abundance in marshy situations in Arabia, as well as in Egypt. Rumphius says: 'Nutrimentum est catholicum in orientalibus hisce insulis et tanquam utilissima regionis censetur planta eodem modo, quo ab antiquis jam fuit temporibus in Egypto, licet ibi haberetur cibus rusticorum, ac forte per saracenos ejus usus innotuit. Occidentalibus Africæ et Europæ partibus, ita ut haud inepte Æthiopum panis vocari posset.'—*Ainslie; Voigt; Jaffrey.*

COLOCASIA INDICA. *Roxb.*

Arum Indicum, *Lour., Roxb., W. Ic.*

Man kuchu, . . BENG. | Tota calir akkisa, . TEL.

This is cultivated in India, E. Australia, and S. Sea Islands, where its esculent stems and pendulous tubers are eaten by all classes.—*Voigt; Irvine.*

COLOCASIA MACRORRHIZA, *Schott*, in the Fiji Islands is called ndalo or taro. There is a water and a land variety, the former of which is the more usually grown. The average weight of the roots is 2 lbs., and the crops are raised from November to April. It requires irrigation. The young stalks and leaves are used like spinach, or in soup. The root is employed for making the mindrai or native bread. It contains much starch.

COLOCASIA NYMPHÆFOLIA. *Royle.*

Arum nymphæifolium, *Roxb.*	Caladium nymphæifolium, *Roxb.*

Colocynth, the Khanzil of the Arabs, has been used in medicine from the earliest times, and is one of the plants supposed to be the pakyoth or wild gourd of Scripture. It grows on the sandy lands of the Dekhan, Gujerat, Kaira, Dehli. Dr. Burn states that two kinds of colocynth occur in Gujerat, the Cucumis colocynthis, and the C. pseudo-colocynthis. The colocynth of commerce is the dried fruit, peeled and unpeeled, and is brought from the Levant, north of Africa, and south of Spain. Colocynth is useful for protecting shawls and feathers against insects. The colocynth used in medicine as a hydrogogue cathartic is an extract from the fruit. That known in India by the Arabic names Indrayun and Bislumba, is said to be obtained from the Citrullus pseudo-colocynthis of Royle. Colocynth oil is prepared in India from colocynth seeds.—*Him. Bot.; Royle, Mat. Med.; Spry.*

COLOMBO, the seat of government in Ceylon, has a population of about 40,000. It is on the west coast of the island, in lat. 6° 56′ N., long. 79° 53′ E., and exports largely to Europe. Colombo is mentioned in Singhalese historical annals so early as A.D. 496; the name is said to signify a seaport. But this and Covelong, south of Madras, and Quilon of the western coast, are all the same name, 'Kulam.' It was visited by the Portuguese A.D. 1505, and occupied by them in 1638; but they were expelled by the Dutch in 1656, who in turn surrendered it to the British on the 16th February 1796.

Kalumb of MOZAMBIQUE.	

The colombo plant is the Cocculus palmatus. It grows wild on the coast of Mozambique, and at Oribo in East Africa, and is much cultivated in the Mauritius. The root is imported into Bombay for re-export to Europe, and is much esteemed in medicine for its powerful antiseptic, tonic, and astringent properties.—*M'Culloch; Voigt.*

COLOPHONIA is in French, Bois de Colophane. To this genus De Candolle refers the tree produc-

ing the Bois de Colophane of the island of Mauritius, and calls it C. Mauritiana.

COLOSSOCHELYS ATLAS, a huge fossil land tortoise, discovered by Dr. Falconer and Sir Proby Cautley in 1835 in the tertiary strata of the Siwalik Hills, skirting the southern foot of the great Himalayan chain. They were found associated with the remains of four extinct species of mastodon and elephant, species of rhinoceros, hippopotamus, horse, anoplotherium, camel, giraffe, sivatherium, and a vast number of other mammalia, including four or five species of quadrumana; also a great number of reptilian forms, such as crocodiles and land and fresh-water tortoises. Some of the crocodiles belong to extinct species, but others appear to be absolutely identical with species now living in the rivers of India, in particular, to the Crocodilus longirostris, between the existing forms of which, and heads dug out of the Siwalik Hills, no difference is detected. The same result applies to the existing Emys tectum, a common species in all parts of India. A very perfect fossil specimen, presenting the greater part of the evidence of the dermal scutes, is undistinguishable from the living forms, not varying more from these than they do among each other. Prof. Thomas Bell considers that there are no characters shown by the fossil, to justify its separation from the living, Emys tectum, now a common species found in all parts of India. There are therefore fair grounds for entertaining the belief as probable, that the Colossochelys atlas may have lived down to an early period of the human epoch, and become extinct since,—1st, from the fact that other Chelonian species and crocodiles, contemporaries of the Colossochelys in the Siwalik fauna, have survived; 2d, from the indications of mythology in regard to a gigantic species of tortoise in India. One in the British Museum is 14 feet in transverse circumference, and is 9 feet long.—*Jour. As. Soc. Ben.* No. 247 of 1855. See Tortoise.

COLOUR.

Couleur, ... Fr.	Colore, ... It.
Farbe, ... Ger.	Colol, ... Sp.
Rang, . . Hind., Pers.	

White is the mourning colour of the Mahomedans of Persia and in India, and of the Hindus, Parsees, and Chinese. Blue with Hindus is an unlucky colour. No one will buy a ruby or garnet with a bluish tinge. But the celestial blue is the imperial colour of the Mongols and Chinese. The colour affected by Hindu, and in Burma by Buddhist, religious mendicants, is a dull orange. In the ceremonies of marriages of Hindus, and on other similar happy occasions, red-coloured clothes must be worn, and the invitation cards must be red-coloured.

Sir George Birdwood tells us that of all artistic powers, that of colour, in its highest harmonies, is the most difficult to teach. Though general principles can be imparted by scientific rules, the power of colouring beautifully is undoubtedly one rarely attained. It seems to prevail in races as a special gift. It exists where the knowledge of form is unknown. It accompanies an unconscious sympathy with nature. Many actually savage nations colour their cloths or wraps or mats harmoniously, though absolutely devoid of social or mental cultivation. Europe may cultivate the study of colour, and understand its laws; but in textiles of all kinds, from carpets to gossamer muslins, and gold and silver tissues, the traditional taste of oriental nations remains unattainable by Europeans. In their silk and woollen fabrics, their metal work and other manufactures, there is an inherent feeling for, and power of producing harmony in, the distribution of colour, and in surface decoration. He tells us that in the colouring of carpets of India, full Indian red, broken by flowers or conventional leaves, in which orange predominates, forms a leading feature. A cool, low blue, a green of similar gravity of hue, and soft creamy white, complete the palette of the Indian designers of these fabrics. European purchasers have introduced changes into these oriental designs, but only to occasion losses of the exquisite harmony of the native arrangements of form and colour. Oriental colouring in textile fabrics seems to result from a gift to the various races that produce them. The native designers proceed in accordance with immemorial traditions, and with a certainty that resembles instinct. Their shawls are the finest textures, if not the most artistic products, of the loom. As studies of colour, the shawls of India have no rivals in the range of textile fabrics. The most celebrated of these productions are produced in Kashmir from the finest wool. The fineness and softness of its fibre retain colours of the most intense and delicate hue. Lakes, yellows, blues, orange, greens of several tints, rich and vivid; white, soft and low of tone, and absolute black, enable the designers to make up endless combinations. The designs in all Kashmir shawls are very similar to each other, with a cone or an occasional peacock amongst the rolling curves, and with the borders of the brightest colours. India also, though not manufacturing shawls, produces woven tissues, some embroidered, and some the work of the loom only, of a splendour unknown to European weavers. The gold and white, gold and purple, white and silver muslins, for colour, taste, and delicacy of arrangement, are amongst the artistic triumphs of the Indian loom. Some of them are of a gossamer transparency, intended for ladies' dresses.

Colour-sticks for the lacquer-ware of India are used in the Panjab by the kharati or wood-turner, to colour his ware when the turning process is complete. The stick consists of shell-lac, melted down with a certain proportion of wax and sulphur, and coloured by various simple or compound colours. They are applied by the hand. The operator holds the colour-stick against the turned wood object while revolving rapidly; the heat produced by the friction melts the lac, and the colour is deposited on the surface of the wood. The skill and fancy of the operator directs him either in laying on a uniform layer of colour, or else putting it on in little spots or touches, by allowing the colour-stick only very lightly to touch the revolving wood, thus producing either a smooth uniform colour, or the pretty mottled appearance so often observed in lacquered ware. Two or three different colour-sticks are often applied, giving the whole a marbled appearance of great beauty. The colour thus applied is spread, fined, and polished, by pressing the edge against the turned object while revolving. The final polish is given by a rag with a little oil. The principal colours are of lac, crimson, orpiment, red lead,

green made of orpiment and Prussian blue, dark blue, indigo or Prussian, black, white, brown or gold colour, light-blue or ultramarine.

Colours for enamels.—Vitreous masses are employed by the minakar, or enameller on silver, etc. The colours are principally green and blue, salts of iron and copper diffused through vitreous matter; a yellowish colour also is produced by litharge. The manufacture consists in taking a silver or metal vase, having the pattern of leaves or flowers worked on it in relief, and filling the hollows with enamel in a melted state. The colours used are blue, green, and red. The art of making this material is known in Lahore, Multan, and other places.

Chinese red colour is made from Taow-fau, or copperas. Their mode of preparation is by putting a pound of copperas into a crucible, over which another crucible is luted, having a small hole in it, which is lightly covered over; around these they pile charcoal, and enclose the whole within bricks, when they fire the charcoal, and as soon as the fumes issuing from the aperture in the crucible become of a light colour, a small quantity of the copperas is taken therefrom, laid upon fir-wood, and moistened with water; if the colour then prove to be a bright red, they remove the fire; if not, they allow the copperas to remain subjected to the heat until it assumes that colour, and then remove the fire. When the crucibles are cool, a cake is found in the lower one, but the finest colour is encrusted on its sides and on the bottom of the upper crucible, which is kept separate from the cake; the pound of copperas produces about four ounces of colour.

Chinese white colour is made from calcined translucent flint, to an ounce of the powder of which they add an equal quantity of white lead.

Chinese green is beautiful. It is prepared with one part of powdered calcined flint, two parts of white lead, and six parts of the scales of well-hammered copper.

Chinese violet is produced by adding an additional quantity of the prepared white to the green.

Chinese yellow is made by combining equal portions of prepared white and red.

Liu is the powder blue of Chinese commerce. It is the Pien-t'sing stone, an azure mineral, probably arseniuret of cobalt, roasted and powdered.

All these various colours are used by the china-ware painters, having been previously dissolved in gum-water, to which they occasionally add saltpetre, copperas, or white lead. The colours are laid on after the first baking and varnishing of the china-ware, but the beauty and depth of the colouring is imperceptible until after the second baking.

Black china-ware, the Ow-mi-ew, ornamented with gold, is very much prized in China. To make it, they mix three ounces of azure and seven of the oil of stones; this is laid on the ware, and when perfectly dry it is baked, after which the gold is laid on, and the vessel is re-baked.

Cracked porcelain, the To-wi-kie, is a porcelain prepared simply by varnishing the vessels with a whitish ash-coloured varnish, made from calcined translucent white pebbles; this has the property of marbling and veining the ware, and giving it an appearance as if it had been fractured into many pieces, which had been carefully reunited. —*Smith, M. M. C.; Jameson's Journal*, 1853; *Williams' Middle Kingdom; Powell's Handbook; Sirr's Chinese; Madras Ex. Jur. Rep.*

COLQUHOUN. In 1882, Messrs. Colquhoun and Wahab crossed China from Canton to Burma. Mr. Wahab subsequently died. They found the river Canton navigable by light-draught steamers for 400 miles to the upper portion of the gorges and rapids; and numerous fine cities in Yun-nan, now fast decaying, owing to the Mahomedan rebellion driving the traffic to the Yang-tze river. The Yun-nan country is a mountainous plateau about 6000 feet high, with ranges of 15,000 feet in the north, falling to 9000 in the south. Its scenery, climate, peoples, languages, and costumes change rapidly. Numerous fine cities attest the former prosperity of the population. Opium, minerals, and tea are the main exports; the imports were cotton from Laos and Bhamo, English salt and piece-goods from the latter place, and large caravans from Tibet, conveying tea. The portion of Yun-nan west of Tali had been a stronghold of Mahomedanism before and during the late rebellion. Traces of its rule were found in these places, in the greatly superior architecture, and especially in the decoration of the buildings, both private and sacred. A considerable portion of the population of the plain, sparse as it is, is still Mahomedan, and the doctrines of Islam are taught in some of the schools of Mong-hoa. The aborigines in this region, dwelling chiefly in the hills and hill-valleys, are mostly Lo-lo in the northern portion, while Han-jen prevail in the south; although Lo-lo, Ka-tu, Oni or Hami, and Pai are plentiful, among whom a few Kut-sung and Pa-tu are found. To the south and south-west of Tali the Lo-lo are most numerous, while round the Tali lake the Min-chia tribe (literally, native family) is alone found. The Lis-sou, a division of the Lo-lo, are to be met with to the N.W. of Tali. I-jen and I-chia are names applied by the Chinese and others to the Lo-lo. They mean 'savage people' and 'savage family,' which is also the complimentary term in use by the Chinese for Europeans. Mr. Colquhoun met with Lo-lo,—often black and white tribes,—Tou-lao, Poula, Lung-jen, You-jen, Miao (black and white), and Pai, as well as others of less importance. I-bang is a Laos district tributary to China, situated seven stages south-east of Ssu-mao, and supplies most of the so-called Puerh tea. At Talifu the aboriginal people met with were hospitable, pleasant, and kind. The explorers left Tali at the end of May, pursued their way to Bhamo by the route followed by Margary, M'Carthy, Gill, and lastly by Soltau and Stevenson. Yung-chang, the Vochan of Marco Polo, and the westernmost prefectoral city of China, was reached on the 7th of June 1882.

COLTS are taken in tribute by several Eastern races, and in the ancient Persian empire the tribute of the distant satrapies was of this kind. Armenia, according to Herodotus, alone gave an annual tribute of twenty thousand colts. Up to a recent date, the princes of Amber received as tribute all the colts reared on one of their estates. Many of the Persian horses which were brought to India up to the middle of the 19th century, were supposed to be tribute horses.—*Tod's Rajasthan*, ii. p. 390.

COLTSFOOT. Kwan-tung-hwa, CHIN. In China two varieties occur, one with large flowers,

which, as also the leaves, are smoked in lieu of tobacco.—*Smith.*

COLUBRIDÆ, a family of snakes, the last of the sub-order Colubrina of Dr. J. E. Gray. The Colubrina include the families Hydridæ, Boidæ, and Colubridæ. See Reptiles.

COLUBRINA ASIATICA. *R. Brown.*
Ceanothus Asiaticus, *Linn.* | C. capsularis, *Forst.*

The Asiatic red-wood is a large shrub with pale greenish flowers, belonging to the natural order Rhamnaceæ. Other two shrubs of this genus are C. Nepalensis of Nepal and C. macrophylla of Martaban.—*R. Brown; Voigt.*

COLUMBA, a genus of birds belonging to the family Columbidæ and order Gemitores. C. intermedia, C. rupestris, C. leuconota, occur in India, C. aromatica, C. coronata, and C. carpophaga have been referred to other genera. The most common in India is the—

Columba intermedia, the blue pigeon or pagoda pigeon.

C. livia, *var.*, *Blyth.*

Kabutar, . . . HIND. | Kovil pora, . . . TAM.
Parivi, ... MAHR. | Gudi purai, . . . TEL.

They congregate in large numbers, and breed wherever they can find suitable spots, on pagodas, mosques, and tombs. The Indian blue pigeon differs from the C. livia of Europe, North Asia to Japan, and N. Africa, only in having an ash-coloured instead of a pure white rump. The C. livia of Europe, or rock-pigeon, with its sub-species, is the parent form of all domesticated pigeons. Of these there are at least 150 varieties, in four groups.

The first group consisting of the German, Dutch, and English pouters.

A second group includes the Kali-par, Murassa, Bussora, dragon, and English carrier; the Bagadot hen, Scanderoon pigeon, cygne rients, the Tronfo, and the Bank.

The third group includes the Java and English fantail, the Turbit and African owl; the Persian Lotan; common and short-faced tumblers; the Indian frill-back and jacobin.

The fourth group includes the dovecot pigeon, swallow, spot, nun, English frill-back, laugher, and trumpeter.

Dr. Jerdon thus arranges the Gemitores or pigeons, syn. Columbæ, *Latham*:—

Fam. Treronidæ.
Sub-fam. Green pigeons; genera, Treron, Crocopus, Osmotreron, Sphenocercus.
Sub-fam. Carpophaginæ, fruit pigeons; genus, Carpophaga.

Fam. Columbidæ.
Sub-fam. Palumbinæ, wood pigeons; genera, Alsocomus, Palumbus, Palumbœna, Columba.
Sub-fam. Macropyginæ, Cuckoo-doves; genus, Macropygia.
Sub-fam. Turturinæ, turtle-doves; genus, Turtur.
Sub-fam. Gouridæ, ground doves.
Sub-fam. Phapinæ, ground doves; genus, Calcophaps Indicus.

Pigeons, doves, and turtles are abundant in Southern Asia and the Indian Archipelago.—*Jerdon; Blyth; Darwin.*

COLUMBUS. Christopher Columbus, a Genoese, and famous navigator, with a fleet fitted out by the king of Spain, discovered America on the 12th October 1492. America had been discovered A.D. 986 by Bjarni Herjulfson; and in A.D. 994 Leif Erikson afterwards reached its shores, somewhere between Boston and New York. But the memory of these discoveries had passed away; and on Friday, August 2, 1492, Columbus set sail from Palos, steering to the west, to reach, in his belief, the East Indies. It was chiefly by the aid of the Pinzon family, a seafaring Spanish house, that he was able to get up the expedition. At midnight of the 11th October, a sailor descried the island, on which Columbus landed at daybreak of the 12th, and named it San Salvador. It is now called Watling Island. He had carried with him a letter to the khan of Tartary from the king of Spain, and he died in the belief that he had reached the eastern shores of Asia, and hence gave it the name of 'West Indies.' By an ordonnance of 4th May 1493, the Pope comfirmed the king of Spain in the sovereignty of America, and strictly prohibited all persons to touch at any port within a line drawn from pole to pole 100 leagues westward of the Azores; and the Portuguese were to possess all eastward of this line. But when Magellan, sailing westward as a servant of the king of Spain, discovered the Philippine Islands in 1521, the Pope's demarcation was rendered useless, and Spain and Portugal came into collision.

COLVILLE, W. H., author of Notes on the Geology and Botany of the Coast between Bandar Abbas and Jaslik; do. between Shiraz and Bushahr; do., island of Kishm; do. around the head of the Persian Gulf, in 1863.

COLYMBIDÆ, a family of swimming birds, now classed with the Natatores as Podicipidæ. The species of Podiceps are called Grebes. They haunt the sea as well as the rivers, are excellent swimmers, and dive frequently. They feed on small fishes, frogs, crustaceans, and insects; and their nests, formed of a large quantity of grass, etc., are generally placed among reeds and carices, and rise and fall with the water.

COLZA OIL, oils of Brassica campestris and B. oleifera.

COMALA or Kamala. HIND. The lotus; pronounced Kawal. Aran-kawal, the lotus of the desert, from Aranya (Sanskrit), a waste, and Comala, lotus. By the spelling it should be called Arancomala, but the pronunciation is as above.

COMANES, a city mentioned by Ptolemy, supposed to be Nagara, near Cambay, now in ruins.

COMANI, a branch of the Kathi tribe of Saurashtra, whose pallia, or funeral monumental pillars, are seen in groups at every town and village. Abul Ghazi describes a famous tribe in Kharazm, the ancient Chorasmia, called Comani, the remains of which were expelled by Chengiz Khan; and the royal author adds, 'Urgens was not always the capital; and Abulfada tells us Cath, also spelt Kaht, in lat. 41° 45′ N., was formerly the metropolis.'—*Rajasthan*, i. p. 59.

COMARASAMY, a hill south of Ramanmalai hill, 30 miles west of Bellary, overlooking the valley of Sundur, used as a sanatorium.

COMARI, mentioned in the Periplus, is Cape Comorin. See Kumari.

COMATESWARA, a colossal Jain figure, known by this name, stands in front of a temple at Sravana Belgola; another colossal Jaina statue is at Karkala in S. Canara.

COMATULÆ, the feather stars of naturalists, found in the Eastern seas.—*Coll.*

COMBACONUM, in Tanjore, 175 miles S. from Madras, a large, populous town. In ancient times the Chola kings were settled in Tanjore and Com-

baconum, in and near the Cauvery and Colerun rivers, and, as some suppose, gave their name to the Coromandel coast. This town is built close to the river Cauvery. It has 12 pagodas, and in Hindu estimation is a very sacred place, celebrated for its learning. Brick remains of the palace of the Chola are found near Combaconum.

COMBERMERE. Stapleton Cotton, afterwards Lord Combermere, accompanied his regiment, the 6th Dragoon Guards, to Flanders in 1793. From the conquest of the Cape he proceeded to India, and he was in command of the 15th Light Dragoons in the year 1796, and was present at Mallavelly and Seringapatam. Returning as a colonel after ten years' service, he married the eldest daughter of the third Duke of Newcastle in 1801; and was at the head of his brigade of the 14th and 16th Light Dragoons at Oporto and Talavera. In 1809 Sir Stapleton Cotton was created locally a Lieutenant-General, and placed at the head of the whole allied cavalry. He was in the retreat from Almeida, and subsequently at Busaco, Fuentes d'Onor, Salamanca, El Bodon, the Pyrenees, Orthes, and at the battle of Toulouse. For his services in the Peninsula he was created a peer, and received the thanks of the British Parliament. In 1814 he married a second time, Miss Greville. Lord Combermere went to the West Indies as Governor of Barbadoes in 1817, and as Commander-in-chief of the forces in the islands at the end of the American war. He served in India as Commander-in-chief; and in 1825–26 he stormed and took Bhurtpur.

COMBOY. SINGH. A waist-cloth resembling a petticoat, worn by the Singhalese.

COMBRETACEÆ. *R. Br.* The myrabolan tribe of plants, consisting of trees or shrubs, simple or climbing, of 22 genera, and about 140 species in Madagascar, Bourbon, Mauritius, the Society Islands, China, and 64 in the East Indies, viz. 23 Terminalia, 25 Combretum, 2 Poivrea, 2 Getonia, 2 Quisqualis, 4 Anogeissus, 2 Lumnitzera. The various species of Terminalia yield several valuable economic products; the Anogeissus and Lumitzera useful woods, and Quisqualis fruits excellent vermifuge. Terminalia bellerica gives a good serviceable wood where elasticity and strength are required. The withes of two species of the Combretum are extensively employed in the place of iron stretchers for the mouths of the leathern buckets used in drawing water from wells. Combretum ovalifolium, rotundifolium, costatum, acuminatum, Chinense, and extensum occur in India.—*Mason; Voigt; Roxb.*

Combs for cleaning and adjusting the hair are formed of horn, bone, tortoiseshell, wood, etc. In Ceylon, the marginal pieces of tortoiseshell are also used at Point de Galle in the manufacture of bracelets; and necklaces, formed of a chain of shell resembling amber in appearance, bear a higher price than such as are formed of the darker shell. In Ceylon, tortoiseshell combs are worn by men as well as women. In the numerous excesses into which European costume has been carried, the size of the back comb worn by ladies has never attained that of the Singhalese men, who also wear a narrow, long, bent comb across the fore part of the head. Five pounds even is a moderate price for a tortoiseshell back comb, which increases in value according to the size and quality of the shell. Hair-pins of tortoiseshell are worn by the women, gold and silver being substituted for full dress. These hair-pins are among the articles purchased by passengers. A comb is always part of the belongings of the darvesh of Central Asia.—*Faulkner; Rohde, MS.; M'Culloch.*

COMILLAH, the chief civil station of Tiperah.

COMMANDMENTS of the southern Buddhists are ten in number. Amongst them,—Kill not, Steal not, Commit not adultery, Lie not, Take nothing that intoxicates.

COMMELYNACEÆ, the spider-wort tribe of plants, comprising the genera Aneilema, Campelia, Commelyna, Cyanotis, Murdannia, Pollia, and Tradescantia. Wight describes Commelyna Bengalensis, cristata, nana, papilionacea, polyspatha, and scapiflora. C. cæspitosa occurs in Burma; and Dr. Honigberger received C. nudiflora from the Himalayas under the name of Kandoolee. The rhizomes of some species are starchy, and are eaten. C. Rumphii is used in India as an emenagogue.—*W. Ic.; Riddell.*

COMMELYNA BENGALENSIS. *Morrison.*

Ho-tan-t'u, . . . CHIN. | Kan churu, kanuraka, HD.

Has small blue flowers.—*Smith.*

Kunnu katti pillu,	,,	Venna vedara,	,,

Its succulent leaves are used by the Hindus for feeding young calves when they wish to wean them from their milk. The plant has a small delicate blue flower, and is found growing on the banks of watercourses, along which it spreads rapidly, sending suckers into the ground. Found in lawns. The leaves are used by the natives mixed with other greens.—*Ainslie; Jaffrey.*

COMMELYNA MEDICA. *Smith?* The T'sun-tung of the Chinese. Its tubers are used as a cooling medicine. The same name is given to the roots of the Ophiopogon Japonicus, and of a species of Aneilema.—*Smith.*

COMMELYNA OBLIQUA. —? Is the Xanjura and Kana of Hindustan. The root of this plant is edible.

COMMELYNA POLYGAMA. *Smith.*

Yah-chih-ts'au, . CHIN. | Chuh-yeh-ts'ai, . CHIN.

The duck's foot grass or spider-wort. In China is much cultivated as a pot herb, which is eaten in spring. The juice of the flower is used as a bluish pigment in painting upon transparencies. —*Smith.*

COMMERCE. From the earliest historic times, products from the S.E. of Asia have been carried to the west by the same sea routes as are now followed, or have been, as now, carried across the deserts of Central Asia and through the passes in its mountain ranges.

The earliest route between Europe and India of which there is any record in the works of Herodotus, Strabo, Pliny, and others, was by the Red Sea. Even before the building of Troy, spices, drugs, and many other kinds of merchandise were

sent from the East by this route. The ships coming from the Indian seas landed their cargoes at Arsinoe (Suez), from whence they were carried by caravans to Cassou, a city on the coast of the Mediterranean. The distance from Arsinoe to Cassou was about 105 miles. According to Strabo, this route was twice altered in search of a more commodious one. Sesostris of Egypt started the idea to which M. de Lesseps in the Christian year of 1869 gave effect. The Egyptian monarch caused a canal to be cut from the Red Sea to a branch of the Nile, and had ships built for carrying the traffic, but for some reason the enterprise did not succeed. In 1 Kings ix. 26, also, it is mentioned that about 1000 B.C., Solomon king of Israel 'made a navy of ships in Ezion-geber, which is beside Eloth, on the shore of the Red Sea, in the land of Edom.' And these ships brought gold, silver, and precious stones from Ophir and Tarshish in such quantities, that king Solomon 'exceeded all the kings of the earth for riches.' Silver was so plentiful at his court, that it was 'accounted nothing of.' The king's drinking-cups were made of pure gold, and his shields were covered with beaten gold. We are distinctly told that the navy of Tarshish brought 'gold and silver, ivory and apes and peacocks,' and Ophir has been supposed to have been some district or port in India. The Tarshish fleet is said to have arrived at Ezion-geber only once every three years, from which we may infer that the voyage was a considerable one, or that the ships had to go with the S.W. monsoon and return with the N.E. winds, or made a trafficking voyage from one place to another, until the one cargo was sold and another shipped. Neither place has been identified. Had the ships visited the Malay Peninsula, Sumatra, Java, or Borneo, they would have known of the Simia satyrus (the orang-utan of Malacca and Sumatra, the mia of Borneo), or seen the Siamanga syndactyla, the long arms of which measure five feet six inches across in an adult about three feet high. As at the present day, the ancient mariners boldly crossed the Arabian Sea, and reached Muziris, a port on the Malabar coast of India, in a voyage of forty days, or about the middle of September, and they left India on their return at the end of December. The races ruling in Mesopotamia, on the shores of the Persian Gulf, the Akkad and the Phœnicians, also prosecuted the Eastern trade.

The *land routes* have varied with the revolutions that have raised and swept away the military rulers. They have, at times, led through the deserts of Africa, have crossed the immense steppes of High Asia, and over the passes in its mountain ranges, and, as at the present day, caravans of camels, with their bales and chests bound with cords, as described in Ezekiel, trailed their long lengths along. Pliny (lib. vi. c. 4) particularly describes one route. 'Having arrived at Bactra,' he observes, 'the merchandise then descends the Icarus as far as the Oxus, and thence are carried down to the Caspian. They then cross that sea to the mouth of the Cyrus (the Kur), where they ascend that river, and, on going on shore, are transported by land for five days to the banks of the Phasis (Rion), where they once more embark, and are conveyed down to the Euxine.'

In the days of Augustus, Aulus Gellius described the caravans of Arabia as being like armies in magnitude. The time and course of each caravan was marked by the convenience of merchants and the position of watering-places. Each had its fixed time of starting, its invariable daily halting-places, its entrepots, and its points of junction with other caravans who would join it for protection.

At one time two great lines of caravans started from Yemen. The one proceeded from Hadramaut by Oman, and took the line of the Persian Gulf; the other came by the Hejaz along the coast of the Red Sea, and arrived at Petra, and from hence bifurcated off into two roads, the one going to Gaza and the other to Damascus. From Yemen to Petra the time of the caravan march was seventy days; and the stations of the present day are the same as those described by Athenodorus, and were probably the same in the days of Ishmael and Abraham. The Maadite tribes found in this traffic an immense field of employment. Some let their camels for hire, some acted as guides, some secured protection in return for payments of money, some engaged themselves in traffic. Some revolution interrupted this caravan trade; the vast cities which maintained their enormous prosperity by the passage of caravans fell into decay; but remains of colonnades, temples, and amphitheatres excite the traveller's admiration and surprise, amid the sands of the Hauran and the deserts east of the Dead Sea and the Lake of Tiberias. Palmyra, Philadelphia, and the cities of the Decapolis were the northern stations or termini of the great caravan road from Petra to Damascus. But the position of Petra was peculiarly adapted to advance it to that incredible degree of opulence which won the admiration of visitors in the days of Greece and Rome, which was described by Athenodorus the Stoic, and which, after having been forgotten in the desert for centuries, still exists, within its rock ramparts and its richly chiselled and stately pillars and edifices, to astonish and instruct the modern traveller. Petra, in fact, was one of the chief points of junction of the great caravan traffic, and it was here that the cargo of the caravan changed hands from the carriers of the southern to those of the northern merchants.

With the fall of the mighty Roman empire, the routes by the Red Sea and Arabia seem to have been abandoned; and centuries afterwards, when the Genoese engaged in commerce and navigation, a former trade route had been reopened up between India and Europe. The merchandise from the western part of India was now carried up the river Indus as far as it was navigable, and then across country, through Samarcand, to the river Oxus, down which it was shipped to the Caspian Sea. In like manner the merchandise from China and the Moluccas was shipped across the Bay of Bengal, and up the rivers Ganges and Jumna, and then carried overland to the Oxus. Samarcand was then a great emporium, and the merchants of India, Turkey, and Persia met there to exchange their wares. The ships sailed across the Caspian to the port of Astracan, at the mouth of the Volga. Thence the goods were carried up the river to the city of Novgorod, in the province of Reizan (a city that must have been considerably to the south of the famous Nijni Novgorod of to-day), then overland for some miles to the river Don, where they were loaded in barks and carried down stream to the Sea of Azof, and on to the port of Caffa or

Theodosia, in the Crimea. Caffa belonged at that time to the Genoese, and they came there in their galliasses to fetch Indian commodities, which they distributed throughout Europe. In the reign of Commodita, emperor of Armenia, a better route was followed, by the merchandise being transported from the Caspian Sea through Georgia to the city of Trebizond on the Black Sea, whence it was shipped to all parts of Europe. This was doubtless the origin of the connection of the Armenians with the trade of India. So highly was this route approved of, that another Armenian emperor is said to have actually begun to cut a canal, 120 miles in length, from the Caspian to the Black Sea, for the greater convenience of the trade, but the author of this scheme was slain and the enterprise fell through.

After a time the Venetians came upon the scene, and took up a new and much shorter trade route to India, that down the river Euphrates,—a route which even at the present day is believed by some to be the best that could be selected for communication between India and Europe. The Venetian merchants sailed from Venice to Tripoli; thence their goods were carried in caravans to Aleppo, which was a famous mart, and whose reputation Shakespeare did not fail to notice. From Aleppo the caravans made their way to Bir on the banks of the Euphrates. Here the merchandise was transferred to boats, and conveyed down the river to a point near Baghdad on the Tigris. Baghdad being reached, the merchandise was then transferred to boats on the Tigris, and carried down to Bassora and the island of Ormuz in the Persian Gulf. In those days Ormuz was the greatest emporium in the south of Asia. Here all the velvets, cloths, and manufactures of the West were exchanged for the spices, drugs, and precious stones of the East.

The wealth acquired by the merchants of Venice in their trade with the East excited the envy of the whole of Europe. The Portuguese especially spared no expense in their endeavours to discover a new route to India, and in the latter part of the 15th century they found their way to Calicut by the Cape of Good Hope; and the cheapest route between Europe and India was the high sea. But after making use of the Cape sea route for 400 years, the world has returned to that by the Red Sea, which was followed by the ships of king Solomon and Hiram king of Tyre.

Along the eastern coast of Africa, merchants from Great Britain, France, Portugal, and Germany are now settled, but Asiatics form a connecting link between the Europeans and the African races. Arabs, and Hindus from Sind and from Cutch, have from time immemorial traded on that coast, and the Arab dynasties of Johanna and of neighbouring places gave accounts of their arrival on the coast, which was long prior to that of the Portuguese, having been far back in the middle ages, and there appears to have been settlements on the coast of powerful Arab and Persian emigrants in the early centuries of the Christian era.

The arrival of the Portuguese revolutionized the trade. It was not only that a stop was put by their discovery to the Venetian and Genoese trade with India, but its effect was very nearly to drive away from the coast of Africa the Indian and Arab traders who had carried on commerce in this region. Vasco da Gama and the early Portuguese traders describe in these regions a state of things much superior to what we have since known of them. They describe the region near the coast north of the limits of Cape Colony as occupied by well-settled kingdoms, some ruled over by Arabs, some by natives, and all enjoying a tolerably advanced state of civilisation. The European traders did not contribute to the peace and happiness of this region. The stronghold of Captain Kyd is shown still in the neighbourhood of Johanna, and his castle was certainly built about that time. A system of plunder prevailed. The power of the Portuguese was much crippled by their rivals, but when they were on the mainland they did nothing but turn their attention to the capture and sale of slaves; commerce dwindled, and the country sank. The early Portuguese maps show that the country which in those older maps was represented as filled with towns, has in the later ones been set down as almost unknown.

The people who have now the most influence in commerce, and carry on by far the largest trade, are the Asiatics from the north-west coast of India. They are of different tribes. None of them can tell very accurately when they began to come to Africa to trade. They do not bring their wives and families with them, but are generally young men who trade on the coast for some years, and return to India to manage the same trade in its home branches. During the Portuguese domination, they were very nearly expelled. The Bhattia and Banya, who form a large number of these traders, are Hindus, and are very strict ones; yet it is remarkable that they may leave India and live in Africa for years, without incurring the penalty of loss of caste which is enforced against Hindus leaving India in any other direction.

Several *land routes* through Central and High Asia continue to be followed. The present channels of trade between Afghanistan, Persia, Western Turkestan, and India, are the passes of the Sulimani range and those leading to and from Peshawur. The Moolla pass near Gandava, level throughout, may be traversed in all seasons. Through the Bolan pass the trade passes from Kandahar into Sind, a distance of 400 miles. The Guleri pass, opposite Dehra Ismail Khan, is the chief trade route between Afghanistan and the Panjab; the trade through it is in the hands of Povindah, a hereditary clan of merchants. The Tatara and Abkhana passes, leading from Kābul to Peshawur, are practicable all the year. The Suliman mountains form the western frontier of the Panjab and Sind. The Bolan pass collects the trade both of Kandahar and Kalat, and debouches upon Sind at the important mart of Shikarpur, whose merchants have direct dealings with the remote cities of Central Asia. The Gomal pass, leading from Ghazni to Dehra Ismail Khan, is followed by the half-military, half-trading clan of Povindahs, who bring their own caravans of camels into the heart of India. The Khaibar pass leads from Kābul to Peshawur. The aggregate value of the annual trade with Afghanistan cannot be less than one million sterling each way, or a total of two millions. In 1875-76 the total imports from Kābul were valued at £914,000, consisting chiefly of raw silk, dried fruits and nuts, manjit or madder, and other dyes, charras (an intoxicating preparation of hemp), and other drugs, wool, and furs. The total exports were valued at £816,000, chiefly cotton goods both

of native and European manufacture, Indian tea, indigo, and salt.

The Panjab also conducts a considerable business, *via* Kashmir, with Yarkand, Kashgar, and Chinese Tibet, estimated at about one million sterling altogether. The chief marts on the side of India are Amritsar and Jullundhur, from which latter place the route runs northwards past Kangra and Palampur to Leh, where a British official has been stationed since 1867, in which year also a fair was established at Palampur, to attract the Yarkandi merchants. Merchandise is usually conveyed across the Himalayan passes on the backs of sheep and yaks; but British enterprise has successfully taken mules as far as Leh. In 1875-76, the total imports from Kashmir were valued at £484,000, chiefly pashmina or shawl-wool, charras, raw silk, gold dust, silver ingots, and borax; the exports were valued at £342,000, chiefly cotton goods, food-grains, metals, salt, tea, and indigo.

In this land traffic the difficulties to contend with are partly from the social and political state of the nations through which the trade passes, and partly the physical difficulties of the countries which it has to traverse. Every skein of Bokhara silk in the market of Amritsar, has to traverse upwards of 1000 miles over unbridged rivers and mountain passes, one of them 11,700 feet above the level of the sea; every fabric from Europe exposed in the bazar at Yarkand, has to perform a journey of 525 miles from the Panjab, over passes of 11,300, 12,570, 13,446 feet in height, to Leh, thence over still loftier mountains and through an inhospitable route for 575 miles more. Nevertheless, to combat these difficulties, we find in existence an indomitable mercantile energy, hereditary in certain tribes, as the Babi of South Afghanistan, the Povindah of the Guleri pass, the Paracha of Turkestan, and the Kiryakash of Yarkand. Year after year their caravans stream into the Panjab from Mashed, Kābul, Bokhara, and Yarkand, bringing tales of perils overcome; native ballads bewail the hardships of the travelling merchant, but they still stream on.

Afghanistan, a mountainous region lying between lat. 30° and 36° N., and long. 60° to 68° E., with a population estimated at 4,200,000, contains within its limits three great entrepots of trade between Europe, Persia, Turkestan, and India, —Herat, Kābul, and Kandahar,—where the silk of Bokhara and Khotan, the shawl-wool of Kirman on the south-west, and Khokand, are exchanged for the fabrics of Europe and for the indigo and the spices of the east. Passing the well-watered plains of Murghab and the petty Uzbak states to the north-west of the Bamian hills and the Kunduz districts, in whose eastern frontier are the ruby mines of Badakhshan, and the lapis-lazuli quarries of the valley of the Kokcha, we come to the plains of the Oxus and Jaxartes, the Amu Dariya and the Syr Dariya, into which Russia has passed, but formerly divided politically into the three Uzbak khanate states of Khiva, Bokhara, and Khokand. Of these, Khiva khanate has a population estimated at 2,500,000; Bokhara, one of 2,000,000; but Bokhara is at once the most productive, and its capital is the great depôt for the trade of Central Asia, occupying the position held in more ancient times by Balkh and Samarcand. Its silk is used throughout the north-west of India; its cotton is exported largely to the north; and the black lambskin wool of Karakul, one of its provinces, is a staple article of trade; while it imports considerable quantities of tea, fur skins, iron, and cotton goods. Caravans leave yearly for Russia *via* Orenberg and other frontier towns, and the trade with that country is estimated at upwards of £300,000 per annum; it has also a considerable trade with Western China *via* Yarkand, with Persia *via* Mashed, and with India *via* Kābul and Peshawur. Under Russian supremacy, Samarcand is resuming its former position as the more important mercantile site.

Proceeding eastward to the borders of *Chinese Turkestan*, including the provinces of Yarkand, Kashgar, and Khotan, we find the former the entrepot of trade between China and Bokhara, and the latter celebrated from the time of Ctesias for its mineral products, its jade and emeralds, its shawl-wool and flax; a considerable importer of furs, broadcloth, leather, and sugar, and at one time the entrepot of a vast trade with Hindustan. Turning south, we come to the kingdom of Kashmir, including its outlying province of Ladakh, the former sending its valuable shawls to all parts of the world, while the latter supplies shawl-wool in exchange for opium, the produce of the Kulu hills, otter-skins, cotton piece-goods, spices, and drugs.

The Quetta trade goes on to Kandahar, but not much further west, as the maritime trade from Bombay up the Persian Gulf carries articles more cheaply than they can be conveyed by any land route.

The trade into Kashmir is conducted with the districts of Hazara, Rawalpindi, Jhelum, Gujerat, Sialkot, and Gurdaspur.

With Kābul the trade passes through Peshawur, Kohat, Dehra Ismail Khan, and Bannu. That through Peshawur is by the Khaibar, Tatara, Abkhana, and Gandal routes; that from Kohat is by the Thul and the Kurram valley; that by the Dehra Ismail Khan district goes by the Gomal pass, and Sewastan is reached by this.

The Bajaur trade is *via* Peshawur and Hazara; to Yarkand, *via* Amritsar; and to Ladakh, through Kulu.

The route to the west from Kābul to Bokhara runs *via* Bamian, Saighan, Doaba, Hibark, Hasrak Sultan, Kulm, Balkh, Kilif-ford, and Karshi. Bokhara is the great centre mart to which merchants resort from Samarcand, Tashkand, and Khokand.

The Chinese Tibet trade goes *via* the Hindustan Tibet road, the several routes converging at Wang-tu, where the Sutlej crosses the road. At Gartokh town, in Chinese Tibet, a commercial fair is held twice a year, at which traders meet from Ladakh, Nepal, Kashmir, and Hindustan.

The routes to Tibet are by five passes, viz. the Nilanghat, at the eastern corner of Native Garhwal (Tehri); the Mana and Niti passes in British Garhwal; and the Johar, the Darma, and the Byans passes in Kamaon.

The routes into Nepal are by Kamaon, Philibhit, Kheri, Bahraitch, Gonda, Basti, and Gorakhpur.

Nepal Trade Routes.—From Khatmandu two routes branch off over the central range of the Himalaya, which both ultimately come down into the valley of the Tsanpu, or great river of Tibet. In 1877-78 the registered trade with Nepal (which is doubtless under-estimated) amounted to a total of £1,687,000, of which more than

two-thirds was conducted by Bengal. The exports from Nepal were valued at £1,054,000, the principal items being food-grains and oil-seeds, cattle, timber, and horns. Other articles of export are musk, borax, chiretta, madder, cardamoms, chauri or yak tails, ginger, balchar or scented grass, furs, and hawks.

British India is geographically adapted to maritime trade, and an Indian nation might have been a naval power almost as easily as the British themselves have become so. The coast of India offers a ready means of intercourse with foreign countries. The mountains on the north are a great barrier to trade with Central Asia. But to the south-east and west are countries and people with whom the natives of India have established independent relations. India possesses a long coast-line of over 2000 miles and about 300 harbours; but the foreign trade of the Indian empire is practically confined to Akyab, Cocanada, Chittagong, Coringa, Negapatam, Beypur, Calcutta, Bombay, Madras, Rangoon, Moulmein, Colombo, Trincomalee, Galle, Tuticorin, and Kurachee, all of which, excepting Madras, are excellently situated as central marts for the distribution of articles of commerce. To Rangoon, Moulmein, and Bassein naturally flow by the Irawadi all the products of Upper Burma and of Pegu; while the railway between Rangoon and Prome offers further facilities for the conveyance of merchandise. Calcutta is the most convenient point of distribution of the trade conveyed by water through Bengal, while it is also the terminus of the two main railway systems of Bengal. The river, too (formerly dangerous to navigation), is now carefully charted, while the Port Trust has provided conveniences for shipping which are probably unequalled in the whole world for the ease with which cargo is loaded and discharged. The Northern Bengal State Railway has opened out rich tracts, producing tobacco, jute, and other valuable commodities in great abundance, and rendering trade to some extent independent of the rivers in that region, which cease to be available highways for the conveyance of goods when the waters are low.

Sir John Strachey has remarked that 'India is a country of unbounded material resources, but her people are poor. Its characteristics are great power of production, but almost total absence of accumulated capital. On this account alone the prosperity of the country essentially depends on its being able to secure a large and favourable outlet for its superfluous produce. But her connection with Britain and the financial results of that connection compel her to send to Europe every year about 20 millions' worth of her products, without receiving in return any direct commercial equivalent. This excess of exports over imports is, he adds, the return for the foreign capital, which is invested in India, including under capital not only money, but all advantages, which have to be paid for, such as intelligence, strength, and energy, on which good administration and commercial prosperity depend. From these causes, he says, the trade of India is in an abnormal position, preventing her receiving the full commercial benefit which would spring from her vast material resources.' In the thirty-six years between 1835 and 1871, the value of merchandise exported from India amounted to £1,012,000,000; the value of merchandise imported into India, to £583,000,000, showing an excess of £429,000,000 on the exports. The value of treasure imported in the same period was £312,000,000 against £37,000,000 re-exported, being a nett import of £275,000,000. In 1880, India sold to foreign nations £66,000,000 worth of strictly Indian produce, which the Indian husbandman had raised, and for which he was paid. In the year 1881–82 the total trade of India, including exports and imports, exceeded £141,000,000.

The commercial transactions of British India with foreign countries are chiefly with the United Kingdom of Great Britain and Ireland, and with China. In the year 1881–82, the total value of the imported merchandise and treasure was £58,314,865, and that of the exports £82,999,346. Cotton piece-goods, twist and yarn, thread and other sorts, imported were of value Rs. 29,99,41,635. The values of sugar, refined and unrefined, and of woollen goods, were each above a million sterling; metals, raw and manufactured, 3½ millions; while of the exported articles the opium was valued at Rs. 12,43,21,418; rice, grain, pulse, wheat, seeds, £17,240,750; tea and coffee, £5,056,601; raw cotton, cotton goods, twist and yarn, £16,946,475. In that year twenty-five of the more important

The opening of the Suez Canal in 1869 stimulated every department of eastern trade into greater activity, but has not materially changed

its character. In 1871-72, the first complete year for which statistics are available, the total number of steamers which sailed *via* the canal was 422, with a tonnage of 464,198. In 1875-76, 85 per cent. of the imports into India from Europe and Egypt (excluding treasure) passed through the canal, but only 29 per cent. of the exports. The actual values of canal trade in 1877-78 were 29 millions sterling for imports into India, and 23 millions for exports from India. The canal has reduced the length of the voyage from London to Calcutta by about 50 days. The route round the Cape was more than 11,000 miles, and occupies, by sailing ships, nearly three months; that from Britain through the canal is less than 8000 miles, and takes, by steamers, from 30 to 45 days. The numbers and tonnage of steamers adopting the canal route have rapidly increased :—

Year.	No.	Tons.	Year.	No.	Tons.
1877-78	1137	1,617,839	1880-81	1459	2,133,872
1878-79	941	1,426,957	1881-82	1989	2,887,988
1879-80	1067	1,609,769			

Bombay is the sole outlet for the products of Western India, Gujerat, the Dekhan, and the Central Provinces; Karachi (Kurachee) performs a similar office for the valley of the Indus, and Rangoon for that of the Irawadi. Bombay is almost exclusively dependent upon its cotton, seeds, and wheat; and a bad crop of any of these is a bad time for the export trade from that port generally.

Calcutta is an outlet for a vast tract of country, capable of producing, besides wheat and seeds, which Bombay does export, though to a less extent, an infinite variety of staples, such as tea, oil-seeds, jute, raw and manufactured in the shape of gunny bags and cloth, also rice and hides. After the opening of the Suez Canal, the exports from Calcutta rose in value from less than 20 millions sterling in 1867-68 to nearly 29 millions in 1878-79.

Rangoon is, however, the most thriving place, commercially, in the Indian Empire, considered relatively to its size. The import trade in 1880-81 was valued at more than £3,846,346, being an increase of 267 per cent. in 10 years; while its export trade exhibited an increase of 233 per cent. in the same period. Burma is without doubt the most prosperous province of the empire, and its people, free from the religious and caste prejudices with which the Hindus and Mahomedans of India are imbued, and fond of personal comfort and adornment, spend their earnings freely on substantially-built and healthy habitations, on silk attire, jewellery, cigars, European provisions of kinds such as in India are consumed by the British-Indian population only, on crockery and glass-ware, and other things which conduce to the personal comfort of a man who will not, as in India, be content to live in a mud hovel.

Europe.—Owing to the removal of the E. India Company's monopoly, and subsequently of customs and navigation laws, and still later the opening of the Suez Canal, the current of trade shows a disposition gradually to return to the channels chiefly used before the discovery of the passage round the Cape. The cities on the Mediterranean are again receiving and profiting by that share of the Eastern trade which enriched them, until it passed first into the hands of the Portuguese, and thence into those of the Dutch and English. London still retains its supremacy as the centre of at least 60 per cent. of the trade of the Indian Empire; but Trieste, Venice, Genoa, and Marseilles play an increasingly important part in the commercial race.

The imports of merchandise *via* the Suez Canal from Europe, Egypt, and the Levantine coast of Asiatic Turkey, increase year by year. The route is not so largely used for exports of Indian produce, the reason being that large quantities of these, such as opium and rice, find their way to China and the Straits, Mauritius, Ceylon, Arabia, and other countries.

China trade with India is practically confined to the opium traffic, though, within the last few years, that country has become an important consumer of Indian-made twist, which no doubt displaces to some extent in the Chinese markets the spinnings of Manchester. The time will come when the Chinese will spin for themselves, and then India will have to be content with her own local markets for her goods. In all respects but one the Chinese are better adapted than the people of India for the profitable manufacture of cotton: they are capable of longer and more sustained exertion, they are more ingenious and skilful as operatives, and their commercial classes are at least as acute and bold in speculation as those of India. But China is compelled to import cotton, and India will have a good market in China and Japan for a portion of the out-turn of her mills. The imports from China, even with the addition of treasure, amount to hardly a fifth of the exports thither, the truth being that the opium is paid for by China through Great Britain. The chief articles imported into India from China are copper (supposed, however, to be Japanese, imported *via* China), raw silk and silk piece-goods, and sugar and tea in small quantities. The imports of raw silk reach the comparatively high figure of 41½ lakhs (£415,000). The sugar brought from China is landed in Bombay, where it supplements or competes with Mauritius sugar. The tea imported from China is of inferior quality.

Straits Settlements trade must be regarded in connection with the trade with China. The goods imported are of little consequence, tin excepted.

Ceylon trade with India is identical in character with the coasting trade carried on from port to port. Crowds of Tamil labourers flock to Ceylon every year from the Madras Presidency, to work on the coffee plantations, and over two-thirds of the exports consist of grains for their sustenance. The imports from Ceylon are hardly a sixth of the xports in value.

Between India and *France* the articles chiefly consist of apparel and millinery, brandy and wines, and silk goods; while the exports comprise cotton, coffee, indigo, oil-seeds, especially rape and gingelly, raw silk, and raw jute.

After France, the *United States* do the most trade with India. Imports are small, and practically were confined to ice and kerosene oil; but ice is now manufactured and sold in India at half the rate hitherto charged by the Tudor Ice Company. In kerosene the value rose from 3,18,898 rupees in 1876-77 to 16,37,966 rupees, and 21,07,907 rupees in the two following years. The imports of grey cotton goods from America are increasing. Indian exports to the United States consist mainly

of indigo, hides, skins, raw jute, gunny bags and cloth, lac, saltpetre, and linseed.

Mauritius sends sugar very largely to India. The most important export to Mauritius is rice, which with other food-grains amounted to nearly a kror of rupees in value.

Italy's trade includes corals, glass beads, false pearls, spirits and wines, and silk goods. The exports to Italy consist mainly of raw cotton, hides, oil-seeds, sesame, and raw silk. The total value of the import and export trade with Italy in 1878-79 was about two kror of rupees.

India is rich in raw products, mineral, vegetable, and animal. It supplied all its own people's wants until the maritime intercourse with foreign nations, and particularly since the construction of lines of railway allowed the delivery of many articles in the Indian ports, and even in its remoter provinces, at lower rates than the native products could be obtained. Its marketable mineral substances useful in the arts, are,—alum, agates, amber, antimony, arsenic, asbestos, barytes, beryl, bismuth, bloodstone, borax, cornelian, chrome ore, coal, cobalt, copper, corundum, diamond, emerald, fluor spar, garnet, gold, graphite, gypsum, iron ores, jade, jasper, kao-lin, kyanite, lapis-lazuli, lead, lithographic stone, magnesite, manganese, marbles, meerschaum, mercury, mica, mineral oils, petroleum, platinum, potstone, rock-crystal, rubies, salt, saltpetre, sapphire, turpentine, silver, sodium compounds, spinel, sulphur, talc, tin, topaz, turquoise, zinc. The chief of the vegetable exports are,—coffee, cotton, indigo, grain, and pulse, jute, oils, opium, seeds, sugar, tea, and woods; and of animal produce are,—living animals, feathers, hides and skins, horns, ivory, lac, musk, oils, saltpetre, silk, wax, wool.

The chief imports into British India are,—apparel, coal, cotton twist and manufactures, liquors, machinery and mill-work, metals, provisions, railway plant and rolling stock, silk, raw and manufactured, spices, sugar, and woollen goods. In the progress since the opening of the Suez Canal, British India is now competing with some of these. Indian mills have taken strong hold of the market for the lower qualities of twist. Of metals nearly 80 per cent. consisted of iron, which always forms the largest item in this category. Sugar comes third in the list of imports, the value being 1,48,08,805 rupees. Indian beer costs but 5½ rupees a dozen at Simla, as against 9 rupees a dozen charged for English beer. Imports of various light German beers have largely increased. The imports of raw silk and silk goods amount to nearly a kror and a half (about £1,500,000), the raw silk being valued at about 56,75,000 rupees. This may be due to a decline in the silk-weaving industry in India. The import of coal, coke, and patent fuel has fallen off. Very little coal is landed in Calcutta, the bulk of it going to Bombay, which is too far from the deposits of Central India to be able to avail itself of their product with profit.

In 1881–82 the value of the foreign merchandise re-exported from India was 2,64,67,165 rupees.

The re-exports are mainly goods consigned in the first instance to Bombay, and then re-exported to ports in the Persian Gulf and Red Sea, Zanzibar, and the eastern coast of Africa. More than half of these consist of cotton twist and piece-goods (chintzes and prints), amounting to 1,32,47,706 rupees in value.

In 1881–82, the declared value of the opium exported was 14,32,33,143 rupees, the largest sum it had attained. Grain and pulse were valued at 17,24,07,506 rupees, the two most important of these being rice and wheat. The exports of raw cotton, twist, yarn, and manufactured, were 16,94,64,755. The first mill for the manufacture of cotton yarn and cloth by steam machinery was opened in Bombay in 1854. Since then others have been established in various parts of India, but mostly in the city of Bombay and in the cotton-growing districts of Gujerat. In 1878-79 there were 58 cotton mills in India, containing 1½ million spindles and 12,000 looms, which employed upwards of 40,000 persons,—men, women, and children. India commits enormous waste by exporting rapeseed, linseed, and til (Sesamum orientale) in a crude condition, instead of expressing it on the spot, and obtaining thereby a valuable food for cattle and land fertilizer in the shape of oilcake. The manufacture of jute on a large scale was unknown until 1857, but there were 21 jute mills in India in 1881.

Indian tea exported was 48,691,725 lbs., valued at 3,60,91,360 rupees. The cultivation of tea and coffee has taken deep root in India, and a large amount of European capital and indigenous labour is absorbed by these industries. No less than 664,326 acres were taken up in 1878 in connection with tea cultivation, though only 200,000 acres were actually planted with it. The quantities of coffee exported have hardly increased during the last 11 years, prices have largely augmented, coffee being now worth nearly double what it was at that time. The quantity exported in 1881–82 was

346,364 cwt., mainly the produce of Mysore, Coorg, and the Wynad district of Malabar. More could be done in the Indian tobacco trade if the Indian leaf could be obtained of somewhat better quality, the French and Italian tobacco departments being both quite prepared to take Indian tobacco in large quantities, if it could be supplied of a suitable quality. It is gradually advancing in public estimation in India and abroad. The quantity exported in 1881–82 was 10,530,325 lbs., value 11,50,380 rupees.

Inland Frontier Trade crosses the long land frontier of India on the north, stretching from Baluchistan to Independent Burma.

In 1878–79, the value of the imports and exports of the inland trade was Rs. 8,85,37,193, viz.:

Baluchistan,	Rs. 16,45,943	Manipur, . .	Rs. 94,524

Agriculture.—The extent to which the population of India are dependent upon the land, may be realized partly from the census returns, which show us that 74 per cent. of the adult male population derive their support from the land either directly or indirectly.

Merchants.—The internal trade of India has never been estimated; it greatly exceeds the external commerce. In the interior of the Bombay Presidency, business is mainly divided between two classes, the Bhattia or Banya of Gujerat, and the Marwari from Rajputana. The former are Vaishnava Hindus of the Valabhacharya sect, the latter are Jains. In the central parts of the Dekhan and Mysore, their place is taken by Lingaets, who follow the Vira Saiva form of Hinduism; but along the eastern seaboard the predominating classes of Hindu traders are the castes named Chettiar, Komati, and Natha Cottiyar. Many of the trading castes of Hindus still claim Vaisya descent.

In Bengal, many of the upper classes of Sudras have devoted themselves to wholesale trade; although there, also, the Jain Marwari from Rajputana and the north-west occupy the front rank. Their headquarters are in Murshidabad district; and Jain Marwari are found throughout the valley of the Brahmaputra as far up as the unexplored frontier of China. They penetrate everywhere among the wild tribes; and it is said that the natives of the Khassya Hills are the only hillmen who do their own business of buying and selling. In the North-Western Provinces and Oudh, the traders are generally called Banya; and in the Panjab are found the Khatri (Kshatriya), who have perhaps the best title of any to regard themselves as descendants of the original Vaisya.

Not inferior to any Hindus as active, intelligent traders, are the Labbi, a Mahomedan race, who also speak Tamil; another Mahomedan race, the Khoja, have spread from Sind to the western and central parts of the Peninsula of India, and along the shores of Arabia and of eastern Africa as far south as the Portuguese dominions. The Borah and Memon Mahomedans are keen tradesmen. The Mopla Mahomedans are but little engaged in inland traffic. Other Mahomedans from Persia are trading in all the ports of Southern Asia; and Arab Mahomedans, as merchants and missionaries, are occupying all the eastern and northern parts of Africa, and have gone eastwards through the Indian Ocean to the islands of the Archipelago. Another race of Aryan descent, the Parsees, are seen throughout all the south and east of Asia, and, with mercantile men of Indo-Germanic race, from Great Britain, France, Germany, and America, they conduct nearly all the foreign trade.

The bold, self-reliant non-Aryan tribes of British India have emigrated largely as labourers to Ceylon, the Straits Settlements, and Burma; to the West Indies, to S. America, S. Africa, the Mauritius, and Bourbon; but as skilled producers they have been far outstripped by the Chinese, whose numbers in Borneo, in Australia, Mauritius, and the western of the United States, have assumed political importance; and to the east, in the Archipelago, the Bugi or Macassar men traverse the seas from Sumatra to New Guinea.—*Rich's Kurdistan; Madras Mail*, 7th June 1870; *Imp. Gaz.; Stat. Abstract; Maritime Trade of British India; Foreign and Inland Trade Reports; Accounts of Trade and Navigation; Moral and Mat. Prog.; Miscellan. Statistics; Trade and Nav. Accts.*

COMMIA COCHIN-CHINENSIS, a small tree of Cochin-China, with a resinous juice. It yields a gum which possesses emetic and purgative properties, recommended in dropsy.

COMMISSIONER, an appellation generally given in India to officials invested with full revenue and judicial powers. In the Panjab, Sind, Burma, etc., are styled chief commissioners, and have commissioners under them. In the Bengal Presidency, a commissioner is a revenue officer who has the superintendence of several collectorates, with collectors under his control.

COMORAH, a bay on the Malabar coast, 51 miles north of Severndrug.

COMORIN, or Cape Comorin, in lat. 8° 4′ 20″ N., and long. 77° 35′ 55″ E. The Greek writers refer to a bathing festival here, which is still continued.—*Imp. Gaz.* See Cape Comorin.

COMORO, a group of volcanic islands midway between the N. extremity of Madagascar and the coast of Africa. Great Comoro is an active volcano 8500 feet high. They rise over a submarine bank of 500 fathoms.

COMPASS.

Söekompass, . .	DAN.	Paduman, . .	MALAY.
Zeekompas, . . .	DUT.	Compasso de marear,	PORT.
Compas de mer, . .	FR.	Kompass korabelnii,	RUS.
Boussole, ...	,,	Sjocompass, ...	SP.
Kompass, .	GER., TAM.	Aguja de marear, . .	,,
Bussola, ...	IT.	Kompassu, . . .	TEL.

The compass is used for nautical purposes by the principal native traders of Southern and Eastern Asia, and of the Archipelago. The Bugis of Celebes use small rude compasses, made expressly for them by the Chinese of Batavia, at the very moderate cost of from one shilling to eighteenpence a-piece. The directive power of the magnet is said to have been known to the Chinese for many ages,—by their own account, no less than 2634 years B.C. Their knowledge of the magnet is supposed to have led them to a knowledge of the compass; and the mariner's compass was invented by the Chinese in the reign of Hoang-Ti. The subdivisions of this nautical instrument, as

made by the Arabs, the Chinese, and the Maldives, all vary. The Malay compass is divided into sixteen parts, twelve of which are multiples of the four cardinal points. For the cardinal points the different nations have native terms; but for nautical purposes, those of the Malay language are used throughout, as in the case of the nations of Celebes, the most expert native navigators of the present day. The introduction of iron ships has materially affected the value of the compasses on board of them, the variation being as much as five points, even up to 24½ and 35½. The sole apparent remedy for this, but it is one of easy application, is to erect a high platform, 15 feet high, over the taffrail, on which to place the compass, and to examine repeatedly.—*Crawfurd's Dict.*; *Bunsen*, iii. p. 383; *M'C. Dict.*

COMPOSITÆ. VAILL. A very extensive order of plants, now known as Matricariaceæ.

COMPOUND. This Anglo-Malay word is a corruption of the Malay Compong or village, and properly applies to the outhouses of the servants, which are erected within the enclosure. It is applied in almost the same sense all over British India, where, however, some suppose it to be derived from the Portuguese word Campagna; and another writer says it is from the Portuguese word Componze, and still another Compinho. It is also applied by the Europeans of India to the grounds or enclosure in which a house stands.—*Earl*; *Sirr.*

COMPRADORE. ANGLO-INDIAN. A purveyor; in China, an accountant.

COMPTI, Kompti, Kamatti, MAHR., TAM., TEL., in the Peninsula of India, persons engaged in trade, as shopkeepers and general merchants, and commonly recognised to be Vaisya Hindus; they wear the sacred string or zonar. They are, amongst the Teling and Tamil people, what the terms Gujerati, Banya, Marwari, and Vais are amongst the traders from Rajputana and Gujerat; they are never soldiers.

CONAJI ANGRIA, a person of low origin who long carried on a piratical warfare on the western coast of India, and rose to princely power. Gheriah was his headquarters, but Severndrug and every creek were fortified. After he acknowledged raja Saho, he remained in nominal dependence on the Mahratta state, but employed his own resources with little or no control. His piracies, which he called levying chout'h on the sea, rendered him formidable to all his neighbours. The British made repeated attacks on him with considerable naval forces, and on one occasion (A.D. 1719) in co-operation with the Portuguese, yet failed in all their attempts. The Dutch also sent a strong force against him at a later period (A.D. 1724), with equal ill success. The Peshwa interposed in a dispute between two brothers of the family, and received from one of the brothers two forts situated in the Ghats (about A.D. 1734). The contest, however, continued, and the Peshwa, though latterly assisted by a British fleet, was unable to bring it to a conclusion till the time of Baji Rao's death. Long afterwards, Gheriah was captured by Clive and Admiral Watson in 1755. —*Elphin.* p. 641.

CONCAN, a small, narrow strip of land lying between the Western Ghats and the sea-coast. The low land in the Concan, Gujerat, and Malabar is traversed by many rivers and smaller streams running to the sea, and is indented by numerous creeks and channels of the ocean. The cold weather is clear and bracing, but the hot season of April and May is succeeded by the deluging rains of the south-west monsoon, when 150 inches fall from June to September, and render much of the already humid lands impassable swamps; the atmosphere is then very damp. The Concan districts extend from Goa to Daman, or very nearly to the Tapti river. In the northern parts of the Bombay Presidency, the chain separating the Concan from the Dekhan is called the Northern Ghats, or Sahyadra mountains. See Konkan.

CONCH or Chank, species of Turbinella. See Chank.

CONCRETE. Dana terms this calcareous sand rock, 'drift sand rock.' Major-General Nelson terms it Æolian formation. It occurs on the coast near Bombay, and at the Bermudas Islands.

CONCUBINAGE is very common all over India amongst all religionists. It is more particularly prevalent in great cities, and in places where, from any cause, the people are necessarily absent from their families and birthplaces.

CONDA-CUPI. TAM. A necklace.

CONDAPILLY, in lat. 16° 37′ N., and long. 80° 33′ E., is a town in the Masulipatam district in the Northern Circars. The rocks of the hills near contain garnets, and diamond mines are near.

CONDA-PUCHI. TAM. A head ornament.

CONDIMENTS.

Assaisonnement, . . FR.	Condimento, . . . SP.
Würze, Brühe, GER., IT.?	

Aromatic barks, roots, seeds, and spices, used as condiments in South-Eastern Asia, are found in every bazar for domestic use, and some of them are largely exported. The following are the better known plants used:—

Allium sativum.	M. pulegium.
Archangelica officinalis.	M. sativa.
Areca catechu.	M. viridis.
Cassyta filiformis.	Moringa pterygosperma.
Cicca disticha.	Laurus cinnamomum.
Chavica Roxburghii.	Myristica moschata.
Crocus sativus.	Narthex asafœtida.
Curcuma longa.	Nigella sativa.
Cinnamomum iners.	Ocimum basilicum.
Citrus bergamia.	Pimpinella anisum.
Carum carui.	Ptychotis ajowan.
Coriundrum sativum.	Phyllanthus emblica.
Cuminum cyminum.	Piper nigrum.
Capsicum annuum.	Rosmarinus officinalis.
C. baccatum.	Salvia officinalis.
C. grossum.	S. sclarea.
C. frutescens.	Satureja hortensis.
C. minimum.	S. montana.
C. Nepalensis.	Sinapis, *sp.*
Caryophyllus aromaticus.	S. Chinensis.
Coffea Arabica.	Spondias mangifera.
Carthamus tinctorius.	Trigonella fœnum-græcum.
Elettaria cardamomum.	Tamarindus Indica.
Fœniculum panmorium.	Thymus vulgaris.
Garcinia purpurea.	T. citriodorus.
Garuga pinnata.	Vanilla planifolia.
Illicium anisatum.	Vitex bicolor.
Mangifera Indica.	Zingiber officinale.
Mentha piperita.	

CONDOOLOO. TEL. Cajanus Indicus; dhal. One kind of dhal is condooloo conda, TEL., malatovarai, TAMIL; another variety is condi-puppoo, TEL., tovarai-purpoo, TAM. See Dhal.

CONDYLODERA TRICONDYLOIDES, a cricket of the Philippines. It is exactly like a tricondyla, one of the tiger beetles. Both insects run along the trunks of trees. The tricondyla

are very plentiful; the insect that mimics it is, as in all other cases, very rare. It is a remarkable instance of an insect of another order mimicking a beetle.

CONESSI BARK, Tellicherry bark.

Curayia; Curaija, HIND.	Cheeree; Kutaja, SANSK.

Ahir, ... PERS.	

The seeds of Wrightia antidysenterica.—*Faulkner, Eng. Cyc.; O'Sh.*

CONEY. Palæontologists have pointed out the curious fact that the Hyrax Syriacus, called 'coney' in the Bible, Lev. xi. 5, Deut. xiv. 7, Ps. civ. 18, is really only a diminutive and hornless rhinoceros. Remains have been found at Eppelsheim which indicate an animal more like a gigantic hyrax than any of the existing rhinoceroses. To this the name of Accrotherium (hornless beast) has been given. Sha-phan or Daman is supposed to be the hyrax of Scripture.

CONFERVÆ abound in the warm water of the hot springs of Surajkhand, in Behar; and two species, one ochreous brown and the other green, occur on the margin of the tanks themselves, and in the hottest water; the brown is capable of bearing the greatest heat, and forms a belt in deeper water than the green. Both appear in broad luxuriant strata wherever the temperature is cooled down to 168°, and as low as 90°.—*Hooker, Him. Jour.* i. p. 21.

CONFLUENCE or fork of two rivers is the Sangam of the Hindus, who esteem all such unions sacred, and make pilgrimages to them. That at the junction of the Jumna and Ganges, at Allahabad, is one of the holiest spots in Hindu estimation; and until the early part of the 19th century many of this faith voluntarily drowned themselves there.

CONFUCIUS, Kung-fu-tze, was born B.C. 551 in Tsow, a district of the province of Shan-tung. He died in the year 479 B.C., at the age of 72 or 73. He was of a ducal house, descended from a brother of Chow, the last sovereign of the Yin dynasty. His father, Shuh-leang-heih, was a soldier of great bravery; and Confucius was the child of a second marriage when he was upwards of seventy years of age.—*Gray*, p. 76. Confucius married when nineteen years of age. He was almost contemporary with Pythagoras, Thales, Solon, Buddha, and Herodotus, in an epoch of philosophical and literary activity equally important for the west, which commenced with Pythagoras, as contemporary of Confucius, embraced Zeno, Empedocles, Herodotus, Thucydides, Socrates, and Plato, and ended with Aristotle, who died about the same time as the Mencius (Mang-tsze) of the Chinese. Confucius devoted himself to reducing the traditions and rough records of antiquity into a perfect form, and he succeeded before his death in compiling and editing the five King,—five canonical books which are reverenced as embodying the truth, upon the highest subjects, from those whom they venerate as holy and wise men. He was the founder of the school of philosophy in China, which contains injunctions as to conduct, and may be termed the moral code of China, in which learning (Wen), courtesy, good-breeding, and propriety (Li), doing as you would be done by (Shu), sincerity in worship of the deity (Tien), are everywhere inculcated, and form a recognised state religion. Every word he uttered has become in China a maxim, a proverb, and an aphorism; and in the fact that his language is intelligible to every Chinaman at the present day, his inculcations are of greater power than any in the Latin or the Greek, both of which are unknown to their descendants. Once he was asked whether there were one word which represented all the duties of life, he answered 'Shu,' a word which Confucius and his commentators have explained to mean, 'As I would not that others should injure me, so would I not injure them also.' And, certainly, to seek the good of others equally with your own, is to fill a large portion of the field of virtue. The number of his disciples was about 3000, of whom about 72 were his more intimate associates. All his teaching consists of a few simple words. One of his aphorisms, 'Chu chung sin,' verbally, 'Head, faithful, sincere,' mean that fidelity and sincerity are the paramount or primary virtues. Another is that Wen and Li make up the whole sum of human excellences. Another, 'Lun yu,' 'Judge others indulgently, yourself severely.'

Confucius was a sage and a statesman. He and Lao-tsze were contemporaries, and Lao-tsze was the founder of the Taoist or Reason Sect. But Lao-tsze was an ascetic, who discouraged acceptance of public employments. He made reason the groundwork of his doctrines, and they have much to recommend them; but his teachings have merged into gross idolatrous rites, the study of astrology and necromancy, fanatical observances, self-inflictions, such as dancing in flames, mutilating the body, practising abstinence and seclusion.

Among other celebrated literary labours undertaken by Confucius in B.C. 490 and the following years, he edited the Yih-king, and appended those annotations which have given the work its subsequent value. What philosophical views may have been attached to the Yih-king of Wan-wang and Chou-kung by the contemporaries of Confucius, we know not. That work, together with the other three works edited or compiled by Confucius, viz. the Shu-king and the Le-ke, constitute the whole of the ancient literature of China which has come down to posterity, and who have it only, as it was explained, arranged or modified in passing through his hands. It is well known that he expressly repudiated portions of it, as containing doctrines adverse to the views which he held and strove to diffuse. The names only of some celebrated ancient books, one dating from the times of Fuh-he himself, have been preserved. It is these circumstances which constitute the labours of Confucius the commencement of a distinct literary epoch. Apart from the labours of Confucius himself, the permanent literary results of this, the first of the two great philosophic or literary epochs of China, are contained in the collection of works called the Four Books, composed by different members of the school which he founded. The last contains a record of the ethical and political teachings of Mencius (Mang-tsze), a philosopher who died in

B.C. 317, and closed the first epoch. The Chinese people are in nowise prohibited from worshipping in the Buddhist and Taoist temples; in other words, they may regulate their purely religious life by the tenets of these, or indeed of any other sect. But where Taoism or Buddhism would leave the region of religion, and, in the form of philosophy or morality, extend their direct influence into the domain of the social science and art, there Confucianism peremptorily and effectually prohibits their action. Not only are the national legislation and administration formed exclusively on Confucian principles; it is by them also that the more important acts of the private life of the Chinese are regulated, as for instance marriages. The cause of the prevalence of Mahomedanism in China, in spite of discouragements, lies in the fact that Confucianism says little or nothing of a supernatural world or of a future existence. Hence it leaves almost unsatisfied those ineradicable cravings of human nature, the desire to revere, and the longing for immortal life. That it has, notwithstanding its want of these holds on the human heart, maintained itself not simply in existence, but as the ruling system, is a fact that must, as soon as it is perceived, form for every true thinker a decisive proof of the existence of great and vital truths in its theories, as well as thorough soundness and wholesomeness in the practical rules which it dictates. By Chinese philosophy must be understood Confucian philosophy, and by Chinese morality the moral principles rooted in that philosophy.

The works of Confucius, which are used by his followers, are called the 'five canonical books,' and are held in the greatest veneration. The whole tenor of these works indicate morality and sound political views. One political extract must suffice. Let those who produce revenue be many, and those who consume it few; let the producers have every facility, and let the consumers practise economy: and thus there will be at all times a sufficiency of revenue.

It is the fact that, though the authors of the first and second epochs, Confucius himself included, professed to teach only what was contained in pre-existing sacred books, and though they possibly themselves believed that they did only teach what was virtually contained in such pre-existing books, they nevertheless did, in each case, originate some entirely new views and doctrines.

It is now impossible to ascertain what part of his writings was original, and what obtained from previous writers; but it is generally recognised that he largely annotated the ancient work, Yih-king, and bequeathed five classics and four books. His works, Shu-king and She-king, contain the historical records of the country and the poems then extant. His Book of Rites regulates the manners and customs and outward forms of the whole society, and constitutes a part of his moral code. Confucius is described by one of his disciples as wise, affable, condescending, just. Another says, gentle, but inspiring respect; grave, but not austere; venerable, yet pleasing. In the troubles that occurred from the efforts at aggrandizement which the several kings made, he was sometimes in high employ, but once at least a fugitive; but at the close of his long life he left about three thousand followers of his doctrines. The smaller states were annexed by the race of Tsin, of which dynasty the first emperor was Chy-Hoang, who built the Great Wall. The Chinese have no existing records older than from the time of the race of Chou, in whose reign Confucius lived, and from his time authentic history commences. In the first of his four books, Confucius traces a system of government from that of a family to that of a province, and from a province to a kingdom, making the family tie the foundation of the government. Indeed, the Chinese religion has never advanced beyond a love of parents, obeying and reverencing them while alive, and worshipping them when dead. It is rather a system of morality and moral philosophy, than a religion; and inculcates rather the duties of men to one another, than to a Supreme Being. Their books teach that the true principles of virtue and social order are obedience to parents, elders, and rulers, and acting towards others as they would be done by. They regulate the duties alike of the sovereign and of private families. The Confucian school does not deny the existence of a Supreme Being, but neither defines this fundamental article of every rational creed, nor inculcates the necessity of worshipping the only God. He inculcates polytheism, by enjoining the worship of heaven and earth, the spirits of hills, rivers, winds, and fire; in fact, all nature, except nature's omnipotent God. His doctrines, called in Chinese Ju-kea-su, the religion of scholars, is the orthodox creed of the state. To the founder divine honour is paid by all his followers, who are not very scrupulous in worshipping one idol more or less, and have long maintained the most absurd pantheism.

The followers of Confucius are, by some authors, called the sect of Ju-kea-su. In reality, the religion, or rather the doctrine of the disciples of Confucius, is positivism. They care nothing about the origin, the creation, or the end of the world, and very little about long philosophical lucubrations. Although the emperor builds and endows temples belonging to the two other sects, the Confucian is the religion of the state, and the court pretend to follow the scheme of ethics and politics laid down by Confucius.

Confucius taught the providential government of an overruling Providence, and that in this world the good are rewarded and the wicked punished. He evidently attached great importance to the solemn public worship of Shang-te by the head of the state in person, assisted by his ministers. He said to his disciples that by the ceremonies of the sacrifices to heaven and earth they served God, and by the ceremonies of the ancestral temple they sacrifice to their ancestors. He who understands the ceremonies of the sacrifices to heaven and earth, and the meaning of the several sacrifices to ancestors, would find the government of a kingdom as easy as to look into his palm.

Confucianism does not provide for the spiritual wants and desires of man's nature. He adhered to the worship of heaven and earth as he found it in the classical books of the ancient empire. His moral teaching was far inferior to that of Buddha. He said, 'Thou shalt not do unto others that which thou wilt not that they should do unto thee.' Also, 'Requite injury with justice, and benevolence with benevolence.' But he inculcated the avenging of murder with murder.

His descendants are still numerous in the province of Shan-tung, and have hereditary titles; they and the royal family having this right.—*Gray's China; Sirr's China; Bowring; Bunsen's God in History; Gutzlaff's Chinese History; Huc's Christianity; Professor E. Douglas, Confucianism and Taoism.*

CONGANI. TAM. In the western parts of Tinnevelly, a hood or penthouse, made of reeds, to protect the person from rain.

CONGEA. In the neighbourhood of Moulmein and Amherst, the forest scenery is often ornamented with the numerous large purple bracts surrounding the small inconspicuous flowers of a species of congea. There are three different species in the Tenasserim Provinces, C. azurea, C. tomentosa, C. velutina, all called ka-yau, the same Burmese name. The leaves of C. villosa have a heavy smell, and are used medicinally.—*Mason; W. Ic.; O'Sh.* p. 486.

CONGEE. ANGLO-HIND. Rice gruel.

CONICOPOLY. TAM. An accountant; from Kanika, an account, and Kapila, a collector or supervisor.

CONIDÆ, the Cone family of molluscs, comprising the genera Conus and Pleurotoma, with several sub-genera.

CONIFERÆ, a natural order of Gymnospermous exogens, called by Dr. Lindley Pinaceæ, consisting of resinous, mostly evergreen, hard-leaved trees or shrubs, inhabiting all those parts of the world in which arborescent plants can exist. The following names embrace the better known coniferous plants of Southern and Eastern Asia, with a few of Australia:—

Abies Brunnoniana, *Hook. Him. Journ.*, E. Nepal.
A. dumosa, *Loudon*, Nepal.
A. Smithiana, *Wall.*, Himalaya.
A. Webbiana, *Hook. Him. Journ.*, E. Nepal.
Araucaria Bidwilli, *Hook.*, N. E. Australia.
A. Cookii, *R. Br.*, N. Caledonia.
A. Cunninghamia, *R. Br.*, N. Holland.
A. excelsa, *R. Br.*, N. Holland.
Callitris quadrivalvis, *Vent.*, Algeria.
Cedrus deodara, *Loudon*, Himalaya.
Cunninghamia Sinensis, *Rich.*, China.
Cupressus funebris, *Endl.*, Bhutan.
C. glauca, *Lamb.*
C. sempervirens, *Willde*, Himalaya.
C. torulosa, *Don*, Himalaya.
Dacrydium elatum, *Wall.*, Tenasserim.
Dammara Australis, *Lamb.*, kauri pine, Norfolk Isld.
D. orientalis, *Lamb*, Amboyna.
Juniperus aquatica, *Roxb.*, China.
J. cæsia, *Roxb.*, China.
J. cernua, *Roxb.*, China.
J. Chinensis, *Linn.*, China.
J. communis, *Linn.*, Himalaya, a shrub.
J. dimorpha, *Roxb.*, China.
J. excelsa, *Bieb.*, Himalaya.
J. patens, *Roxb.*, China.
J. recurva, *Hook. Him. Journ.*, Sikkim.
J. squamata, *Don*, Himalaya, a shrub.
J. Wallichiana, *Hook.*, Sikkim.
Larix Griffithii, *Hooker*, Nepal.
Picea Webbiana, *Lamb*, Himalaya.
var. *a.* Pindrow.
var. *b.* Khutrow.
Pinus excelsa, *Wall.*, Himalaya.
P. Gerardiana, *Wall.*, Himalaya.
P. Khassiana, *Hook. Him. Journ.*
P. Latteri, *Mason*, Burma.
P. longifolia, *Roxb.*, Himalaya, the chir.
P. Massoniana, *Lamb*, China.
P. Merkusii, *Jungh.*, Burma.
P. Sinensis, *Lamb*, China.
Podocarpus bracteata, *Bl.*, Cachar.
P. latifolia, *Wall.*, Tinnevelly.
P. neriifolia, *Lamb*, Sikkim.
Salisburnia adiantifolia, —? China, Japan.
Taxodium nuciferum, *Brogn.*, Japan, Nepal.
Taxus baccata, *Linn.*, Himalaya, Ting-schi of Sikkim.
Thuja orientalis, *Linn.*, Nepal, China, Japan.

The coniferæ of the Himalaya were described by Major Madden in 1846 to 1849.

No order of plants can be named of more general importance to mankind than this. The pitch, tar, resins, and turpentines of commerce are products of the plants of this order. Their timber is known as deal, fir, pine, and cedar; and that known to Great Britain and other parts of Europe is principally the wood of the spruce, larch, Scotch fir, Weymouth pine, and Virginian cedar. The Norfolk Island pine, Araucaria excelsa, is an immense tree, rising to 150 feet; the kauri tree of New Zealand, Dammara Australis, attains to 200 feet in height. Pinus Lambertiana, and Abies Douglassii of N.W. America, rise to 230 feet. The seeds of the Pinus Gerardiana, *Wall.*, are used as food in Kunawar, as are the cones of the Bunya-bunya pine (A. Bidwilli, *Hooker*), by the aborigines of Moreton Bay, Australia.

Thunberg mentions many pines in Japan, and they are numerous in China. In Sikkim and Bhutan there are twelve coniferæ, viz. juniper, yew, Cupressus funebris, Abies Webbiana, A. Brunnoniana, and A. Smithiana, larch, Pinus excelsa and longifolia, and Podocarpus neriifolia. Four of these, viz. larch, Cupressus funebris, Podocarpus neriifolia, and Abies Brunnoniana, are not common to the N.W. Himalaya, west of Nepal, but the other eight are common. Of the 13 natives of the N.W. mountains, again, only the following five, Juniperus communis, the deodar, Pinus Gerardiana, P. excelsa, and Cupressus torulosa are not found in Sikkim. Dr. Masson mentions the P. Latteri as growing in Tenasserim, and Dr. Brandis adds P. Massoniana, *Lamb*, and P. Khassiana.

Dr. Cleghorn described the following:—

Cedrus deodara, *Loudon*, deodar or Himalayan cedar, Kelu; grows on the north slope of Dhaola Dhar, and in Kullu.
Pinus excelsa, *Wall.*, Kail; grows in Kullu, not in Kangra.
P. longifolia, *Roxb.*, chil or chir; grows luxuriantly on north slopes; timber best at 4000 to 5000 feet.
P. Gerardiana, *Wall.*, edible pine, Neoza; a few trees across the Dhaola Dhar, near Classa on the Ravi.
Picea Webbiana, *Lamb*, silver-fir, Tos; the wood is not much valued; shingles are laid on the roofs of houses. Var. *a.* Pindrow. Var. *b.* Khutrow.
Abies Smithiana, *Wall.*, Himalayan spruce, Rai; often 100 ft. high, and 5 ft. in diameter.
Cupressus torulosa, *Don*, twisted cypress; at the head of the Parbati.
Taxus baccata, common yew, Bramhi or Rakhab; in Kullu very scarce.
Juniperus excelsa, *Bieb.*, pencil cedar, Leuri or Suri; on the crest of Dhaola Dhar and in Lahul.

The deodar has not been seen east of Nepal, nor the Pinus Gerardiana, Cupressus torulosa, or Juniperus communis. On the other hand, Podocarpus is confined to the east of Khatmandu. Abies Brunnoniana does not occur west of the Gogra, nor the larch west of the Cosi, nor funereal cypress (an introduced plant, however) west of the Tista in Sikkim. That the deodar is possibly a variety of the cedar of Lebanon, is now a prevalent opinion, which is strengthened by the fact that so many more Himalayan plants are now ascertained to be European than had been supposed before they

were compared with European specimens; such are the yew, Juniperus communis, Berberis vulgaris, Quercus ballota, Populus alba and Euphratica, etc. The woods of several of the conifera are called cedars.—*Voigt; Eng. Cyc.* p. 123; *Hooker, Him. Jo.* ed. 1854, i. p. 256; *Cal. Cat. Ex. of* 1862; *Drs. Brandis, Mason, Cleghorn, nd Stewart; Mr. Gamble.*

CONIUM MACULATUM. *Linn.* Hemlock.

Shokran, ... Arab. | Spotted hemlock, . Eng.
Banj-i-rumi, . . . ,, | Koneion, . Gr. of Diosc.
Keerdamana, . Bombay. | Cicuta, ... Lat.

Dr. Royle says there is little doubt of this being the κώνειον of the Greeks and the Cicuta of the Romans; but it must not, from the similarity of name, be confounded with Cicuta maculata. Cicuta virosa occurs in Kashmir, where it is called Zahr-gugul, poison turnip, and Salep-i-Shaitan, *Pers.*, or devil's salep. Spotted hemlock is the Shokran of the Arabs, who give Kuniun as the Greek name. It is found in Europe, east of Asia, and America. It derives celebrity from being considered to have been used as the Athenian state poison, by which Socrates and Phocion perished. The extract of hemlock is employed as an anodyne in scrofulous or cancerous affections, in rheumatism, neuralgia, and painful ulcerations. *O'Sh.; Royle.*

CONJEE MARAM. Tam. ? A light, red-coloured wood of Travancore, sp. gr. 0·650, used for furniture, etc.

CONJEVERAM, or Kanchi-varam, a town and taluk, in the Chingleput district of the Madras Presidency, in lat. 12° 49′ 45″ N., long. 79° 45′ E., and in 1871 the town had a population of 35,396. It is one of the seven sacred cities of the Hindus in Southern India, and in the time of Hiwen Thsang, in the 7th century, was the capital of the Dravida country, ruled by the Chola dynasty. It was then a great Buddhist centre; subsequently professed the Jaina creed, followed by Hinduism. Two of its Hindu temples are the largest in Southern India; one of them belongs to the Saiva, the other to the Vaishnava sect. During the wars of the Karnatic, the town repeatedly changed hands, was taken by Clive on the 29th August, and again in December 1751, and again in 1752. Since 1758 it has been in the hands of the British. Many Jaina sculptures have been discovered there. The Chola held sway in the south of India from the eighth to the sixteenth centuries, when Sha-ji, the father of Sivaji, totally annihilated every vestige of their once great power. It was one of the most ancient and prolonged of all the Indian dynasties.

CON-MOO. Burm. ? A tree of Tavoy; timber good, used for buildings and boats.

CONNARUS CHAMPIONII. *Thw.* A tree of the central province of Ceylon, growing up to an elevation of 4000 feet.—*Thw.* p. 80.

CONNARUS MONOCARPUS. *Linn.*

Doke-ka-det, . . Burm. | Radaleya-gass, . . Singh.

A tree of Burma, and very abundant in the hot, drier parts of Ceylon.—*Thw.* p. 80.

CONNARUS NITIDUS. *Roxb.* A small tree of Sylhet. In British Burma it is a shrub about ten feet high, very plentiful, especially in the Rangoon districts, and affords an oil-seed of small size, but rich in a sweet oil. C. paniculatus, *Roxb.*, is a large timber tree of Chittagong.—*Voigt; M'Clelland.*

CONNARUS SPECIOSA. *M'Clelland.*

Gwai-douk, . . . Burm. | Kadon kadet, . . Burm.
Khwæ touk, . . ,,

A large tree, very plentiful throughout the Rangoon, Pegu, and Tounghoo districts. Growing in all the forests scattered with teak. It has a large, heavy, and strong timber, white-coloured, adapted to every purpose of house-building. It is remarkable for the quantity of its seeds, which are of large size, abounding in sweet oil.—*Dr. M'Cl.*

CONNARUS UNIFOLIOLATUS. *Thw.* A moderate-sized tree of the central province of Ceylon, growing at an elevation of 3000 to 4000 feet, rather rare.—*Thw.*

CONNELLY. Four distinguished brothers of this name served in India, Captain Edward Connelly, Captain Arthur Connelly, Captain John Connelly, and Henry Valentine Connelly. Edward was killed at Toolian Durrah (Purwan Durrah?), October 1840; Arthur, the traveller, went on a mission to Bokhara in August 1840, and is believed to have been murdered in prison along with Colonel Stoddard; John was killed at the capture of Kābul in July 1842. Their brother, Henry Valentine Connelly, of the Madras Civil Service, was murdered 11th September 1855, at the instigation of Mopla fanatics.

Captain Edward Connelly wrote on the Physical Geography of Seisthan in As. Jl. 1839, ix. p. 710; On Figures of Gems and Coins, in Bl. As. Trans. 1842, xi. p. 137; Account of the City of Oujein and its Environs, ibid. 1837, vi. p. 831; Journal kept in Seisthan, ibid. 1841, p. 319.

Captain J. Connelly wrote a Report upon Khorasan, Bl. As. Trans. 1842, xi. p. 116.

Captain A. Connelly wrote on the White-haired Angora Goat, Lond. As. Trans. vi. p. 159; Overland Journey through Persia and Afghanistan to India, Lond. 1834, 2 vols.

CONOCARPUS ACUMINATUS. *Roxb.*

Andersonia acuminata, *R.* | Anogeissus acuminatus, *Wall.*
A. lanceolata, *Rottler.*
Yoong, ... Burm. | Pashi, Panchi, . . Tel.
Pachcha manu? . Tel.

This is a large, very valuable, and plentiful timber tree, growing throughout the southern forests, along with Conocarpus latifolia. In British Burma it is almost equal to the Terminalia microcarpa in size and the regular growth of its stem. Its wood is reddish-brown, hard and strong, its breaking weight being 262 lbs. A cubic foot weighs 50 to 57 lbs.; and in a full-grown tree on good soil the average length of the trunk to the first branch is 80 feet, and average girth, measured at six feet from the ground, is 12 feet. It sells in Burma at 12 annas per cubic foot. It flowers during the cold season. Its wood is exceedingly like, and fully as strong and as durable, if kept dry, as the C. latifolia, but, exposed to the water, it soon decays. It is thus unfit for the marine yard, but is equally fit for house-building when it can be obtained straight, which is seldom the case. But for its weight, it would be most excellent timber.—*Drs. M'Cl. and Brandis; Mr. Rohde's MSS.; Voigt; Roxb.* ii. 443.

CONOCARPUS LATIFOLIA. *Roxb.*

Andersonia altissima, *Roxb.* | Anogeissus latifolius, *Wall.*
Dinduga, . . . Can. | Vellai naga maram, Tam.
Thoura, ... Hind. | Tella neredu chettu, Tel.
Dawura; Dhowa, . Mahr. | Siri manu, . . . ,,
Thoura, ... ,, | Dhoboo; Nongoliah, Uria.
Daa woo gass, . . Singh. | Pooroo, ... ,,

This large timber tree grows in the Dehra Doon, in the Kenneri jungles, valleys of the Konkan rivers, on the inland Dekhan hills at Chillaime, and on the mountains which separate the Circars from the Nizam's dominions. It grows in Ceylon, to the north of Kandy, up to 1500 feet. It flowers during the cold season, in January and February. Its trunk is erect, straight, varying in length and thickness, the largest being 35 feet to the branches, and about 6 feet in circumference. In Coimbatore the specimens sustained 500 lbs. It also grows in Chittagong. Its timber is esteemed for almost every economical purpose, house-building, shafts, and yokes, is in general use for railway purposes, and it makes very good cabinet furniture. Towards the centre, it is of a chocolate colour. For house and ship building the natives reckon it superior to every other sort, Pentaptera tomentosa and teak excepted. Captain Sankey, writing from Nagpur, says it is a white wood with a heart of a dark colour, and somewhat like rosewood. Its average length there is 12 feet, and girth 7 feet. It is so much prized by the natives of Nagpur for axletrees, that but few trees are permitted to attain their proper growth. By all accounts, in Nagpur, about 20,000 axletrees are made from this wood yearly. It is attacked by white ants. It ranks high as a rafter timber.—*Drs. Roxb., Gibson, Riddell, Voigt, Wight, Thwaites; Mr. Rohde; Captain Sankey.*

CONOCARPUS ROBUSTUS. *M'Cl.* Caibyah, BURM. A very large and strong timber tree, growing plentifully in the Pegu, Tounghoo, and Prome forests, along with teak. Adapted for fancy work and cabinetmaking.—*M'Clelland.*

CONRADE of Montferrat, Prince of Tyre, titular king of Jerusalem, was assassinated 29th April 1192 A.D., A.H. 13th Rabi-us-Sani 588, by two emissaries disguised as monks, sent by Sinan. Both Saladin and king Richard of England have been accused of instigating it, but, according to Ibn ul Athir, it was the request of Saladin (Salah-ud-Din) to have both Conrade and Richard destroyed.—*Osborn, Islam.*

CONSERVE OF ROSES, Gulcand and Gulkandu, consists of rose-petals and sugar mixed in certain proportions, and bruised in a mortar. The conserve of roses met with in the bazars of Bombay is chiefly obtained from Surat. Conserve of violets, 'gulkand-i-banafsha.'—*Faulkner.*

CONSTABULARY has been extensively introduced in British India since the revolt of the Bengal Native Army, and to Sir William Robinson, K.C.S.I., of the Madras C.S., the credit was chiefly due. At the commencement of 1862, the experiment of the introduction of the new Indian police was made in the North Arcot district. At the end of 1862 not a taluk or town in the entire length and breadth of the Presidency remained unoccupied by the new constabulary.

CONSTANTINOPLE, the capital of the Turkish dominions, which extend to the shores of the Indian Ocean. It is known to the Mahomedans of Asia as Konstantinia, also as Rum, and the emperor is called the Sultan, also the Kaisar.

CONTI. Nicolo Conti, a noble Venetian, who travelled in S.W. Asia and in the East Indies between A.D. 1419 and 1444, and on his return, on seeking absolution from Pope Eugene IV. for having in Egypt denied Christ to save his wife and children from death, the penance was imposed on him of relating his adventures to Pogio Braciolini, the pope's secretary. Conti left Damascus and passed through Bussora, Baghdad, Ormuz, Cambay, Malabar, Bijanagar, Mylapur, Ceylon, Sumatra, Tenasserim, Ava, Arakan, Bengal, Java, Banda, Ceram, Bouro, Cochin-China, and returned by way of Cochin-China, Malabar, Cambay, Aden, and Cairo.

CONTINENTS. In Hindu geography, the continents connected with each other are four, viz. Uturukuru, Purwawidesa, Aparagodana, and Jambudwipa.

CONTINGENT, a term applied in British India to designate the armies which, by treaty, the feudatory sovereigns keep. The Mysore contingent of 4000 soldiers has been enrolled since the treaty of Seringapatam. The Nizam of Hyderabad's contingent of 7498 men, in six regiments of infantry, four of cavalry, and four batteries of artillery, was established by the treaty of 1798. The contingent of H.H. the maharaja Sindia, of 5000 cavalry, whose capital is Gwalior, was arranged for by the treaty of Gwalior of November 1817. In the same year a contingent of 300 men was arranged for from the Gaekwar at Baroda. The treaty of Bhopal of February 1818 provided for a contingent of 600 cavalry and 400 infantry; and by the treaty of the 6th January 1818, maharaja Man Singh of Jodhpur undertook to furnish 1500 cavalry for service with the British Indian army. The Indore contingent of 3000 cavalry horses by the maharaja Holkar, by the xi. article of the treaty of Mundesur, was agreed to be provided ready for service. See British India, p. 464.

CONUS, the Cone genus of Gasteropodus Mollusca, founded by Linnæus. The species are found in southern and tropical seas. Lamarck records 181 recent species and varieties. C. textilis, *Linn.*, found at Aneityum of the N. Hebrides, bites and injects a poisonous acrid fluid into the wound, occasioning the heart to swell, and often endangering life.

CONVENT OF ST. CATHERINE is on the Jib'l Musa.

CONVOLVULACEÆ. *R. Br.* The bindweed tribe of plants, in which there are about 28 genera and more than 450 species in the west and east of Asia. The more important genera are aniseia, argyreia, batatas, Blinkworthia, Breweria, calonyction, calystegia, convolvulus, cressa, evolvulus, Havittia, ipomæa, Moorcroftia, neuropeltis, pharbitis, porana, quamoclit, rivea, sepistemon, Skinnera.

Convolvulus arvensis, *Linn.*, Corn bindweed.
C. Chinensis, *Ker.* | C. Malcolmi, *Roxb.*

It is native throughout Europe in sandy fields and by-roads, also in China, Persia, and some parts of India; is abundant as a weed all over the plains of the Panjab, and up to 10,000 feet in the Panjab Himalaya. The officinal hirn-padi (deer's foot) appears to be from this plant. It is said to possess a purgative quality, as also C. soldanella, C. maritimus, and C. macrocarpus.—*Stewart.*

Convolvulus pluricaulis, *Chois.*
Porprang, Baphalli, HIND. | Gorakh panw; Dodak, HIND.

Common throughout the Panjab plains. It is eaten by cattle, and is reckoned cooling; used as a vegetable, or given in sherbet.—*Stewart.*

Convolvulus reptans, Olus vagum, *Rumph.*
Kulmi shak, . . BENG. | Po-ts'ai, Po-ling, . CHIN.
Mandavalli, . . . CAN. | Tootu kura, . . . TEL.

A native of standing sweet waters, very common in India; affords a milky juice, which, when dried, is nearly equal to scammony in purgative efficacy. The tops and leaves are eaten in stew by the natives. This is largely cultivated in China as a vegetable, and eaten in spring.—*Ainslie; Smith.*

Convolvulus scammonia, *Linn.*
Sakmunia, Sagmoonia, AR. | Mahmudah, . . . HIND.

A native of Syria, the Levant, and of Kaira in Gujerat. The proper juice when dried is called scammony, but is often adulterated with concrete juices of a similar kind, and with flour, chalk, sand, and earth. The most abundant harvest of scammony is in Smyrna and Aleppo. There are several modes of collection, which give rise to corresponding commercial varieties. The Arab name of this drug, Ul Sugmoonia, signifies the purgative.—*O'Sh.* pp. 500, 501.

CONWAY, an officer of the Madras army, who rose to the rank of Colonel. He was selected, while quite a young man, to be Adjutant-General of the army of Madras at a time of trial, when the European officers had become disaffected, and he held that post up to the year 1837, when he died of cholera on the banks of the Kistna, *en route* to be Brigadier of the Hyderabad subsidiary force, and he was buried there. In St. Mary's Chapel, Madras, is a tablet to his memory:—

The Soldier's Friend,
CONWAY,
Adjutant-General,
obiit
13th May 1837.
Erected by the
ARMY
and by the
PUBLIC.

COOCH BEHAR. See Kuch Behar.

COOKIA PUNCTATA. *Retz.* Wham-pi fruit.
Quinaria lansium, *Lour.* | Hwang-p'i kwo, . CHIN.

This fruit-tree of China and the Moluccas is middle-sized, bearing an edible fruit about the size of a pigeon's egg, yellow on the outside, with a white pulp, rather acid, but sweet, and much esteemed in China and the Archipelago. Hwang-pi, or wham-pi, means yellow skin. In India it bears its rough-skinned fruit in April and May. The tree has very dark green shining leaves.—*Roxb.; Voigt; Riddell; Smith; Macfadyen.*

COOKING WAGGONS are constructed somewhat like a battery caisson, so that the parts can be unlimbered and separated from each other. The 'limber,' or forward part, bears a large chest, which is divided into compartments, to contain coffee, tea, sugar, and corn starch, with a place also for two gridirons and an axe. From the rear portion rise three tall smoke-pipes, above three large boilers, under which there is a place for the fire, and under the fire a box for the fuel. Each boiler will hold fourteen gallons; and it is estimated that in each one, on the march, ten gallons of tea, or coffee, or chocolate, could be made in twenty minutes,—thus giving ninety gallons of nourishing drink every hour.

COOLEE, a term in use in British India to designate any labouring man working for hire, also the hire itself. The word is a corruption of the Tamil word Woleeya or Wozheeya, Karan, a servant. Under this designation great numbers of the labouring classes of India have emigrated to Ceylon, the Mauritius, Bourbon, and the West Indies. The mortality on the voyages at one time was so considerable, ranging up to 19 per cent., that emigration agents were appointed at the Indian ports, under Acts of the Council, to control the emigration. Coolee bandy or Coolee gari means a hired carriage.

COOLEN or Kulang. HIND. The Grus cinerea of British India and of Europe. It is much liked as a table bird. They are easily domesticated.

COOLING MIXTURES.

Nitrate of ammonia, water, each 1 part,—46°.
Nit. of ammonia, carb. of soda, water, each 1 part,—57°.
Phosphate of soda, 9 parts; sulphuric acid, 4 parts,—62°.
Sulphate of soda, 8 parts; muriatic acid, 5 parts,—50°.
Sulph. of soda, 5 parts; dilute sulph. acid, 4 parts,—47°.
Phosphate of soda, 9 parts; nitrate of ammonia, 6 parts; dilute sulphuric acid, 4 parts,—47°.

The fall of the thermometer is here calculated from 50°, and the full effect is not produced unless the materials employed and the substance acted upon be previously cooled to that point.

Pounded ice or snow, 2 parts; common salt, 1 part,—from any temperature to 5°.
Snow or pounded ice, 12 parts; common salt, 5 parts; nitrate of ammonia, 5 parts,—25°.
Snow, 3 parts; dilute sulphuric acid, 2 parts,—from 32° to 23°.
Snow, 8 parts; muriatic acid, 5 parts,—to 27°.
Snow, 7 parts; diluted nitric acid, 4 parts,—to 30°.
Snow, 4 parts; muriate of lime, 5 parts,—to 40°.
—*O'Sh.* p. 46.

COOMPTA, in lat. 14° 26′ N., long. 74° 27′ E., is the chief commercial town in the Canara district. —*Imp. Gaz.*

COONCHEE. HIND. A child's cloak.

COONDOOR. DUKH. Frankincense.

COONOOR, in lat. 11° 20′ N., long. 76° 50′ E., S.E. of Ootacamund, is 5960 feet above the level of the sea. The mean height of the adjoining Jakatalla cantonment, now called Wellington, is 6100 feet. It is a favourite sanatorium for Europeans.—*Baik.; Schlag.*

COONR-MOONDLA, or Cunr-mundla, is the name given at Benares to the day on which seed-sowing is concluded. In the Lower Doab and Baiswara, it is generally called Coonr Bojee and Huriur. Hindus devote this day to festivity, and, amongst other ceremonies, decorate the ploughs, and make the residue of the seed-corn into a cake, which is partaken of in the open field, and in part distributed to Brahmans and beggars. A similar practice prevails in Great Britain, when the seed-cake and furmenty of All-Hallows are in request. In Tusser's homely verses we read,—

'Wife, sometime this weeke, if the wether hold cleare,
An end of wheat-sowing we make for this yeare,
Remember you, therefore, though I do it not,
The seed-cake, the pasties, the furmenty-pot.'

—*Elliot.* See Duleājhar; Huriur; Hurpoojee.

COOPER, SIR FREDERICK, K.C.S.I., a Bengal civil servant, who did much good service in the Panjab during the revolt and rebellion of 1857–58.

COORBAN. See Kurban; Sacrifice.

COORG, a British province between lat. 11° 56′ and 20° 50′ N., long. 75° 24′ and 76° 13′ E., area 1580 square miles, and, in 1881, a population of 178,302, of whom 100,439 were males and 77,863 females. Its prominent inhabitants are the Kodaga or Coorg mountaineers, who were ruled over by the Haleri polygars; but Vira Rajendra, the last raja, was dethroned by the British in

1834, and he died in Britain in 1862. The Kodaga had successfully opposed Hyder Ali and his son Tipu; but Vira Rajendra (Dodda), who died in 1809, was guilty of about 5000 summary executions; his successor, Linga, died 1820, was greedy, cunning, and cowardly. The aspect of Coorg (Kurg or Kodagu, meaning steep mountain), presents an entire forest; the long and narrow cultivated valleys enclosed within it serve but to render the vast woods more striking. The country is intersected in every direction by cuddungs or breastworks, estimated at 600 miles in extent, many 12 feet deep and 10 or 15 feet across the ditch. They cross the ranges of hills and each other with little appearance of order, and defy conjecture as to their object. The prevailing languages are Coorg, Kodaga, Canarese, Malealam, Tamil, Tulu, Hindustani, and English. There are about 40,000 native Coorgs (Kodaga) scattered throughout the country. They are a tall, muscular, broad-chested, well-favoured race of mountaineers, far superior in physique to the inhabitants of the plains, whom they greatly despise. They are far advanced in civilisation, and very intelligent. The vice of drinking has a deep and widely-spread hold upon them. They marry at a ripe age, but the wives of brothers are considered as common property. They generally retain the old devil-worship of the Dravidian race. The raja's palace is supposed to have been built by an Italian, who is said to have been bricked up in a wall as soon as the building was finished. The tribes and races of the population in 1881 was 178,302 souls, comprised, besides the Coorg or Kodaga proper,—

Amma or Amma Kodaga or Kaveri Brahmans.
Aimbkula, goala or herds.
Higgade, cultivators.
Ainaya Badage, artisans in iron and wood.
Kavati, jungle cultivators.
Paleya, farm labourers from the Tulu and Maleala districts.
Kurubar, two tribes, the Jenu and Bettu.
Yerawa, slave emigrants from Malealam.
Meda, umbrella makers.
Holeya, viz. Keinbati Holeya, who speak Kodaga, and Badaga Holeya, who speak Canarese.

There are also some Mahrattas, Rajputs, Rachewar, and Rajpinde, the last being connections of the late rulers. The out-castes number 34,100, and the wild tribes 14,783.

In 1837 there was a rebellion in the British district of Canara, adjoining Coorg. The Coorgs at once marched there, quelled the rebellion, and recaptured for the British the treasures carried off by the insurgents. The Governor-General directed that the recovered treasure should, as a reward, be divided amongst the Coorgs, but they to a man refused to receive it, and proudly declared that they had not fought for loot. The British Government, awakened to a sense of the spirit of these rude warriors, then directed jaghirs and oomli lands to be conferred on them, and presented their chiefs with horses, rifles, khillats, and other marks of honour. Later still, when British supremacy in India had been shaken to its foundation, a body of Coorgs, armed to the teeth, suddenly made their appearance at Periyapatna in Mysore, under the secret instructions of the late Sir Mark Cubbon, and by their presence tended to suppress the growing insolence and disaffection of the Mahomedan classes of Seringapatam and the adjacent parts of that province.

In the vicinity of the palace are settled the descendants of the private guards and executioners of the rajas. These men are called Kapalarus, and were the principal instruments in carrying out the mandates dictated by the last raja.. The Amma Coorg, the Sanna Coorg, the Malla Coorg, and the Boddhu Coorg differ chiefly in the matter of marriages. The right of choosing a husband for the girl vests with her father. Should he have demised, it devolves in succession upon her paternal grandfather, mother, and brothers. In their absence, on the head of the house, whoever he may be. There are only two kinds of marriages amongst the Coorgs,—the Brahman, based on disinterested motives, and which is not brought about on account of pecuniary considerations, and the Gandharva, which is founded in reciprocal desire. The former is the more prevalent. A Coorg is justified in taking to himself a plurality of wives, supposing his first one for the period of ten years produces only daughters. Re-marriage of women is permitted, under certain restrictions. In the event of there being no male issue in a house, a daughter is retained to represent the name, and a husband is procured for her from another house. This husband does not become alienated from his own family, but can take a wife for his own family also, thus raising up seed for both houses. These marriages must take place for the purpose expressed at the time, and the arrangement cannot be made after marriage. This is termed amongst the Coorg a Makka Parje marriage, or for the rights of the children. Their women have large eyes, and are not very dark. Their hair, *en chignon*, has splendid gold ornaments on it, and bunches of white flowers. White jackets with short sleeves, embroidered with red cotton, with muslin skirts embroidered with a narrow gold lace, and very short. Their legs and feet bare; round their ankles massive silver bands, from which hang a number of little bells, with a silver chain from the band to each toe, holds a number of rings. Their arms covered with bracelets, and round their necks a number of gold chains with jewel ornaments. In their national dance Coorgs form into a circle. The first figure of the dance is called Balakata, and is a slow movement, the men all dancing round, singing, and gracefully waving about chowris (long whisks of hair), with an accompaniment of drums. This is followed by the second figure, called Kolhata, or stick dance, in which each man is provided with a couple of sticks. They all move round as before, beginning slowly, with a sort of prancing step, which gets quicker and quicker. They keep tapping their neighbours' sticks in time, getting more and more excited and hitting harder, as if they were to have a fight, but at a given signal they all instantly stop. The third figure consists of a single combat. One man leaps into the circle with a war-whoop, armed with a long switch and a metal shield, challenging the ring. Then out springs another, and both dance. At last they rush together, hitting hard. The laws of the game do not allow hitting above the knees, although some, in their excitement, certainly transgress. The ankles, however, suffer most, and must smart terribly after an encounter. When one of the combatants gives in, the other embraces him, to show there is no ill-will. At the end of the third figure, the assembly dance,

leaping vigorously into the air. The Coorg or Kodaga language has been regarded as Canarese, modified by the Tulu. But Mr. Moegling states that it is more nearly allied to the Tamil and Malealam than to the Canarese. Cairns or tumuli are in great numbers. They conceal kistvaens. There are also Kolle Kallu, or sculptured tombstones in honour of warriors slain in battle. Raja Vira Rajendra's daughter Gauramma, whom he brought with him to London, was baptized as Victoria, Queen Victoria being the sponsor, and she married a British army officer, but shortly after he and her daughter disappeared, and she died in 1864. —*Cole's Coorg; Bowring's Eastern Experiences; Rice, Coorg; Coorg Gazetteer; Moegling's Coorg.*

COORMEE or Koormee, a race of cultivators under the different names of Coormee, Kumbhi, Kunabi, Koombhee, extend throughout the greater part of Hindustan, Berar, and the Western Dekhan. They are famous as agriculturists, but frequently engage in other occupations. The Coormee women, like the Jatni, assist the men in husbandry, and have passed into a proverb for industry,—

'Bhulee jat koonbin kee k'hoorpee hat'h
K'het nirawen apne pee ke sat'h.'

The Coormee of the provinces are said to have seven subdivisions, which are usually enumerated as K'hureebind, Puturya, G'horchurha, Jyswar, Canoujea, Kewut, and Jhooneya.—*Elliot*, p. 227.

COOROOKOO OIL, oil of prickly poppy, or Jamaica yellow thistle, pale yellow, limpid oil, from the round corrugated seeds of the Argemone Mexicana, is sometimes expressed by the natives and used in lamps, but is doubtless adapted to more important uses.—*Madras Exh.* 1855.

COOROOMBAR or Kurumbar, properly Kurubar, a shepherd, from the Canarese Kuru, a sheep.

COOROOMBAR, a race of Wynad, very docile, quick of imitation, and slavishly submissive to their moodely or head, who exercises undisputed power over his own family, numerically containing about twenty or thirty beings. Those employed by the coffee-planters are a little civilised, appreciating the comforts of life in a slight degree higher than their more savage brethren. They erect rude huts for themselves and family, on elevated ground, surrounded by jungles, and about six in number; they touch one another, and the whole present the form of a crescent. One larger than the rest, styled the cutcherry, is erected in the middle, in the shape of a hall, for the sojourn of casual strangers; it is dedicated to their village deity, and the place cannot be contaminated by a shoed foot. The presence of a suspected stranger in their vicinity, sickness, or other trifling but natural cause, make them emigrate from one place to another, sometimes miles away, but always preferring lonesome localities and dense jungles. Some are partly civilised. Government possess some forest lands towards Periah and Teriate, and in several spots over Wynad. In the teak belt are several bands of Cooroombars, some of the Jani, and others of Moolly clan. The former live entirely in the forest. They are the only axe men, and without them it would be difficult to work a forest. Other tribes are the Panniar, Puliar, Gurchea, Chetty, and squatters. The Cooroombar, through their headmen, are held responsible, and the Chetty are also responsible for their Panniar or farm slaves. The Cooroombar's services are constantly called for by the wood contractor and the planter. They will not leave their haunts in the forests for any time. During the gold speculations of the western coast from 1876 to 1881, the Cooroombar were found useful labourers.—*C. H. S. in Newspaper; Cleghorn, Forest Report.* See Kurumbar.

COOROOMBRANAAD, a district of Malabar.

COOROOMINGA. TAM. A beetle, the Butocera rubus, which penetrates the trunk of young cocoanut trees near the ground, and deposits its eggs near the centre. The grubs eat their way up and destroy the tree.

COORTALLUM, not very far from Cape Comorin, is a large place, with several bungalows close into the hills. Of the cataracts close at hand, the lowest falls from a height of 200 feet. The scenery is splendid. There are in all three falls, the highest being 2000 feet above the sea. The average temperature of the water is 72° to 75°, and invalids derive great benefit from bathing in it. The bathing place is under a shelving rock, affording the most delightful shower-bath possible. The climate is particularly enjoyable to Europeans in June, July, and August.

COOSSUMB. SANSK. Carthamus tinctorius.

COOSY, a tributary to the Hoogly, also written Cosi and Kosi. It rises in the Ramghur district, lat. 23° 35′, long. 85° 58′, runs S.E. into the Hoogly. Its length is 240 miles.

COOTANAD, a district of Malabar.

COOTE, SIR EYRE, K.C.B., a distinguished British officer, who served in India from the middle of the 18th century, and in command in the Karnatic from 1759 during the contests for supremacy between the British and French. At the battle of Plassey in 1757, while a Major in rank, he had commanded the third division of the army, and he seems to have taken command in the Karnatic in 1759. He was out-manœuvred on the Palar river, but in 1760, after defeating Lally at Wandiwash, and driving him back to Pondicherry, he took easy possession of Cuddalore in April 1760, of Chellumbrum, and other French garrisons. He took Pondicherry on the 4th Jan. 1761. The French shortly before had destroyed Fort St. David, and in retaliation Coote razed the fortifications to the ground. On the 18th June 1781, Colonel Coote had been repulsed with loss by Hyder in a night attack on Chellumbrum. After forcing his way through two or three enclosures, and when falling back to Cuddalore, and he had passed on a few miles from Porto Novo, he found his march intercepted by the whole army of Hyder Ali, 60,000 strong. Hyder had made a rapid march, and had thrown up batteries across Coote's line of retreat; he had his left protected by a range of sandhills, and his right by the sea. Coote made two determined assaults, one on the batteries, which were carried, the other through a passage in the sandhills left unprotected by Hyder, whose flank became thus exposed. A war schooner at the same time appeared in sight, and, anchoring close in, poured her broadsides on the enemy, causing great confusion. Hyder's army was completely routed. Coote's strength was 7878 men, including artillerymen. It was known as the battle of Metapolliam, and was fought on the 1st July 1781. In June 1782, while Coote was advancing rapidly on Arnee, where Hyder had treasure and military stores, Hyder overtook and

compelled him to return to Madras. Coote died in 1783, and the command of the army devolved on General Stewart.

COPAIVA or Copaiba is the fluid resinous exudation of several species of Copaifera, of C. Langsdorffii, *Dec.*, of C. officinalis. It was first described by Marcgraaf and Piso in 1643. Species of dipterocarpus yield a substance closely resembling copaiba.—*Faulkner; Royle*, p. 364.

COPAL, Pa-ma-yu, CHIN., Chandras, HIND. This very important resin is obtained from trees of America, Africa, Madagascar, India, and Australia. It exudes spontaneously from Rhus copalinum and Elæocarpus copalifer, the first being an American and W. Indian, and the second an E. Indian tree. Another copal is obtained from the coasts of Guinea; and several species of Hymenæa, on the Amazons, are said to produce kinds of copal, one of the plants being Hymenæa verrucosa. Vateria Indica furnishes the resin called in India copal, which in England is known by the name of gum anime, and very nearly approaches the true resin of that name; in its recent and fluid state it is used as a varnish, called Piney varnish, in the south of India, and, dissolved by heat in closed vessels, it is employed for the same purpose in other parts of India; it is extremely tenacious and solid, but melts at a temperature of 97½° Fahr. Mineral copal is found in ligniform pieces near Quilon, under laterite. A copal, called gum anime in the London market, is found on the east coast of Africa, from Panjan to Mboamaji. An endless supply is obtainable there, and it is largely imported into Bombay from Zanzibar, the major portion being re-exported to England, and occasionally to France and Calcutta. The copal of Zanzibar is obtained from the Trachylobium Hornemanianum; but larger quantities are found imbedded in the earth, often where no copal-yielding trees now exist. This semi-fossil copal is called copalline. Specimens of the leaf, flower, etc., obtained from the semi-fossil gum, agree in all respects with those of the living tree. The peculiar and more valuable properties of the buried gum anime are supposed to be from a chemical action, the result of a long retention in the earth. It is classed as raw or jackass copal, and ripe or true copal. The value of the latter is estimated by its colour, the clearest and most transparent pieces bring the highest prices, after them the light amber, lemon, dark yellow, and red. Sometimes the gum, like amber, contains drops of water, bees, tics, flies, and other insects. The diggers do not excavate more than the depth of a man's waist, and the copal occurs in a red sand underlying blue clay.

Copal is generally imported into England in lumps about the size of small potatoes, of a slightly yellow tint, and often including insects and animal remains. It is often covered with a clay-like substance, from which it is freed by the dealers by scraping. The finest and palest lumps are selected for what is called body-gum; the next best forms carriage-gum; and the remainder, being freed from wood and stones, forms what is called third, or worst quality, and is used for gold-size or japan-black. Fracture conchoidal; it is transparent, and tasteless. Copal is liable to be confounded with anime, when the latter is clear and good; but the solubility in alcohol furnishes a useful test,—the anime being readily soluble in this fluid, while copal is sparingly so. Copal is also brittle between the teeth, whereas anime softens in the mouth. The American copal occurs in commerce in flat fragments; whereas the East Indian is generally obtained in roundish masses. The latter furnishes the finest varnishes. —*Dr. Kirk, in Madras Agri-Horticult. Proc.*

COPALM BALSAM is a product of the Liquid-amber styraciflua.

COPAL VARNISH is a solution of copal gum resin in linseed oil, oil of turpentine, spirits of wine or alcohol; it is used for japanning snuff-boxes, tea-boards, and similar articles. Copal varnish and amber varnish are also much employed by the artist and by the photographer for the preservation of their works. Fresh essence of turpentine dissolves copal completely, but old turpentine will not do so. It is stated that essence of turpentine, digested upon sulphur, will dissolve double its own weight without letting any fall. The oil of rosemary also dissolves copal with great readiness. An excellent varnish may be made by dissolving one part of copal and one of essence of rosemary, with from two to three parts of pure alcohol.

COPAULDROOG, taken by the British, by storm, on the 14th May 1819.

COPE, HENRY, wrote on The Ruined City of Ranade, Sindiah's Dominions, in Bl. As. Trans. 1848, xvii. p. 1079; On the Ruined City of Ferozabad, ibid. 1847, xvi., 1848, xvii. p. 971; On the Silk Manufactures of the Panjab, Lahore Agri. Trans. 1852.

COPHONES of Arrian, supposed to be the Kābul river.

Copper ore is abundantly diffused in nature, being found native as an oxide, a sulphuret, a sulphate, carbonate, arseniate, and phosphate, in Persia, Baluchistan, Nepal, Kashmir, Tibet, India, Sumatra, Borneo, China, and Japan. Copper ore in the form of sulphuret is abundant in Ramgurh in Shekawatti. Near Ajmir, carbonate of copper is found in small veins, and in connection with ores of iron (Genl. Med. Top. p. 169). A silicate of copper occurs in Nellore and Ongole, but not in workable lodes. Copper ores are found in the Jeypore dominions, and in the vicinity of Nejeebabad, Nagpur, and Dhunpur. Copper has been pointed out near Beila, in the province of Luz, on the western frontier of Lower Sind, by Captain Del Hoste and Captain Harris; in Kamaon, by Lieutenant Gasfurd and Captain Durand; at Porkee and Dhanpur, by Captain Richards; at Almorah and in Afghanistan, by Captain Drummond. It is said to have been worked in Cutch.

From Gurgaon there was sent to the Panjab Exhibition a piece of copper pyrites, also specimens of good copper ore from the Hissar district, and of the metal got from it; from Pelang in Kulu,

and from Manikarn near Kulu, in the Kangra district, some copper pyrites, and with blue carbonate of copper from Spiti. Copper is found in Kashmir, but is not an article of trade.

Iron and copper mines occur at Marma, S.E. of Byans, and the people bring copper pots to barter with the Chaudansi and Byansi races. Copper mines in Kamaon, Garhwal, Nepal, and Sikkim, are worked by the natives on a small scale.

Copper has been discovered in Singhana; in mines in Kamaon and Garhwal. Copper mines occur at Papulee, Pringlapanni, Murbuggettee, and old mines at Kerraye, Belar, Raie, Seera, Toma Cottee, Doberee, and Dhunpore. The Beng. As. Soc. Journ., No. 1 of 1851, p. 1, mentions the copper of Deoghur or Byjnath, a small town in zillah Birbhum. The surface veins run east and west, and present the ore in irregular masses of $\frac{1}{8}$ths of an inch broad, so much corroded by atmospherical influence as to appear in a soft, friable, red, yellow, and liver-coloured or garnet-coloured earth; but, upon digging a couple of feet below the surface of the ground, the veins become a compact liver-coloured mass, spangled with shining particles of copper; the whole enclosed in a soft, friable apple-green, yellow, or white felspathic rock. Traversing the copper from north to south, small veins of lead appear, which occasionally form the containing walls to the copper. Mr. Vincent traced the vein of copper for about 100 feet east and west, and dug to the depth of 2 feet only. With the aid of coal dug from Banslee Kullah in the Rajmahal hills, he smelted some of the ore, which gave a return of 30 per cent. of good copper; inferior specimens, mostly water-worn pieces picked up on the surface, gave 25 per cent.

The mountainous parts of Nepal are rich in mines of iron and copper. The produce of the former is smelted. The copper is of a very superior kind, and was at one time preferred for consumption in the territories of the king of Oudh to that exported from Britain.

In Singbhum, copper ore is found extending over 80 miles to the westward of Midnapur. Three slabs, weighing about 139 lbs., were subjected to lamination, and proved to be well suited in all respects for purposes of coinage. The quality of this metal is decidedly superior to imported copper.

The copper ore of the Nellore collectorate of the Madras Presidency, was called by Dr. Thomson an anhydrous carbonate of copper, containing 60·73 per cent. of black oxide of copper. It occurs in hornblende schist at Bungeral Mettah, and the carbonate, passing into malachite and mountain blue there, and at Gurumany Pentah, Saligherri, and Yerrapully.

The existence of copper ore in the Callastri, Venkatagiri, and Nellore districts, was ascertained by Dr. Heynes about the year 1797, and he described that of Wangapadu.

Copper ore is found about 20 miles east of Kurnool, about 2 miles from the village of Gunny, in the centre of a low range of hills; also at Sidhout and Badwail.

Dr. Helfer said that the copper on the Lampei islands is worthy of attention. Mr. O'Riley stated that the copper ore from several islands of the Mergui Archipelago, is the grey copper ore, containing from 40 to 50 parts of the metal, in combination with antimony, iron, and sulphur. Dr. Mason had a fine specimen of the green carbonate, or malachite, found near the headwaters of the Ataran; and natives assured him that the same mineral exists up the Salwin. He had also seen specimens from Cheduba, near the coast of Arakan.

Copper is found in the Shan States, also at Kolen-myo and Sagaing; at Bawyine and Kolen-myo the malachite appears to be of a rich description, and the deposits seem to be abundant. The Sagaing mines were worked in former times by Chinese. The surface ore is not promising. Most of the copper used in Upper Burma is imported from China. It is plentiful in the province of Yunnan. Serpentine mines are said to occur at the Ura river, about 45 miles north and 30 west from the modern town of Moun-goung, in native Burma, and about 30 miles from Seebsagur in Upper Assam; carbonate of copper was, however, mistaken for it. But the serpentine rocks above Bamo appear to imbed oxides of copper. Copper and antimony occur in Shwe-green, and in the hill confines of Tounghoo.

Copper ores have been found in Sumatra? Celebes, and Timur. In the two former, mines of it are said to be worked.

Copper abounds throughout the whole Japanese group, and some of it is said to be not surpassed by any in the world. The natives refine it, and cast into cylinders about a foot long and an inch thick. The coarser kinds they cast into round lumps or cakes. Quicksilver also is said to be abundant. Lead also is plentiful. Tin in small quantities, and of a quality so fine and white that it almost equals silver. Iron is found in three of the provinces, of which they make steel unsurpassed in excellency. The copper ore found in Japan contains gold in alloy; it occurs in the market in small red bars, six inches long, flat on one side, and convex on the other, weighing 4 or 5 lbs. each; this copper is the most valuable of any found in Asia. The Chinese and Dutch exported upwards of 2000 tons annually.

A natural alloy found in China, known under the name of white copper, is used in great quantities. It seems peculiar to China, and was supposed by Dr. Black to owe its distinguishing colour to an alloy of nickel (Ains. Mat. Med. p. 53). It is used for dish-covers, candlesticks, tripods, plates, etc., which, when new and polished, look almost as well as silver.

Copper ores have been found as long ago as 1802 at Port Curtis, near the southern extremity of the range which extends along the north-east coast of Australia. Flinders met with indications of copper at Good's Island in Torres Strait. Lead and copper mines have been worked in South Australia for some years past, and others have been opened recently in the western coast range, a little to the north of Swan River. Hematitic and specular iron ore and copper pyrites have been found on the north-west coast near Admiralty Gulf.—*Kinneir's Geog. Memoir; M'Culloch's Dict.; Piddington in B. As. S. J.; Crawfurd's Dict.; Mason's Ten.; Irvine's Ajmir; O'Sh. Beng. As. Soc. Tr.*, 1841 to 1844; *Heyne's Tracts, Bomb. Geog. Soc. Tr.* vi. 117; *Friend of India*, 28th Feb. 1850; *Flinder's Voyage; Powell, Handbook; Smith, Nepal; Smith's Report on Singrowlee.*

Acetate of copper (arugo, verdigris) is a common bazar article in India, and is prepared on a large scale, by strewing copper plates with grape husks or tamarind pulp. During the fermentation of the traces of sugar in the husk, the copper combines with oxygen, and the oxide with acetic acid formed by the grape sugar. The process is extremely tedious.—*Beng. Phar.* p. 324.

COPPERAS, T'sing-fan, CHIN., an impure sulphate of iron.

COPPER PASTILLES. Pastilles containing sulphate of copper, when burned, destroy bugs, mosquitoes, and fleas, using three or four in a day.

COPPERSMITH is the small green barbet, Megalaima viridis, *Gmel.* (Xantholæma Indica), common in the Peninsula of India. It generally perches on the top branch of a tree, and the sound of its voice is Took, took, took, continuously, almost identical with that produced by striking a metal vessel.

COPPER, SULPHATE OF. Blue-stone.

Sulfate de Cuivre, . FR.	Turushu, Nila tutam, TAM.

This salt is produced naturally in the water of copper mines, and is manufactured in many parts of India and the eastern islands. It is easily prepared, by heating copper to redness in contact with the air, removing the black scales which form, and dissolving these in dilute and boiling sulphuric acid, and crystallizing. In the refining of silver it is incidentally prepared in very large quantities (Beng. Phar. p. 322). It is much used in dyeing operations, in the printing of cotton and linen, and for various other purposes in the arts. It has been employed to prevent dry-rot by steeping wood in its solution, and is a powerful preservative of animal substances; when imbued with it and dried, they remain unaltered. It is obtained by the decomposition of copper pyrites, in the same manner as green vitriol from iron pyrites. It is manufactured for the arts from old copper sheeting, copper turnings, and copper refinery scales. A little sulphate of copper or blue vitriol mixed with the rice or flour paste used for joining papers, very effectually keeps these destructive pests at a distance. It is made at Amritsar by boiling sheet copper in oil of vitriol. Sells at 8d. per lb.—*Royle; Beng. Phar.*

COPPER-WARE and tutanague utensils, with coral and glass beads, form small portions of the Chinese trade to India; the Chinese seldom use glass beads as ornaments.

COPRA. HIND.

Nari kela, . . SANSK.	Kobari ten-kaia, . TEL.
Kobara tengai, . . TAM.	

This is the dried albumen or kernel of the cocoanut. In preparing it, the kernel is taken out when fully ripe, divided in the middle, and dried. It is used as an ingredient in curries and in medicine, and is largely exported from India. The kernel of the cocoanut has much the taste of a filbert, and is a valuable ingredient in curries. It is considered as very nutritious. The correct Hindi word is K'hopra.—*Ainslie; Faulkner; Seeman.*

COPRIDÆ. *Leach.* A family of coprophagous beetles, or dung beetles, containing the genera,—

Ateuchus, *Weber.*	Sisyphus, *Latr.*
Gymnopleurus, *Illig.*	Orepanocerus, *Kirby.*
Taprobanæ, *West.*	Bonassus, *Fabr.*
Copris, *Geoffr.*	Onitis, *Fabr.*
Pirmal, *Fabr.*	Philemon, *Fabr.*
Onthophagus, *Latr.*	

Copridæ and Dynastidæ correspond to the dung beetles. Some of them are of great size, with immense horn-like protuberances on the head and thorax of the males, and, combined with their polished or rugose metallic colours, render them perhaps the most conspicuous of all the beetle tribe. See Insects.

COPSYCHUS, a genus of birds of the order Insessores, *Fam.* Merulidæ, and sub-family Saxicolinæ. C. saularis is the dial bird, common in Ceylon.

COPT, a race in Egypt, about 150,000 souls, following Christianity. Though now more or less mixed with other races, they are the undoubted descendants of the ancient Egyptians. The Coptic language became almost extinct as a living tongue in A.D. 1700. They now for the most part speak Arabic. It was found, when the hieroglyphic letters were written in English letters, that the words formed were in the main Coptic, with a slight admixture from the Hebrew and other tongues; and that the language of the ancient Pharaohs did not differ so much from the language of their modern descendants, as modern English does from that of Alfred the Great. With this key, learned men who knew Coptic have been able to read the hieroglyphics. They have now an alphabet, grammar, and dictionary, and any person may learn to read the mysterious language on the monuments of Egypt as easily as Greek or Latin. The language, though in the main Semitic, has a considerable mixture of Aryan, or Indo-Germanic roots. The Turks call them, in derision, the posterity of Pharaoh; but their uncouth figure, their stupidity, ignorance, and wretchedness, do little credit to the sovereigns of ancient Egypt. Of the diminution of the numbers of the Copts, some idea may be formed from the reduction of the number of their bishops. They were seventy in number at the period of the Arabian conquest. They are now only twelve, and most of these are settled in Upper Egypt.—*Bunsen's Egypt; Cal. Rev.*, No. 73, Sept. 1861, p. 118; *Niebuhr's Travels*, p. 104; *Sharpe's Egypt*, i. p. 133.

COPTIS TEETA. *Wallich.*

Mishmee teeta, . ASSAM.	Hong-lane, . . . CHIN.

The golden thread root plant of Assam, is a native of the mountainous regions bordering on Upper Assam, and its root is in high repute among the Mishmee, Lamas, and Assamese. Quantities are sent down to Assam in neat little baskets with open meshes, made of narrow strips of rattan, and measuring 3 to 4 inches in length by 2⅓ in breadth and 1½ in width; each basket contains about an ounce of small pieces of the root, from 1 to 3 inches long. The taste is intensely and purely bitter, very lasting, with only a slight aroma. On mastication, the root tinges the saliva yellow. In North America, the Coptis trifolia is much employed as a bitter tonic. Coptis teeta root brings a very high price, and is deemed a tonic remedy of the greatest value. Its influence in restoring appetite, and increasing the digestive powers, are very remarkable. It did not seem to exercise any febrifuge virtue, but under its influence several patients recovered from acute diseases, manifestly and very rapidly improved in strength. The dose

was 5 to 10 grs. of the powder, or an ounce of the infusion thrice only. Latterly, medical officers have used it as a substitute for quinine, both in remittent fever and in common agues. The tincture is a bitter tonic, and its flavour and colour are much more agreeable than the tincture of colomba.—*Beng. Phar.; Beng. Disp.; Voigt.*

COQUILLA NUTS are produced in the Brazils by Attalea funifera, *Martius*, the Cocos lapidea of Gœrtner, and the latter title is highly descriptive. The plant might advantageously be introduced into S. Asia. The coquilla nut shell is nearly solid, with two separate cavities, each containing a hard, flattened, greasy kernel, generally of a disagreeable flavour; the cells occasionally enclose a grub or chrysalis, which consumes the fruit. The passages leading into the chambers are lined with filaments or bristles, and this end of the shell terminates exteriorly in a covering of these bristles, which conceal the passages; this end is consequently almost useless, but the opposite is entirely solid, and terminates in the pointed attachment of the stalk. Sometimes the shell contains three kernels, less frequently but one only, and a coquilla nut has been seen entirely solid. The substance of the shell is brittle, hard, close, and of a hazel brown, sometimes marked and dotted, but generally uniform. Under the action of sharp turning tools it is very agreeable to turn, more so than the cocoanut shell; it may be eccentric turned, cut into excellent screws, and it admits of an admirable polish and of being lacquered. They are extensively used for the handles of bell-pulls, small tops, the knobs of walking-sticks, umbrellas, and other articles. In addition to the nuts, a coarse black fibre is obtained from the dilated base of the petioles. It is partly used for consumption, partly exported to Europe, tied up in bundles of several feet in length, and sold in London under this name at about £14 the ton. It is manufactured into cordage in its native countries, and as it is light, cables made of it do not sink in the water. In 1850, about 250,000 nuts were imported into England, and sold at 30s. to 40s. the 1000.—*Seeman; Holtzapfel; Poole's Stat. of Com.* p. 98.

CORA, also Kora. HIND. New, raw, fresh. Hence the Hindi Ghilek, and the Greek Koree, a virgin.—*Pop. Poetry of Persia*, p. 542; *Elliot.* See Corah.

CORACIADÆ, a family of birds of the order Insessores, consisting of 2 gen., 7 sp., viz. Coracias pileata, garrula, Indica, affinis; Eurystomus gularis, orientalis, and pacificus. C. Bengalensis is the Indian roller. This and the king crow habitually perch on the telegraph wires to watch for their insect prey, the former displaying his gaily-painted wings to advantage as he whisks and flutters about. C. Bengalensis meets in the Panjab, etc., the European C. garrula; in Assam, Sylhet, Tiperah, and more rarely in Lower Bengal, it co-exists with the C. affinis. C. garrula, the roller of Europe, Africa, W. Asia, Afghanistan, Kashmir, Sind, and the Panjab, is migratory. Celebes has the Coracias Temminckii.—*Wallace*, p. 284. See Birds.

CORACLE. For crossing the rivers in the S. of Asia, on the Tigris, Euphrates, the Upper Indus, and its affluents, the practice of three thousand years still continues. Xenophon's ten thousand were ferried over on inflated skins; and three slabs in the British Museum show the representation of the king of Assyria crossing the Euphrates in this mode. Canoes are of common use on ferries; and two pieces of the bole of a palmyra tree, scooped out and blocked with clay at the end, and fastened together, are used in the Circars. The coracles of Tibet and all India are circular wicker baskets, six or eight feet in diameter, covered with green hides; when laden, they float lightly on the water, and, presenting but little obstruction to the current, are easily paddled. The wicker and leather coracle traverses most of the rivers in the Peninsula of India. The ferrymen on the Kistna river in the Peninsula are the Koli race, stalwart men. The Kili-katr or Maddakpore race are also Kabl-gira or ferrymen. See Boat.

CORA-CORA. See Java.

CORAH, also written Cora, the mercantile name of plain silk cloth undyed. Bandanna is the same article dyed. This word is derived from Bandhna, to tie, because in dyeing the materials, the portions to be left white are tied into knots. See Cora; also Cotton Piece-Goods.

CORAL.

Bussud,	ARAB.	Corale,	IT.
Ky-a-ve-khet,	BURM.	Corallium,	LAT.
Gulli,	DUKH.	Poalam; Karang,	MALAY.
Koraalen,	DUT.	Korallii,	RUS.
Corail,	FR.	Birbat; Vidruma,	SANSK.
Korallen,	GER.	Prabala,	,,
Ramuth,	HEB.	Bubalo,	SINGH.
Marjan, H.,	MALAY. PERS.	Pavalam,	TAM.
Munga,	HIND.	Pagadam,	TEL.

Coral, as seen in the market, is the calcareous cell of a mollusc, whose flesh has been removed. It is merely carbonate of lime secreted by species of polypi, its particles cemented together by a gelatinous secretion from these animals. Marsili, an Italian naturalist, thought coral to be a marine plant, and the polype animal its flower, and Dr. Parsons entertained similar views; hence the name zoophytes, or plant animals. The polypi which make the coral so much used for ornament and jewellery, are chiefly Antipathes glaberrima, Madrepora corymbosa, M. pocillifera, Gorgonia tuberculata, two species of Astræa, Leiopathes glaberrima, and L. Lamarckii. When still alive in the sea, the rough surface is seen dotted with red spots, and a minute examination detects thousands of the polypi or coral insects, each inhabiting permanently a little cell of its own. Many of the polypi or coral insects have a little parasol-shaped cover for the head; the arms are furnished with eight claws, are long compared with the body, and are generally seen extended as if searching for food. Some of the kinds of coral resemble gigantic plants, with flowers and leaves. Some grow like a tree with leafless branches, and others spread out, fan-like, into broad, flat surfaces.

Coral is in great abundance in the Red Sea, in the Persian and Arabian Gulfs, in various parts of the Mediterranean, at the Mauritius, on the coast of Sumatra, in Japan, etc. It is carried to China from all the islands of the Indian Archipelago in native vessels, and is there wrought into ornaments and official knobs or buttons. It sells from 40 to 60 dollars per pikul, according to the colour, density, and size of the fragments.

The red or precious coral, Corallium rubrum, is gathered from the rocky bottoms of the borders of the Mediterranean or its islands, and most

abundantly at 15 to 20 feet, though occurring at 1000 feet. There are independent coral fisheries on the coast of Southern Italy, off Ponza Island; off the Gulf of Gaeta; off Sicily, especially at Trapani, its western extremity; off Corsica and Sardinia, and the islands off Bonifacio; off Algeria, south of Sardinia, near Bona, Oran; off the Marseilles coast, and other places, which in 1853 afforded 80,000 pounds of coral. It is imported to some extent into India, where the most esteemed is the red coral. The pale, delicate pink colour is the most valued in England.

The *coral polypi* of the E. Indies, Red Sea, Zanzibar, and Central Pacific comprise genera of the Astræacea, Fungacea, Oculinacea, Madreporacea, Alcyonoids, Milleporæ, and Nulliporæ. In the Fiji Islands, Astræas and Mæaudrinas or brain corals, are abundant. Madrepores add flowering shrubbery of many kinds, besides large vases and spreading folia, some of these folia being over six feet in expanse. Mussæ and related species produce clumps of large flowers; Meruliuæ, Echinoporæ, Gemmiporæ, and Momiporæ form groups of gracefully infolded or spreading leaves; Pavoniæ, Pocilliporæ, Seriatoporæ, and Porites, branching tufts of a great variety of forms; Tubipores and Xerna, beds or masses of the most delicately-tinted pinks; Spongioidiæ, large pendent clusters of orange and crimson; and Fungiæ display their broad discs in the spaces among other kinds. It will suffice here to name the more beautiful of the coral polyps:—

Alveopora verriliana, *Dana*, Fiji.
Astræa pallida, *Dana*, Fiji.
Alcyonium, *sp.*
Anthelia lineata, *Stimpson*, Hong-Kong.
Cancrisocia expansa, *Stimpson*, China Seas.
Dendrophylla nigrescens, *Dana*, Fiji.
Fungi lacera, *V.*, Fiji.
Goniophora columna, *Dana*, Pacific.
Madrepora cribripora, *Dana*, Fiji.
Madrepora Formosa, *Dana*, Fiji.
Porites mordax, *Dana*, Fiji.
Telesto ramulosa, *V.*, Hong-Kong.
Xema elongata, *Dana*, Fiji.

Coral reef corals comprise species of the Astræa tribe, and all but two of the Fungia tribe.

Of the Oculina tribe, all of the Orbicellids and Pocilloporidæ, parts of the Oculinids, Stylasterides, Caryophyllids, Astrangids, and Stylophorids.

In the Madrepora tribe, all of the Madreporids and Poritids, many of the Dendrophylla family, or Eupasammids.

Among Alcyonoids, numerous species of the Alcyonum and Gorgonia, and some of the Pennatulacea.

Among Hydroids, the Millepores and Heliopores.

Among Algæ, many Nullipores and Corallines.

The corals of colder waters are mostly solitary polyps, either outside the coral reef seas, or at considerable depths within them, and comprise a few Fungids, some Oculinids, many Eupsammids, some of the Gorgona and Pennatula tribes, and a few of the Alcyonium tribe; a few Milleporids of the genus Pleobothros.

Coral Reefs are classed by most authors into lagoon islands or atolls, barrier or encircling reefs, and fringing or shore reefs.

The Atoll or Lagoon Reefs are vast rings of coral rock, often many leagues in diameter, here and there surmounted by a low verdant island, with dazzling white shores, bathed on the outside by the foaming breakers of the ocean, and on the inside surrounding a calm expanse of water, which, from reflection, is generally of a bright but pale green colour. These are raised by soft and almost gelatinous coral polypifers, which work on increasing the outer edge of the reef, which day and night is lashed by the breakers of an ocean never at rest.

Barrier Reefs are little less marvellous than atolls. In rare places, the whole of the part of the reef that is visible is converted into land; but more usually the barrier reef is shown by a snow-white line of breakers, with here and there an islet crowned by cocoanut trees, and separating the smooth waters of the lagoon-like channel from the waves of the open sea. There are many such outside the small islands in the Pacific Ocean, but the Barrier Reefs of Australia and New Caledonia have excited much attention from their great size.

Fringing Reefs or *Shore Reefs* differ from barrier reefs in not lying far off shore, and in not having within them a broad channel of deep water.

Darwin supposes that as the reef-building polypifers can flourish only at limited depths, the foundation on which the coral was primarily attached has subsided, alike in the case of the atoll as in that of the barrier reef.

Sometimes the barrier reef recedes from the shore, and forms wide channels or inland seas, where ships find ample room and depth of water, exposed, however, to the danger of hidden reefs. The reef on the north-east coast of Australia and New Caledonia extends 400 miles, at a distance varying from 30 to 60 miles from the shore, and having many fathoms of depth in the channel. West of the large Fiji Islands, the channel is in some parts 25 miles wide, and twelve to forty fathoms in depth. The sloop-of-war Peacock sailed along the west coast of both Viti Lebu and Vanna Lebu, within the inner reefs, a distance exceeding 200 miles. A barrier reef, enclosing a lagoon, is the general formation of the coral islands, though there are some of small size in which the lagoon is wanting. These are found in all stages of development; in some the reef is narrow and broken, forming a succession of narrow islets with openings into the lagoon; in others there only remains a depression of surface in the centre to indicate where the lagoon originally was. The most beautiful are those where the lagoon is completely enclosed, and rests within a quiet lake. Maraki, one of the Kingsmill group, is one of the prettiest coral islands of the Pacific. The line of vegetation is unbroken, and, seen from the mast-head, it lies like a garland thrown upon the waters. It is in the South Pacific Ocean that coral reefs and coral islands are seen in the greatest perfection. The largest known coral reef is the Great Barrier Reef, that runs for 1000 miles parallel to the coast of Australia, and at a distance from the shore of from 20 to 60 miles. The barrier reef of New Caledonia is 40 miles long.—*Dana, Corals and Coral Islands; Darwin, Naturalist's Voyage; Darwin, Structure of Coral Reefs; Gosse, Natural History; Macgillivray's Voyage; Figuier, Ocean World; Maury, Physical Geog.; Hartwig; Jansen; Collingwood.*

CORALLINACEÆ, a family of marine plants, belonging to the order Algæ. According to

Harvey's definition, it includes the Corallinæ and Spongiteæ of Kutzing, and the Corallinidæ and Nulliporidæ of Dr. Johnston. They secrete a dense skeleton of carbonate of lime.—*Eng. Cyc.*

CORAL PLANT, Jatropha multifida.

CORAL TREE, Erythrina Indica, one of a genus of tropical trees, with clusters of very large long flowers, which are usually of the brightest red, whence their name of coral trees. Moore, when describing the Indian islands, notices the

'Gay, sparkling loories, such as gleam between
The crimson flowers of the coral tree,
In the warm isles of India's sunny sea.'

Frequently their stems are defended by stiff prickles. Voigt (p. 237) notices E. aborescens of Nepal, E. ovalifolia of Bengal, E. Indica of India generally, E. stricta and E. suberosa of the western coast of India, E. sublobata of the Peninsula, and E. crista-galli has the same popular name.

CORALU. TEL. Millet.

CORAN or Al-Kuran, the sacred book of the Mahomedans. It was written in Arabic, but has been translated into Turkish, Persian, Tamil, Burmese, Chinese, and Malay, and into most of the European tongues. See Koran.

CORAWA, a homeless race in the Peninsula of India, engaged in mat-making and basket-making. There are several sections, the Tiling Corawa and Koonchi Corawa, etc. An ancient Dutch writer on Cochin speaks of its lower ranks, consisting of the Cannianol, who are astrologers; the Corwaa, or exorcisers of evil spirits; the Cuca Corwaa, snake charmers and diviners; and the Poenen Poeloon, who accompany them with tambourines or small drums. These four castes are in some measure distinct, but resemble each in their strict separation from other castes, in their unsettled mode of life, wandering from place to place, and earning their livelihood by exorcism, jugglery, snake-charming, etc., like the heathens in Europe, and in their independence, for they manage their own lawsuits, punish their own criminals, and are subject to no prince or raja. Another caste, he said, are the Mocquaa, who inhabit the sea-shores, and subsist by fishing, many of whom have become Romish Christians. See India; Korawa.

CORBAN. ARAB., HIND., PERS. The sacrifice; called in the Gospels, a gift. See Kurban; Sacrifice.

CORBYN, FREDERICK, a medical officer of the Bengal army, editor of the Indian Review; Indian Journal of Medical Science, Calcutta, 1838-1844; Author of the Science of National Defence with reference to India, Calcutta, 1844; Treatment of Cholera.

CORCHORUS, a genus of plants belonging to the Tiliaceæ or Linden tribe; the species in India are acutangulus, capsularis, fascicularis, humilis, olitorius, prostratus, and trilocularis.

CORCHORUS ACUTANGULUS. *Lam.*

C. fuscus, *Roxb.* | Tita-pat, ... BENG.

This annual of tropical Africa grows in Bengal and both Peninsulas. Its flowers are small, yellow, springing up about Rangoon in the rainy season, and mostly found growing along with urena, but not to the same extent. It is one of the jute plants, and affords a strong fine grey fibre.—*M'Cl.; Voigt.*

CORCHORUS CAPSULARIS. *Linn.* Jute.

Ghinalita-pat, . . BENG. | Heart-leaved corchorus, ENG.
Ta-ma; Ho-ma, . CHIN.

Cultivated in India and China as a fibrous plant, like C. olitorius. Jute is sown in good land, well ploughed and drained. It needs damp soil, but requires no irrigation. It is ripe in three, four, or five months, when the flowers turn into fruit capsules. Jute, like hemp, sown around cotton fields protects them from insects and caterpillars; 2000 lbs. to 7000 lbs. may be obtained from an acre. 100,000 tons were woven in Dundee in 1876, and 50 million gunny bags were exported from Britain in one year.—*Roxb.* ii. p. 581; *V. Mueller.*

CORCHORUS FASCICULARIS. *Roxb.*

Jangli-pat, . . . BENG. | Bil nalita, . . . BENG.

Grows in Hindustan, Bengal, and the Peninsula.—*Roxb.* ii. p. 582.

CORCHORUS OLITORIUS. *Linn.* Jute.

C. decem-angularis, *Roxb.*

Gania, . . . AMBOIN. | Kowria of . . CUTTACK.
Pat; Ban-pat, . . BENG. | Jew's mallow, . . ENG.
Bhunghi-pat; kooshta, ,, | Rami tsjua, . . MALAY.
Phet-wun, . . . BURM. | Putta, ... SANSK.
Oimoa, ... CHIN. | Parinta; Perintakura, TEL.

An annual plant. In Bengal there are two varieties,—the green (Pat, BENG.), the reddish (Bun-pat, BENG.); both are used for their fibres, which are called jute and pat, the jute of commerce. A coarse kind of cloth (tat) is woven from the jute, and affords the material for the well-known gunny bags. An infusion of the leaf is much employed as a fever drink among the natives of the Lower Provinces. It grows wild about Rangoon during the rainy season, though not to the extent that urena does. The leaves of this plant are used in Egypt as a pot herb, and under the name of Nurcha or Sag greens; they are in common use amongst the natives of India. Both C. capsularis and C. olitorius afford the jute of commerce, which, both in the raw and manufactured form, is exported from India. The plant is to be found everywhere under cultivation. Every farmer requires rope and twine, and so grows a little jute. The fibre is extracted similarly to that of the 'sunn' hemp. Mr. Le Franc of New Orleans constructed a machine for cleaning jute and other fibre plants. With it four men in a day produced a ton of fibre, and it leaves no butts or refuse.—*Roxb.* ii. 582; *Voigt; Jaffrey; Royle; M'Clelland; O'Sh.* p. 229; *Cuttack Local Committee.* See Jute.

CORCHORUS PYRIFORMIS. *Smith.* T'ang-ti, CHIN. A plant of China and Japan; fruit pear-shaped.

CORCHORUS TRILOCULARIS. *Linn.*

The plant—Ba-phalli, . H. | The seeds—Isband, HIND.

Grows wild in the Panjab; seeds are given in rheumatism; it is C. acutangulus, *Lam.*—*Stewart.*

CORDAGE.

Touw-werk, . . . DUT. | Caolame, ... IT.
Manœuvres, . . . FR. | Tali; Kalat; Utas, MALAY.
Tauwerk, . . . GER. | Cordaje; Jarcia, . . SP.
Dudah, ... GUJ. | Nar, ... TAM.
Rassi, ... HIND. | Daramu, ... TEL.

Cordage is the commercial term for cord or rope of every kind. Cordage of excellent quality is manufactured in India, and plants of Southern and Eastern Asia yielding fibre are as under:—

Abelmoschus esculentus, Vendee fibre.
A. ficulneus.
Abutilon Indicum, Toottee.
A. polyandrum.
A. tomentosum.

Acacia Arabica.
A. leucophlœa.
Æschynomene cannabina.
Agave Americana, Pita fibre or great aloe.
A. vivipara, Kathalay.
Ailantus Malabaricus, Poroo maram.—Inner bark.
Aloe Indica or A. vulgaris, Kuttally nar.
A. perfoliata, aloe fibre.
Ananassa sativa, pine-apple fibre.
Andropogon schœnanthus, Camachy pillo.
A. involutum.
Antiaris saccidora, Arengee.
Arundo donax.
Bauhinia racemosa.
B. diphylla.
B. Vahlii, Vepy tree bark.
B. tomentosa, Vellay atee nar.
Bignonia coronaria.
Boehmeria; several species.
Borassus flabelliformis, Palmyra fibre.
Butea frondosa.
Callicarpa lanata, Thondy nar.—Inner bark.
Calotropis gigantea, Ak, Mudar, Yercum.
C. procera.
Cannabis sativa, hemp.
Carex Indica.
Chamœrops Ritchiana, hemp palm.
Cordia obliqua, Pothooveroosen nar.
Crotalaria Burhia.
C. juncea, Sunn, Wuckoo nar, Canamboo.
C. tenuifolia.
Cocos nucifera, coir.
Corchorus olitorius, jute.
C. capsularis, jute.
Cyperus textilis, mat-grass, or Coaray.
Decaschistia crotonifolia.
Desmodium argenteum.
D. tiliæfolium.
Dæmia extensa, Ootrum.
Eriochlœna Candollii.
Eriodendron anfractuosum, bast.
Eriophorum comosum.
Erythrina Indica.
Ficus religiosa, Arasa nar.
F. racemosa, Atti nar.
F. Indica, Aulamaram nar, Aallen nar.
F. opositifolia, Bodda nar.
F. Mysorensis, Kul-aallun nar.—Not much used.
F. Roxburghii; F. venosa.
Fourcroya gigantea, Seemay Kathalay.
Girardinia Leschenaultiana, Neilgherry nettle.
Gossypium Indicum, Indian cotton.
G. acuminatum, Brazil cotton.
G. Barbadense, Peruvianum, religiosum.
Grewia Asiatica, bast.
G. oppositifolia.
G. tiliæfolia.
G. rotundifolia, Oonoo.—Moderate strength.
Guazuma tomentosa.
Hibiscus cannabinus, Polychay fibre.
H. macrophyllus.
H. sabdariffa, Roselle fibre.
H. vesicarius, wild ambara.
H. rosa Chinensis, shoe plant fibre.
H. vitifolia; H. lampas; H. macrophylla.
Isora corylifolia, Valumbrikai, Kywen nar.—The most valuable fibre in Travancore. The plant grows abundantly at the base of the hills. Fibre is from the stem.
Linum usitatissimum, flax.
Marsdenia Roylii.
Mimosa intsia, Eenjy nar.
Missiessya.
Musa paradisiaca, plantain fibre.
M. textilis, Manilla hemp.
Orthanthera viminea.
Pandanus odoratissimus, fragrant screw-pine.
Paritium macrophyllum.
P. tiliaceum.
Philadelphus, *sp.*
Phœnix acaulis.
P. dactylifera.
P. sylvestris.
Rhapis.
Saccharum spontaneum.
S. sara, Sara.
Sanseviera Zeylanica, Morghee or Marool.
Salmalia Malabarica, Elavum parooty.
Sesbania cannabina.
Sida populifolia.—Used for cordage, etc.
Strychnos potatorum, Kathaven nar.
Smilax ovalifolia, Krinkoddy nar.—Used for tying bundles, etc.
Sterculia guttata; S. ornata; S. ramosa; S. villosa.
Terminalia alata, Mooroothen nar. — Bark very strong, and lasts many years; used for dragging timber, cordage, etc. Common in the forests.
T. belerica, Umburothee nar.
Tylophora asthmatica, Koorinja.
Typha angustifolia.
Ulmis campestris.
Urtica heterophylla.
Vernonia anthelmintica, Caat seeragum.
Wikstræmia salicifolia.
Yucca gloriosa, Pita or Adam's needle.
Y. aloefolia.

The exports of cordage, excluding jute, from British India, were as under:—

1875–76, .	. 30,216	cwt.	Rs. 3,33,673
1876–77, .	. 24,193	,,	2,65,603
1877–78, .	. 46,087	,,	3,65,790
1878–79, .	. 32,812	,,	3,55,377

It still requires to be determined whether tanning or tarring is the better mode of preserving cordage in India, and whether a substitute for tar might not be discovered in some of the numerous resins and gum-elastics of Southern India.

CORDIACEÆ, an order of plants comprising the genera Cordia, Cordiopsis, and Erycibe. The chief species of Cordia known are, — angustifolia, cuneata, domestica, fulvosa, gerascanthus, grandis, latifolia, Leschenaultii, monoica, myxa, obliqua, orientalis, Perrotettii, polygama, prionodes, Rothii, sebestana, serrata, tectonæfolia, tomentosa, trichostemon, Wallichii. C. fragrantissima, *Kurz*, is of Burma; C. Nepalensis, *Wall.*, also occurs in Simla; C. obliqua, *Thw.*, is a tree of Ceylon; C. tomentosa is confined to the southern parts. In the Dehra and Kheree jungles is C. latora, *Ham.*, *Buch.*, perhaps only a variety of C. myxa, and a new species, C. incana. The bark of some of the Cordia, when young, may be found to yield a useful fibre.—*Voigt*, p. 441; *W. Ic.; M. E. J. Rep.; Royle, Ill. Him. Bot.*

CORDIA ANGUSTIFOLIA. *Roxb.*

C. reticulata, *Roxb.*	Narrow-leaved sepistan.
Gund; Goondi, . HIND.	Naruvalli, . . . TAM.
Gundni; Goondni, ,,	Chinna botuku, . TEL.
Liyar, ... SIND.	Nukkeru, . . . ,,

This tree grows from 30 to 40 feet high in Hurdwar, Gujerat, and the Dekhan; the wood is very tough, is used for carriage poles, posts, and in house-building, and is recommended for gun-stocks. It is common about villages in the Circars, but never seen in the jungles. Fruit the size of a large pea, round and smooth, the pulp yellow and gelatinous, edible, but tasteless.—*Roxb.; Royle; Riddell; Beddome; Voigt; Bird.*

CORDIA LATIFOLIA. *Roxb.* Sepistan.

Buhuari, ... BENG.	Pistan-sug, . . . PERS.
Buro buhooari, . ,,	Gedooroo, . . . SIND.
Burgoond; Vurgoond, GUJ.	Sheloo, ... SANSK.
Bhokur; Barra lesura, H.	Kicha virigi chettu, TEL.

The tree occurs in Gujerat, Hindustan, but is mostly confined to the southern parts of India. It has numerous spreading branches, and the young shoots are angular and smooth. Phaleeta or slow matches are made of the bark. The tree

is hardy and ornamental. The wood is very inferior, and of small size. The fruit is eaten. Under the name of sebesten plums, or sepistans, two Indian fruits have been employed as pectoral medicines, for which their mucilaginous qualities, combined with some astringency, have recommended them. They are believed to have been the Persea of Dioscorides, and this tree furnishes one of them. Linnæus applied the name of Sebestan to an American species of this genus, which is not known in medicine.—*Eng. Cyc.; Roxb.* i. p. 588; *Voigt; Irvine; O'Sh.; Wight; Royle; Elliot, Fl. Andh.*

CORDIA MACLEODII. *Hooker.*

C. monoica? | Hemigymma Macleodii.
Dhengun, . . . HIND.? | Dhyan; Deyngan,. HIND.

A tree of Jubbulpur, from which there was sent to the Exhibition of 1862 specimens of a remarkably beautiful wood, found in Mundla and Seonee, and also Central India. Its wood approaches teak in its properties.—*Cal. Catalogue*, 1862.

CORDIA MYXA. *Linn.* Lebuk of Avicenna.

Mochayet of Forskal. | Cordia domestica, *Roth.*
Prunus sebestana, *Pluk.* | Sebestana domestica, *Lam.*
Cornus sanguinea, *Forsk.* | S. myxa, *Commel.*
Cordia officinalis, *Lam.* | S. officinalis, *Gærtn.*

The Fruit.

Sepistan plum tree, ENG. | Nakkeru; Iriki, . TEL.
Lasura, Gondni, . HIND. | Pedda botuku, . . ,,
Kendal, ... JAV. | Mookooroo karra, . ,,

A pretty large tree, a native of Egypt, Persia, Arabia, Ceylon, the forests of the Godavery, Hindustan, and Nepal. It grows wild in the Siwalik up to 4000 feet, and it is common throughout the Konkan, Pegu, and the Malay Peninsula. The trunk is from 8 to 12 or 15 feet high, generally crooked, but as thick as, or thicker than, a man's body, with numerous spreading branches bent in every possible direction, and forming a dense shady head. The wood is soft, and of little use except for fuel. In Sind, fuse is prepared from the grey cracked bark. It is reckoned one of the best kinds of wood for kindling fire by friction, and is thought to have furnished the wood from which the Egyptians constructed their mummy cases. The wood and bark are said by Dr. Royle to be accounted a mild tonic. Its dried fruit is the smaller sebestens or lobestens of European medicine; it is a yellow berry, with a strong, sweetish taste, and serves as a preserve; the mucilage of the fruit is demulcent. The root is said to be purgative. The larger fruit is called lasura, and the smaller variety lasuri; its seeds are the Chakoon ki binj, HIND., used in powder mixed with oil as an application in ringworm.—*Roxb.; O'Sh.; Stewart; Royle; Brandis; Riddell; Bird.; Powell; Eng. Cyc.; Fl. And.; Voigt; Thw.*

CORDIA OBLIQUA. *Willd.*

C. tomentosa, *Wall.* | C. domestica? *Roth.*
C. Wallichii, *G. Don.*
Gondni; Lasura, . HIND. | Selu; Naruvalli, . TAM.

This is a large, handsome tree, common in the lower provinces of India, with a small, round, reddish-coloured, pleasant-tasted, but glutinous fruit; furnishes a fibre, Pothooveroosen nar, of moderate strength.—*Ainslie*, p. 228.

CORDIA POLYGAMA. *Roxb.* i. p. 494.

Bottu kuru chettu, . TEL. | Pach-cha botuku, . TEL.

A strong, close-grained wood, small and crooked, found in the Circars.

CORDIA ROTHII. *Rœm. et Sch.* C. cuneata, *Heyne.*

Bokur, ... MAHR. | Narvilli maram, . . TAM.

Dr. Wight believes the wood is very inferior, the trees being usually small; and Dr. Gibson says that C. Rothii, C. fulvosa, and C. obliqua do not yield timber fit for anything but firewood. They are not uncommon in the Bombay forests, but are more generally met with near cultivated lands and villages.—*Roxb.* i. 591; *Wight; Gibson.*

CORDIA VESTITA. *H. f. et Th.*

C. incana, *Royle.* | Gynaion vestitum, *D. C.*
Kumbi of . . . . BEAS. | Karuk of . . . SUTLEJ.

A small tree of Garhwal, rare in the Siwalik tract, nearly as far as the Jhelum, and in the Salt Range to 3000 feet. Common in N.W. Provinces. The wood is valued for wheel-work. The fruit is eaten, and said to be sweet.—*Stewart; V. Mueller.*

CORDIA WALLICHII, *G. Don.*, C. tomentosa, *Wall.*, is a good-sized tree, tolerably common throughout the Madras western forests, also in Mysore and the Bombay Presidency. Technically it is hardly distinct from the common Cordia myxa, but the densely woolly leaves will distinguish it. The timber is serviceable, and in use with the natives.—*Beddome, Fl. Sylv.* p. 245.

CORDYCEPS SINENSIS. *Smith.* Hia-ts'au-tung-Ch'ung. This fungus, the Spæria of some writers, grows upon the head of a caterpillar, as a disease of the insect; supposed to be a species of Hepialus. It is said to be common in Southern Tibet; it occurs in Sze-chuen, Hu-kwang, Hu-peh, and Hu-nan. It is reported to be as good as ginseng, and to be worth four times its weight of silver.—*Smith.*

CORDYLES, the Zonuridæ family of the lizards or sauria. See Reptiles.

CORDYLIA PALMARUM, the grub of the palm weevil; is eaten roasted in the West Indies. It is the size of the thumb.

CORDYLINE BANKSII. *J. D. Hooker.* The long-leaved palm lily of New Zealand. Its leaves furnish a superior fibre for ropes. C. Baueri, *J. D. Hooker*, of Norfolk Island, rises 40 feet high; and C. indivisa, *Kunth*, of New Zealand, also furnishes the toi fibres.

COREA or Korea, the Kaoli of the Chinese, called Chaou Seen by the natives. Corea is a kingdom in a large peninsula, stretching from lat. 42° 19′ N., southwards to the Straits of Corea, area 91,000 square miles.

The peninsula of Corea bears a strong resemblance in its physical aspects to Italy. An axial range of mountains runs close to and parallel with the east coast; the rivers which flow westward from it, and fall into the China Sea, being of considerable length, and those that flow eastward into the Sea of Japan, small and unimportant. Regarding the west coast but little is known. It is for the most part a flat and uninteresting coast, inhabited by a class of people reported to be rude and inhospitable, and dangerous to navigation on account of rapids and high tides. The east coast, on the contrary, is a magnificently wooded series of mountain spurs, running down from the axial range of the country close to the water's edge, and

visible many miles at sea. It is conterminous with the coast of Russian Tartary, and has been accurately surveyed again and again by Russian men-of-war. The whole coast is one grand succession of hills and mountains, forest-clad at their summits, and covered on their lower slopes with a jungle of dwarf oaks, creepers, stunted pines, and a dense undergrowth of shrubs and grasses of every variety. Tigers abound, and pits to catch them may be seen close to the villages with which every valley is studded.

Corea is an independent state, perfectly sovereign within her own borders, with a peaceful and industrious population, who desire nothing better than that they be left alone to earn their own bread in their own way. The hills which cover the east of the country are given over to wild beasts, it is true; but wherever cultivation by simple methods is possible, there it swarms with millions of people, and there is no reason to believe that they are not perfectly satisfied with themselves, their rulers, and their country.

The Coreans are in physique the finest people in Eastern Asia, and in bearing much more manly than it is the fashion to represent them, but they are as a nation absolutely unarmed. They have lived in such complete seclusion, that they are frightened with strange sounds and sights even, although this is the timidity of ignorance, not of a craven spirit.

Although Corea is thus described as an independent sovereign state, in the sense that her municipal laws, her executive, the succession to her throne, and the treaty relations she has entered into with Japan, are purely of her own creation, she is in another sense a feudatory of China. The services which she performs, whatever may have been their origin, are now-a-days performed from sentimental, not political motives, and her title to the sovereignty she possesses is not based on their due performance. To speak strictly, they consist of a formal recognition by the emperor of China of each successive king, and the despatch to Pekin at stated intervals of a mission bearing tribute. Its border on Russian territory has been surveyed. It is the most easterly part of the Asiatic continent, and is separated from the Chinese empire by the Than-pe-chang or Pe-theu-shan, the white-headed mountains, a formidable range. The native prior race are of Mongoloid origin, but the mercantile population are said to belong to the Indo-European race. The native race averages 5½ feet, have a wheaten-yellow colour, prominent cheek-bones, heavy jaw, flat and crushed root of nose, wide nostrils, rather large mouth, thick lips, oblique eyes, coarse, thick, blackish hair, frequently tinged with red, thick eyebrows, thin beard. They have a tradition that they sprang from a black cow on the shores of the Japan Sea. It has innumerable islands on its W., S., and E. coasts, the largest being Kang-wha on the west, Quelpart on the south, and Ollongto on the east. Quelpart mountains rise to 6600 feet above the sea. The total inhabitants of the peninsula and islands are estimated at 16 millions. Some of the mountains rise to 10,000 feet above the sea. The capital and residence of its kings is Saoul, with 100,000 to 150,000 inhabitants. The higher classes have a tendency to the Turanian physical type, as with the Japanese and those of Siberia. They are polygamic, and purchase their wives. Their women are secluded. The dead are buried in wooden coffins, or wrapped in sheets. Rice is the chief article of diet; they eat largely, and drink much alcoholic fluid; are fond of music, honest, good-natured.—*Ernest Offert's Forbidden Land; Yule, Cathay*, ii. 268.

CORGE. Twenty pieces of cloth.

Coriandro, ...	IT.		

This is the fruit or seed of the annual plant, Coriandrum sativum, cultivated in the East and in Europe, and procurable in all Indian bazars. When fresh, their smell is strong and disagreeable, but by drying it becomes sufficiently grateful. They are used as an ingredient in curries in India, and medicinally as a stimulant and stomachic. In Europe, coriander seed is chiefly used by distillers to produce an aromatic oil. The quantity imported annually into Britain is about fifty tons, and sells at 24s. the cwt.—*M. E. J. R.; Simmonds; M'C.; Birdwood; Waring.*

CORIANDRUM SATIVUM. *Linn.* The coriander plant is found in the cornfields of Tartary, the Levant, Greece, Italy, and south of Europe, and it is grown in every part of Southern Asia, where the leaves are used by the natives for chatnis and curries; the fruits being also carminative and aromatic, are used in decoction, in sweetmeats, in certain stomachic liqueurs, and in some countries in cookery; they are little esteemed in England. During the unripe state, the odour resembles that of bugs, but this changes rapidly as ripening proceeds. Fee derives Coriandrum from κορις, a bug.—*O'Sh.; Roxb.; Voigt; Lindley.*

CORIARIA MYRTIFOLIA, *Linn.*, is used in tanning leather, and also for staining black. It is worth £9 to £10 per ton.

CORIARIA NEPALENSIS. *Wall.*

Grows all along the Himalaya, from 5000 to 7000 feet, and, from its abundance, has bestowed its name on Mussoori hill station. The fruit formed by the junction of several pistils is eaten in the hills, although that of the European species is poisonous, inducing narcotism and tetanus.—*O'Sh.; Clegh.; Stewart; Voigt; Royle; Powell, Handbook*, i. p. 336.

CORINGA, a town at the northern mouth of the Godavery river, on a branch generally called the Coringa river. It is a seaport town, where ships are built, and is in a bay from off the Bay of Bengal; population, 5649. The district has been repeatedly inundated. In May 1787, after a long and very violent gale from the northward, the sea rushed over the site of the town, and in a moment destroyed nearly the whole of the people, 4000 in number. A similar catastrophe occurred in 1837, when 15,000 people and 100,000 head of

cattle were destroyed; and the ships in the bay and on the stocks were swept far inland. It is 9 miles S.W. of Cocanada, in lat. 16° 48′ 25″ N., and long. 82° 16′ 20″ E. It is the only harbour between Trincomalee and Calcutta where ships can be docked.

Cork is the outer bark of Quercus suber, an evergreen oak growing in Portugal, Italy, the south of France, Corsica, and in Spain throughout the whole extent of the Tierra Caliente, but most abundant in Catalonia and Valencia, whence the principal exports have been made. This substance is developed on other plants, but on none in so large quantity as in the Quercus suber. It is light, porous, compressible, and elastic, and many articles are cut out of it. As soon as the bark dies, it falls off in flakes, which correspond to the layers that are formed annually. These outer layers the Spaniards collect; the inner living bark should be spared. In Corsica and Spain, where the tree is abundant, this bark is removed for tanning, and contains twice as much tannin as oak-bark of average quality. The tannin appears to resemble that of catechu; it affords scarcely any bloom, and gives a dark colour to the leather. At the Madras Exhibition of 1855, two specimens of a cork-like substance were exhibited, one good, from the 'Western Coast Jungles,' and another inferior, from Coimbatore; the trees producing the samples were not mentioned. The deeply cracked spongy bark of the Bignonia suberosa, the country cork tree, yields an inferior kind of cork.—*M. E. J. R.; Eng. Cyc.; M'C. Dict. of Com.; Royle, Arts and Manufactures*, p. 484.

CORK TREE of China. *Smith.* Fan-Sha, CHIN. Its bark resembles that of Quercus suber.

CORMORANT. Salach, HEB. Cormorants are trained in great numbers, in the eastern Chinese provinces, to capture fish, and are sometimes under such good order that they will disperse at a given signal, and return with their prey without the precaution of a neck-ring. A single boatman can easily oversee twelve or fifteen of these birds; and although hundreds may be out upon the water, each one knows its own master. If one seize a fish too heavy for it alone, another comes to his assistance, and the two carry it aboard. The birds themselves are fed on bean-curd, and eels or fish. They lay eggs when three years old, which are often hatched under barn-yard hens, and the chickens fed with eels' blood and hash. They do not fish during the summer months. The price of a pair varies from 5 to 8 dollars. See Fisheries.

A quartzose mineral, found in great abundance in India; classed as one of the inferior gems, and largely cut at Cambay from stones collected from the drift of the Rajpipla range. Shafts are sunk to the stratum containing the minerals. These are burnt to bring out the colours, and are cut into paper-weights, knife handles, miniature-sized cups and saucers, tables for snuff-boxes, sets of brooches, necklaces, and bracelets, pins, buttons, and studs. A field gun, with all its appointments, is one of the finest ornamental pieces of Cambay stone work; they sell for from Rs. 40 to 50. The polish of Cambay stones is not such as pleases the eye of the European lapidary; yet they are so cheap, they might be expected to become a considerable article of commerce, and might be built up into mosaics for work-tables, into chess-boards, and other elegant articles of furniture,—the chief part of the work being performed here, where labour is cheap, the final finish being given in Europe. The Cambay agates equal the finest Scottish pebbles in beauty; they generally exceed them in size, and may be had for a mere fraction of the price.

In 1844 their exports amounted in value to Rs. 93,478, and in 1845 to Rs. 88,849. See Arts; Cambay.

CORNICULARIA JUBATA. *Ach.* The Kek-kieo of the Burmese; an edible cryptogam of Ramree.

CORNUS, a genus of large trees and shrubs of the Cornaceæ or dogwood tribe. C. oblonga occurs in the Dehra Doon, C. macrophylla and C. nervosa in Mussoori, and C. capitata, *Wall.* (Benthamia fragifera, *Lindl.*), at a still higher elevation. The fruit of Benthamia is eaten in the hills, and from the seeds of some species an oil is expressed. Wight figures C. altera, C. sylvestris, and C. Zeylanica. The bark of the C. florida and C. sericea are said to be most excellent tonics.—*Drs. Riddell, O'Sh., Wight.*

CORNUS MACROPHYLLA. *Wall.*

This is found in the Sutlej valley between Rampur and Sungnam, and in many parts of the Panjab Himalaya, at an elevation of 7000 feet. Its fruit is edible, and goats feed on the leaves; and the wood hard, but small, is made into charcoal employed in the manufacture of gunpowder.—*Drs. Stewart, Cleghorn, Panjab Report.*

CORNUS OBLONGA. *Wallich.*

Ban-kukur, . . JHELUM.	Bakar, . . CIS-SUTLEJ.

A smallish tree in the outer hills in the east of the Panjab, sparingly in the Siwalik tract; occasionally to 4000 feet up to near the Indus; timber of no special use.—*J. L. Stewart, M.D.*

CORNUS OFFICINALIS. *Smith.*

Shan-cha-yo, . . CHIN.	The fruit—Jau-tsau, CHIN.

The Cornelian cherry is a prickly shrub of Japan, Kiang-su, Shen-si, and Shan-tung. The flowers are white. The red drupes contain a good deal of oil; they are dried and sold.—*Smith.*

CORNUS SINENSIS, *Smith*, Cornelian cherry, the Hu-t'ui-tsz of China, resembles C. mascula. It

has white flowers; slender, supple branches, with long pointed leaves, downy on the under surface. Its fruits are astringent, and leaves used in coughs.—*Smith.*

CORNWALLIS, CHARLES, MARQUIS, was twice Governor-General and Commander-in-Chief in India. He served successfully in Ireland, but subsequently in America with great disasters. He was sent out by Mr. Pitt to India, and the Act of Parliament of 1784 and 1786 was passed to give him supreme power. He arrived in Calcutta on the 12th September 1786, and re-embarked on the 10th October 1793. During this period the second war with Mysore occurred. He was the first to bring about unity of action between the Indian and Home Government, and the first to recognise the duty of paying Indian servants well, and to abolish all distinctions between the King's and Company's military officers. In 1788 he received power to bestow local commissions on the latter. His care was directed alike to financial and administrative measures, but also to the moral and social condition of the Anglo-Indian community; and in 1793 he issued regulations which for 38 years formed the basis of the administration of justice in India, and were changed only in 1831 during Lord William Bentinck's administration. He gave effect to the long-discussed subject of perpetual settlement under a zamindar class, a system which has since been greatly condemned. In 1793 he went from India to Ireland. He received the title of Marquis, and returned to India on the 30th July 1805, from which date, till his death at Ghazipur on the 5th October 1805, he was a second time Governor-General. A monument was erected to his memory at Ghazipur, and a statue at Madras.

COROMANDEL, with Europeans a geographical designation of the coast-line in the south of the Peninsula of India washed by the Bay of Bengal. It extends from Point Calimere to near the mouth of the Kistna river. Its revenue districts are Tanjore, S. Arcot, Chingleput, N. Arcot, and Nellore. The name is not known to the people, and has been supposed to have its origin from the village of Coromandel, on the Pulicat marine lagoon north of Madras, and to give its name to the entire eastern coast of the Peninsula. It has also been derived from Cholamandala, which Paolini the Carmelite explained to mean the middle country, but which scholars interpret as the dominion of the Chola race, one of three Hindu dynasties who anciently held the Tamil country in the south. It is not impossible, however, that the general name has been connected with this particular village of Kurr-mandlum, TAM., meaning 'Black Sand.' It is on the sea bank of the Pulicat lake, about 35 miles north of Madras, and formerly held by the Dutch. It is in the Chingleput district, in lat. 13° 26′ 10″ N., long. 80° 20′ 36″ E. Population, 3050 in 1871. See Chola-Mandaloor.

COROMANDEL WOOD is the produce of the Diospyros hirsuta, a Ceylon tree of great size, having a dingy ground, and sometimes running into white streaks. The figure is between that of rosewood and zebra-wood; the colour of the ground is usually of a red hazel-brown, described also as chocolate brown, with black stripes and marks. It is hard, but veneer saws cut it without particular difficulty; it is a very handsome furniture wood, and turns well. Mr. Layard says there are three varieties,—the Calamander or Coromandel, which is the darkest, and the most commonly seen in England; the Calemberri, which is lighter-coloured, and striped; and the Omander, the ground of which is as light as English yew, but of a redder cast, with a few slight veins and marks of darker tints. He says the wood is scarce, and limited to Ceylon; that it grows between the clefts of rocks; this renders it difficult to extract the roots, which are the most beautiful part of the trees. Its names are corruptions of two Singhalese words, Kalu mederiye.—*Faulkner; Mendis; Tredgold; Holtzapfel; Fergusson.*

COROSOS, or Ivory Nut, is produced by the Phytelephas macrocarpa, growing in Central America and Columbia (Humboldt). The tree is a genus allied to the Pandaneæ, or screw-pines, and also to the palms. They are seeds with osseous albumen. The nuts are of irregular shape, from one to two inches diameter, and when enclosed in their thin husks they resemble small potatoes covered with light-brown earth; the coat of the nut itself is of a darker brown, with a few loose filaments folded upon it. The internal substance of the ivory nut resembles white wax rather than ivory. It has, when dried, a faint and somewhat transparent tint between yellow and blue; but when opened, it is often almost grey from the quantity of moisture it contains, and in losing which it contracts considerably. Each nut has a hole which leads into a small central angular cavity; this, joined to the irregularity of the external form, limits the purposes to which they are applied, principally the knobs of walking-sticks, and a few other small works. It might be introduced into India.—*Holtzapfel.*

COROXYLON GRIFFITHII. Soda is made from this plant by burning and levigating; three kinds are recognised,—Choa-sajji, the purest; Hat'ha-sajji, second sort; K'hara-sajji, third sort.

CORPULENCE is a state of body very frequently seen amongst the richer of the Hindus. A tabular statement, taken from a mean average of 2648 healthy Englishmen, was formed and arranged for an insurance company by the late Dr. John Hutchinson. His calculations were made upon the volume of air passing in and out of the lungs, and this was his guide as to how far the various organs of the body were in health, and the lungs in particular. It may be viewed as an average, some in health weighing more by many pounds than others:

5 ft. 1 in.,	120 lbs.	5 ft. 7 in.,	148 lbs.
5 ,, 2 ,,	126 ,,	5 ,, 8 ,,	155 ,,
5 ,, 3 ,,	133 ,,	5 ,, 9 ,,	162 ,,
5 ,, 4 ,,	136 ,,	5 ,,10 ,,	169 ,,
5 ,, 5 ,,	142 ,,	5 ,,11 ,,	174 ,,

This is largely made in India, but in an imperfect manner, and used in native medicine. Some very fine specimens were shown at the Panjab Exhibition from Amritsar and Lahore.—*Powell.* See Mercury; Rascapur.

CORSICAN MOSS. See Edible Seaweed; Fucus.

CORTES. Hernan Cortes, a Spanish navigator, who, in A.D. 1528, endeavoured to follow up the discoveries of Magellan. He took possession of the Marianas or Ladrone Islands, but, with all the members of his expedition, fell victims to the climate and the hostility of the Portuguese.

CORTINARIUS EMODENSIS, *Berkley*, and also C. violaceus, *Fr.*, are large mushrooms, the Onglan of the Tibetans and the Yungla t'schamo of the Bhot, a favourite article of food.—*Hook. Him. Journ.* ii. p. 47.

CORUNDUM.

Kin-kang-shih, . . CHIN.	Samada, . . . GUJ.
Adamantine spar, . ENG.	Kurund, . . . HIND.

Several substances, differing considerably in colour and sometimes in form, but nearly agreeing in composition, are classed together under the name of kurundu by the natives of India. This mineral is, with the exception of the diamond, the hardest substance known. It is generally of a pale grey or greenish colour, but sometimes of red and brown tints. It is found in India, China, and in some parts of Europe. The Indian variety is whiter than the Chinese, and is considered the purer. In India, diamond dust is very rarely used in polishing gems, marbles, and metals, corundum being the chief material employed. This mineral is found in granite, or the detritus of granite rocks in the Mysore country and in the neighbourhood of the S.W. Ghats. Though excessively hard, it is by no means tough,—it flies in pieces after a few strokes of the hammer, and is easily pulverized in a mortar. The natives generally powder it on an anvil or stone, keeping it from flying about by a collar of cotton rope. The fine particles are separated from the coarse by sifting; the European process of lixiviation is not seemingly resorted to. For sharpening swords or burnishing metals, it is generally used like a whetstone or burnisher; for polishing gems, it is either made up into a cake with lac, or into a paste with oil or grease. It is never employed for the manufacture of emery paper or anything resembling it. For polishing marble or other stone, it is used in two forms, viz. that of a cake of about eight inches long, three across, and two deep. This is used by an individual in the hand. For heavier purposes, a cake a foot square or so is employed, placed in a frame. Two men work at this, and the reducing process is very rapidly accomplished by it; it is in fact a file with a lac body and corundum teeth.

The corundums of the Madras Presidency are well known to the people, who use them in mass or mixed in lac; they are used by cutlers, etc., in the form of discs for laps, or wheel grindstones; also, in the form of whets, and hones, and ragstones, for sharpening the finer and coarser cutting implements used by farriers, etc. The first specimens sent to Europe were forwarded by Dr. James Anderson to Mr. Berry, a lapidary in Edinburgh, as the substance used by the people of India to polish masses of stone, crystal, and all gems, except the diamond, and it was then examined by Dr. Black, who named it adamantine spar.

The sites where corundum occur are—

Nammaul, Viralimodos.—On the north bank of the Cauvery, in the Permutty taluk.—*Newbold.*
Sholasigamany (probably Scholaserameny).
Trichingode taluk, near the village in a low hill, in great abundance.—*Newbold.*
Caronel, Aupore, Mallapollye, and at various localities up the river Cauvery as far as Corcorambodi in Permutty, where it is dug by the natives in the fields, and remains of many ancient excavations are to be traced.—*Newbold.*
Gopaulchetty pollium, 50 miles north of Salem.
Yalanerry.
Coundapady.
French Rocks.—*Captain Loudon.*
Golhushully, in the division of Nooghully.—*Newbold.*
Kulkairi, in the division of Chinrayapatam.
Burkunhulli, in the division of Chinrayapatam.—*Newb.*
Kundeo, in the division of Chinrayapatam.—*Newbold.*
Yedgunkul, in the division of Chinrayapatam.—*Newbold.*
Norhik, in the division of Narsipur.—*Newbold.*
Deysani Carbonhully, in the division of Banawaram.
Appianhully, in the division of Harnally.—*Newbold.*
Nullapardy, on the road to Bangalore, Mysore.
Mundium, in the Astagram division.
Cuddoor, in the Nuggur division.
Nuggur, in the Nuggur division.

It occurs also at Gudjelhutty in Coimbatore, at the Tapoor Ghat in Salem, at Chennimully in Coimbatore, and in Cuttack. At Namaul and at Viralimodos on the north bank of the Cauvery; in the Permutty taluk, Salem district, it occurs embedded in gneiss and a greyish earth, resulting in part from the disintegration of that rock. It is found in great abundance in a low hill near the village of Sholasigamany, Trichingode taluk, Caronel, Aupore, Mallapollye, and at various localities up the river Cauvery, as far as Corcorambodi, where it is dug for by the natives in the fields; and there are the remains of many ancient excavations still to be traced. The caste usually employed in collecting it is the Vittaver. At the Madras Exhibition of 1855, Mr. Rohde exhibited specimens from Guntur, and remarked of them that experienced jewellers would pick out stones suited for common jewellery from it, and the refuse cannot be worth less than £15 and £20 a ton at home. From Hyderabad was received a very excellent sample of picked stones, possessing an irregularly crystalline structure. Professor Thomson mentions (Mineralogy, i. 213) that fibrolite is found accompanying crystals of corundum in the Karnatic, and that it is a component part of the granite which is the matrix of the corundum of China. Professor Jameson, in his Geognosy of Peninsular India (Ed. Cab. Lib. No. viii. p. 349-50), states that the corundum of Southern India occurs embedded in granite and sienite in the district of Salem, in the Madras Presidency, associated with Cleavelandite, Indianite, and fibrolite; but near Gram at Golhushully and Kulkairi, at which good corundum is obtained, the mineral occurs in decomposed beds of a talcose slate, to which gneiss is subordinate, associated with nodules of indurated talc, and of a poor quartzy iron ore; asbestos, chlorite, actinolite, and schorl were

found in the talcose slate. Newbold mentions that in the Salem district, also, this mineral occurs embedded in gneiss and a greyish earth, resulting in part from the disintegration of that rock. Rubies, sapphires, emeralds, and topaz have from time to time been discovered in many of the corundum localities just enumerated, associated with this mineral, particularly in the gneiss at Viralimodos and Sholasiramany in the Trichingode taluk and at Mallapollye, though, comparatively speaking, rare. The formation around Gram is gneiss associated with protogene. Proceeding from it in a westerly direction, the northern shoulder of the insulated range, south of the village of Belladaira, running nearly north and south, is crossed, and the soil suddenly changes from a light sandy colour to a deep red. The surface of this soil is covered with fragments of a ferro-silicious schist, with quartz in alternate layers. The natives have a tradition that gold was formerly got from this hill, which is not at all improbable, as it is found in similar gangue near Baitmungalum. The corundum mines of Golhushully lie four or five miles north-east of this place, and those of Kulkairi about a mile farther. The surrounding country is a succession of smooth, slightly convex plains, except to the south-east, where the gneiss rises above the soil in a rocky ridge, terminating in a knoll about 700 yards to the east by south of the mines, to which it descends, rising again into a slope to west north-west of the mines, on which lie fragments of a light brown compact quartzy iron ore. Nearly at the bottom of this stone are the mines, from which the ground descends on both sides to the north-west to a tank, and towards the south-east to the village of Golhushully, about a mile distant.

The chert and a dark-red ferruginous jasper are used by the natives as flints. Salt springs occur in the vicinity. The wells about Gram are both sweet and brackish within a short distance, and a fragment of rock-salt was found in the green earth of the mine. A little to the east of Kulkairi is a low plain nearly covered with a white travertine, partly compact, partly cellular, resembling that found in the bed of the Cauvery at Seringapatam. The corundum mines at Kulkairi are situated both near the summit and at the foot of the excavations of the rising ground there. There are a series of excavations varying from two to twelve feet in depth, sunk perpendicularly though similar strata to those just described. The corundum is thrown out, cleared, and separated by the miners into four classes, viz. the red, the white, the scraps of both, and the refuse. The three first form the article of commerce.

The corundum of Battagammana is frequently found in large six-sided prisms, is commonly of a brown colour, whence it is called by the natives Curundu galle, cinnamon stone; occasionally it is to be met with partially or entirely covered with a black crust, and is merely the stone with an unusual proportion of iron.

Corundum is found about eight miles S. from Sahapur, in the Singraula territory, about 120 miles from Mirzapore. It is found in masses as large as a man's head, on a ridge.

Common corundum occurs, like the sapphire and ruby, commonly in the secondary form of six-sided prisms, but usually much larger. It is sometimes nearly colourless, and rather translucent; it presents great variety, greyish, occasionally brown or red, rarely blue. It occurs also in acute and obtuse double six-sided pyramids.

Corundum pebbles are found in the gem-sand of Ava river.

Prismatic corundum, or chrysoberyl, is found among the Tora hills near Rajmahal, on the Bunas in irregular rolled pieces, small, and generally of a light green colour; these stones are considered by the natives as emeralds, and pass under the name of punna, but they are aware that they are softer than the real emerald.—*Dana, Engl. Cyc.; Edward Balfour, Report for* 1856 *on the Government Central Museum, Madras; M. E. Jur. Rep.; Dr. Mason; Captain Newbold; Irvine, Gen. Med. Top. of Ajmir; Jameson, Ed. Journ.* ii. 1820, p. 305.

CORUNGA MUNJI-MARAM. TAM. Rottlera tinctoria.

CORUTTI. TAM. Tricosanthes palmata.

CORVIDÆ, the crow family of birds, sub-fam. Corvinæ, crows, magpies, nutcrackers. Corvus culminatus, corone, corax, splendens, intermedius, Tibetanus, tenuirostris, and frugilegus, occur in India. The genus corvus has no representative in all South America, nor in New Zealand, nor in the numerous archipelagoes of the Pacific, and there is one species only in Australia. Corvus corax, the raven, takes the circuit of the northern regions; rare in N. Africa, Panjab, Kashmir, Afghanistan. The true raven is pre-eminently a bird of the coldest climates; though a few occur so far southward as in the Barbary States, in America so low as in the Carolinas, and in India proper within the Panjab only. The raven, remarks Sir John Ross, is one of the few birds that are capable of braving the severity of an arctic winter. In the fearful cold of a northern Siberian winter, Von Wrangell says, the raven still cleaves the icy air with slow and heavy wing, leaving behind him a long line of thin vapour, marking the track of his solitary flight. The Tibetan raven is considered as a peculiar species by Mr. Hodgson, an opinion to which the Prince of Canino seems to incline; it may be presumed to inhabit the lofty mountains of Bhutan to the north. The smaller crow of Southern Asia is the C. splendens; the common black crow of all India is C. culminatus. The true rook, C. frugilegus, is known to visit the Peshawur valley, Afghanistan, Kashmir (the rook of China and Japan being considered a distinct species, C. pastinator of Gould); and the jackdaw, C. monedula, accompanies it in those countries. C. advena is a rare black and white crow, occurs along with Cittura cyanotes, the forest kingfisher of Celebes. C. corone is the carrion crow of Europe, Afghanistan, Japan; C. cornix, hooded crow of Europe, Asia Minor, Afghanistan, Japan (*Temminck*), Barbary; C. monedula, the jackdaw of Europe, Siberia, Barbary, W. Asia, Peshawur valley, Kashmir. A nutcracker and a magpie occur in the Himalaya.

CORVINUS, a genus of fishes, several species of which, C. bola, C. chaptis, and C. coitor, furnish isinglass. C. bola, *M'Clell.*, Bolo chaptis, *Buch.*, furnished the isinglass which Mr. O'Riley sent to Calcutta from Amherst. It is closely allied to C. niger, but of monstrous dimensions compared with the European species. The jawbone of this fish is described as Boalee.—*Mason; M'Clelland.*

CORYATE, THOMAS, a native of Britain, a

most singular traveller. After publishing, in 1611, his most laughable travels, styled Coryate, His Crudities, prefaced by above forty copies of verses by the waggish wits of the time (amongst which is one in the ancient British language), he set out on his greater travels, and seems to have been buried at the port of Swally, near Surat, in December 1617.—*Pennant's Hindoostan*, i. p. 73.

CORYDALIS AMBIGUA. *Smith.*

Yen-hu-soh, . . CHIN. | Hiuen-hu-soh, . . CHIN.

A Chinese plant belonging to the sub-order Fumareæ, the fumitory tribe; its tubers are used medicinally in hæmaturia.—*Smith.*

CORYDALIS GOVANIANA. *Wall.* Bhootkes, HIND. Is common above 8000 feet of elevation in the Choor mountains, where it is regarded as a charm against evil spirits. The roots sent by Dr. Falconer were long, fibrous, tough, and exceedingly bitter, dark brown externally, yellow within.—*O'Shaughnessy.*

CORYDON SUMATRANUS, a singular and rare bird; it is crepuscular, very likely diurnal as well, and so stupid or tame as to allow itself to be pelted without moving.

CORYGAUM, a small village on the left bank of the Bhima river, half-way between Poona and Seroor on the Gor-naddi. It is memorable for the defence made on the 1st of January 1819, by a small body of Madras artillery and native infantry about 500 strong, against the entire army of Baji Rao, Peshwa. About 4000 Arabs continued the attack from daybreak till dark. Surgeon, afterwards Sir James Wylie, of the Madras Medical Department, greatly aided in their repulse. Captain Staunton of the Bombay army, with the 2d battalion of the 1st Bombay Native Infantry, mustering 600 bayonets, 26 of the Madras Artillery under Lieut. Chisholm, and 300 Auxiliary Horse under Lieut. Swanston, in all 926 strong, on New Year's eve were ordered to Poona to join Colonel Burr's brigade. On New Year's morning of 1818, as he approached Corygaum, he saw the army of the Peshwa, consisting of 20,000 horse and 8000 foot, covering the plain beyond. Both parties made a rush to seize the village, but entered it together at different ends. All day long the strife was kept up, fresh bodies of Arabs coming from the enemy to take the place of those who fell. Of the eight officers, Lieutenants T. Pattinson and Chisholm and Dr. Wingate were killed or mortally wounded. Captain Staunton and Dr. Wylie were amongst those who survived, but 175 had fallen. The E. I. Company voted Captain Staunton a purse of 500 guineas and a sword of honour, and afterwards erected a granite obelisk, 70 feet in height, with the names of all the brave men who fell, engraved on it in English, Persian, and Mahratta. Assistant-Surgeon Wylie was afterwards created a K.C.B.

CORYLUS AVELLANA, the European hazel, is abundant in the Himalaya. Fruits (nuts), called Bindik and Finduk in bazars, are grouped in clusters together, inodorous, taste sweet and agreeable, become rancid very quickly. By expression the kernel yields a very agreeable oil, nearly in the proportion of half its weight. The wood of the hazel was the material of the divining rods of the magicians and snake enchanters, who even in modern times have had their believers in Europe. The Japan hazel is C. heterophylla, *Fischer*; C. ferox, *Wall.*, is a plant of the Simla hills.—*O'Sh.*

CORYLUS COLURNA. *Linn.* Hazel.

This tree grows to a height of 40 feet at elevations of 5500 to 10,500 feet in the Panjab Himalaya. Wood elastic, light and compact, used for hoops and walking-sticks. The nuts edible.—*Drs. Cleghorn and J. L. Stewart.*

CORYNOCARPUS LÆVIGATA, a New Zealand tree with beautiful evergreen foliage; the pulpy portion of the fruit is eaten by the natives.

CORYPHA, a genus of palms of the order Cocoaceæ. Sec. D. Corypheæ, C. elata and C. taliera grow in Bengal; C. rotundifolia and C. utan, in the Moluccas; C. umbraculifera in Ceylon and the Moluccas, and C. gebanga in Java. It seems to be C. gebanga which Mr. Wallace (p. 158) describes as a great species in Lombok, called Gubbong, which grows there in great abundance. He says it has a lofty cylindrical stem, about a hundred feet high and two or three feet in diameter. C. taliera, the Tara of Bengal, and the Talipat of the Peninsula, is much employed for making leaf hats and leaf umbrellas; the leaves, when smoothed, are much used for writing on, and also for tying the rafters of houses, as they are strong and durable. C. umbraculifera, the codda-panna of Madras and the talipat of Ceylon, and very like the former, is common in Ceylon, and found also on the Malabar coast. The dried leaf is very strong and limber (Knox's Ceylon). The Burmese books are all made of the leaf of a species of Corypha. C. australis is the cabbage-palm of the northern part of Australia to Port Jackson. It rises erect to 70 or 100 feet, with a diameter of 1 foot.—*G. Bennett; Seeman; Royle, Fib. Pl.; Voigt; Wallace*, 158.

CORYPHA ELATA. *Roxb.*

Taliera elata, *Wall.* | Bujoor, Bujur, Batool, BENG.

This stately palm grows in Bengal, and, according to Mr. Mason, in the Tenasserim Provinces. It has a straight trunk, but often varying in thickness. A tree about thirty years old, when in flower, was seventy feet to the base of the inflorescence, another about sixty; circumference near the root, eight feet, and about the middle of the trees five and a half or six; their whole length strongly marked with rough, dark-coloured spiral ridges and furrows, which plainly point out the spiral arrangement of the leaves. The ligneous fibres, as in the order, are on the outside, forming a tube for the soft spongy substance within, of a dark chocolate colour, tough and hard, but by no means equal, in either quantity or quality, to the very serviceable wood of Borassus flabelliformis. This palm, in Bengal flowering in March and April,—the seeds require about twelve months to ripen,—is to be at once recognised by its black spirally-marked trunk. From the other species of Corypha it is abundantly distinct by its long obviously spirally placed ex auriculate petioles, and by the smaller dark-green flat lamina, with narrow linear-ensiform segments. The fruit is smaller.—*Voigt; Mason; Roxb.* ii. 176.

CORYPHA GEBANGA, *Blume*, is one of the most useful of all the palms of South-Eastern Asia. Its pith furnishes a sort of sago. In Java, thousands of boys and girls are employed in

fabricating its leaves into baskets and bags; thatch and broad-trimmed hats are made of them; fishing-nets and linen shirts are woven from its fibres, and ropes from its twisted leaf-stalks; the root is both emollient and slightly astringent; and Waitz says it is a valuable remedy for the periodical diarrhœa which in the East Indies attacks Europeans. It flowers in a huge terminal spike, on which are produced masses of a small round fruit, of a green colour, and about an inch in diameter. When these ripen and fall, the tree dies, and, after standing a year or two, it too dies. Flocks of green pigeons and troops of the Macacus cynomolgus monkeys resort to the trees when fruiting, the latter chattering and showering down the ripe fruit. Kurz joins C. elata to this.

CORYPHA TALIERA. *Roxb.* ii. 174.

Taliera Bengalensis, *Spreng.*

Tara, Taliera, Tariat, BENG.	Sri talam, . . . SANSK.
Taliera, ... HIND.	Talipat, ... SINGH.
Tali, ... MART.	Sri talam, . . . TEL.

An elegant, stately palm of Bengal, has a trunk, perfectly straight, about thirty feet high, and, as near as the eye can judge, equally thick throughout, of a dark brown colour, and somewhat rough with the marks left by the impression of the fallen leaves. It grows in Bengal, but it is scarce in the vicinity of Calcutta. It flowers at the beginning of the hot season, the seeds ripen nine or ten months afterwards. It is so closely allied to C. umbraculifera, as to be difficult to distinguish when out of flower. The leaves are much employed for making leaf hats and leaf umbrellas, and for tying the rafters of houses. They are in about 80 divisions, each 6 feet long by 4 inches broad, radiating from the point of a leaf-stalk from 5 to 10 feet long, and covered with strong spines at its edge. Roxburgh describes the spadix as decompound, issuing in the month of February from the apex of the tree and centre of the leaves, forming an immense diffuse ovate panicle of about 20 or more feet in height. The fruit is the size of a crab-apple, wrinkled, dark olive, or greenish-yellow. The leaves are used by the natives of India to write upon with steel styles; it is known as the book palm, and is not unfrequent in the neighbourhood of religious edifices in the Tenasserim Provinces.—*Roxb.* ii. 174; *Voigt; Eng. Cyc.; Mason.*

CORYPHA UMBRACULIFERA. *Linn.*

Tali, ... BENG.	Tala or Tala gass, SINGH.
Pæ, ... BURM.	Konda panna maram, TAM.
Fan palm, Talipat, ENG.	Sidalam, ... TEL.
Kodapana, . . MALEAL.	

The talipat palm of the Moluccas, Malay coast, Malabar, and Ceylon, is similar in appearance to, but its leaves are not so round as, those of C. taliera, the divisions in the centre being shorter than those at the sides. It has a stem 60 or 70 feet high, crowned with enormous fan-shaped leaves, forming a head 40 feet in diameter, each leaf with 40 or 50 pairs of segments. These fronds, when dried, are very strong, and are used for hats and umbrellas. The petiole is 7 feet long, and the blade 6 feet long and 13 feet broad. Fans of enormous size are manufactured from this plant in Ceylon. The bole is wholly pith, which furnishes a sort of flour, of which bread is made; the leaves make excellent thatch, and are also used for writing on, like those of the C. taliera. Griffith met with trees in flower at Mergui, which he thought belonged to this species; and Dr. Mason saw trees in Tavoy, which he regarded as probably talipat palms. The dark-coloured roundish seeds of these trees are used as beads by the Tader or Dasari religious mendicants. C. umbraculifera is found also on the Malabar coast. The dried leaf is very strong and limber, and, according to Knox, is 'most wonderfully made for men's convenience to carry along with them; for though this leaf be thus broad enough to cover fifteen or twenty men when it is open, yet it will fold close like a lady's fan, and then it is no bigger than a man's arm; it is wonderfully light.'—*Knox's Ceylon, in Royle's Fib. Pl.; Seeman; Eng. Cyc.; Mason; Roxb.; Voigt.* Kurz joins C. taliera to this.

CORYPHA UTAN. *Lam.*

Taliera sylvetris, *Bl.*	Lontarus sylvestris, *Ru.*

A palm of the Moluccas.—*Roxb.* ii. 178.

CORYPHÆNA, a genus of fishes belonging to the section Acanthopterygii, family Scombridæ, and fifth group Coryphænina. There are nine genera in the group; one of them, Coryphæna, has six species. C. hippuris, *Linn.*, is the dolphin or dorado, and is often confused with the delphinus or porpesso, from its bearing the same name. Its colours when swimming are very lively, and tail of a golden yellow. When dying it presents a greatly varied play of colours. It is good for eating.—*Bennett.*

CORYPHODON BLUMENBACHII, the rat snake of Ceylon, is almost domesticated in households.—*Tennent*, p. 42.

COS, a little Dorian island on the coast of Asia Minor, which fell under the power of Ptolemy. It was the first spot in Europe into which the manufacture of silk was introduced, which it probably gained when under the power of Persia before the overthrow of Darius. The luxury of the Egyptian ladies, who affected to be overheated by any clothing that could conceal their limbs, had long previously introduced a light thin dress; and for this, silk, when it could be obtained, was much valued; and Pamphila of Cos had the glory of having woven webs so transparent, that the Egyptian women were enabled to display their fair forms yet more openly by means of this clothing. Occasionally, also, they sent their treasures and their children there as to a place of safety from Alexandrian rebellion; and there the silk manufacture flourished in secret for two or three centuries. When it ceased is unknown, as it was part of the merchants' craft to endeavour to keep each branch of trade to themselves.—*Sharpe's Aristotle, Hist. An. V.* 19; *Hist. Egypt*, i. p. 263.

COSCINIUM FENESTRATUM. *Coleb.*

Menispermum fenestratum, *Gærtn.*

Turmeric tree, . . ENG.	Huldi-ka-jhar, . DUKH.
Mara munjil, . . TAM.	Mani-pasupu, . . TEL.

A creeping plant of Ceylon and S. India.

COSI, a river of the Himalaya, is formed from seven alpine feeders, the Sapt Cosi of the Nepalese, which unite within the Himalaya mountains. Bengal has a river of the same name, with the town of Midnapur on its bank.

COSMAS, called from his maritime experiences Indicopleustes, was apparently an Alexandrian Greek, who wrote between 530 and 550. He was the first Greek or Roman writer who speaks of China in a matter-of-fact manner, by a name which no one has ever disputed to mean China.

He was a monk when he composed the work

which has come down to us, but in his earlier days he had been a merchant, and in that capacity had sailed on the Red Sea and the Indian Ocean, visiting the coasts of Ethiopia, and apparently also the Persian Gulf, and the western coasts of India, as well as Ceylon. His book was written at Alexandria (A.D. 535), and is termed Topographia Christiana (Universal Christian Topography), the great object of it being to show that the tabernacle in the wilderness is a pattern or model of the universe. Sir J. E. Tennant (Ceylon, i. p. 542) says that Cosmas got his accounts of Ceylon from Sopatrus, whom he met at Adule; and Lassen ascribes all Cosmas says of India to the same authority (ii. 773). But they have not given the ground of these opinions. One anecdote is ascribed to Sopatrus, no more. He gives a clear account of the commerce between India and Egypt in his day. He says that the produce of Kalliana was brass, sesamine logs, and cotton stuffs; of Sindus, castorin and spikenard; of Male (Malabar), pepper; and that from Tzinitza (China) and other countries beyond Sielediba or Taprobane, came silk, aloe-wood, cloves, nutmegs, and sandal-wood. Writing of the island of Taprobane in Further India, Cosmas says where the Indian Sea is, there is a church of Christians, with clergy and a congregation of believers, though I know not if there be any Christians further on in that direction. And such also is the case in the land called Male, where the pepper grows. And in the place called Kalliana there is a bishop appointed from Persia, as well as in the island which they call the Isle of Dioscoris, in the same Indian Sea. The inhabitants of that island speak Greek, having been originally settled there by the Ptolemies, who ruled after Alexander of Macedon. This Male is evidently Malabar, probably the Kalliena of the Periplus, which Lassen identifies with the still existing Kalyani on the mainland near Bombay. Father Paolino, indeed, will have it to be a place still called Kalyanapuri on the banks of a river two miles north of Mangalore, but unreasonably.—*Via Galle, Indie Orientale*, p. 100, *in Yule, Cathay*, i. p. 171.

COSMETIC BARK. The fragrant bark of Murraya paniculata, a tree indigenous in Burma above Rangoon, is more used for a cosmetic than sandal-wood. It is a very ornamental fragrant flowering shrub of the citron tribe.

Cosmetic Powders, Dusting-powders.

Puh-fen, Shwui-fen, CHIN.	Fu-yung-fen, . . CHIN.
P'ing-shie-kung-fen, „	

In China, the shells of several molluscs are washed, scraped, calcined, and levigated, and scented with musk or other ingredients. The addition of Borneo camphor makes these powders exquisitely cooling to the skin, especially if troubled with prickly heat. Water is used with the Shwui-fen, in laying it on the face. An inferior cosmetic wood of Burma, is the tubercle of some plant. The Burmese appear from their name to regard them as produced by a species of erythrina, for they call them erythrina thorns; but Mr. Mason suspected that it is Toddalia aculeata and T. floribunda. The cosmetic wood of Mergui from one of the Xanthoxylaceæ? is fragrant. It is sold in the bazar.—*Mason; Smith.* See Abir.

COSS, the itinerary measure of India, of which the precise value has been much disputed, chiefly on account of the difficulties which attend the determination of the exact length of the guz or yard. The Ayin-i-Akbari lays down distinctly that the coss consists of 100 cords (tunab), each cord of 50 guz; also of 400 poles (bans), each of 12½ guz; either of which will give to the coss the length of 5000 guz. The distances in English yards between the old minars or coss pillars may be considered to afford the correctest means we have of ascertaining the true standard, viz.:—

	By Road.	Direct.
Octagonal minar to Nurelah in Dehli, .	4513	4489
Minar between Nurelah and Shapurgurhi,	4554	4401
Minar opposite Alipur, ...	4532	4379
Minar opposite Siruspur, . . .	4579	4573
Ruins of Minar opposite to Shalimar, .	4610	4591

Length of the coss, 2 miles 4 furlongs 158 yards. It is important to observe that the length of the Ilahee guz, deduced from the measurements, is 32·818 inches, showing how very nearly correct is the length of 33 inches assumed by the British Government. The Chinese lih is the distance which can be attained by a man's voice exerted in a plain surface; and the same may be remarked of the oriental meel, as well as the European mile and league. The two former evidently derive their names from the Roman milliare, and the difference of their value in different places proves that the mere name was borrowed, without any reference to its etymological signification. Coss is an Indian word; the equivalent word in Persian is Kuroh, the same as the Sanskrit Korosa, of which four go to the yojan. Malcolm says the coss is in general estimated at forty-two to the degree; but its length differs in almost every province of India. It may be computed as never under a mile and a half, and never (except in that introduced by the mandate of the late Tipu Sultan in Mysore) more than two miles. In Gujerat they estimate the coss by the lowing of kine (gao), which in a still day may be heard at the distance of a mile and a quarter. Thus twelve coss is baragao.—*Elliot, Supp.; Malcolm's Central India*, i. p. 20. See Ilahee Guz.

COSSACK, an irregular soldiery whom the Russian Government recruited from the country at the foot of the Caucasus, known as Little Kabarda and Great Kabarda, bordering on the Malka and Kouma rivers. Cossack (Kazak) is also a term by which the Mahrattas described their own mode of warfare. In their language, the word Cossakee, borrowed, like many of their terms, from the Moghuls, means predatory.—*Malcolm's Central India*, i. p. 69. See Kabarda.

COSSÆA or Cissia is the name by which the Greeks knew the tract east of the Tigris. It was also called Elam or Elymais. It is now called Khuzistan. Cossæa is supposed to be derived from Koh-siah, or Black Mountain. The people spread their conquest over Susiana and the districts eastward. See Luristan.

COSSEIR or Kosseir, a town and harbour on the western side of the Red Sea. It was occupied by the French in their expedition to Egypt, and then by the British. Kosseir harbour is open to the east, but on the north reefs advance into the sea; on the south is a chain of mountains of some elevation. The bottom is rocky.

COSSID, PERS.; properly Kassid. A mounted messenger.

COSSYA HILLS, or Khassya Hills, estimated area 7290 sq. miles, 80 miles in length from N. to S., and 40 in breadth, extend from lat. 24° 35'

to 26° 7′, and from long. 91° 35′ to 92° 4′. About 16 miles on the Sylhet side, and about the same on that of Assam, consists of lowland interspersed with small hills. In the interior, about 50 miles in extent, is an undulating hilly table-land, from 1500 to 2500 feet high. The localities admitting of cultivation are the plateaux of the Cossya and Jaintia hills, the lower ranges on the Assam border, and the slopes towards the Sylhet plains. The area of the three plateaux is about 3500 square miles, and their heights vary from 3000 to 6000 feet above sea-level. The soil is a ferruginous red clay, with a subsoil of shingle, little qualified for profitable cultivation. In the hollows, however, a fine black mould is found, extending often over many acres. The population of the Jaintia hills is about 40,000 souls, and of the Cossya hills about 82,400. The Cossya states are twenty-five in number, of which five, Cherrapunji, Khyrim, Nusting, Sungree, and Nuspoong, are commonly called the Semi-independent States. The chiefs exercise civil and criminal jurisdiction over their own people in all matters pertaining exclusively to them. The minor states, known as the Dependent States, are twenty in number, the chief of which is Nungklow.

Moleem was conquered in 1829, and the raja of Khyrim ceded to the British the territory to the S.E. of the Oomean or Booga Pane river. In 1861 the raja was deposed, and Malay Singh, a new chief, installed. Agreements have been entered into with Mowyang in 1829, Dowarrah Notoormen in 1837, Soopar Punji in 1829, and in 1860 with Bhawal.—*Aitcheson's Treaties, etc.* See *Cairns*, p. 543.

COSTUS.

Kust; Koshta, AR., BENG.	Koot, ... KASHM.
Putchuk, ... HIND.	Koosht-i-Sherin, . PERS.

A fragrant substance, highly prized by the ancients. It was supposed by Dr. Falconer to be the produce of a genus of the Compositæ or thistle tribe, to which he gave the name of Aucklandia. He found it growing in great abundance all round the elevated summits of Kashmir. He considered it could be produced to an unlimited extent, of the best quality, in the Himalayas, at elevations of from 7500 to 9000 feet above the sea. The roots are dug up in September and October, when the plant begins to be torpid; they are chopped up into pieces from two to six inches long, and are exported without further preparation,—the quantity annually collected amounting to about two million pounds. The cost of its collection and transport to Kashmir is about 2s. 4d. the cwt. From Bombay it is shipped for the Red Sea, the Persian Gulf, and China; a portion of it is taken to Calcutta, and bought up there with avidity under the name of putchuk. The value at Jugadree on the Jumna is about 16s. 9d. or 23s. 4d. per cwt. The exports from Calcutta were:—

1841–42,	12,847 cwt.	1848–49,	2110¾ cwt. worth
1847–48,	2,050¼ ,,		about £1500 annually.

In the Chinese ports it fetches nearly double that price per cwt. The Chinese burn the roots as an incense in the temples, and regard it as aphrodisiac. The import into Canton in 1848 was 414 pikuls, and in 1859 was 854 pikuls, and valued at 5150 dollars. In Kashmir it is chiefly used for the protection of bales of shawls from insects.—*Royle*, p. 360; *O'Shaughnessy*, p. 652; *Simmonds.*

This and C. rotundifolia, *Wall.*, have the same vernacular names. The two species are most common from 4000 to 10,500 feet in the Panjab Himalaya. Their wood, though small, is tough and strong, and is much used for axe handles and walking-sticks, and it is said for jampan poles. In Kashmir the twigs are extensively employed for basket-making, and are frequently mixed with Parrotia (*q.v.*) for the twig bridges. — *J. L. Stewart, M.D.*

COTTA KALANG. TAM. Aponogeton monostachyon, *Thunb.* Grows in the beds of tanks. Root eaten in Kaffraria as a great delicacy; it is relished by the natives of India.—*Ainslie*, p. 248.

COTTAMALLI. TAM., TEL. Coriandrum sativum; coriander seed.

COTTON. Sir Dodmore Cotton in 1627 was sent as Ambassador from the king of England to Shah Abbas of Persia.

COTTON, GENERAL SIR WILLOUGHBY, K.C.B. and G.C.B., born 1783, died in London on May 1848, only son of Admiral Cotton, cousin of Lord Combermere. In his 16th year he entered the 3d Guards as ensign. He commanded a division of Sir Archibald Campbell's army in the Burmese war. He commanded the 1st division of the Bengal army in the Afghan war in 1838–39, under General Sir Henry Fane, and afterwards under General Sir John Keane. He was present at the storming and capture of Ghazni on the 23d of July 1839, at which he commanded the reserve which entered the city after the storming party had established themselves inside. He received the Order of the Bath of all the grades, being nominated a Grand Cross of that order in 1840. He was made a Knight Commander of the Royal Hanoverian Guelphic Order in 1830, and had conferred upon him the Order of the Dooranee

Empire of the 1st class at Kābul, in September 1839.—*Men of the Time.*

Gossypium, . . . LAT.	

Cotton consists of the delicate, tubular, hair-like cells which clothe the seeds of species of gossypium. Its commercial value depends on the length and tenacity of these tubular hairs, which, in drying, become flattened, and are transparent, without joints, and twisted like a corkscrew. Under water, they appear like distinct, flat, narrow ribbons, with occasionally a transverse line, which indicates the end of cells.

In America, two distinct varieties are indigenous,—G. Barbadense, yielding the cotton from the United States, and G. Peruvianum or acuminatum, that which is produced in South America. India also has two distinct species,—G. herbaceum, or the common cotton of India, which has spread to the south of Europe, and G. arboreum, or tree cotton, which yields none of the cotton of commerce.

Cotton plants have been characteristic of India from the earliest times; and at the present day the majority of its people are clothed with fabrics made from cotton, which is woven to a large extent in India, but more largely in Europe and America. Indigenous varieties in the tropical regions of Asia, Africa, and America, and in the southern provinces of the United States, have been cultivated with such success, that its produce is an important article of commerce.

Dr. Cleghorn compared all the species of gossypium in the herbarium of the Botanical Society (comprising the collections of Buchanan Hamilton and Lady Dalhousie, with contributions from Drs. Wight, Campbell, etc.), and also those in the herbarium of Professor Balfour, with a view to expiscate the specific characters by which to discriminate them from one another. The series showed the striking difference which soil, climate, and culture produce in species, and which may appear in nature, giving rise to a multiplication of species. But the whole group of so-called species seemed to him referable to G. herbaceum, *Linn.*, G. arboreum, *Linn.*, G. Barbadense, *Linn.*, and G. acuminatum, *Roxb.*

Since 1790, efforts to improve the Indian cotton crops have been almost continuous. Experienced planters from America were employed, and Drs. Wight and Watson were long engaged in experiments in Coimbatore, Gujerat, and Dharwar. The plant has always been grown in almost every district of India, for local use or export, in soils suitable and unsuitable to its growth; and at the London Exhibition of 1862, the values of 138 samples exhibited ranged from sixpence to three shillings the pound.

Mr. Shaw says (p. 186, Cotton Report) cotton cultivation in India would not be a profitable speculation for Europeans; the natives can grow it much cheaper. Our function is simply that of buyer. We have no local market for the American cotton. It does not answer for native spinning so well as their own.

The use of cotton dates from a very early period. Sanskrit records carry it back at least 2600 years, while in Peruvian sepulchres cotton cloth and seeds have been found. It is noticed in the book of Esther, i. 6, where its Sanskrit name Karpas is translated 'greens' in the English Bible. Herodotus and Ctesias notice it; but it was not till the invasion of India by Alexander that the Greeks were acquainted with the plant, as may be seen in Theophrastus, and also in Pliny.

Pliny, writing about 500 years subsequent to the time of Herodotus, mentions (lib. 19, c. 1) that the upper part of Egypt, verging towards Arabia, produces a small shrub which some call gossypion, others xylon, and from the latter the cloth made from it, xylina, bearing a fruit like a nut, from the interior of which a kind of wool is produced, from which cloths are manufactured inferior to none for whiteness and softness, and therefore much prized by the Egyptian priesthood.

The varieties of cotton known in the commercial world may be referred to three distinct species, each having several sub-varieties. The Gossypium Barbadense is the species cultivated in the West Indies, North America, and in one or two parts of the Peninsula of India. Gossypium Peruvianum yields the cotton of Brazil, Pernambuco, Peru, etc. Gossypium Indicum is the species which, in a number of varieties, produces the great bulk of the cotton of India and China. The Gossypium arboreum, or tree-cotton of India, and peculiar to India alone, is unfitted for manufacturing purposes, and is unknown to commerce, though yielding a beautifully soft and silky fibre, admirably adapted for padding cushions, pillows, etc. In commerce, Indian cotton has usually been known under the names of the locality of its growth or place of shipment. The staple of these sorts appears to range from 0·85 to 1·1 of an inch in length; the staple of the celebrated Sea Island cotton being usually 1·5 in length.

The *three qualities* by which the value of cottons are determined are, length of staple, strength of fibre, and cleanness of sample. Colour, which at one time was thought much of, is no longer looked upon as a matter of moment. The respective lengths of the different kinds of cottons are given by Mr. Clements Markham as under:—

	Minimum.	Max.	Mean.
Sea Island, ...	1·41 in.	1·80 in.	1·61 in.
Egyptian, ...	1·30	1·52	1·41
Peruvian, ...	1·10	1·50	1·30
Brazilian, ...	1·03	1·31	1·17
New Orleans or Uplands, .	0·88	1·16	1·02
Uplands grown in India, .	0·95	1·21	1·08
Indigenous Indian cotton, .	0·77	1·02	0·89

The cotton of India is allowed to be inferior as regards its staple and purity, but in durability it at least equals the produce of any part of America, and of this fact the Hindus are themselves perfectly aware. Dr. Royle gives 3 distinct *varieties* of cotton, all indigenous to Hindustan. The *common description* is found scattered more or less throughout India, reared as a triennial or annual. It reaches the height of 5 or 6 feet in warm, moist climates. The seeds are five in number, clothed with a short greyish down. In the Peninsula there are two distinct varieties of this sort, known amongst

the natives as Oopum and Nadum. The first thrives only on the richest black soil, and is an annual, producing a fine staple; the latter is a triennial plant, and grows on the poorer red soil, yielding small crops of inferior quality.

Second.—Dacca cotton is a distinct variety of the Gossypium Indicum. It differs from the previous variety in the plant being more erect, with fewer branches, and tinged with a reddish hue, whilst the cotton is finer, softer, and longer. This variety is reared more or less extensively throughout Bengal, especially in the Dacca district, where it is employed in the manufacture of the exquisitely fine muslin cloths known over a great part of the world as Dacca muslins, and whose delicacy of texture so long defied the imitation of the art-manufacturers of the West.

A *third variety* is the cotton grown in Berar, in the northern provinces of the Madras Presidency, and in Surat and Broach. This plant attains a greater size than the preceding, bears for a longer period, and produces a fibre of a finer quality than the former. It appears to thrive best on a light black soil.

Soil.—The soil in which all these Indian varieties thrive may be classed under two distinct heads, the *black cotton soil* and the *red soil*. The former of these, as its name indicates, is of a black or deep brown colour, absorbs and retains much rain, forming in the rains a heavy tenacious mass, and drying into solid lumps in the hot months. An analysis of this gives 74 per cent. of silex, 12 of carbonate of lime, $7\frac{1}{4}$ protoxide of iron, 3 of alumina, 2 of vegetable matter, and $\frac{1}{3}$ salts, with a trace of magnesia. The *red soil* of India has been found in some localities better suited to the growth of cotton than the black earth. It is a rather coarse yellowish red soil, commingled with particles of the granitic rocks,—silex, felspar, and aluminous earth. It mainly differs in composition from the preceding in the iron existing in the state of peroxide or red oxide, whilst the carbonate of lime is found present in greater abundance. Analyses of the best cotton soils of America prove that they differ from those of India chiefly in the large proportion of peaty matter which they contain.

Cotton-wool bears value according to its colour, length, strength, and fineness of fibre. Pure whiteness is generally held to denote a secondary quality; whilst a yellowish tinge, provided it be not the result of casual exposure to damp, or the natural effect of an unfavourable season, is indicative of superior fineness. Many varieties of raw cotton are seen in commerce, each sort being distinguished by the name of the locality where it is produced. American, Bourbon, Egyptian, Amraoti, Dacca, Oopum, Nadum, Orleans, Sea Island, etc. etc.; but the main distinction recognised is that between the long and short stapled qualities; though of these, again, there are different degrees of excellence. The 'Sea Island' cotton of Georgia (so named from being raised on certain narrow sandy islets lying along the coast of that province) is esteemed the best of the long-stapled kind; and the upland produce of the same state excels amongst the short-stapled classes. The indigenous Asiatic cotton is exclusively of the latter class.

The indigenous plant of India is an annual, and succeeds best in the rich black soil that characterizes various districts. The American plant, though in reality perennial, is practically an annual in India; for in India neither native nor foreign cotton is cultivated on the same ground more than one year in three, its properties being found to exhaust the productive powers of the soil. American cotton grows well on the black soil of India, but thrives still better on the light red lands. Each of these species possesses advantages peculiar to itself. The Indian variety is capable of being manufactured into fabrics of extraordinary durability and wonderful fineness; its colour, too, is superior, but the staple short. The American species, on the other hand, excels in length of staple. The plant yields more flowers, and each flower a larger pod, whilst the quantity of seed contained in the pod is smaller, and more readily separated from the fibre.

Mr. Laing, in a letter to *The Times* as to the future supply of Indian cotton, showed that Sir C. Wood makes it entirely a question of price, citing the authority of Lord Hardinge. Mr. Laing thinks that both climate and soil are so much against India, that its average produce per acre will never approach that of America. But Mr. A. N. Shaw, collector of Dharwar, has expressed an opinion that while Mr. Laing's facts may hold good of indigenous cotton, there are few parts of India where American cotton will not grow as luxuriantly as in Alabama, the best cotton-field in America.

Mr. Talboys Wheeler, who wrote the Cotton Handbook for the Madras Presidency, drew the following four general conclusions, viz.:—

1st. American cotton can be grown, but the profit is questionable.

2d. Indian cotton may be improved, but only to a degree.

3d. American cotton must always command a higher price than Indian.

4th. The demand for Indian cotton must always depend on the supply of American.

But a superior cotton can undoubtedly be raised in the Karnatic at a cost not exceeding the production of the common native fibre. The tenure of land in the Madras Presidency leaves the ryot free to grow what crop he pleases; there is no export duty or special tax on cotton, and the assessment is nowhere heavy. The exports of cotton from the Madras Presidency have increased of late years; and if cotton be still not grown in the quantity or of the quality desired, the cause must be that some other crop is more remunerative to the ryot. A steady market at a remunerative price is the great want, and this the mercantile community alone can supply. There is grown in India a vast supply of cotton, and it is capable of increase by extended cultivation consequent on increased demand. A large portion of the existing supply is absorbed by the local manufacturers, but is capable of diversion if increased prices are offered by exporters. The diversion to other markets may be immediate; but an increase requires the lapse of at least one season after the demand arises, and some prospect of a continuance of that demand. Every rise in price of Indian cotton in England, however small, if likely to be permanent, exercises an immediate effect on the export of cotton from India to England. The quality is capable of great improvement, but by a more tedious process. The American cotton plant

cannot withstand so much drought as the Indian. The ordinary native cotton-cleaning machine, for freeing the cotton fibre from the seeds, has not yet been equalled by all the mechanical skill of Europe.

Native Indian cotton is a small-podded, small-seeded, short-stapled variety; but in picking the seed, in carefully gathering and ginning, it may be much improved.

Indian cotton is somewhat difficult to spin, from its often breaking, and requiring more turns of the spindle, and from its shortness of fibre, than that of America. But the yarn made from a pound of East Indian cotton, which costs 3½d. sterling, will sell for 7d., while from the American, which costs 4½d. the pound, the yarn sells for 7¾d.

Imports into Great Britain.

1877,	12,112,819 cwt.	value	£35,489,197
1878,	11,978,288 ,,	,,	33,524,362

The value of the raw cotton exported from India has been—

1877-78, .	Rs. 9,38,35,340	1880-81, .	Rs. 13,24,17,341
1878-79, . .	7,91,30,458	1881-82, . .	14,93,59,595
1879-80, . .	11,14,54,528		

The largest consumption of cotton-wool is in the tropical countries. Americans consume 11½ pounds per head; and it has been calculated that the British Indian people consume 10 pounds per head, but Great Britain only 4½ pounds per head.

In *America*, for the cultivation of cotton, the ground is well ploughed, and cast into ridges about 10 inches in height, and from 5 to 6 or 7 feet apart, according to the richness of the soil or the kind of cotton to be cultivated. In poorer soils the ridges are narrower, so that the plants, which do not grow so large, may yet be able to cover the ground. The ridges allow superfluous moisture to be carried off by the water furrow, which in low situations is made into a trench. The soil is allowed to settle for a few days before sowing, as the young plants take root more vigorously than when they spring up in freshly ploughed and loose earth. Sometimes the ground is manured by running a deep furrow early in the spring between the old rows of cotton stalks, which are beaten down into it by women and children, who follow the ploughman; or well-rotted cotton seed is added as manure, and well covered up by forming a slight ridge over it. When the ground is quite prepared, a one-hole drill makes a slight furrow, from 1½ to 2 inches deep, along the centre of the ridge. The sower follows, and drops in the seeds pretty thickly. These are immediately covered by a light harrow, which also smooths the ridge. Sometimes five or six seeds are dropped into holes, which are made at intervals of about 15 inches on the top of the ridge. In favourable weather the plants make their appearance in five or six days, and are thinned out as soon as they put forth the third or fourth leaf. This operation is performed by scraping out with the hoe all the superfluous plants and weeds, leaving three or four together, with spaces of 12 or 14 inches between them. When the plants are sufficiently established, they are reduced to a single one, and care is taken to remove every particle of grass or weed. A light furrow is then run with a one-horse plough within 5 or 6 inches of the plants, turning the earth inwards towards the roots, and even drawing it around them with the hoe, in order to supply the place of that previously removed by scraping. Hoeing and ploughing are frequently repeated, so as to keep the ground free from weeds; and this is considered essential towards obtaining a good crop. The above processes, besides loosening the soil and keeping it clean, must assist in drying it, at the same time that they prevent much lateral extension of the roots. Lopping or pinching off an inch or two of the top of the plant is not always necessary, but is useful when there is a tendency to the production of wood and leaves, to the detriment of flowers and buds.

In *S. India* the land should be well ploughed two or three times, and the deeper the better. All the weeds should be collected into heaps on the ploughed land and burnt, as the ashes make the best manure for cotton, and burning the soil improves its quality. Salt and lime are also good additions to a soil, as cotton requires chiefly alkalies and silicates for its nourishment. Animal

and vegetable manures are injurious, as they breed insects, which destroy the roots, leaves, and young pods of the cotton. After the land has been well and deeply ploughed, it should be left for three or four days to get well aired; it may again be ploughed into long ridges four to five feet apart. The seed is to be planted on the tops of these ridges carefully, at the depth of an inch or two, and at the distance of five feet between each seed, for Oopum, Nadum, or religious cotton; six to seven feet apart for Bourbon, New Orleans, or Havanna; ten feet apart for Sea Island, Peruvian, Egyptian, or Queensland; and fifteen feet apart for Brazil or Pernambuco cotton. Cotton seed may be sown in any month of the year, but if there is no rain, it requires to be watered about three times; it germinates about the fifth day. If sown during the monsoon, the ridges must be eight inches high, and the water must be led away from the young plants, or they rot; the seed must be sown on the top of the ridges. If the leaves begin to get pale or to shrivel up, the remedy is to dig trenches between the plants so as to let air in about the roots, but must not injure them. The uncultivated cotton plant lives for three or four years; but it becomes dwarfed, and produces smaller leaves and smaller pods each year till it dies. In clay or cotton soils the plants do not attain nearly the size, nor do they produce such fine leaves or pods, as on sandy or loose soils. The cotton plants require sun, air, and moisture, but not so much of the last as of sun, light, and air at the roots; the lighter and looser the soil, the more healthy is the plant. The best soil for cotton is a sandy soil with iron and salt; or, if far from the sea, ashes of plants or of firewood may be used as a substitute for salt. When the cotton plants have attained the height of a foot, they do not require to be much watered; once in ten days will be sufficient. Oopum or common country cotton varies from one to six feet in height, and covers from two to five feet of ground; on cotton soils it seldom grows to more than two feet in height. The Pernambuco and Brazil cottons attain a height of thirty feet on favourable loose soils, and the stem grows to ten inches in diameter. They yield crops for twelve or fourteen years, but hardly any produce the first year. They bend over in the second year, and do not afterwards stand higher than eight or nine feet.

Irrigation, in Assam, is generally unnecessary, though it may be found partially beneficial in dry and sandy soils, if judiciously applied. Irrigation is not resorted to in the Benares, Allahabad, and Jubbulpur divisions, and the feeling is against its employment. In the N.W. Provinces the cotton crop is invariably irrigated, where a want of rain is likely to prove detrimental to the plant, and the process is not supposed to be in any way injurious to the fibre.

In most parts of the Madras Presidency artificial irrigation is not carried on; this remark applies more particularly to Coimbatore, Madura, South Arcot, Bellary, Western Mysore, and Nellore. In Vizagapatam, on the other hand, the opinion is that irrigation would prove beneficial rather than injurious in seasons when rains fail or vary in their supply.

Artificial irrigation is almost unknown in the Bombay Presidency, Berar, and British Burma.

In some parts of the Panjab, cotton is irrigated from wells, and well water is considered better for the purpose than river or canal water. In other parts, more especially in the Jullundhur Doab, the best cotton is produced upon unirrigated lands, irrigation being very sparingly resorted to in tracts where water is abundant.

Artificial irrigation to cotton is rather the exception than the rule in most parts of India; it proves more serviceable to exotic than to indigenous kinds; and in heavy black soil cotton will seldom flourish under irrigation, even of the most careful kind, while in sandy and light red sorts it might be much benefited.

Manure.—Salt marsh mud is used for manure in various parts of the cotton-growing districts of the United States, more especially in Eddesto island, one of the largest of the South Carolina group, about 30 miles S.W. of Charleston, which yields the finest cotton in the world. As much as 40 cartloads of this mud is used to the acre. Some compost it, others put it in the cattle pens. Some dry it before hauling, and then spread upon the land; while others prefer to use it as soon as dug, spread upon the land wet, and ploughed in. It is supposed that the Sea Island qualities owe their superiority to the use of marsh mud, which is rich in alkalies and alkaline earths.

In the Panjab, the localities best suited for the growth of cotton are the submontane districts of Ambala, Hoshiarpur, Gujerat, and Peshawur. The time of sowing varies from February in the south, to the middle of June in some of the northern districts. The flowering commences according to locality, between August and December; the picking following about a month after the flowering, and continues at intervals for two months.

There the average produce per acre, after the cotton is cleaned from its seed, is a little over one maund (or 80 lbs.), the rate varying from three maunds (240 lbs.) of raw cotton in the Hoshiarpur, to 16 seers (32 lbs.) of cleaned cotton in the Kangra district.

The *Nurma-bun* cotton is cultivated in small quantities all over Hindustan, and its produce is in great request for the manufacture of the best kind of Brahmanical thread. It is a bushy plant, grows to the height of about seven feet, and lasts about six years. It is cultivated all over Oudh, usually as a mixed crop, in light soils, with arhar (Cajanus Indica), or with kodo (Paspalum scrobiculatum), and often with maize. It is sown in the month of June. It is sown broadcast with the above, and nothing is done to it till it begins to ripen the pods. The cotton is picked out of the shell, which is left on the tree. The proportion of staple produced is very small. It is generally on high lands, on which the rain water does not lie.

Agra, Rohilkhand, Meerut, and Allahabad are the great cotton-producing districts of the N.W. Provinces, and their average yield per acre is moderate. In Aligurh the sowing is in June and July, and gathering from October to end of December.

In Gorakhpur and the neighbouring districts, the indigenous sorts are called Kukti, Murwa, and Desi. The *Kukti* kind is sown in February, in calcareous soils, when the ground has been but slightly prepared; it is picked in September and October. It is an annual, and the same ground is never used in two consecutive seasons.

Murwa cotton, if carefully tended, is triennial,

or even quinquennial; it is generally grown both in silicious (bangar) or calcareous (bhat) soils, as a border round sugar-cane or vegetable plots.

The *Desi* or indigenous variety is common to all Gorakhpur and its neighbouring districts. It is sown in June, in ground but little prepared for its reception, and does not yield till the following April. It is an annual; bears pods for six weeks only, and is then cut down.

In *Bundelkhand* cotton grows to great perfection, and its produce is of a softer texture and of a whiter colour than that of the Doab.

The *mar* or *maura* black soil of the first quality is the most productive, yielding on the average 286 lbs. per acre.

The *purwa* soil of Bundelkhand is reddish, a mixture of sand and clay, and yields 191 lbs. per acre, 2-7ths being the proportion of cleaned cotton.

Bankar is a light-coloured, sandy, gravelly soil, which yields 143 lbs. per acre, 1-5th of the produce being cleaned cotton.

In Bundelkhand cotton is sown as a mixed crop in the beginning of the rains, and if the season is favourable, picking begins in the middle of September in the poorer soils, but not till the middle or end of October in the rich ones. Two ploughings and three weedings are necessary. The seed is rubbed in moist cow-dung, to serve as manure, and is sown broadcast. The cost of cultivation per acre is Rs. 9. After the removal of the fibre, the seed (binoula) finds a ready sale in E. Oudh at 50 or 60 seers the rupee.

Jaloun, Jhansi, and Bundelkhand lie to the westward of the Jumna, and have always been famed among the natives for their cotton.

Central India cotton has always been esteemed. The soil in many places is the black cotton soil. In some parts of Nagpur the field is tilled and manured with ashes and cow-dung before sowing. In pargana Boondoo, besides the common Kapas, there are two other sorts of cotton, called Tureea and Guteh. The former is sown in October, and picked in April and May, the field being tilled ten or twelve times before sowing. The latter is sown in July; cotton is picked two or three times in April; the trees last from three to four years, producing cotton every year, and they are 2½ yards high. This is grown by the poorest class in their own premises. The time of picking, speaking generally, is the whole of November and December, excepting in pargana Boondoo, where, as already stated above, the Tureea and Guteh or Gujar are picked in the months of April and May.

In *Berar*, the Chundelee, a very fine cotton fabric of India, so costly as to be used only in native courts, was made from Amraoti cotton. The chief care bestowed was on the preparation of the thread, which, when of very fine quality, sold for its weight in silver. The weavers work in a dark under-ground room, the walls of which are kept purposely damp, to prevent dust from flying about.

Mr. Terry has stated that the Amraoti cotton, if well prepared, is equal to any American cotton for the great bulk of the manufactures of England.

Hinginghat cotton is admittedly one of the best staples indigenous to India. It is, properly speaking, the produce of the rich Wardha valley, brought for sale to the Hinginghat market; but a good deal of the cotton known in Bombay as Hinginghat is not really produced in the neighbourhood of the town, but is grown elsewhere, attracted to Hinginghat by the ready market there found; thus some of inferior quality goes into the market at Hinginghat. The best foreign cotton is that brought from Edalabad in the Hyderabad territory, where the growth of the Pain Ganga valley is collected. This cotton is reckoned quite as good as the Hinginghat staple, and is eagerly sought after.

The *Bombay Presidency's* best cotton districts are the Southern Mahratta country, about 16° N. lat., where experimental farms were established. In Gujerat and Kattyawar districts, superior cottons have long been grown by the natives; in consequence of which, these were selected as the sites of the northern experimental farms, much favourable land for the purpose being found between the latitudes of 21° and 24° N. The causes which favour the growth of cotton, esteemed both in India and England, in the tract of country extending from Surat and Ahmadabad, or from about lat. 21° and 23°, in a broad band across Malwa to Banda and Rajakhaira, in about 25° and 27°, near the banks of the Jumna, are no doubt physical. The black cotton soil which is spread over a great portion of this tract, has undoubtedly a considerable share in producing the result; but good crops of cotton are produced in some parts where there is no black soil, as immediately on the banks of the Jumna and in the Doab.

In the *Kandesh* model farm in 1875-76, the average yield was 50 lbs. of clean cotton per acre of the Hinginghat variety, the maximum being 130 lbs. per acre. The average in the Nagpur model farm was 50·6 lbs. per acre. On unmanured land only 28 lbs. per acre. On Syedapet farm, the western variety yielded 353 lbs. per acre, and in the Sind Hyderabad collectorate the yield was 346·94 lbs. per acre of uncleaned cotton.

Cotton, wheat, and bajra (Penicillaria spicata) all ripen in Gujerat at the same period of the year, about the end of February, and the cotton-picking continues to the middle of April. The first picking of cotton affords the best kind, the second is the most abundant, and the third is greatly inferior to the other two, both in quantity and in quality.

In *Cuttack* and *Orissa* there are two highland or upland varieties, the one called the Daloona, because the plants throw out numerous branches. The second kind of upland is called yellow, from the colour of the flowers; the flower of the Daloona being white. A third variety may be called the lowland, and is known locally as the Keda. The upland varieties are grown more or less all over the Gurjuto or Hill States, wherever a virgin forest soil exists. They are grown generally in the Sumbulpore district and its dependencies, throughout the Tributary States, and in Dhenkanal and Khoordah. A virgin forest soil is the only requisite for the successful cultivation of these varieties. The jungle is cut down, all the brushwood cleared, heaped and burnt on the spot, the stems and roots of the larger trees being left in the ground, which then receives a superficial ploughing. These clearings are called taela, and the cotton grown in them Taela cotton. These preparatory processes are attended to in Sumbulpore, Khoordah, and Dhenkanal, just before and during the first falls of rain, in the latter half of May and the first half of June, so that the plants

shoot and grow and arrive at maturity through the rainy months. Dwarf paddy, sooa, Panicum Italicum, Eleusine coracana, bajra, or castor-oil, are sown with the cotton seed broadcast. The edible seed-crops in the third or fourth month are gathered as they ripen, then the ground is weeded and turned about. In January and February the cotton plants yield the first picking, and a month after the castor-oil seed ripens, and its plants are plucked and removed. Daloona cotton plants last for two or three years, and yield three pickings annually, and reach a height of 9 to 12 feet. With the yellow upland, it is not so generally the practice of sowing other crops.

The cultivation of the Keda or lowland variety of cotton is confined almost to the settled and open districts of Cuttack, Puri, and Balasore; a little is raised in Dhenkanal and Khoordah. The best soil selected for this variety is do-fuslee, or double crop. It is generally a light sandy soil, handy for irrigation purposes. The seed used throughout the district for lowland cotton is procured from Khoordah and Dhenkanal, it being alleged that none other will germinate in the lowland districts. It is placed in a pot, and soaked in dung and water for a night, and then dried by exposure to the sun on the following day. It is afterwards laid on straw, contained in an earthen vessel covered over with castor-oil leaves and placed near a fire. So soon as the seed splits and shoots it is planted, and watered at intervals of two, three, and four days. November and December are the usual months for the planting. The plants are annual, and attain a height of 4 to 6 feet. The cold weather showers falling occasionally in December, January, and February, favour the plants, and when plentiful, constitute a good season. The pickings are obtained continuously in April, May, and June. In the latter month all the bolls are picked off the plants, and after exposure to the sun, open. After the month of June, the lowland cotton plants are plucked up, and the land cleared for a pulse crop.

Madras Presidency.—As early as 1790, Dr. Anderson was employed in sending Mauritius cotton seeds, as well as brown cotton seeds, imported from Malta, to different parts of the Peninsula; and Dr. Roxburgh, who left Samulcotta in the Northern Circars, and took charge of the Calcutta Botanic Garden in 1793, had already ascertained that the elevated, dry, and less fertile soil of Coromandel was better suited than that of Bengal to the Bourbon cotton. He obtained its seeds from Mr. Hughes, who had for some time been engaged in the culture of cotton in the Tinnevelly district, and whose success was so considerable with Bourbon cotton, that for twenty years Hughes' Tinnevelly cotton continued to be quoted in the Liverpool market as the best from India, and sold at higher prices than the American short-staple cottons, and 3d. per pound above the best Surats. The fact is important, on account of the latitude of Tinnevelly being only $8\frac{1}{2}°$, and because the success was evidently the result of skill applied to the culture. The produce, only 100 lbs. per acre, was fine in quality and much esteemed. The cottons of the Madras Presidency are more largely grown in the valley of the Kistna, and in the Bellary, Kurnool, Tinnevelly, and Coimbatore districts.

At *Coimbatore*, the Oopum or best indigenous cotton is raised in rotation of two years, with cumboo, Panicum spicatum, Penicillaria spicata, and cholum or Sorghum vulgare. The Oopum cotton is raised on black soil.

In *Bellary*, cotton is grown in drills along with cholum or millet; with the former, the drills are about six feet apart, and have from four to six rows of sorghum between each one of cotton; with the latter, the drills of cotton are only three feet apart, and have two rows of millet between them. When the crop of the millet is cut down, a very singular and sudden change occurs; one day nothing is seen but yellow grain, which on the next disappears, and a thick crop of green cotton plants, about half a yard high, remains. None of the fields are enclosed, but they are generally protected at the sides of the road by rows of the prickly Jamaica yellow thistle, Argemone Mexicana.

In *Vizagapatam*, about lat. 17° N., very liberal pruning is practised, and the return is much greater than in any other of the Madras districts. In sandy soils near the sea, the Oopum cotton yields the more largely.

In *Mysore*, large belts of land in the northern and central taluks are deemed excellent for cotton culture.

For a series of years up to 1850, Dr. Wight, an eminent botanist, was employed in experimental cotton-growing in the collectorates of Tanjore, Coimbatore, and Tinnevelly, and he formed the opinion that the less yield of the cottons ripening there in January, was owing to the insufficient warmth of that season of the year.

In *Ceylon*, cotton is grown very generally both by the Singhalese and Tamil races, but upon no regular plan nor to any extent.

Bengal Presidency. — The indigenous cotton of Dacca has long been celebrated for its superior quality. It is cultivated along the banks of the Megna from Feringybazar to Edilpore in Bakarganj, a distance of about forty miles, on the banks of the Brahmaputra creek (the ancient channel of the river of the same name), and along the Luckia and Banar. It presents different shades of quality, the finest of which is named Photee, and is the material of which the delicate muslins are made. It was described by Roxburgh as differing from the common herbaceous cotton plant of Bengal in several particulars, chiefly in having a longer, finer, and softer fibre. It has, however, often been doubted whether the superiority of the Dacca manufacture was dependent on the skill of the workmen or the goodness of the cotton; but, from Mr. Lamb's account, it appears to have been carefully cultivated. Probably both had some influence; and it is certain that the workmen prefer the Dacca cotton, because, as Mr. Webb long ago explained, its thread does not swell in bleaching, as is the case with the cotton grown in North-western and Central India.

In Burdwan the Wesbee or native cotton plant is sown in the month Ashar. The soil is ploughed four or five times, the seed is kept in water for three or four days, is taken out on the day before it has to be sown, and is then mixed with ashes and cow-dung, and in this state is scattered over the ground, which is then again ploughed. Some cultivators, however, put four or five seeds in

small holes at the interval of about 1½ cubits. In the month of Magh (January—February), when the plants become ½ cubit high, they are watered. The picking of the Wesbee cotton is commenced in the month of Cheyt, corresponding with April, and finished in June and July (Joyte). Nurma cotton is cultivated in the month of Ashar, corresponding with June. The roots of the plants are well covered with earth. No irrigation is required, as nurma cotton is a rainy season plant. Its cotton is picked in November and December.

The Garo, Tiperah, and Chittagong hills produce a large quantity of inferior cotton, called Bhoga. It is used in the manufacture of the inferior kinds of hummum, bafta, boonee, saree, jore, etc., also for making ropes and tapes, and the coarsest of all fabrics, viz. garha and guzeeh, which are commonly used for packing other cloths, and for covering dead bodies, for which purpose a large quantity of them is consumed annually both by Hindus and Mahomedans. A piece of guzeeh cloth, measuring 10 yards, could be purchased for 12 annas (eighteenpence), which is the one hundred and twenty-fifth part of the price paid for a piece of mulmul-i-khas of the same dimensions.

In *Tirhut* the cottons produced are of the kinds called Bhojra, Bhogla, and Kooktee; the two former ripen in April and May, the Kooktee ripens in September. The fabric manufactured from Kooktee cotton is not white, but of a stained white colour, white cotton being produced only from the Bhojra and Bhogla kinds.

The soil upon which the cotton plant in *Cachar* is grown, consists of a rich red clay, considerably mixed with sand, which forms the soil of the principal hills in the district, and also of the small ranges of hillocks that run through it. The cotton cultivation lies on the slopes of these hills and mountains, such lands being never inundated, although they are wonderfully retentive of moisture. The same hills and slopes became in great request for the cultivation of the tea plant, the soil being peculiarly adapted for its growth. The cotton seeds, together with others, are put in in March and April; they are planted irregularly, but never closer than from 3 or 4 feet apart. The whole cultivation is weeded three or four times during the rains. The cotton flowers in July and August; the picking commences in September, and is continued till December.

In *Burma*, the cotton grown is Gossypium herbaceum, and it reaches a very fair staple. The soil on which it thrives best is the alluvial deposit left by the numerous mountain streams and rivulets on their subsidence at the close of the south-west monsoon. It also grows very well on recent forest clearings, where, often, soils containing a considerable portion of peaty matter and lignite are met with, and appear very suitable for the good of the plant. It appears to thrive also in a limestone soil, which abounds in these provinces.

Cotton grows all over *China*. The Nankin variety is called Tsz-hwa. The Kiang-hwa plant grows in Central China. The cotton plant of Shan-tung and Peh-chi-li is called Peh-hwa, and Cheh-hwa is that of Che-kiang. China has ever been a largely importing country. The cotton-growing area in that country is, however, very large. The yellow cotton from which the beautiful Nankin cloth is manufactured, is called Tze-mie-wha by the Chinese. Although the yellow variety has a more stunted habit than the other, it has no characters which constitute a distinct species. It is merely an accidental variety; and although its seeds may generally produce the same kind, they doubtless frequently yield the white variety, and *vice versa*. Hence specimens of the yellow cotton are frequently found growing amongst the white in the immediate vicinity of Shang-hai; and again, a few miles northward, in fields near the city of Pou-shan, on the banks of the Yang-tze-kiang, where the yellow cotton abounds, Mr. Fortune often gathered specimens of the white variety. Nankin cotton is chiefly cultivated in the level ground around Shang-hai, where it forms the staple summer production of the country. This district, which is part of the great plain of the Yang-tze-kiang, although flat, is yet several feet above the level of the water in the rivers and canals, and is consequently much better fitted for cotton cultivation than the plain of Ningpo, where the ground is either wet and marshy, or liable at times to be completely overflowed. The soil is a strong rich loam, capable of yielding immense crops year after year, although it receives but a small portion of manure. The manure applied to the cotton lands of the Chinese is obtained from the canals, ponds, and ditches, which intersect the country in every direction, and consists of mud which has been formed partly by the decay of long grass, reeds, and succulent water plants, and partly by the surface soil which has been washed down from the higher ground by the heavy rains. In the end of April and beginning of May, the land having been prepared in the manner just described, the cotton seeds are carried in baskets to the fields, and the sowing commences. They are generally sown broadcast, and then the labourers go over the whole surface with their feet and tread them carefully in. The cotton plant produces its flowers in succession from August to the end of October; but sometimes, when the autumn is mild, blooms are produced even up to November. As the pods are bursting every day, it is necessary to have them gathered with great regularity. When perfectly dry, the process of separating it from the seeds commences. This is done by the well-known wheel with two rollers, which when turned round draws in the cotton, and rejects the seeds. It is a simple and beautiful contrivance, and answers well the end for which it is designed.—*Reports of East India Company on Cotton*, p. 350; *Agri-Horticultural Societies of India and of Madras; C. COTTON GATHERER.

Binahar, Pinjara, . HIND.	Pyhura of BUNDELKHAND.
Pykar of . . . . DOAB.	Pooree of . . . DEHLI.

In India generally these receive one-tenth of the gross produce, as well as a share, sometimes equal to a fourth, of the cleaned cotton.

COTTON-GRASS, Eriophorum cannabinum. Its seeds are clothed at their base with a silky or cotton-like substance, with which pillows are stuffed, and wicks of candles, as well as paper, made. Its name is bhabhur and bhabhuree, and it is made into ropes by the Hindus. An old writer says, 'The wind-trees of that country bear fleeces as their fruit, surpassing those of sheep in beauty and excellence; and the Indians use cloth made from those trees.'—*Birdwood.*

COTTON MANUFACTURES. Amongst the goods which appear to have been brought to Europe from the Indian seas, in the days when Arab traders were the only medium of intercourse between the eastern and western worlds, we find mentioned cloths of silk and cotton of various colours and devices. It does not appear, however, that there existed in Europe any great demand for cotton,—the consumption of the Roman people, who were then the customers for all luxuries, being chiefly confined to cloths of silk and wool. During the trade of Europeans with India by the long sea route, the calicoes and fine muslins of that country came into general notice; and until the production of machine-made fabrics in Britain, they continued to rise in public estimation. It was deemed a great thing with the Lancashire manufacturers, when, by the aid of mechanical and artistic skill, combined with the potent agency of steam, they found themselves able to produce an article which was considered equal to that which the unlettered Hindu had manipulated in his little mud hut on the remote banks of the Ganges, and which had been produced of like excellence by their ancestors, when the 'father of history' penned his observations upon their countries. That the Hindus paid considerable attention to the details of this manufacture in the most remote ages, there remains sufficient proof on record. In the Indian work of highest antiquity, the Rig Veda, believed to have been written fifteen centuries previous to the Christian era, occurs the following passage: 'Cares consume me, Satakralu! although thy worshipper, as a rat gnaws a weaver's threads,'—the temptation to the rat being evidently the starch employed by the spinner to impart tenacity to the thread; nor can there be any doubt that cotton was the thread alluded to. Again, in the Institutes of Menu, we find it directed as follows: 'Let the weaver who has received ten palas of cotton thread, give them back increased to eleven by the rice-water (starch) and the like used in weaving; he who does otherwise shall pay a fine of twelve panas.' In recent times the cotton fabrics of India formed a considerable item in the exports from the East, during the early days of British Indian commerce; the delicacy of their fabric, the elegance of their design, and the brilliancy of their colours, rendered them as attractive to the better classes of consumers in Great Britain, as are, in the present day, the shawls of Kashmir or the silks of Lyons. So much superior, indeed, were the productions of the Indian spinning-wheel and handloom, to those turned out by the manufacturers of Lancashire in the middle of the 18th century, that not only were Indian calicoes and Indian prints preferred to the British-made articles, but the Manchester and Blackburn weavers actually imported Indian yarns in large quantities for employment in their factories. It was about the year 1771-72 that the Blackburn weavers, taking advantage of the discoveries and improvements of Arkwright, Hargreaves, and others, found themselves in a position to produce plain cotton goods, which, if they did not quite equal the fabrics of the East, at any rate found their way very rapidly into general consumption in Europe. The invention of the mule jenny in 1779 was the commencement of a new era in the history of the cotton manufacture of Great Britain; and when, six years later, Arkwright's machines were thrown open to the public, a revolution was effected in the production of all kinds of yarns. Great Britain found herself able not only to supply all her own wants with cotton goods of every variety of quality, but also to carry the produce of her looms 10,000 miles across the sea, and, placing them at the doors of the Indian consumer, undersell some kinds of the goods made by his own hands from cotton grown in his own garden. Nor is it only in the heavier goods that the West are able to beat out of their own markets the weaver of the East. There have been masters in their craft who produced fabrics more exquisitely delicate and light in texture than those beautiful muslins of Dacca, so long and justly celebrated with a world-wide fame. Although in some particulars these latter fabrics claim a certain degree of superiority, many of the Hindus prefer much of their own woven goods to those of Manchester and Glasgow; and the cotton manufactures of British India have been steadily advancing in the out-turn of twist and yarn and piece-goods. It is generally believed that Manchester will fail to contend with the Indian mills in respect to the precise class of goods they are in the habit of turning out. The cotton mills of Bombay have made, since the date of their first starting in 1854, very rapid progress.

In the 25 years between 1857-58 and 1881-82, the value of all the cotton goods imported into British India from foreign countries rose from £5,726,618 to £20,772,098. Since 1868-69 the values of the twist and yarn and of the piece-goods have but little increased. In 1881-82 the twist and yarn was of value £32,220,648. British India has been latterly holding its own. The exports have consisted of cotton goods, including twist and yarn, and have risen from £637,651 in 1850-51, to £1,906,868 in 1881-82.

The yearly increasing exports from Europe misled exporters, for Europe had seldom been able to compete either with the delicate hand-made fibres which the Hindus and Mahomedans have been producing, or with the strong, coarse fabrics which the village weavers produce during the slack time of their agricultural pursuits. In the middle of the 19th century, British India also began to use machinery. In 1880 there were 58 cotton mills at work in British India, with 1,471,730

spindles, mules, and throstles, and 13,283 looms, turning out twist and yarn and cotton cloths, with a nominal capital of four millions sterling.

With their rude implements the Hindus of Dacca formerly manufactured muslins, 'to which,' as Dr. Ure observed, 'European ingenuity can afford no parallel,—such, indeed, as has led a competent judge to say it is beyond his conception how this yarn, greatly finer than the highest number made in England, can be spun by the distaff and spindle, or woven by any machinery' (Ure's Cotton Manufacture of Great Britain, i. p. 54). The jawbone of the boalee fish (Silurus boalis), the teeth of which being fine, re-curved, and closely set, serves as a fine comb in removing minute particles of earthy and vegetable matter from the cotton. The Hindu spinner, with that inexhaustible patience which characterizes the race, sits down to the laborious task of cleaning with this instrument the fibres of each seed of cotton. Having accomplished this, she then separates the wool from the seeds by means of a small iron roller (dullun kathee), which is worked with the hands backward and forward, on a small quantity of the cotton seeds placed upon a flat board. The cotton is next bowed or teased with a small bow of bamboo, strung with a double row of catgut, muga silk, or the fibres of the plantain tree twisted together; and, having been reduced by this instrument to a state of light downy fleece, it is made up into a small cylindrical roll (puni), which is held in the hand during the process of spinning. The spinning apparatus is contained in a small basket or tray, not unlike the catheteræ of the ancient Greeks. It consists of a delicate iron spindle (tukooa), having a small ball of clay attached to it, in order to give it sufficient weight in turning; and of a piece of hard shell imbedded in a little clay, on which the point of the spindle revolves during the process of spinning. With this instrument the Hindu women almost rival Arachne's fabled skill in spinning. The thread which they make with it is exquisitely fine; and doubtless it is to their delicate organization and the sensibility with which they are endowed by nature, that their inimitable skill in their art is to be ascribed. The finest thread is spun early in the morning, before the rising sun dissipates the dew on the grass, for such is the tenuity of its fibre, that it would break if an attempt were made to manufacture it during a drier and warmer portion of the day. The cohesive property of the filaments of cotton is impaired by high temperature accompanied with dryness of the air, and hence, when there is no dew on the ground in the morning to indicate the presence of moisture in the atmosphere, the spinners impart the requisite degree of humidity to the cotton, by making the thread over a shallow vessel of water. A specimen which Dr. Taylor examined at Dacca in 1846 measured 1349 yards, and weighed only 22 grains, which is in the proportion of upwards of 250 miles to a pound weight of staple. During the process of preparing the thread, and before it is warped, it is steeped for a couple of days in fine charcoal powder, soot, or lampblack, mixed with water, and, after being well rinsed in clear water, wrung out, and dried in the shade, it is rubbed with a sizing made of parched rice (the husk of which has been removed by heated sand), fine lime, and water. The loom is light and portable; its cloth and yarn beams, batten, templet, and shuttle are the appurtenances requisite for weaving.

Dacca was the seat of a manufacture of muslins known by its name, and spoken of by the ancients as 'woven webs of air.' The principal varieties of plain muslins manufactured at Dacca were Mulmul-i-Khas, Ab-rawan, Shab-nam, Khasa, Jhuna, Sircar Ali, Tanzeb, Alabullee, Nyan-zook, Baddan Khas, Turandam, Sarbūtee, and Sarband, —names which either denote fineness, beauty, or transparency of texture, or refer to the origin of the manufacture of the fabrics, or the uses to which they are applied as articles of dress. The finest of all was the Mulmul-i-Khas (literally, muslin made for the special use of a prince or great personage). It was woven in half-pieces, measuring 10 yards in length and 1 yard in breadth, having 1900 threads in the warp, and weighing 10 siccas (about $3\frac{3}{4}$ ounces avoirdupois). The finest half-piece seen weighed 9 siccas, priced 100 rupees. Some of the other muslins were also beautiful productions of the loom, as Ab-rawan, compared by the natives from its clear pellucid texture to running water. Shab-nam, so named from its resemblance, when it is wetted and spread upon the bleaching field, to the evening dew on the grass. Jhuna, a light transparent net-like fabric, made for natives of rank and wealth, worn by the inmates of zenanas and dancers, and apparently the cloth referred to in the classics under the figurative names of Tela arenarum, Ventus textilis. All these muslins were made in full pieces of 20 yards in length by 1 in breadth, but varying considerably in the number of threads in the warp, and consequently in their weight. Of figured fabrics, as striped Dooria, chequered Charkhanee, and flowered Jamdanee, there exists a considerable variety, both in regard to quality and pattern. The flowered muslin was formerly in great demand both in India and Europe, and was the most expensive manufacture of the Dacca Urung. There was a monopoly of the finer fabrics for the court of Dehli; those made for the emperor Aurangzeb cost 250 rupees per piece. This muslin is now seldom manufactured of a quality of higher value than 80 rupees per piece.

For the masses of the people, the British manufacturer sends to India the plain and striped Dooria, Mulmul, Aghabani, and other figured fabrics, which have established themselves there, and which, both from their good quality and moderate prices, are acceptable to the numerous classes who make use of them. Some of the chintzes of Masulipatam and of the south of India are as beautiful in design as they are chaste and elegant in colour.

Printed cloths are worn occasionally, as in Berar and Bundelkhand, for sarees; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the poorer classes in Upper India; but the greatest need of printed cloths is for the kind of bedcover called palempore (palangposh), or single quilts.

In the costlier cloths woven in India, the borders and ends are entirely of gold thread and silk, the former predominating. Many of the saree or women's cloths, made at Benares, Pytun, and Burhanpur, in Gujerat, at Narrainpet and Dhanwarum in the Hyderabad territory, at Yeokla in

Kandesh, and in other localities, have gold thread in broad and narrow stripes alternating with silk or muslin. Gold flowers, checks, or zigzag patterns are used, the colours of the grounds being green, black, violet, crimson, purple, and grey; and in silk, black shot with crimson or yellow, crimson with green, blue, or white, yellow with deep crimson and blue, all producing rich, harmonious, and even gorgeous effects, but without the least appearance of or approach to glaring colour, or offence to the most critical taste. They are colours and effects which suit the dark or fair complexions of the people of the country; for an Indian lady who can afford to be choice in the selection of her wardrobe, is as particular as to what will suit her especial colour—dark or comparatively fair—as any lady of England or France. Another exquisitely beautiful article of Indian costume for men and women is the do-patta or scarf, worn more frequently by Mahomedan women than Hindu, and by the latter only when they have adopted the Mahomedan lunga or petticoat; but invariably by men in dress costume. By women this is generally passed once round the waist over the petticoat or trousers, thence across the bosom and over the left shoulder and head; by men, across the chest only.

The *do-pattas*, especially those of Benares, are perhaps the most exquisitely beautiful of all the ornamental fabrics of India; and it is quite impossible to describe the effects of gold and silver thread, of the most delicate and ductile description imaginable, woven in broad, rich borders, and profusion of gold and silver flowers, or the elegance and intricacy of most of the arabesque patterns of the ribbon borders or broad stripes. How such articles are woven at all, and how they are woven with their exquisite finish and strength, fine as their quality is, in the rude handlooms of the country, it is hard to understand. All these fabrics are of the most delicate and delightful colour,—the creamy white, and shades of pink, yellow, green, mauve, violet, and blue, are clear yet subdued, and always accord with the thread used, and the style of ornamentation, whether in gold or silver, or both combined. Many are of more decided colours—black, scarlet, and crimson, chocolate, dark green, and madder; but whatever the colour may be, the ornamentation is chaste and suitable. For the most part, the fabrics of Benares are not intended for ordinary washing; but the dyers and scourers of India have a process by which the former colour can be discharged from the fabric, and it can then be re-dyed. The gold or silver work is also carefully pressed and ironed, and the piece is restored, if not to its original beauty, at least to a very wearable condition. The do-pattas of Pytun, and indeed most others except Benares, are of a stronger fabric. Many of them are woven in fast colours, and the gold thread—silver is rarely used in them—is more substantial than that of Benares. On this account they are preferred in Central India and the Dekhan,—not only because they are ordinarily more durable, but because they bear washing or cleaning better. In point of delicate beauty, however, if not of richness, they are not comparable with the fabrics of Benares.

Scarfs are in use by every one,—plain muslins, or muslins with figured fields and borders without colour, plain fields of muslin with narrow edging of coloured silk or cotton (avoiding gold thread), and narrow ends. Such articles, called sehla in India, are in everyday use among millions of Hindus and Mahomedans, men and women. They are always open-textured muslins, and the quality ranges from very ordinary yarn to that of the finest Dacca fibres. Comparatively few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But what all classes wear are coloured cloths,—black, red, blue, occasionally orange and green, violet, and grey. All through Western, Central, and Southern India, sarees are striped and checked in an infinite variety of patterns. Narrainpet, Dhanwar, and Muktul, in the Nizam's territories; Gudduk and Bettigerry in Dharwar; Kolhapur, Nasik, Yeokla, and many other manufacturing towns in the Dekhan; Arnee in the south, and elsewhere, send out articles of excellent texture, with beautifully arranged colours and patterns, both in stripes and checks. The costly and superb fabrics of cloths of gold and silver (kimkhab), and the classes of washing satins (mushroo and hemroo), even if European skill could imitate them by the handloom, it would be impossible to obtain the gold and silver thread unless they were imported from India. The native mode of making this thread is known, but the result achieved by the Indian workman is simply the effect of skilful and delicate manipulation. The gold and silver cloths (kimkhab) are used for state dresses and trousers, the latter by men and women; and ladies of rank usually possess petticoats or skirts of these gorgeous fabrics. Mushroo and hemroo are not used for tunics, but for men's and women's trousers, and women's skirts; as also for covering bedding and pillows. They are very strong and durable fabrics, wash well, and preserve their colour, however long worn or roughly used; but they can hardly be compared with English satins, which, however, if more delicate in colour and texture, are unfitted for the purposes to which the Indian fabrics are applied. For example, a labada or dressing-gown, made of scarlet mushroo in 1842, has been washed over and over again, and subjected to all kinds of rough usage, yet the satin is still unfrayed, and the colour and gloss as bright as ever. Many of the borders of loongees, dhotees, and sarees are like plain silk ribbons, in some instances corded or ribbed, in others flat.

In Europe, it has been usual to name particular fabrics after the place of their manufacture, and this practice was extended to eastern products, as calico from Calicut, gauze from Gaza, muslin from Mosul, chintz from the Hindi chinte, spotted. In British India, however, the people name their woven fabrics from the form of their construction, their appearance, or the use to which they are applied. The cotton goods sent from Bombay to the Paris Exhibition of 1855, comprised bafta, boonee, carpets, chandni, choli, dastarkhan, dhoti, ek-patta, do-patta, dungari, khadi, lungee, peshgir, phatka, pagga, quilts, razai, sailcloth, saree, soosi, turband, tablecloth, table napkins, and towels.

Omitting the second-rate kinds of cloth, which constitute the great bulk of the Dacca cotton manufacture, a class worthy of attention is that of fabrics of a mixed texture of cotton and silk. They are designated by various names, as nowbŭttee, kutan, roomee apjoola, and lucka; and, when embroidered with the needle, as many of

them frequently are, they are called kusheeda. The silk used in their manufacture is the indigenous muga silk of Assam and Sylhet; but the cotton thread employed is now almost entirely English yarn, of qualities varying from Nos. 30 to 80. These cloths are made exclusively for the Jedda and Bussora market; and a considerable stock is yearly exported in the Arab vessels that trade between Calcutta and these ports. Pilgrims, too, from the vicinity of Dacca not unfrequently take an investment of them, which they dispose of at the great annual fair held at Meena, near Mecca. They are used by the Arabs chiefly for turbands and gowns. The golden colour of the muga silk gives to some of these a rich lustrous appearance. Pieces made of native-spun cotton thread and of the best kind of muga silk, would be admired in England.

In Ganjam is fabricated a cotton cloth, each side of a different colour. This effect is produced not by dyeing the cloth after it is woven, but by a dexterous manner of throwing the woof across the warp on either side. Madapollam and Ingeram used to be famous for cotton cloths, but since the abolition of the Company's trade, the finer panjams have not been made. Palampores, as bed coverings, of the former place deserve attention. Very fine muslins are made at Oopada, north of Cocanada, and handsome turbans, with gold thread interwoven; but all these things are far surpassed by the Bengal fabrics. The Chicacole muslins are, however, prized by European ladies. Cotton cloths from Nellore consist of manufactured articles which find a ready sale in the markets of this Presidency.—*Madras Exh. Jur. Rep.* 1855, 1857; *Dr. Taylor of Dacca, Reports of Great Ex. of* 1851; *Cal. Cat. Ex. of* 1862; *Juries' Report, Ex. of* 1862; *Royle, Arts of Ind.; Royle, Prod. Res. of India; Bombay Times.*

COTTON SEED is the Binour, Binoula of Hindustan. It is chiefly used in India for feeding cattle, and also sometimes as manure for cotton plants. In the year 1878, 175,000 tons were imported into Great Britain, and sold there at from £7, 17s. 6d. to £9, 10s. Cotton seed oil is expressed from cotton seeds. It is used for burning in lamps, and is also considered to have, in a peculiar manner, the virtue, when externally applied, of clearing the skin of spots and freckles. It is a drying oil, and therefore unfit for lubricating. When obtained by pressure, its colour, owing to the presence of a resinous substance, is of a very dark red, and 10 to 15 per cent. is lost in bleaching it. When prepared by steaming the seeds and collecting the oil by skimming it from the surface of the water, it has a bland, light-coloured appearance.—*Faulkner.*

COTTON, SILK. The silk-cotton trees of India are the Eriodendron aufractuosum, *D.C.*, and the red cotton tree, Salmalia Malabarica, *Schott.* The seeds of E. aufractuosum are embedded in silky cotton. The capsules, on bursting, display a flocculent cotton-like substance, more silky than cotton, and named silk-cotton. It differs also in not spinning like cotton. Mr. Williams of Jubbulpur, however, succeeded in spinning and weaving some of it, so as to form a very good coverlet. It is used for stuffing pillows, muffs, and coverlets; for wadding, or for conversion into half stuff for papermakers. In the Trans. of the Agri-Hortic. Soc. iii. p. 274, there is a report from the Society of Arts on two pieces of cloth made from the simul or silk-cotton tree; but from the shortness of the staple of the down, and its elasticity, it cannot be spun by ordinary cotton-spinning machinery. A silk-cotton surrounds the seeds of Bombax ceiba, *L.*, a South American tree, and is used for stuffing cushions and the like, but not suited to work into cloth fabrics. Another beautiful silk-cotton (West Indian) is from Ochroma lagopus.—*Royle, Fib. Pl.*

COTTON SOIL, or Black Cotton Soil, is the name given to the 'regar.' See Soil.

COTTON THIEF, a name applied in Ceylon to the beautiful long-tailed bird, Tchitrea paradisi, *Linn.*, the sultana bulbul of the Mahomedans of the Peninsula, its long white feathers in the tail streaming like cotton as it flies.

COTURNIX VULGARIS, the common quail of Europe, Asia, Africa, is chiefly migratory, and is abundant in India.

COULAM, in Southern India, is the name given by the Tamil people to the whole island of Ceylon. It is also the name of the towns which Europeans call Covelong near Sadras, on the east coast, and Quilon on the west coast, of the Peninsula.

COUNTRY, a prefix in use amongst the British to indicate a product of India. It is a translation of several vernacular words, used to express an article local and not foreign. The Tamil word Nat'h has this signification.

Country Almond Tree, Terminalia catappa.
Country Borage, Coleus Amboinicus.
Country Fig Tree, Ficus racemosa.
Country Galls, myrabolan.
Country Gooseberry, Cicca disticha.
Country Greens, Amarantus oleraceus.
Country Kreat, Exacum bicolor, chiretta.
Country Mallow, Abutilon Indicum.
Country Rosin, dammer.
Country Sarsaparilla, Hemidesmus Indicus.
Country Walnut, Aleuritus triloba.

COURMARINE, an aromatic principle found in Melilotus officinalis, or common melilot, and in the tonquin bean, Dipterix odorata.

COURSE, a term applied by European residents in India to the places of evening promenade, probably obtained from the Corso of southern Europe.—*Elliot.*

COURT, a general of Ranjit Singh. He had previously been a lieutenant of the old Imperial French Guard.

COURT, M. H., major of the Madras Artillery, wrote an account of Palembang, 1821.

COURTALLUM, a town near Tinnevelly in the Arangole pass. It is in lat. 8° 56′ 20″ N., long. 77° 20′ E., and is 700 feet above the sea. It has waterfalls considered sacred by the Hindus.

COURTNEY, an ancient village 11 miles from Bellary, in which the Jaina religion was formerly prominent, supposed to have been suppressed by the Jangam sect.

COUSIK, a tribe of Sombansi Rajputs; their name would, however, seem to imply Brahmanical descent or connection.—*Elliot.*

COUVADE, a custom amongst several ancient and some existing tribes. According to Apollonius Rhodius, this singular custom prevailed among a people called the Tibareni, at the mouth of the Black Sea.

'In the Tibarenian land,
When some good woman bears her lord a babe,
'Tis he is swathed and groaning put to bed;
Whilst she arises, tends his baths, and serves
Nice possets for her husband in the straw.'

Diodorus Siculus mentions that in Corsica the wife was neglected, and the husband put to bed and treated as the patient.

Marco Polo, in the 13th century, seems to have observed the custom in the Chinese province of West Yun-nan amongst the aboriginal tribes of the land, the Miau-tze, who practise it to the present day. The father of the new-born child, so soon as the mother can leave her couch, gets into bed, and there receives the congratulations of acquaintances. And Marco Polo mentions that in the Zar-dandan (gold teeth) tribe on the frontiers of Burma, when a woman bore a child, she rose and went about her business, and the husband took to bed for forty days, and was fed on possets.

About the beginning of the Christian era, Strabo (iii. 4, 17) mentions that among the Iberians of the north of Spain, the women after the birth of a child tend their husbands, putting them to bed instead of going themselves. In the same locality, amongst the modern Basques in Biscay, M. Michel found the same custom prevailing a few years ago. The women, he says, rise immediately after childbirth and attend to the duties of the household, while the husband goes to bed, taking the baby with him, and thus receives his neighbours' compliments. This practice seems to have spread to France, and to have there received the name of *faire la couvade*. It has been found in Navarre and on the French side of the Pyrenees.

Amongst the Caribbees of the West Indies, the father is put to bed and fed on meagre diet, and his body punctured and tortured; and the Abipone husband of S. America is treated like a lying-in woman.

The Yerkala or Yerkal-wanlu dwell in the Telugu districts of the Madras Presidency. Those in the neighbourhood of the Dumagudian practise the Couvade. Directly the woman feels the birth-pangs, her husband puts on some of her clothes, places on his forehead the mark which women apply to their foreheads, retires to a room where there is only a very dim lamp, and lies down on the bed, covering himself up with a cloth. When the child is born, it is washed and placed on the cot beside the father. Asafœtida, jagari, and other articles are then given, not to the mother, but to the father. During the days of ceremonial uncleanness, the man is treated in the manner that on such occasions other Hindus treat their women. He is not allowed to leave his bed, but has everything needful brought to him.—*Mr. John Cain in Ind. Anti.*, May 1874; *Apoll. Rhod. Arçon*, ii. p. 1012, in *Quarterly Review*, July 1868; *Müller's Chips*, ii. pp. 277–284.

COVELLIA GLOMERATA. *Miq.*

Ficus glomerata, *Willd.* | Atteekka-gass, . SINGH.

Common in Ceylon on the banks of rivers and up to 2000 feet.—*Thw.* p. 267.

COVELLIA OPPOSITIFOLIA. *Gaspar.*

C. Dæmonum, *Miq.* | Ficus oppositifolia, *Willd.*
C. Assamica, ,, | F. Dæmonum, *Vahl.*
C. Dasycarpa, ,,

Kota-dimboola-gass, . . SINGH.

Very abundant in the warmer parts of the Ceylon island.—*Thw. Pl. Zeyl.* p. 266.

COVELONG, Coulam, or Kovilam, a seaport village 22 miles south of Madras, in lat. 12° 46′ N., and long. 80° 18′ E. A fort, now demolished, was erected by Anwar ud Din near the ruins of one that the Imperial E. I. Company of Ostend had erected. In 1750 the French obtained possession of it, but in 1752 it surrendered to Captain Clive.

COVIL GRASS, or Penna stipata, during the month of June is in flower, impregnating the atmosphere with an aromatic perfume. On this grass feed innumerable flocks of horses and mares, and its flower communicates to the milk of the mares a certain aromatic quality. Out of the milk is made the Tartar koumiss, and the drinkers of koumiss at this time of the year set at defiance most of the woes that distress mankind.

COVILHAM. Pedro da Covilham and Alfonso de Payva were sent as merchants in 1494, *via* Genoa, Alexandria, Cairo, and the Red Sea, to Aden, where they separated, agreeing to meet again at Cairo, Payva to search for Prester John in Abyssinia, whom he heard of as reigning there over a highly-cultivated people, but he died before reaching Abyssinia. Covilham went on to India, where he made drawings of cities and harbours, especially Goa and Calicut. Thence he returned along the coast of Persia to Cape Guardafui, and continued south to Mozambique and Zofala, where he ascertained that that land joined the Cape of Good Hope. From Zofala he returned to Abyssinia, and sent his diary, charts, and drawings to Genoa by some Portuguese merchants who were trading to Memphis. On receipt of these, King Emanuel, in 1495, sent four ships under Vasco da Gama, who visited Natal and Mozambique. In 1498 he was at Calcutta, and in 1499 back at Lisbon. See Portuguese.

COW.

Vache, ... FR.	Gow, ... LETT.

A good milch cow should have a good-looking udder, fine skin, and fine tail. The herdsmen of Indian villages take out cows daily to graze, receiving 2 to 8 annas a month. In ancient Egypt the cow was a sacred animal, as also were the bulls Apis and Mneves. At present the cow is worshipped amongst all Hindus; and the Banjara are perhaps the only race in British India who apply the cow to labour. But the Vedas do not enjoin reverence to the cow; and in the Hindu marriage ceremony, where a milk cow, Surabhi, is released on the intercession of a barber, sufficient remains to show that the sacrificial rite of killing a cow was formerly practised at marriages, for the sake of hospitality.

Two Hindu traditions seem to indicate the domestication of the cow. In Hindu mythology, the Cow of Plenty, called Kamadhenu, Surabhi, Savala, granting all desires, is fabled to have been produced by the Sura and Asura, at the churning of the ocean after the deluge, for the recovery or production of the Chaoda-ratna or fourteen sacred things; another fabulous cow, the cow of five colours, or Panch-warna, was given by Indra to the parents of Rama. It is common for Brahmans and others to feed a cow before they take their own breakfast, ejaculating as they present their food, 'Daughter of Surabhi, framed of five elements, suspicious, pure, holy, sprung from the sun, accept this food by me; salutation unto thee!' Or if he conduct the kine to grass, 'May cows, who are mothers of the three worlds and daughters of Surabhi, and who are beneficent,

pure, and holy, accept the food given by me' (Colebrooke, As. Res. vii. p. 276). In marriage ceremonies the hospitable rites are conducted by letting loose a cow, at the intercession of the guest, a barber, who attends for that purpose, and exclaims, 'The cow! the cow!' upon which the guest pronounces this text, 'Release the cow from the fetters of Varuna. May she subdue my foe! may she destroy the enemies of both him (the host) and me! Dismiss the cow, that she may eat the grass and drink water.' When the cow has been released, the guest thus addresses her: 'I have earnestly entreated this prudent person, saying, Kill not the innocent, harmless cow, who is mother of the Rudra, daughter of the Vasu, sister of the Aditya, is the source of ambrosia,' etc. (ibid. p. 293). In the Hitopadesa (p. 110), the earth is called Surabhi, and the learned translator (Wilkins) notes the same to be not usually so applied, although the earth may well be called the cow of plenty.

The cow with the female buffalo furnish most of the milk used by the people of India, and there are several breeds of cows famed for the large quantities they yield; one of these, from Aden in Arabia, is much praised.

The custom in India, of using cow-dung for smearing floors and walls, is practised by all sects as well as Hindus, as the most cool and cleanly appliance. Cow-dung is plastered over the cooking-place before the meal of a person of a high class is cooked; in camps, or on journeys, a space of 10 or 12 square feet is so purified, but is easily polluted by the approach of impure persons or things, in which vexatious case the food becomes unclean. The ashes of cow-dung, vibudi, are also of a very purifying nature; and Hindus of almost all ranks and degrees, men and women, occasionally or frequently use them, mixed sometimes with other ingredients, to mark their foreheads, necks, arms, etc. Sometimes men, especially religious mendicants, or penitents, or those having some claims to sanctity, are rubbed all over with these ashy mixtures, and present a curious sky-blue appearance. Amongst Hindus, the greatest of all purifiers is the urine of a cow. Hindu spirits of impurity abhor this sin-expelling, sanctifying liquid. Images are sprinkled with it; no man, of any pretensions to piety or cleanliness would pass a cow in the act of staling without receiving the holy stream in his palm, sipping a few drops, and with his bedewed fingers marking and crossing his forehead, shoulders, and breasts. —*Moor's Pantheon*, p. 143; *Williams' Nala*, p. 136; *Kennedy on Languages*, p. 43; *Wilford; Colebrooke*, p. 276; *Coleman*, p. 293.

COW BEZOAR, and bezoars from all ruminating animals, always find a ready market in China, where Chinese doctors lay it up as a rare medicine. They are not unfrequently deceived by an artificial preparation of pipeclay and ox-gall, mixed with a little hair. — *Williams' Middle Kingdom*, ii. p. 406. See Bezoar; Calculus.

COWDEE, seeds of Aristida setacea, a wild grass, also of Exacum bicolor, and of the wild grass Kusai.

COW-DUNG BRATTIES. ANGLO-TAM.

Bau-kanda, . . . ,,	Bratti; Shani, . . TAM.

With water, cow-dung forms a useful wash for walls and floors, and it enters into the composition of the farriers' fomentations; it hides bad joinery. But its chief use is in forming bratties, or dried cow-dung cakes for fuel. The ground cropped by cattle, and which supplies straw, ought to receive it back before it is reduced to ashes; till this be done, lands must be unduly exhausted. Cow-dung mixed with paddy husk and earth is a fuel much used in Southern India for burning bricks and chunam, also for heating iron tyres for tyring wheels, for which purpose it answers better than any other. It is more economical than any other fuel. It has a disagreeable smoke, but when thoroughly ignited, the heat given out is very intense. The cow-dung ashes balls are Tirunar unde, TAM., and Vibudi in Telugu.

A cake of cow-dung is placed on the top of a heap of corn to ward off the evil eye, and to make the grain increase (barhé, HIND.); hence the cow-dung cake is a Barh-wan, also Chauk and Ch'hatur. A Hindi couplet ridicules the practice:

'Jag baurāhā trishna bibas bhut puj bhau len;
Barhé na barhé barhwan jin Kisan rak'h den;'

'The world is mad, and for the sake of avarice will worship devils, and will still put on the Barhwan, increase or not.'—*Rohde, MSS.*

COWHAGE, or Cow-age.

Al-kushi, . . . ARAB.	Atmagupta, . . . SANSK.
Kiwach, . BENG., HIND.	Kosam billi wail, . SINGH.
Kaunchkuri, . . DUKH.	Puney kali, . . . TAM.
Cowage, ... FR.	Pilla-dugu-kailu, . TEL.
Kuhkratze, . . . GER.	Enuga-dola-gunda, ,,
Rawe, ... JAV.	

Cowhage, probably a corruption of the Arabic or Hindustani and Bengali names of one of the plants that produce it. Cowhage consists of the hairs found upon pods of different species of Mucuna. They are exceedingly slender, brittle, and easily detached, and the fragments readily stick into the skin, and produce an intolerable itching. Cow-itch is used medicinally as a vermifuge, by being mixed with syrup till of the consistence of honey, and given in doses of two or three teaspoonfuls. The species are found in hedges, thickets, on the banks of rivers, and about watercourses, in the E. and W. Indies, and in America within the tropics. M. urens and M. pruriens usually furnish the substance; but that from M. monosperma, called by the Telinga, Enooga dola Gunda, or elephant's scratchwort, is said to exceed the others in the irritating burning property of its hairs. Dr. Roxburgh states that M. pruriens was one of the plants formerly used in India to poison wells; but it is less hurtful than was supposed.—*Roxb.; Eng. Cyc.* p. 177.

COWRIE.

Wuda, ... ARAB.	Khar-Mahra, . . PERS.
Beya, ... BENG.	Pingo, ... SINGH.
Kauris, . . DUT., GER.	Bucios Zimbos, . . SP.
Coris, Cauris, Bouges, FR.	Kavadi, ... TAM.
Cori, Porcellanne, . IT.	Gavvallu, . . . TEL.
Beya, JAV., MALAY, SANSK.	

Cowries are small, white, or yellow, glossy shells, of the genus Cypræa, found in abundance on the shores of the Laccadive and Maldive islands, African coast, Zanzibar, and the Sulu

islands, etc. There are many species, but the Cypræa moneta pass current as coin in payment of fractional parts of a pice, in India and some parts of Africa. They are brought to India in large quantities, and are re-exported to Britain, where they are used in inlaying, in ornamenting toys, work-boxes, etc., and in the manufacture of the superior kinds of porcelain-ware. They were, during the slave trade, exported from Bombay to Africa. The cowrie seems never to have been used for money among the Indian islanders, as it has immemorially been by the Hindus. Yet the Malay and Javanese name Beya is Sanskrit, and is one of the synonyms which express duty, impost, or tolls. In the currency of India, 4 cowries make a ganda, 20 ganda=a pan, and 5 pan=one anna. In A.D. 1740, a rupee exchanged for 2400 cowries, in 1756 for 2560 cowries, and in 1870, in Madras, as many as 5760 cowries were obtainable for one rupee. The Persian name, Khar-mohra, means literally a jackass' or mule's shell, because mules are ornamented in that country with trappings of shells, as a Gosain's bullock is in India. Ibn Batuta says cowries were carried from the Maldive Islands to Bengal, to be used as coin. The Kamoos adds that a split or broken shell is suspended from the neck to avert the evil eye, and this is still done in India. Among European nations, excepting the British, these shells are known by the name Porcelli, Porcellian, Porcellanen, and Porcelaine, on account of the fancied resemblance of their shape to that of the back of a little pig; and thence arose the term for the Chinese 'porcelain,' of which the glaze or varnish is similar to that of the cowrie. Liverpool imported as under:—

1851,	1704 cwt.	1854,	90 cwt.
1852,	2793 ,,	1855,	311 ,,
1853,	1680 ,,		

Two commercial varieties are known, the 'live cowrie' and the 'dead cowrie.'—*Morrison's Compendious Description; Crawfurd's Dictionary.*

COW-TREE, a tree belonging to the natural order Urticaceæ, Brosimum utile of Endlicher. When wounded, a milky juice is discharged in such abundance, it is said, as to render it an important object to the poor natives in whose country it grows. It is described by Humboldt as being peculiar to the Cordilleras of the coast of Caraccas, particularly from Barbula to the lake of Maracaybo, near the village of San Mateo, and in Caucagua, three days' journey east of Caraccas. In these places it bears the name of Palo de Vaca, or Arbol de Leche, and forms a fine tree, resembling the star-apple of the West Indies. The Kiriaghuna plant of Ceylon, Gymnema lactiferum, is described as another cow-plant, notwithstanding it belongs to the acrid and dangerous asclepiadaceous order.—*Eng. Cyc.; New Comm. Pl.*

COX, Captain H., was sent on an embassy to the king of Burma, and wrote his Journal of a Residence in the Burman Empire.

See Crustaceæ.

CRAB-MUNGOOS, Urva cancrivora, *Hod.*

CRAB'S-EYES, seeds of Abrus precatorius, *L.*, used in India by jewellers and druggists as weights, being nearly each one grain. They are strung together for necklaces, rosaries, etc.

CRACKERS, etc. Chinese fire-crackers are exported to the United States, to India, and S. America. They are made up in strings, and then in papers, and lastly in boxes, five of which are estimated to weigh one pikul. The market of Canton is chiefly supplied with fireworks from Fat-shan.—*Compendious Descrip.*

CRAMBE CORDIFOLIA. *Steven.* A plant of Persia, Caucasus, Tibet, and Himalaya, growing up to 14,000 feet. Root and foliage of this kale are eaten. Crambe maritima, *Linn.*, is seakale.

CRANE.

Grue,	Fr.	Grua, Gru,	It.
Kranich, Krahn,	Ger.	Grulla, Grua,	Sp.

Cranes differ from storks in their appearance, habits, anatomy, modes of breeding, and everything except that both happen to be long-legged birds. The Argila or adjutant, Leptoptilus argala, is erroneously termed the gigantic crane. The words Crane, Geranos, and Grus, and the Hindustani names of the three common Indian species, Saras, Karranch, and Kankarra, all have reference to the loud trumpeting of these birds, which have a curious internal conformation resembling that of the trumpeter swans; whereas the storks are voiceless birds, having actually no vocal muscles, and can make no sound but by clattering their mandibles together, which they do pretty loudly. In Australia the term crane is applied to the egrets, or white paddy-birds, as they are called in India, of the family Ardeidæ; while in the Malay countries the so-called paddy-bird is a finch; and the real crane of Australia, Gr. Australasiana, is known as the Native Companion. Some cranes and storks, four-fifths of the ducks, and the great majority of the scolopacidæ, breed in the north, and come to India in the cold season.

(*a*) Grus antigone, *Linn.*, Grus torquata, *Vieillot*, the Saras, a noble bird, is the largest of the whole tribe. During the breeding season it has a pure white collar below the crimson papillose naked portion of the neck, whence the name torquatus. It is mostly seen in pairs, a few of which breed in India in extensive jhils, but the great majority cross the Himalaya for that purpose.

(*b*) Grus leucogeranos, *Pallas*, is the beautiful arge white crane of N. Asia, with black wing-primaries, and crimson naked face. A few stray pairs have been observed in the Upper Provinces of Hindustan; and Burnes figured it from the vicinity of Kābul.

(*c*) Grus cinerea, *L.*, the Kulung or European crane, common to Asia and N. Africa, visits India in great flocks, which wholly disappear in the breeding season. If we except the Manchurian species, the European crane is equal to any in the majesty of its gait and the beauty of its plumage.

(*d*) Anthropoides virgo, *L.*, the Karkarra or Demoiselle, common to Asia and N. Africa, is only known in India during the cold weather. It is the smallest, and certainly one of the most elegant, of this particularly graceful group; the only one with the head fully feathered. And it is adorned with beautiful white neck-tufts, and with lengthened and drooping tertiaries, and a

bright crimson eye. Highly gregarious, the flocks are sometimes immense. Cranes are easily tamed, and they are very ornamental birds to keep. They have a curious and peculiar habit of skipping about at times, attitudinizing or dancing, and now and then emitting their loud cries. In the wild state they do much damage to the crops from their numbers; and repair during the heat of the day to sandflats in rivers, or to other extensive waters, returning to feed morning and afternoon at regular hours. They fly in V-like flocks, like wild geese. The young, commonly two in number, follow the mother soon after exclusion, unlike those of the stork and heron tribe, with which the cranes have little in common.—*Z.*

CRANE-FLY. This gnat is a species of Tipula. Its grub is a pest of the young poppy plant, both on and under the surface of the soil.

CRANGANORE, on the Malabar coast, in lat. 10° 12′ N., built on the Aycotta river, seems to have been one of the most ancient capitals of Malabar, and in some of the ancient copper deeds appears to have been called Muyiri-Kodu, the classical Muziris (?).—*Horsburgh; Yule, Cathay.*

CRANGONIDÆ, a family of Crustaceæ belonging to the division Decapoda Macroura. The type of the family is the common shrimp, Crangon vulgaris. See Crustaceæ.

CRANI. ANGLO-HIND. A Christian copyist or clerk in a public office, generally of mixed European and native descent. The term may be a mispronunciation of Karana, by which the Kayet'h (Kayast'ha) or writing caste is designated in Bengal. The word Krani has begun of late years to be considered decidedly dyslogistic. In India, Kayet'hs are now never called Khaja. In Mahomedan countries, however, the term Khaja is still applied to writers and teachers. Dr. Shaw says of the Moors in Barbary, 'The Hojas suspend their inkhorns in their girdles' (p. 227); and Lady Montagu says, 'The monastery is now belonging to a Hojia, or schoolmaster.'—*Letters*, p. 176; *Elliot, Supp.*

CRANIAL DEFORMITIES. Certain tribes alter the shape of the skulls of their children, making use of, for this purpose, various mechanical contrivances, so as by pressure to bring about that outline which comes up to their peculiar ideas of beauty. Captain Cook noticed it in the island of Ubetea; Marsden mentions it at pp. 44, 45 of his Hist. of Sumatra. In the Narrative of the Voyage of Her Majesty's Ship Rattlesnake, Macgillivray mentions (1852) having seen some skulls of children at Cape York, altered into quite a conical shape by a constantly-applied manual compression of their mothers. Dr. Miklucho-Maclay, a countryman, when visiting, in April 1880, the islands of Torres Straits, had an opportunity of seeing, at Mabiak, this strange operation performed on the heads of several lately-born children. During the first weeks of the child's life, the mothers are accustomed to spend many hours of each day in compressing the heads of their infants in a certain direction, with the object of giving them quite a conical shape. Dr. Maclay saw the operation performed daily, and on many children, and fully convinced himself that the deformity which is perceivable in the adults is the result of this manual deformation only. It would appear that among these people we have the only well-authenticated examples of cranial deformities brought about in this way. At Mabiak the deformation is intentional; but Dr. Maclay observed on the east side of New Guinea, numerous cases of distortion of the heads of adult females, in consequence of the practice of their carrying from childhood heavy burdens in large bags, the band of which serves as a handle, and rests across the head a little behind the coronal suture, where a permanent transverse and saddle-shaped depression of the skull occurs. In some cases this depression was not less than from three to four millimetres; and he thinks that this acquired cranial deformity has a great chance of being more or less transmitted from generation to generation by inheritance, and is therefore most worthy of being recorded.

CRAPE.

A small and very handsome tree of both the Indian Peninsulas, of the Circars, and growing in Bengal, and at Saharunpur; common on the banks of rivers, and is much planted by natives. Wood white and hard; the native dhol is often made of it, and it is used for many common purposes, and for carving models. Dr. Gibson says it is not common on the Bombay side. The fruit is hard, globose, and woody, something like that of the wood-apple; the mucilate of the fruit furnishes a cement. The juice and a decoction of its astringent bark are given in intermittent fever and typhus. The bark, macerated in water and mixed with ginger, long pepper, milk, and gingelly oil, is applied as a liniment for drying up sores. An infusion of the bark is also given in flatulency.—*Flor. And.; Voigt; Ainslie; Wight; Gibson; Useful Plants; Cat. Ex.* 1862; *Beddome.*

CRATOXYLON NERIIFOLIUM, *Kurz*, and other species, timber trees of British Burma.

CRAW-FISH. See Crustacea; Palinurus.

CRAWFURD, JOHN, F.R.S., a medical officer of the E.I. Company's army. He entered the service in 1803, and died in 1868. In 1811 he accompanied Lord Minto in his expedition to the conquest of Java, and was afterwards appointed to a native court. In 1817 returned to Britain; and in 1820 he published his History of the Indian Archipelago. He returned to India, and was sent on diplomatic missions to Siam and Cochin-China; and in 1823 he was, on the retirement of Sir Stamford Raffles, appointed Governor of Singapore. In 1826, Lord Amherst appointed him Commissioner in Pegu; and, on the restoration of peace, sent him as Envoy to the Burmese court. In 1827 he returned finally to Britain; and in 1828 he published his Embassy to Siam and Cochin-China; and in 1829 an Account of his Mission to Burma. In 1856 he published a Dictionary of the Malay Archipelago; and he took part in all the discussions of the learned at the ethnological and other societies. His publications were:—History of the Indian Archipelago, Edin. 1820, 3 vols.; Researches in India, Lond. 1817, 2 vols.; Embassy to Siam and Cochin-China; Grammar and Dictionary of the Malay Language, 2 vols. 8vo, Lond. 1851; Dictionary of the Indian Archipelago, Lond. 1857; Journal of an Embassy to the Court of Ava in the year 1827, containing a Description of Fossil Remains by Buckland, 4to, Lond. 1829; View of the Present State and Future Prospects of the Free Trade and Colonization of India, 8vo, Lond. 1829.

CREAM is the Lah and Tung of the Chinese, and Mallai of Hindustan.

CREAM OF TARTAR or bitartrate of potash, deposited in a crude state upon the bottom and sides of casks containing fermenting wine. 57,898 cwt. were imported in 1870 into Britain.

CREED. Mahomedans distinguish between a creed and a sectarian faith. Din is a creed, and Mazhab a faith. See Kalamah.

CREEK, Kyungyee, BURM.; Sherm of the Arabs.

CREMATION was common among the old German tribes, and among the ancient Britons in druidical times; but where Christianity established itself, there cremation ceased. Amongst the Hindus it is called Bhoidagdaha, Samasan, Sumsan. A cremation site is Chihai, Chiwan, Chihani, Mar-ghat.

CRESCENT. This is used by the Mahomedan rulers of Turkey and of Hyderabad in the Dekhan as a symbol on their standards. The Adal Shahi also retained it. The crescent is worn by the Hindu god Siva and by his consort Parvati.

CRESS. American or Belleisle cress has a harsh flavour, but, being of a more robust nature than the garden cress, is easier cultivated on the plains of India. It is raised from seed; the young leaves, cut when young, are used for salads; requires plenty of water.

Garden Cress, Lepidium sativum.

Beluta pola-tali, MALEAL.	Lakshmi narayana, ,,

There are about forty species of Crinum in S.E. Asia, many of them with several synonyms. C. Asiaticum is common in Indian gardens and groves. The flowers are fragrant and ornamental. The Bengali name means interview of ease. The root of the variety toxicarium is a good substitute for squill. The succulent leaves are about two inches broad and two or three feet long. The natives bruise and mix them with a little warm castor-oil, and consider them useful for repelling whitlows and other inflammations on the ends of the fingers and toes. The juice of the leaves is applied to

the outer ear in earache. Its juice is emetic, but very irregular in its action. From two to four drachms of recent bulbs are mild emetic, and are used in Hindustan for the purpose of producing vomiting after poison has been taken, especially that of the Antiaris. The syrup is emetic for children. Dose, a dessert-spoonful, repeated as required. An infusion is a mild and certain emetic. In doses of two drachms, given every twenty minutes, this solution occasions nausea and perspiration. It does not cause griping, purging, or any other distressing symptoms.—*Genl. Med. Top.; O'Sh.; Ainslie; Eng. Cyc.; Roxb.*

CRINUM LATIFOLIUM. *Herb.*

Crinum ornatum, *Bot. Mag.* | Amaryllis latifolia, *Willde.*
Jovanna-pula tali, . . . MALEAL.

A plant common in Southern India. In Tenasserim are species of crinum, which Europeans usually denominate lilies. A very large-petalled species, of which there are two varieties, is much cultivated in gardens.—*Mason.*

CRINUM SINICUM, *Roxb.*, Wan-shu-lan of the Chinese, is a beautiful plant, cultivated in India, Ceylon, Cochin-China, China, and the Moluccas.—*Smith.*

CROCODILE.

Crocodil, ...	GER.	Buaya; Buwaya,	MALAY.

The species known in the E. Indies are,—

Crocodilus palustris, *Less.*, Ganges, Peninsula of India, Ceylon.
C. Siamensis, *Schneid.*, Siam, Gamboja.
C. porosus, *Schneid.*, all rivers.
C. Pondicerianus, *Gray*, Pondicherry.
Gavialis Gangeticus, *Gm.*, Ganges.

The crocodiles are the largest of the reptiles. They are present in all the larger rivers of the Peninsula, the Cauvery, Kistna, Godavery, and their feeders; also in the Indus and its feeders; in the Ganges and its feeders; in Ceylon; in the Irawadi and its feeders; and in all the rivers of the Malay and Philippine Archipelago. The Malays of the Peninsula reckon three species,—the labu or gourd, the kutak or frog, and the tambaga, or copper crocodile. That found in Sumatra and Java, Celebes, Borneo, and the Moluccas, is C. porosus; but there is another in the rivers of Borneo, formidable by its size and rapacity, partaking of the character of the biporcatus and the garial of the Ganges (Crawfurd, p. 10). Crocodiles are in every creek, in every river, in the Sunderbuns, varying in size from a span in length to 18 or 23 feet. They are usually seen lying on the surface of the black mud, basking in the sun; they sleep very soundly, for a steamer may be going at full speed, and making the usual splash and noise, passing within ten paces of a sleeping crocodile, without disturbing their slumbers. To a casual observer they resemble mud-covered logs of wood; and it is not until the large square glittering scales, which are of exceeding strength and beauty when closely examined, and the elevated and doubly dentilated ridge or crest that runs along either side of the tail, become visible, or are seen to glisten in the sun, that the shapeless mass is found to be a fierce, carnivorous, and dangerous animal. The Gangetic garial is not seen in the Sunderbuns; it appears to love the sweet and, comparatively speaking, quieter waters of the upper rivers of India and their clean sand-banks, where they may be seen lying with their mouths wide open, but for what purpose it is difficult to divine, unless it is to get rid of numerous small red filamentous worms that cluster about their fauces. The lower jaw being prolonged backward beyond the skull, causes the upper jaw to appear moveable, which it only is when accompanied by the whole of the skull. A small brown bird has been seen to alight upon the tongue of an open-mouthed crocodile, and pick the worms from the throat as it lay upon a sand-bank in the Ganges. It is generally believed that the snubbed nose crocodile always remains in fresh water; but such is not the case, as they are found all along the Chittagong and Arakan coasts,—never far from the shore, it is true, but still in *bona fide* salt water, where they are as dangerous as sharks. In the rivers of the delta of the Ganges, where they flow through the cultivated portions of the country, stakes are driven into the bed of the river at the watering places or ghats opposite to the villages, where the inhabitants may bathe in security, and draw water for domestic purposes; but even this precaution is not always sufficient to ward off the attacks of the fiercer crocodiles. The crocodile finds no difficulty, when pinched by hunger, in turning the flank of the stakes, and taking up his post within the enclosure, where he silently awaits his prey. A surveyor on the banks of the Goraee was witness to a shocking occurrence in connection with these enclosures. A young Hindu girl about 14 years old came to fill a pitcher with water, and had hardly put her feet into the water, when a crocodile, which had been lying in wait inside the enclosure, rushed at the poor girl, seized her in its formidable jaws, scrambled up the banks of the river, holding the shrieking, struggling girl well up in the air by the middle of her body, and plunged heavily into the river outside of the stakes. A smothered scream, a ripple upon the water, a few bubbles, and the frightful scene was closed. A more daring attack by a Sunderbun crocodile than even the above, occurred at Hoolna. A gang of ironed convicts were being inspected by the magistrate prior to their being sent off to another and a more distant jail. The men, numbering with their guards about fifty, were drawn up in line on the raised embankment or levee of the river; the examination was proceeding, when a crocodile rushed up the bank, seized a manacled prisoner by the legs, dragged him from the ranks, and in a moment, and before any assistance could possibly be rendered, plunged into the river and disappeared. The Peer-puker at Pundooa, in Sind, is a large tank, forty feet deep and 500 years old. The most remarkable tenant of this tank was a tame crocodile, called Fatteh Khan, which answered the call of a fakir living upon the embankments. On summons, the monster would show itself upon the surface, and keep floating for several minutes. Captain von Orlich saw thirty crocodiles in a tank near Kurachee, which at the call of the fakir instantly crept out of the water, and, like so many dogs, lay in a semicircle at the feet of their master. In Colonel Tod's time there were two crocodiles familiar to the inhabitants of Udaipur, who came for food when called. He often exasperated them by throwing an inflated bladder, which the mon-

sters greedily received, only to dive away in angry disappointment. On one of these a Rajput chief affirmed he had ventured to swim. Portions of crocodiles have been discovered fossil in the Siwalik Hills, and in Burma. In India the crocodiles are often called alligators; but the alligator belongs to tropical and Southern America, where they are styled also cayman, jacar.

In Egypt the crocodile was sacred to Typhon and to the god of Papremis.

Herodotus (ii. p. 69), after describing the honours paid to the sacred crocodile by the Egyptians, adds: 'But the people who live round about Elephantiné even eat them; they don't think them sacred.' In Siam the flesh of the crocodile is sold for food in the markets and bazars. The Singhalese believe that the crocodile can only move swiftly on sand or smooth clay, its feet being too tender to tread firmly on hard or stony ground. In the dry season there, when the watercourses begin to fail and the tanks become exhausted, the marsh-crocodiles have occasionally been encountered in the jungle, wandering in search of water. During a severe drought in 1844, they deserted a tank near Kornegalle, and traversed the town during the night, on their way to another reservoir in the suburb; two or three fell into the wells, others, in their trepidation, laid eggs in the streets, and some were found entangled in garden fences and killed. Generally, however, during extreme drought, they bury themselves in the mud, and remain in a state of torpor till released by the recurrence of rains. At Arne-twoe, in the eastern province of Ceylon, whilst riding across the parched bed of the tank, Sir J. E. Tennant was shown a recess, still bearing the form and impress of a crocodile, out of which a crocodile had been seen to emerge the day before. They are said to eat only living creatures, but the dead bodies in the Ganges are also said to be eaten by them. A curious incident occurred in Ceylon some years ago on the Maguruganga stream, which flows through the Pasdun Corle to join the Bentotte river. A man was fishing seated on the branch of a tree that overhung the water, and, to shelter himself from the drizzling rain, he covered his head and shoulders with a bag, folded into a shape common with the natives. While in this attitude, a leopard sprang upon him from the jungle, but, missing its aim, seized the bag and not the man, and fell with it into the river. Here a crocodile, which had been eyeing the angler in despair, seized the leopard as it fell, and sank with it to the bottom.

The garial of the Ganges is supposed to be the largest of the living saurians. The measurement of the largest mentioned by Messrs. Dumeril and Bibron is given at 17 feet 8 inches. The garial abounds in all the great rivers of Northern India. It is found in the Indus, from its delta northwards to near Attock, and up the Panjab rivers for a considerable distance, where it is most abundant.

Major Court mentions that as canoes were paddled along the Moosee river in Palembang, he saw, on two occasions, crocodiles raise their heads out of the water near the boat's side, and attempt to seize one of the paddlers. The boatmen escaped their grasp by moving away. During the time he was at Palembang, seventeen paddlers were carried away by crocodiles. Two gentlemen coming in a small boat up the river to pay him a visit, had provided themselves with a basket of provisions for their journey. On their way, a crocodile raised its head from the water; the paddlers shrieked, and fortunately escaped, but the basket of provisions became the prey to its voracity.—*Letter from Gooneratne Moodelliar, Interpreter of the Supreme Court*, 10th January 1861; *Cal. Rev.; Jo. B. A. S.; Low's Sarawak*, p. 83; *Tennant's Ceylon*, p. 288; *Court's Palembang; Adams.*

CROCODILE ROCK, a dangerous rock 16 miles due east of Cape Comorin.

CROCODILIDÆ, the crocodile tribe, a family of Saurians, of the order Emydosauri, which includes also the family Gharialidæ, comprising the largest living forms of that order of reptiles. Dumeril and other naturalists distinguished the family by the appellation of Aspidiot (shielded) saurians, while many modern zoologists have considered them as forming a particular order. See Crocodiles.

CROCUS, in the arts, a peroxide of iron, used as a polishing material.

CROCUS SATIVUS. *Linn.* Saffron, Crow saffron.

Keysur, Kangan mundi, ,,	Kunkuma puvoo, . Tel.
Kongs, ... Kashm.	

A native of Asia Minor, naturalized in England, France, and many other parts of Europe, and cultivated in Persia and in Kashmir, in one small tract at Pampur, not far from the capital. The saffron is exported both to south and north from Kashmir. Vigne says it goes mostly to Yarkand; and Cayley mentions that, in 1867, 5½ maunds reached Leh, which would be worth at Yarkand Rs. 8640. The saffron of commerce consists of the dried stigmata of the flower. These are picked out, dried on paper, either in a kiln or by the sun. If compressed into cakes, it is called cake saffron. Hay saffron is what is usually met with, and it consists of the stigmas, each about an inch and a half long, brown-red, the upper part flattened, widened, and cleft; the lower hair-like and yellowish. The odour is fragrant, taste bitter but agreeable. Saffron tinges the saliva yellow. Mr. Pereira informs us that one grain of good saffron contains the stigmata and styles of nine flowers, so that one ounce of saffron is equal to 4320 flowers. Cake saffron, as now met with, contains none of the real article, being prepared from the florets of the safflower (see Carthamus), made into a paste with gum-water. Dr. Honigberger mentions that Crocus sativus is monopolized by the Kashmirian government, and that the hakims of the Panjab use saffron in melancholy, typhus fever, enlargement of the liver, and retention of urine.—*O'Sh.* p. 654; *Honigb.; Royle; Stewart; Birdwood; Waring.* See Saffron.

CROCUS THIBETANUS. *Smith.* Tsang-hung-hwa, Chinese. A saffron of Tibet.—*Smith.*

CROMLECH is a word applied by the British to widely different structures. It is derived from the Keltic word Krom, crooked or curved, and Lech, a stone. In Brittany they are known as the Grottes aux fées, also the Roches aux fées. Its correct application is a circle of upright stones,

like the 'Hurlers' and 'Nine Maidens' in Cornwall. The cromlech of the British antiquarian is the same as the Welsh and English 'quoit,' such as Arthur's quoit or coetan (Coetne Arthor) near Criccieth, Lanyon quoit and Chun quoit and others in Cornwall, Stanton Drew quoit in Somersetshire, the Kitts koty or quoit near Maidstone, and the Coit-y-enroc in Guernsey, all of them circles of upright stones. Professor Sven Nilsson, however (on the Stone Age, p. 159), defines the English cromlech as synonymous to the French dolmen, the Scandinavian dös, and the dyss of Denmark, consisting of one large block of stone supported by some three to five stones arranged in a ring, and intended to contain one corpse only, several of these dorsar being sometimes enclosed in circles of raised stones. Following, however, the nomenclature given by the late Dr. Lukis, we cannot be far wrong in assigning the word cromlech to all elaborate megalithic structures of one or more chambers, in which category the passage graves may be included.

The dolmen (Dola, table, Moen, a stone) is, as its name implies, of different structure. The cromlechs of Jersey and the adjacent islands partake of the character of the French grottes aux fées, the faity's grotto, as well as the Gangrifter, the gallery tombs of the Swedes, the Jettestuer or chambered tumuli of the Danes, and the German Hunenbetten.

In China the chambered tumuli associated with megalithic avenues have attained their greatest development. The great tomb (the Ling or resting-place of Yung Lo of the Ming dynasty), thirty miles from Pekin, consists of an enormous mound or earth barrow covered with trees, and surrounded by a wall a mile in circumference. In the centre of the mound is a stone chamber containing the sarcophagus, in which is the corpse. This chamber or vault is approached by an arched tunnel, the entrance to which is bricked up. This entrance is approached by a paved causeway, passing through numerous arches, galleries, courts, and halls of sacrifice, and through a long avenue of colossal marble figures, sixteen pairs of wolves, kelins, lions, horses, camels, elephants, and twelve pairs of warriors, priests, and civil officers.

The tombs of the Hova race of Madagascar consist of stone vaults, made of immense slabs of stone, flat inside, forming a subterranean grotto. They also erect stone pillars similar to the menhir. The supposed aborigines of Madagascar were the Vasimba, whose tombs are small tumuli or cairns, surmounted by an upright stone pillar. The cromlech or trilithic altar, in the centre of all Druidic monuments, is supposed by Tod to be a torun or triumphal arch, sacred to the sun-god Belenus.

In 1881, Lieut. Conder saw 400 cromlechs in E. Palestine, in seven central localities. In addition to the cromlechs, several menhirs or standing stones were found, and ancient stone circles in connection with both classes of monuments. Among the sites explored were Heshbon, Elealeh, Medeba, Baal-Meon, Nebo, and Pisgah, the hot springs of Callirrhoë Rabbath Ammon; he found the place of the worship of Baal-Peor and the site of Bamoth-Baal; he discovered the method by which the enormous stones used at Arak el Emir were brought up from the quarries.—*Lt. Oliver, R. A. F. R. G. S. Quarterly Journ. of Science*, April 1870. See Cairn.

CROOM. BENG. A dip, a ravine, a valley, a hollow.

CROPS. On fertile lands susceptible of irrigation, British India enjoys two crops during the year, one called the Kharif, or rain crop, sown in June and reaped in October; the other sown in October, and reaped in March and April, called the Rabi, or cold-weather crop. The latter, embracing the months which approximate in temperature to that of the season of cultivation in colder countries, corresponds with them also in the nature of the plants cultivated, as, for instance, wheat, barley, oats, and millet; peas, beans, vetch, tares, chick-pea, pigeon-pea, and lentils; tobacco, safflower, and succory; flax, and plants allied to mustard and rape, as oil-seeds; carrot, coriander, and cumin, and other seeds of a similar kind, as ajwain, sonf, soya, aneesun. In the rainy season, a totally different set of plants engages the agriculturist's attention, as rice, cotton, indigo, and maize, with sorghum, pulse, joar, koda, most of the tropical legumes, as well as several of the cucumber and gourd tribes, together with the sesamum for oil, and varieties of the egg-plant as a vegetable. The sunn and sunnee, two cordage plants, are also cultivated at this season.

Dr. Royle gives the following arrangement of the countries of which the plants will grow in the different parts of India:—

Tropical and East Indian islands, tropical Africa, Brazil, Guiana, W. Indies, and Florida.	Travancore, Cochin, Malabar, Ceylon, Malay Peninsula, Chittagong, Bengal, Lower Assam.
East and west coast of Africa.	Coromandel coast, Northern Circars, Konkan.
S. States of N. America, Egypt, n. of Africa, Syria.	Gujerat, Behar, Doab, Dehli, Malwa.
Mexican highlands, lower mountains of Spain.	Mysore, hilly ranges in Dekhan, Rajputana.
S. of Africa, extra tropical N. Holland, S. America beyond lat. 23½° S.	Saharunpur and Northern Doab.
Mediterranean region.	Dehra Doon, and Himalayan valleys to moderate elevations.
Chino-Japanese region, Middle Andes, Peru, and mountains of Brazil.	Neilgherries, Upper Assam, Himalayan mountains.
North of Europe, north of Asia, and North America.	Himalayan mountains, regions of oaks and pines.
Arctic regions, mountains of Europe, elevated Andes.	Himalayas above region of forest.

The Tamil-speaking countries in the S.E. parts of the Peninsula have the benefit of the N.E. monsoon; their principal rice crop, called Karupanta, is sown during the wet season; a lesser crop is sown in the spring and reaped in the rains.

Penicillaria spicata, in the Cuddapah district, is usually sown mixed with nine other seeds. Dolichos uniflorus, D. Sinensis, Phaseolus mungo, Cicer arietinum, Cajanus Indicus, Lablab vulgaris, Sesamum orientale, and Hibiscus subdariffa.

The ragi crop (Eleusina, *species*) is usually sown mixed with Lablab vulgaris, this pulse being put in lines, without reference to the ragi crop, being dropped in a furrow made with the native plough. Mixing crops is of value: it serves the purpose of an alternation of crops, as the plants differ in demands on the soil; the variety increases the chances of success; and, as they ripen at different stages, they give continuous work to the ryot and his family.

56·2 per cent. of the adult male population of British India are engaged in agriculture, the total

being 34,844,000. The number of persons returned as engaged in agriculture and in tending or dealing in animals, is 37½ millions; but besides these, the boys and girls and wives of a household, and many tradesmen and artisans, own land which they cultivate by the aid of the younger members of the family. The farms of India are all small, and the machinery and capital proportionate. The farmer works the soil himself, assisted at times by relatives, labourers being rarely hired. The plough is light and rude, and the draught cattle are in general small; but the fields are ploughed and re-ploughed a dozen times, and freely exposed to the weather. The crops raised are excellent; and no Mahomedan, European, or East Indian has ever been able to compete with the Hindus.

In Mysore, where the ragi and other dry grains occupy about 80 per cent. of the cultivable area, —rice 10 per cent.,—little has been done to provide water for artificial irrigation.

Very good land in Bengal will yield 48 maunds per acre, and in exceptionally good lands 53 maunds. In an ordinary year, in that good land, the range may be 36 to 40 maunds. Ordinarily fair low land in a really good year, from 30 to 36 maunds; and, on an average of ten years, 18 to 24 maunds. Poor or high sandy lands, 18 maunds, or, on an average, 12 to 13 maunds. The average of all classes of land, 15 maunds per acre. (Lieut. Ottley in Mor. and Mat. Pro., 1874–75, pp. 36–37.)

In the Upper Provinces of N. India, the following is the detail of seed sown per acre, and the yield, of the more ordinary crops:—

Grain.	Seed per Acre.	Yield per Acre.	Grain.	Seed per Acre.	Yield per Acre.
Wheat, .	1m.28s.	16m.0s.	Urd, . .	0m.7½s.	6m.0s.
Barley, .	1 10	18 0	Mothi, .	0 6	6 0
Peas, Gram,	1 0	10 0	Makro, .	0 2½	9 0
Sarson, .	0 0½	1 0	Kakun, .	0 2¼	5 0
Kuari dhan,	1m. to 45s.	12 0	Sanae, .	1 0	10 0
Sathi dhan,	1m. to 45s.	12 0	Patua, .	0 0½	0 3
Jarhan, .	1m. to 45s.	12 0	Cotton—Kapas, Radhia,		
Maize, .	0m.7½s.	6 0	Maruva,	0m. 4s.	4 0
Bajra, .	0 2½	7 20	Jethi dhan,	1 20	16 0
Juar, . .	0 7½	7 20	Sawan, .	3m. to 4s.	12 0

One of the most important points for the Indian statesman is to discover other industries than that of the production of food, in order to give profitable employment to the varied capacities of the people. A large addition to the production and manufacture of tobacco, sugar, wool, silk, jute, paper, etc., would have this effect, and this could be obtained without curtailing the supply of food, by the addition of one-tenth to the yield of food crops,—a result that might easily be brought about if greater attention was paid to the cultivation. This would set free an area covering 20 million acres, which would add 200 millions sterling to the general wealth, at the moderate value of £10 per acre, when the crops were converted into a manufactured product by the well-employed industry of the people. To aid in this, further attention to artificial irrigation is needed. The inferior pulses are greatly dependent on rain; but for garden cultivation, as for the vegetables, the poppy, tobacco, and sugar-cane, artificial irrigation is indispensable everywhere, except in low-lying lands near rivers. Every tank should be kept in repair, wells sunk wherever water is to be met with, and manure largely used. Mr. Schrotty says that in the middle of the 17th century the average quantity of rice produced in India from each acre of land was 1338 lbs.; of wheat, 1155 lbs.; cotton, 670 lbs., unpicked, which is equal to 223 lbs. of picked. But the statistics of the 19th century show that the land yields rice now at an average of 800 to 900 lbs. per acre; wheat, 660 lbs.; and picked cotton, 52 lbs. In 1828, certain lands in Central India yielded 128 lbs. of cotton per acre. In Broach, in 1844, the yield was 83 lbs.; and at the present time the quantity produced does not come to above 83 lbs. And the conclusion arrived at is that the land is becoming poor, and unless it gets a portion at least of what is taken from it, its producing qualities will still further deteriorate.—*Carnegy.*

CRORE, or Kror, ten millions. A crore of rupees is equal to one million sterling. The names of the higher numbers, Elliot says, are thus given in the Zabdat-ul-Quanin:—

100 crore = 1 urub.	100 pudum = 1 sunk'h.
100 urub = 1 k'hurub.	100 sunk'h = 1 uld.
100 k'hurub = 1 neel.	100 uld = 1 unk.
100 neel = 1 pudum.	100 unk = 1 pudha.

When Akbar introduced his revenue reforms, he appointed a collector for every crore of dams (*i.e.* Rs. 2,50,000), whom he designated by the title of Amil or Amilguzar; and to that functionary the instructions are directed in the Ayin-i-Akbari; the designation of Crori being of subsequent introduction.—*Elliot.*

CROSS.

Croix, ... Fr.	Salib, ... Pers.
Kreuz, ... Ger.	Cruz, ... Sp.
Croce, ... It.	

The symbol of the circle and the cross, under every variety of circumstance, in Egypt, Africa, Britain, China, Scandinavia, and America, in every age, by every people, from the dawn of secular history to the present hour, has been held by all in the same superstitious veneration, has been honoured with the same distinguishing rites, and has always expressed the same doctrine or mystery. Divine potentiality was sometimes indicated by two or more sceptres arranged at right angles or quadrinally, with the nave of a wheel, or a simple circle, or six or eight round stars, at the point of intersection, with other orbs or ornaments. Osiris by the cross gave eternal life to the spirits of the just. With the cross Thor smote the head of the great serpent. The Muysca mothers laid the children beneath a cross, trusting by that sign to secure them from evil spirits. The cross-cake, says Sir Gardner Wilkinson, was the hieroglyph for civilised land, obviously a land superior to their own, as it was indeed to all other mundane territories; for it was that distant traditional country of sempiternal contentment and repose, of exquisite delight and serenity, where nature unassisted by man produces all that is necessary for his sustentation, and whose midst was crowned with a sacred and glorious eminence,—the umbilicus orbis terrarum,—towards which the heathen in all parts of the world and in all ages turned a wistful gaze in every act of devotion, and hoped to be admitted, or rather to be restored, at the close of this transitory scene. The Crux ansata is the earliest known form of the cross. It is commonly called the key of the Nile, because often seen on Coptic and Egyptian monuments. It was very similar to the Roman letter T, with a roundlet or oval placed immediately above it, and signified hidden wisdom or the life to come. It was used by the Chaldæans, Phœnicians, Mexicans, and Peruvians; doubtless it was intended to denote the solar and terrestrial

spheres. And, subsequently, sovereigns each adopted the circle, associated with it the cross, and this symbol of royalty is in use with every king of Europe. The Chakra in the hands of Brahma, Vishnu, and Siva, is a modification of it. In Egypt and China it was used to indicate a land of corn and plenty; and, when divided into four equal segments, it was the symbol of the primeval abode of man, the traditional paradise of Eden. The cross, says Colonel Wilford (As. Res. x. p. 124), though not an object of worship amongst the Buddhists, is a favourite emblem and device amongst them. It is exactly the cross of the Manichees, with leaves and flowers springing from it, and fruit also, it is said. It is called the divine tree, the tree of the gods, the tree of life and knowledge, and productive of whatever is good and desirable, and is placed in the terrestrial paradise.

The pre-Christian cross is not unfrequently associated with a tree or trees. The sign of the cross began to be used by Christians in the fourth century, and is described by Lactantius as an impregnable fortress to defend those impressed with it, for such the devil cannot approach. The use of the pre-Christian cross, either in the form of the handle cross of the Mediterranean districts, or the swastika ✠ of the Buddhists, was widely spread amongst ancient peoples, and it is in use at the present day over all Buddhist and Hindu countries. Mr. W. King has described many cruciform monoliths at Mungapet, in the Paluncha taluk, on the right bank of the Godavery on the road to Hanamconda, in the Nizam's dominions.—*Journal Bengal Asiatic Society.*

CROSS, ROBERT, a skilled gardener who aided Mr. Clements Markham, C.B., in introducing cinchona trees (1860–1879) and caoutchouc trees (1875) into India from S. America, species of castilloa. He made five journeys to procure cinchona plants.—*Markham, Peruv. Bark.*

CROSSBILL, Loxia himalayana, *Hodgson*, inhabits the pine forests.

CROTALARIA, a genus of plants of the order Fabaceæ, sec. B. loteæ, of which about 40 species are known in India. The fibres of the barks of C. Burhia, C. juncea, and C. retusa are largely used as cordage material. C. juncea yields the sunn of commerce; the C. tenuifolia furnishes the Jubbulpur hemp.—*W. Ic.*

CROTALARIA BURHIA. *Ham. Buch.*

The Crotalaria juncea is cultivated for its fibre in many parts of India. Its fibres make a good strong hemp for cordage, canvas, gunny, and sackcloth, twine and paper. It is sown very thickly at the beginning of the rains, so that it may grow tall and thin, and in favourable soil it grows to 8 or 10 feet high. When it begins to flower, it is cut near the root, tied in large bundles, and immersed in water, putting some weight on it, generally mud, to prevent it from being carried away. After remaining immersed from four to eight days, it is withdrawn from the water, taken by handfuls, beaten on a piece of wood or stone, and washed till quite clean, and the cuticle with the leaves completely removed from the other portion of the plant. Each handful is then piled musket fashion, and left to dry. When perfectly dry, the woody portion, which has been more or less broken, is separated from the fibre by further beating and skaking. From 3 to 6 maunds of fibre are extracted from each bigha of plant. The raw material on the field, as plant, costs from two to four rupees per bigha, according to quality; and the prepared fibre costs from four to ten rupees per maund, according to strength, length, and cleanliness of fibre.—*Roxb.; Royle.*

CROTALARIA LABURNIFOLIA. *Linn.*

C. pendula, *Bert.*	C. pedunculosa, *Desv.*
Muna, ... BENG.	Pedda gili gich-cha, TEL.
Chiri gili gich-cha, TEL.	Manne, ... ,,

Grows from Ceylon to Bengal; has large, bright yellow flowers.—*Voigt; Elliot.*

Grows in Malabar and Bengal. It has bright blue and greenish-white flowers. The juice of its leaves is used in medicine.—*Voigt.*

CROTALIDÆ, a family of reptiles of the order Ophidia, and sub-order Serpentes viperini.

CROTON, a genus of plants of the natural order Euphorbiaceæ. The species of India and the Archipelago are,—C. aromaticum, bicolor, drupacea, iliciodora, joufra, lævigata, lacciferum, microdenia, Moonii, muricatum, nigro-viride, oblongifolia, pavanum, polyandrum, tiglium, urophylla, umbellatum. The seeds and oil of C. polyandrum and C. tiglium are purgative. A species of croton, whose roots are used by the Burmese for a cathartic, abounds in some parts of Burma, especially on the Moulmein hills.—*Mason.*

CROTON AROMATICUM. *Linn.* Wel-kappiteya, SINGH. Abundant in the hotter parts of Ceylon.—*Thw.* p. 275.

CROTON HYPOLEUCUM. *Dalz.* C. reticulatum, *Heyne;* grows in the central province of Ceylon, at 2000 to 3000 feet.—*Thw.* p. 276.

CROTON LACCIFERUM. *Linn., W. Ic.*

Aleurites lacciferus, *Willd.*	Ricinoides aromatica arbor, *Burm.*
Croton foliis ovatis, etc., *Fl. Zeyl.*	Gass-kappiteya, . SINGH.

A native of the East Indies, very common in Ceylon up to 3000 feet; trunk arborescent, with rude and angular branches, and is said to furnish the finest of all the sorts of lac, of a bright red, and also to furnish a brilliant varnish in Ceylon.—*Thw.* p. 275; *Eng. Cyc.* p. 212; *O'Sh.* p. 553.

CROTON OBLONGIFOLIUM. *Roxb.*

C. lævigatum, *Wall.*

Bhutam kusam, SANSK. | Bhutala bhairi, . . TEL.

A small tree not uncommon in S. India and Ceylon. The Telugu name means demon-driver or devil-goad, sticks made of it being carried as a protection against evil spirits. — *Voigt; Elliot; Thw. Zeyl.* p. 276.

CROTON POLYANDRUM. *Roxb.*

Croton Roxburghii, *Wall.*	Croton polyandra, *Roxb.*
Dunti, ... BENG.	Hakni; Hakun, . HIND.
Tha-dee-wa, . . BURM.	Konda amadum, . TEL.

Grows in the Circars, Bengal, and Hindustan, near hills and streams in moist places. Perennial; seeds exactly like those of the castor-oil plant, but much smaller. Esteemed by the natives of India to be a good purgative, one seed bruised with water being given for each evacuation desired. The Burmese cultivate this species of croton, which grows into a thick bush. It is very common also on the banks of the Jumna, where it is called Jumalghota.—*Royle; O'Sh.; Roxb.*

CROTON SANGUISFLUINA, the blood-wood of Norfolk Island; is said to be of little value except for firewood. On an incision being made in the bark, a fluid exudes which is used for marking the convicts' slopes, staining furniture, etc.; and it is a good tonic and astringent, strongly resembling dragon's blood (Dam-ul-ukwain).— *O'Sh.; Keppel's Ind. Arch.* ii. p. 282.

CROTON SCABIOSUM. *Bedd.* A small tree on the Nullaymallay mountains, Kurnool district, where it is most abundant about the Yerrachalma (2000 to 3000 feet elevation); its very silvery appearance renders it highly ornamental.—*Beddome, Fl. Sylv.* p. 283.

Kadel-avanaku, . ,,	

This small tree grows to 15 or 20 feet high in most parts of India, Assam, and the Moluccas. Every part of the plant is purgative, but the fruit or seeds are dangerously so, and in the medicinal practice of Europe they are never given, though in India native practitioners separate the embryo, and give it internally. The seeds yield a powerfully cathartic oil, by grinding the seeds, placing the powder in bags, and pressing it between plates of iron. The oil is then allowed to stand 15 days, and afterwards filtered. The residue of the expression is saturated with twice its weight of alcohol, heated on a sand-bath from 120° to 140° Fahr., and the mixture pressed again; the alcohol is distilled off, the oil allowed to settle, and filtered after a fortnight. One seer (2 lbs.) of seed furnishes 11 fluid ounces of oil,—6 by the first process, 5 by the second.

Croton Oil. Napala oil; Tiglii oleum.

Dund, also Batu, . ARAB.	Dund, ... PERS.
Kannakoh, . . . BURM.	Nirvalam yennai, . TAM.
Jumalgota-ka-tel, HIND.	Naypalam nuna, . TEL.
Bori, ... MALAY.	

This oil is prepared by grinding the seeds of C. tiglium, placing the powder in bags, and pressing between plates of iron. The oil thus expressed is allowed to stand about a fortnight, and then filtered. It is of an orange-yellow colour, is soluble in alcohol, and reddens litmus paper powerfully. It is an exceedingly powerful cathartic. It has a heavy oily smell, and is very irritating to the skin. It is procurable in most Indian bazars, often adulterated with castor-oil and other fixed oils. The seeds are administered by native doctors; and when the operation is excessive, they give the patient the juice of the sour lime, which is said to counteract the effect of the croton seeds.

Croton Seed.

Hab-ul-maluk, . ARAB.	Cheraken, . . . JAV.
Pa-tau, ... CHIN.	

The seeds of C. tiglium are about the size of a small marble, of a convex shape on one side, and bluntly angular on the other, enveloped in a thin shell.—*Faulkner; Ainslie; Royle; Roxb.; Voigt; O'Sh.; Lindley; Jur. Rep.*

CROTON VARIEGATUM, an ornamental shrub, commonly called the laurel; the leaves are variegated. There is a willow leaf variety equally ornamental and handsome; the plants thrive best in large pots or tubs, shaded from the noonday sun.—*Jaffrey; Graham; Thomson's Records.*

CROWS.

Corneille, ... FR.	Cantare, ... IT.
Krahen, ... GER.	Kaka, . . SANSK., TAM.
Kowa, ... HIND.	Ciurvo, Barra, . . . SP.

Conostoma œmodium, one of the Rasorial Crows, of the sub-family Glaucopinæ, inhabits the northern region of Nepal, and in Celebes; and on the Malabar coast black and white crows occur, also occasional albinos. The crow is reckoned a bird of ill-omen in India; still Malabar women are sometimes named Kaka, the name in that dialect, as well as in Sanskrit, for the crow. The females

of Malabar are, more than others, called after animals. Mani, the crocodile, is a name among them. In Christian countries, Barbara, Ursula,—Barbarian and Little Bear,—are not unusual. The crows incubate chiefly in March and April. The common crow of India is of unwonted familiarity, impudence, and matchless audacity. Mr. Sirr mentions a crow seizing bread from a toast-rack, and another taking food from a dog while eating. Sir James E. Tennant mentions that one of these ingenious marauders, after vainly attitudinizing in front of a chained watch-dog, that was lazily gnawing a bone, and after fruitlessly endeavouring to divert his attention by dancing before him, with head awry and eye askance, at length flew away for a moment, and returned bringing a companion, which perched itself on a branch a few yards in the rear. The crow's grimaces were now actively renewed, but with no better success, till its confederate, poising itself on its wings, descended with the utmost velocity, striking the dog upon the spine with all the force of its strong beak. The dog started with surprise and pain, and the bone he had been gnawing was snatched away by the first crow the instant his head was turned. The Corvus culminatus, or large black crow of India, may be constantly observed wherever there are buffaloes, perched on their backs, and engaged, in company with the small minah (Acridotheres tristis), in freeing them from ticks. —*Tennant's Ceylon; Sirr's Ceylon.* See Corvidæ.

CROZOPHORA PLICATA. *Juss.*

Croton plicatum, *Vahl.*	C. tinctorium, *Burm.*
Khoodi-okra, . . BENG.	Subali, ... HIND.
Indian turnsol, . . ENG.	Linga maram, . . TAM.
Saha-devi, Nilak-rai, HIND.	Linga manu, . . TEL.

Common in all the south of India, in rice-fields, flowering in the cold weather. Its value in leprosy is asserted. The juice of its green leaves dyes blue.—*Voigt.*

CRUCIBLE. Musa, TEL. In India, these are made by coppersmiths, etc., for their own use, of pipeclay or other suitable clay, beaten up for a considerable time on the anvil with burnt paddy husk; being formed, they are left to dry and are then ready for use. Mr. Rohde had seen a crucible formed for melting silver, simply by spreading wet clay on a bit of rag, which was immediately placed on the fire, which again was urged by the breath through a bamboo tube.—*Rohde, MSS.*

CRUCIFERÆ. This order of plants is so called from the four flower-leaves (petals) being disposed, more or less distinctly, in the form of a cross, as in the the wallflower, cabbage, and cress. Nearly all are herbaceous; none are poisonous, though they are generally a little acrid; they are especially antiscorbutic.

CRUDE, a commercial term applied to raw and unrefined products, as crude camphor, crude tartar, crude midsummer root.

CRUDIA ZEYLANICA. *Thw.* A large tree, of Galpaata, near Caltura.—*Thw.*

CRUSADES, military expeditions made from Christian countries in the 11th to 13th centuries, to recover the sacred buildings famed from the first origin of Christianity. At the time of the first crusade, the Mahomedan power was shared between those of Arab and those of Mongol origin. The Arab movement had been stayed by their defeat by Charles Martel, on the banks of the river Loire, and they had settled down in the countries which they had conquered, advancing in civilisation and cultivating science. But later, the fresh converts to Mahomedanism, the Seljukian Turks and Tartars, issued from Central Asia, carrying ruin in their path. Asia Minor was lost to the Greek empire, and Constantinople itself imperilled, when Peter the Hermit roused Christian Europe to recover the Holy Sepulchre at Jerusalem. It was subsequently, in 1187, lost again by the conquest of Salah-ud-din; and at the time that St. Louis of France took the cross, Chengiz Khan with his followers had so ruined the whole tract from the Caspian to the Indus, that the succeeding centuries have not sufficed to restore it. The right wing of this enormous host was bringing ruin on the Slav nations of eastern Europe, while its left wing was menacing Baghdad and Syria. Poland and Hungary were invaded in 1258, and they had entered Bohemia and Moravia. Frederick II., in 1229, after Salah-ud-Din's death, recovered the Holy City, but it was again finally lost to the Kharasmian Turks, who destroyed every Christian whom they found. Not long after, the Christians were again defeated at the battle of Gaza, which was fought in company with Malik Mansur, the ruler of Damascus, against the king of Egypt. St. Louis made two crusades, in the first of which he was completely defeated. The Ayubi are descendants of Salah-ud-Din. The family are known as the Hasan Keif, and occupy the district of Shirwan. In Mr. Rich's time, the Bey was powerful and independent. See Acre; Eyubi; Kafra.

CRUSTACEA are the Crustaces of the French, and the Krustentheire of the Germans. The common crab, the lobster, and crayfish, the common shrimp and the water-flea, may be taken as types of different sections of this family.

Cancer is a genus of short-tailed crustacea, and is the type of the family Canceridæ of Linnæus; it includes a large number of species of the genus Cancer; and the term Crab, which is a translation of it, is in common parlance applied to the great bulk of the brachyurous crustaceans. Dr. Leach restricted the genus Cancer to the form of Cancer pagurus, *Linn.*, the large eatable crab of British coasts, which was, when he defined the genus, the only species known. For the Blood-spotted Crab of the Asiatic seas (Cancer maculatus, *Linn.*, etc.), and the Coralline Crab (Cancer corallinus, *Fabr.*), Dr. Leach instituted the genus Carpilius, characterized by the existence of a single tooth on the border of the carapace, and by the tridentated front; and for the 'Eleven-toothed Crab' (Cancer undecimdentatus, *Fabr.*), Egeria is a genus of brachyurous decapod crustaceans established by Dr. Leach. E. Indica, in size, general form of the body, and length of the feet, bears a great resemblance to Inachus scorpio; but, besides generic differences, the arms are rather short and slender. It inhabits the Indian seas. The Hermit Crabs are very common; and the nimble little Calling Crabs, Gelasimus tetragonon, *Edw.*, G. annulipes, *Edw.*, G. Dussumieri? *Edw.*, scamper over the moist sands, carrying aloft their enormous hand, sometimes larger than the rest of the body. They are of the E. and W. Indies. They bore holes for themselves in the black soil of the coasts. On some coasts of the East Indies the sands at ebb-tide swarm with them. They are

the food of the inshore sea fishes, and some of them are the best bait that can be used; and one species of Gelasimus is common in the cassava fields of Brazil.

Several small crabs are parasites, or take shelter within other animals. Cymothoe, a genus of the Indian Ocean, is too imperfectly organized to catch its own food, and the species take up their home in the mouth cavity of fishes of the genus Stromatea, where they snap up all that comes within their reach; Cymothoe stromatei is found inside the mouth of Stromatea nigra on the Coromandel coasts; another species has been found in the mouth of a chetodon, and inside that of a cyprinus of the Amur, and the Ceratothoa exoceti has been found within the mouth of the flying fish.

Ostracotheres tridacnæ, *Ruppell*, is a little crab which lives within the great tridacna mollusc, whose immense shell serves in European churches as a vessel for holy water. The crab takes shelter in the branchial chamber. Conchodytes tridacnæ inhabits the Tridacna squamosa; the Conchodytes meleagrinæ lives in the shell of the pearl mussel; the Epichtys giganteus lives on a fish of the Indian Archipelago; the Ichthyoxenus Jellinghausii lodges in a fresh-water fish of the island of Java. Pinnetheres is a genus of small crabs which live within mussels, amongst others the Avicula margaritifera or pearl mussel, and in the holothurians of the Philippine Islands, and Pin. Fischerii is of New Caledonia; one species lives within the Chama.

Again, species of Pagurus, about 30 in number, all lodge in deserted shells, and change their dwelling-places as they grow older. They are known as the Hermit Crabs. Darwin thinks (p. 544) that certain species always use certain kinds of shells. Their abdomen is too soft to be exposed. In the Keeling islands, the large claws of some of the hermit crabs are beautifully adapted, when drawn back, to form an operculum to the shell.

Crustacea, occupying deep waters in places to which light is inaccessible, are found without eyes. Three species of Amphipoda and one Isopoda, from Kaiapai, New Canterbury, New Zealand, were found in this state.

The Birgus latro of the Keeling islands is famed for the skilful manner in which it tears off the husk and opens the cocoanut, in order to extract the medullary matter of the interior. It is a kind of intermediate link between the short and long tailed crabs, and bears a great resemblance to the Paguri. Darwin observed that they live on the cocoanuts that fall from the trees. The story of their climbing these palms and detaching the heavy nuts is mere fable. Its front pair of legs are terminated by very strong, heavy pincers, the last pair by others narrow and weak. To extract the nourishment, it tears off the husk, fibre by fibre, from that end in which the three eyes are situated, and then hammers upon one of them with its heavy claws until an opening is effected. It then, by its posterior pincers, extracts the white albuminous substance. It inhabits deep burrows, where it accumulates surprising quantities of picked fibre of cocoanut husks, on which it rests as on a bed. Its habits are diurnal, but every night it is said to pay a visit to the sea, perhaps to moisten its branchiæ. It is very good to eat, and the great mass of fat accumulated under the tail of the larger ones, sometimes yields, when melted, as much as a quart of limpid oil. They are esteemed great delicacies, and are fattened for the table.

Several small crabs are destructive to the growing grain crops of the tropics. The rice plant grown on the bhulls at the mouth of the Indus, is much cut down by a small black sea crab, called by the people Kookee. Without any apparent object, it cuts down the growing grain in large quantities, and often occasions much loss.

The Land Crabs are migratory, and often take long journeys. They live in the interstices of rocks, in the clefts of trees, and bore holes in the ground.

The Eriocheir Japonicus of Manchuria is remarkable for its hairy hand. A curious little crab of the Malacca Straits has been called by Mr. Bate, Sphærapœia Collingwoodii, because of its taking in sand to eliminate its food, and ejecting the sand in the form of a pill. The species is gregarious. The Phyllosoma are styled Glass Crabs. The large Spider Crab of the Japanese islands, Inachus Kæmpferi, has been measured 11½ feet from tip to tip. It is of a bright yellow, with crimson patches.

The Ocypode ceratophthalmus of Ceylon burrows in the dry soil, jerking out the sand to a distance of seven feet. Of the Painted Crabs, the Crabes peintes and Crabes violets of the French, Grapsus strigosus, *Herbst.*, is distinguished by dark red marks on a yellow ground. They are found on the reef to the south of Colombo harbour. The Paddling Crabs, Neptunus pelagicus, *Linn.*, and N. sanguinolentus, *Herbst.*, have their hind pair of legs terminated by flattened plates, to assist them in swimming.

The larvæ of the crab are termed Zoeæ. The crab has periodic moultings, during which it escapes from its shell a soft, harmless creature, incapable of exertion or resistance, and would become an easy prey to any of the devourers so numerous in the sea, were it not that so soon as the denudation is complete, a stout crab of the same species takes care of it to the best of its ability, until a new shelly case grow, and it is enabled again to protect itself, and present a strong back to its foe. If the sentinel be removed, another will be found to have taken its place after the next tide, and this will be repeated many times in succession. While the crabs are young, the change of shell is supposed to take place frequently, and there is probably a time when the changes cease. Crabs and other crustacea are said to cast away their limbs when alarmed or frightened, as on the occasion of a thunderstorm, or on the firing of a cannon, and this is believed to be true. When a claw has sustained any injury, it is cast off by the animal, and a new one in due time takes its place. Most land crabs are carrion feeders; a few are vegetarians. Swimming crabs, Polybius species, are mostly predacious.

The place of the crabs amongst the crustaceæ is well defined.

Latreille, Desmarest, Leach, the two Milne-Edwards, De Haan, Dana, Heller, and Stimpson, have been among the most prominent systematic writers on the Crustacea; and of the naturalists of the present day, M. A. Milne-Edwards of Paris, Mr. Miers of the British Museum, M. de Man of Leyden, and Prof. Wood-Mason of Calcutta, have paid

especial attention to the Crustacea of the Indian and Malayasian regions.

Class, Crustacea.

Order, Decapodes.

1st Division, Podophthalmien, *Edw.*

Fam. Oxyrhinques. *Tribe*, Macropodes.

Egeria arachnoides, *Edw.*, Coromandel coasts.
E. Herbstii, *Edw.*, Asiatic seas.

CRUTTENDEN, G. S. J., an officer of the Indian Navy, author of a Report on the Mijjartheza Tribe of Somali, inhabiting the district forming the N.E. point of Africa; also of a Memoir on the Western and Eastern Tribes inhabiting the Somali Coast of N.E. Africa; also of a Journal of an Excursion to Sanaa, the capital of Yemen; Memoir on the Edo, or Tribes of the N.E. Coast, Somali Coast of Africa, Bombay, 1848. He was largely employed in surveying parts of the coasts of the south of Asia. He wrote a journal of his excursion into Dahar.—*Bomb. Geo. Trans.* 1844-46, 1847-49; *E.I. Marine Surveys.*

CRUZCOOL, an opening or strait separating Mascal Island from the Chittagong coast, north of the White Sandcliffs, which are in lat. 21° 17′ to 21° 24′ N.—*Horsb.*

CRYPSIRHINA VARIANS, a curious bronze-coloured magpie, common to Siam and Java. C. varians is the Phrenotria temia, *Horsfield*, and seems to be of common occurrence in the Tenasserim Provinces, where its presence was first remarked by the late Dr. Helfer.—*Wallace; Blyth.*

CRYPTOCARYA, a genus of plants, all of them trees, of the natural order Lauraceæ. C. amygdalia, *Nees*, of Patgong; C. floribunda, *Nees*, of Sylhet; C. Griffithiana; C. membranacea, *Thw.*, of Saffragam, Ceylon, up to 2000 feet; C. Wightiana, *Thw.*, of Ceylon; C. Stocksii, *D. C.*, Peninsula of India; C. Neilgherriensis, *D. C.*, Peninsula of India, are known species.—*Voigt.*

CRYPTOCARYA FLORIBUNDA. *Nees.*
C. Wightiana, *Thw.* | Golu-mora of . CEYLON.

This very large, fine tree is not uncommon in the moist forests of the Western Ghats and in Ceylon, at elevations from 2000 up to 5000 feet; also in the Tinnevelly and Travancore ghats, Malabar and S. Canara. In Ceylon its timber is considered valuable for building purposes.—*Thw.; R. Br.; Wall.; Beddome.*

CRYPTOGAMIC PLANTS of the S. and E. of Asia have been little studied. They include acrogens, bryogens, thallogens, and protophytes; ferns, rushes, mosses, fungi, lichens, seaweeds, etc.; and from the lichen tribe and from the algæ, fungi, mosses, and ferns, man derives nutriment and valuable products. Some form articles of commerce, particularly as food-plants, affording gelatinous and amylaceous matter, and being useful in medicine and the arts. The flowerless cryptogamic plants include the

seaweeds, Porphyra, *sp.*, laver; Ulva, *sp.*, green laver; Laminaria, *sp.*, tangle; Alaria, *sp.*, badderlocks; Iridæa, *sp.*, and Rhodymenia, *sp.*, dulse. Ceylon moss is Plocaria candida, and Pl. tenax is Chinese moss; Gracillaria helminthocorton is Corsican moss, also the Laurencia obtusa. Australian moss is the Eucheuma speciosum; the edible seaweed of Valparaiso is Durvillæa utilis; Sphærococcus lichenoides is found on the British coasts. Irish moss is Chondrus crispus and Gigartina mamillosa, and Cetraria Islandica is the Iceland moss. Several of the lichens furnish valuable dyestuffs, particularly species of Lecanora, Rocella, and Borrera asneh.—*Food*, 105; *Simmonds.*

CRYPTOLEPIS, a genus of plants belonging to the natural order Asclepiaceæ. C. elegans, C. grandiflora, C. pauciflora, C. reticulata, and C. Buchananii occur in India.—*W. Ic.; Voigt.*

CRYPTOMERIA JAPONICA. *D. Don.*
Cupressus Japonica, *Thunb.*

The suji, or Japan cedar, a beautiful and greatly admired tree of Japan and N. China, is a species of pine not unlike the araucaria of Norfolk Islands and Brazil. When growing luxuriantly, it is highly ornamental, rising from the ground as straight as a larch, and sending out numerous side branches almost horizontally from the main stem, which again droop towards the ground in a graceful and weeping manner. It is the finest of all the trees of Japan, rising to 60 and 100 feet high, and five feet in circumference at three feet from the ground. It is seen everywhere in the valleys, and up to 7000 feet on the mountains. The wood of the tree has a kind of twisted grain, and possesses great strength and durability. It is highly valued by the Chinese; and, from its beauty and straightness, is often used by the mandarins and priests for the long poles which are generally seen in front of their houses and temples. It is also well known and highly prized by the natives of Japan as an ornamental tree. It is a most conspicuous tree, evidently in high favour with the priests of Buddha, and well deserves to be so. It succeeds admirably in China, and has been introduced into England, where it is admired.—*Fortune's Wanderings*, p. 128; *Tea Districts*, pp. 16, 212, 304; *F. von Mueller.*

CRYPTOSTEGIA GRANDIFLORA. *R. B.*
Nerium grandiflorum, *Rox.* | Palay, . MALEAL., TAM.

A climbing plant belonging to the family Asclepiadaceæ. It is common in the south of India, and yields a fine silky fibre, capable of being spun into fine yarn, and of employment for many of the purposes to which flax is applicable, suited to the weaving of different qualities of cloths. It seems to be a good substitute for flax, as it is soft, pliant, and susceptible of being split into the finest threads. The stalk contains a large percentage of fibre, besides yielding a milky juice, which solidifies into a gum-elastic of the nature of India rubber; but it has not as yet been collected for the purposes of commerce, and it is doubtful if a sufficient quantity could be obtained to render it an article of trade. The small samples obtained answer well for rubbing out pencil marks from paper. Mr. Underwood made a fair attempt at producing waterproof cloth by simply running the juice over the cloth.—*M. E. J. R.*

CRYPTOTHELEA CONSORTA, the wood moth.

CRYSTAL.

Cristal, . . .	FR., SP.	Balur, .	HIND., PERS.
Krystall, ...	GER.	Cristello, ...	IT.
Koreh, ...	HEB.		

The word for crystal alluded to in Genesis xxxi. 40 as ice, and in Job vi. 16 as frost, and the Hindi-Persic word Balur, seem to have been applied indifferently to ice and rock-crystal. Rock-crystal occurs abundantly in many parts of India, and that of the south of the Peninsula is known as vellum stone, from the place of its occurrence. It is said that rock-crystal, if made red-hot, and plunged repeatedly into the tincture of cochineal, takes a ruby hue; if into a tincture of red sandal, it takes a deep red tint; into tincture of saffron, a yellow like the topaz; into a tincture of turnesol, a yellow like the topaz; into juice of nerprum, it takes a deep violet like the amethyst; and into a mixture of tincture of turnesol and saffron, it becomes an imitation of the emerald. Also by steeping the crystal in oil of turpentine, saturated with verdigris or spirits of wine, holding dragon's blood or other coloured resins in solution, depth of tints are produced proportioned to the time of steeping. Crystals can be coloured if heated in a crucible with orpiment and arsenic. Crystals coloured red are false rubies, known in France as rubaces. Cups of rock-crystal were highly prized in ancient Rome; but even in Pliny's time the price of agates, as he calls them, had begun to fall, and now-a-days the Cambay stones formation is so extensive, that the principal use of Cambay stones is as studs, paper-cutters, knife-handles, and murrhine cups.—*King*, p. 178. See Cambay.

CSHITIJA, Cacsha. SANSK. The horizon; also the sine of an arc referred to the horizon, used for finding the ascensional difference.—*Warren, Kala Sankalita.*

CSOMA DE KOROS. Alexander Csoma de Koros was a highly learned Hungarian philologist, who died in 1842 on the Himalaya. A memoir of him appeared in the Bl. As. Trans. 1841. He bequeathed Rs. 5000 to the Asiatic Society of Bengal. He resided in Kunawar, and at Ladakh and Kanum, from 1828, for the sake of studying the language of the country. An account of Gerard's interview with him appeared in the Gleanings in Science, 1829, i. p. 110. He wrote a Geographical Notice of Tibet in Bl. As. Trans. 1833, i. 121. The Buddhist religious works of Tibet, brought to notice by him, are the Tanjur, which consists in its different editions of 100, 102, and 108 folio volumes, and comprises 1083 distinct works. The Tanjur consists of 225 volumes folio, each weighing from 4 to 5 lbs. in the edition of Pekin; but an edition has also been published at Lhassa and other places; of these De Koros gave an analysis in the 20th volume of the Asiatic Researches. See Pali.

CTESIAS, B.C. 440–370, a Greek of Cnidos, of the Asclepiad tribe, a contemporary of Xenophon and Herodotus. He took service with the Greek mercenaries who joined Cyrus, son of Darius II., in his expedition against his brother Artaxerxes Mnemon, by whom he was taken prisoner at the battle of Cynaxa, B.C. 401, 41 miles from Babylon. He became physician to Artaxerxes Mnemon, king of Persia, at whose court he resided for 17 years. During his residence he was able to consult the public archives, and he compiled from them a history of the Persians and of their predecessors in the empire

of Asia. He also wrote an account of India and its productions, but the absurd exaggerations and fables which this contains have caused all his other works to be viewed with suspicion. He is likewise accused of being led, by extreme jealousy of Herodotus, into direct mis-statements, that he might contradict that historian. Aristotle more than once declares him to be unworthy of eredit; and modern critics have generally agreed to reject altogether, or to receive with great reserve, all his assertions. Yet Diodorus Siculus and several ancient authors appear to have followed and trusted him; and it may be observed that whilst mere travellers' tales and vulgar traditions were probably the only sources of his Indian marvels, written records and monuments may have furnished him with well-authenticated historical facts, to assist him in compiling the history of the country in which he resided, and of which he had a personal knowledge. Unfortunately, of his history very little remains, except the names of kings. Much relating to Assyria, contained in the works of others, was, however, undoubtedly copied from him. Ctesias and Isidore both mention a statue pillar of Semiramis at Baptane, but these and the Syriac inscriptions have disappeared. Ctesias mentions the use of swords as lightning conductors.—*Smith's Dictionary of Gr. and Rom.; Yule, Cathay*, i. p. 39; *Layard, Nineveh*, i. p. 15.

CTESIPHON. The Babylonian empire was subverted by Cyrus, who is said to have taken the capital by turning the course of the Euphrates, and marching his troops along the bed of the river into the centre of the city. The walls and temple of Belus are said to have been demolished by Xerxes on his return from the Grecian expedition; but if so, they must have been rebuilt, as they were standing in the time of Alexander. After the building of Seleucia and Ctesiphon, Babylon became gradually deserted; and we learn from St. Jerome that the space within the walls was converted by the Parthian kings into a royal hunting park. From this period we cease to hear of Babylon as a city; but, notwithstanding that so many ages of barbarism and ignorance have passed away, tradition still continues to identify both its name and situation. The town of Hilleh is said by the people of the country to be built on the site of Babel; and some gigantic ruins, still to be seen in its vicinity, are believed to be remains of that ancient metropolis. From her fallen towers have arisen not only all the present cities in her vicinity, but others which, like herself, are long ago gone down into the dust. Since the days of Alexander, we find four capitals at least built out of her remains,—Seleucia by the Greeks, Ctesiphon by the Parthians, Al Modain by the Persians, and Kufa by the Khalifs,—with towns, villages, and caravansaris without number. The ruins of Ctesiphon are to be seen on the eastern shore of the Tigris, 18 miles south of Baghdad; and immediately opposite to it the ramparts and fosse of the Grecian city of Seleucia, which afterwards becoming identified with the former under the name of Coche, they assumed, when thus united, the epithet of Al Modain, or the cities. Ctesiphon was most admirably situated, on a sort of peninsula formed by a sudden flexure of the Tigris, which must have embraced the greatest part of the town. Its foundation, however, can hardly be ascribed to any particular person, as it would seem to have increased gradually, during a succession of many years, from a camp to a city. Pacoras, supposed to be Orodes, king of the Parthians, and contemporary with Anthony, is thought to be the first who surrounded it with walls, and made it the capital of the Parthian empire. It was sacked, together with Seleucia, by the generals of Marcus Aurelius, A.D. 165, and afterwards by the emperor Severus. It became the favourite winter residence of the powerful successors of Artaxerxes, from whom it was taken by Said, the general of the khalif Omar, A.D. 637. The capital was taken by assault, and the tumultuous resistance of the people gave a keener edge to the sabres of the Mahomedans, who shouted with religious transport, 'This is the white palace of Chosroes! this is the promise of the Apostle of God!' The sack of Ctesiphon was followed by its desertion and gradual decay. The Arabs disliked the air and situation of the place, and Omar was advised by his general to remove the seat of government to the western side of the Euphrates; and little now remains but part of the palace of Chosroes, called Tak-i-Kesra, the Arch of Chosroes. It is seen from afar on the plain, and presents a front of 300 feet in length by 160 in depth, having in its centre a vaulted hall 106 feet in height to the top of the arch, the span of which is 85 feet. The Ali Capi at Isfahan, and gates of the palace of Dehli, sink into insignificance beside the Tak-i-Kesra. The city walls, which appear to have been of very great thickness, may also be traced to a considerable distance on both banks of the river. The names of Seleucia and Ctesiphon are very frequently confounded by the early Christian writers; but the cities stood on opposite sides of the river Tigris, and were built at different periods. Mr. Jackson, when proceeding up the Tigris in 1797, passed by the ruins of Ctesiphon, which that river had considerably undermined. There were visible a great many earthen jars, some half-exposed, others ready to fall into the river. Captain Mignon dug into the sides and bases of many of the mounds at the Tak-i-Kesra, and found their foundations invariably composed of the fire-burnt brick.—*Layard, Nineveh*, i. p. 242; *Kinneir's Geographical Memoir*, pp. 253-54, 273, 274; *Porter's Travels; J. B. Fraser's Travels.*

CUBEBS, Piper cubeba.

Kababah, . . .	ARAB.	Lada barekor, .	MALAY.
Sin-bau-ka-ra-wa, .	BURM.	Timmue, . . .	NEPAL.
Peh-ching-kia, . .	CHIN.	Sughanda-marichu,	SANSK.
Dumki mirchi, . .	HIND.	Walgu-meris, . .	SINGH.
Kabab-chini, . .	,,	Val-mullaghu, . .	TAM.
Kumunkus, . . .	JAV.	Chalava mirrialu, .	TEL.

The cubeb pepper of commerce is stated to be the fruits of Piper cubeba and P. caricum, both of them natives of Java, to which island their cultivation appears to be confined. Dumki mirchi and lada barekor, meaning 'tailed pepper,' are derived from the appearance of the dried fruit, which has always the footstalk adhering to it.—*Irvine; Crawfurd's Dict.* p. 117.

CUBERO. Don Pedro Sebastiano Cubero, author of the Peregrinacion de la Mayor Parte del Mondo, published at Saragossa 1688. He set out about 1650 from Moscow, with the Russian ambassador, to the court of Persia. From Ormuz he sailed to Damayn (Daman?), Surat, and Goa, where he found the capital of Portuguese Asia in a state of miserable decay, and its trade almost in the hands of the Dutch,

English, Swedes, and Danes. From Goa he sailed to Masulipatam, and thence to Malacca, already in the hands of the Dutch, and on to Manilla, where he took ship across the Pacific to Mexico.

CUBE SPAR, or crystalline carbonate of lime, of good quality occurs in Nellore, Kurnool, and Cuddapah. It is used for mounting microscopic objects, and as a source of very pure lime. Rhomb spar or dolomite spar occurs in Cuddapah.

CUBIT, the Hindi hat'h. A measure of length, from the point of the elbow to the point of the middle finger. The Egyptians made use of the cubit measure, divided into six handbreadths, or twenty-four fingers, and also of the royal cubit, which consisted of this lesser cubit and a handbreadth over. The royal cubit contained twenty English inches and two-thirds. The Jews made use of the same measure, for length, of a cubit and a handbreadth. The Egyptians measured long distances by the Schœnus of about 6 miles in length. Land was measured by the aroura or half-acre, which, if square, measured a hundred cubits on each side. That a measure nearly the same was in use from the earliest times, we learn from the size of the pyramids. Exactly such was the cubit used in making the five smaller pyramids of Gizeh.—*Egypt. Inscrip.* 2d series, pl. 46; *Ezekiel* xi. 5; *Herodotus*, lib. ii. p. 168; *Vyse's Pyramids in Sharpe's Egypt*, i. p. 167.

CUBYA KANYA, from Cubja, the spine, of the virgin, Kanya, a name of Kanouj.

CUCHHOURA, a small Rajput clan of Gorakhpur.—*Elliot.*

CUCHWAHA, a celebrated Rajput tribe. The rana of Amber is of the race who claim descent from Cush, second son of Rama, king of Ayodhya, who migrated and built the fort of Rotas, on the Sone. Authentic history commences in A.D. 294 with Raja Nola, who founded Narwar or Nishidr. Amber or Dundhwar, the early capital of Jeypore, was built by Jey Singh, and was a city of great architectural beauty.—*Tod; Thomas' Prinsep's Antiquities*, p. 259; *Elliot, Supp. Gloss.*

CUCIFERA THEBAICA.

Doom; Gingerbread tree. | Hyphæne coriacea, *Gært.*

Clumps of it occur near Thebes, in Upper Egypt. Its stem, instead of growing without branches like other palms, forks two or three times, thus assuming the appearance of a pandanus. The fruit is about the size of an orange, angular, irregularly formed, of a reddish colour, and has a spongy, tasteless, but nutritious rind. The albumen of the seed is hard and semi-transparent, and is turned into beads and other little ornaments. Its brown mealy rind resembles gingerbread.—*Eng. Cyc.* p. 385.

CUCUBALUS DRABA. *Gœrtner.* A plant of the alpine vegetation of Kedarnath.—*Hoffmeister.*

CUCULIDÆ, the cuckoo family of birds, is of the tribe Scansores. Their outer toe is versatile, usually turned back. They mostly live on insects, a few on fruit. Some hatch their own eggs in nests constructed by themselves, others deposit their eggs in the nests of other birds. This family is divided as under:—

Sub-Fam. Cuculinæ, *Sw.*
True cuckoos, parasite cuckoos.
Cuculus canorus, *Linn.*, Europe.
C. Himalayanus, *Vigors.*
C. poliocephalus, *Latham.*
C. Sonneratii, *Latham.*
C. micropterus, *Gould.*
C. striatus, *Drapiez.*
Hierococcyx varius, *Vahl.*
H. nisicolor, *Hodgson.*
H. sparverioides, *Vigors.*
Polyphasia nigra, *Blyth.*
P. tenuirostris, *Gray.*
P. merulina, Malayana.
Surniculus dicruroides, *Hodgson.*
S. lugubris, *Horsfield.*
Chrysococcyx Hodgsoni, *Moore.*
C. lucidus of Australia.
C. xanthorhynchus, *Horsf.*
C. Malayanus.
C. Basalis.
Coccystes melanoleucos, *Gmelin.*
C. coromandus, *Linn.*
C. glandarius.
C. serratus of Africa.
C. afer of Africa.
Eudynamis orientalis, *L.*
E. Flindersii, N. Zealand.
Zanclostomus tristis, *Less.*
Z. viridirostris, *Jerdon.*
Z. Javanicus, Burma.
Z. Sumatranus.
Z. diardi of Malacca.
Phœnicophaus pyrrhocephalus, Ceylon.
P. curvirostris, Burma.
P. callirhynchus.

Sub-Fam. Centropodinæ.
Centropus rufipennis, *Ill.*
C. viridis, *Scopoli.*
Taccocua sirkee, *Gray.*
T. Leschenaultii, *Lesson.*
T. infuscata, *Blyth.*
T. affinis, *Blyth.*

Cuculus canorus is the cuckoo of Europe, Asia, Africa, Malay countries, and common in the Himalaya, visiting the plains during the cold season. The noisy koel is remarkable for the dissimilar colours of the sexes, and for parasitically laying in the nests of the crow. The coucol, or crow-pheasant, is another noisy and conspicuous bird wherever there is a little jungle. Phænicophaus callirhynchus is one of the finest known cuckoos. Its bill is of a brilliant yellow, red, and black.—*Jerdon.* See Birds.

CUCUMBER, Cucumis sativus.

Kusaja, ... Arab. | Khekra, ... Hind.
Coucombre, ... Fr. | Cetrinolo; Cocomeri, It.
Gurken, ... Ger. | Cohombro; Pepino, . Sp.

The cucumber (Cucumis sativus) is grown from seed at all seasons. The plants should never be too close. It thrives in all parts of India, and grows with much or little water; and, if allowed to climb over sticks or trellis-work, is out of the way of jackals and porcupines, who are fond of the fruit. The natives grow them in their fields, in the cold season, amongst grain and pulse of various sorts, and in the sandy beds of rivers during the hot weather. The cucumber of Numbers xi. 5 is the Cucumis melo, the melon.

Cucumber Seed Oil.

Antimun bij miniak, Mal. | Villerikai yennai, . Tam.
Timun-biji-miniak, . ,, | Dosa kaia nuna, . Tel.
Katimun-biji-miniak, ,,

A clear, edible oil, obtained by expression from the seeds of Cucurbita pepo and C. melapepo.

The Cucumis genus of plants belongs to the Cucurbitaceæ. C. cicatrisatus, *Stocks*, the Wungee of Sind, has an edible fruit about 6 inches long. C. conomon, *Thunb.*, an annual of Japan, is used for preserves.

The cucumber family of plants is largely preyed upon by a twelve-spotted species of the ladybird, which, alike in the grub and perfect state, feeds on the leaves and flower-buds.—*Jaffrey; Irvine; Voigt; Eng. Cyc.; W. Ic.; Von Mueller.*

CUCUMIS MELO. *Linn.* Melon, musk melon.

Betikh (musk melon), Ar. | Baka-kaia, . . Maleal.
Tha-khwa-hmwæ, Burm. | Gilas; Girasa, . . Panj.
Tien-kwa; Hiang-kwa, Ch. | Sarda; Paliz, . . Pusht.
Hu-kwa; Hwang-kwa, ,, | Ghidro, ... Sind.
Kharbuzeh, Hind., Pers. | Rata komadu, . . Singh.
Labo-frangi, . Malay. | Mulam, . . Tam., Tel.

The native country of this valuable plant is unknown. Linnæus says Tartary, but he does not give his authority. De Candolle says Asia; Roxburgh only knew it in a cultivated state in tropical India; and Professor Royle seems] unacquainted with any wild station for it in the

Himalaya regions. It is cultivated in Persia and Afghanistan, the Panjab, and all over India. From time immemorial Kashmir has been famous for the excellence and abundance of its melons, which form a staple article of the food of the inhabitants; and the melons of Multan and Jhang are excellent. Dr. J. L. Stewart says that this fruit rapidly degenerates if sown in the plains. In Kābul it thrives, and is in perfection in October and November, when the first frost touches the plant. It is largely taken for sale to Peshawur.

CUCUMIS MOMORDICA. *Roxb.*

C. muricatus, *Willd.*	Momordica sativa, *Roxb.*
Phunti, ... BENG.	Kakari; Karkata kai, TAM.
Phunt; Tuti, . . HIND.	Pedda dosa kaia, . TEL.
Kakra, ... PANJ.	Mullu dosa kaia, . ,,

Cultivated throughout India; when young, is a good substitute for the common cucumber. Seeds occasionally ground into a meal. When the fruit is ripe, if eaten with a little sugar, it is little inferior to the melon, and reckoned very wholesome; natives use it in curries.—*Roxb.*

CUCUMIS PUBESCENS. *Willd.*

C. maderaspatanus, *Roxb.*

Fowl's cucumber, . ENG.	Chibbur, ... SIND.
Kakri, Bun-gumuk, HIND.	Kekri, ... SINGH.
Raushanak, . . . PERS.	Kodi, Nella budinga, TEL.

Grows wild in South India, in the Panjab, Hindustan, Bengal, and the Peninsula. Its small fruit is eaten by the natives, though they do not cultivate the plant; on ripening it becomes aromatic.—*Roxb.; Voigt; Stewart; Irvine.*

Cucumis dudain, Queen Anne's Pocket Melon, is a native of Persia, and produces a fruit variegated with green and orange, and oblong unequal green spots; when full ripe it becomes yellow, and then whitish. It has a very fragrant vinous musky smell, and a whitish, flaccid, insipid pulp.

CUCUMIS SATIVUS. *Linn.* Cucumber.

Kusud, ... ARAB.	Khiyar, ... PERS.
Kankari, ... DUKH.	Mutrulla, Sookasa, SANSK.
Fakus, ... EGYPT.	Rata kækari, . . SINGH.
Kira, also Susa, . HIND.	Pipingya, . . . ,,
Antimun, Timmun, MAL.	Mulu veleri, . . TAM.
Mullen velleri, . MALEAL.	Vellerikai, . . . ,,
Khira, ... PANJ.	Dosa kaia, . . . TEL.

This is commonly grown and largely used all over India, but most Europeans find it difficult to digest. Cucumbers of the C. sativus and C. utilissimus are consumed in immense quantities by the Karens and Burmans, who seem to prefer them large and yellow, rather than pluck them when green and tender. The seeds of this and of C. utilissimus are considered cooling.

CUCUMIS TUBEROSUS. *Heyne.*

Adulay kai, . . . TAM.	Casara kaia, . . . TEL.
Nellay piku, . . . ,,	

This is a pot vegetable, eaten by the people in curry. It grows wild in cotton soils of North Tinnevelly. It is very prolific, and on waste lands, headlands, etc., in great abundance. A coolie load of tubers gives six large measures of fine flour, considered by the natives a most excellent breadstuff. One measure of the flour is considered equal to two measures of the Panicum glossarium, which latter is the staple food of North Tinnevelly. The tubers are washed and peeled, then bruised on a rough stone, after which it is washed precisely like arrowroot, the washing extending over seven or eight days, when the starch is dried in the sun. The flour is almost as white as arrowroot; it is reduced to conjee quite as easily, by pouring boiling water upon a spoonful or two which has been first moistened with cold water. The fruit, a small capsule used in sweetmeats, is known as the Adully.—*Roxb.; Rev. J. F. Kearns in Agri-Hort. Soc. Pro.* 1862.

CUCUMIS UTILISSIMUS. *Roxb.*

Kiza-ut-taul, . . ARAB.	Kakri, Kakni, . . HIND.
Kankur, also Karkti, BENG.	Khyar-i-badrang, . PERS.
Tha-khwa, . . . BURM.	Dosa, Nakka dosa, TEL.
Gurkel lange, . . GER.	

Cultivated throughout India; and Dr. Stewart has seen it at 6000 feet, on the Ravi, in the hills. This gourd attains 2 or 2½ feet, and is stated to reach the extraordinary length of 5 feet. When ripe, if carefully gathered and suspended, it will keep good for several months, from which circumstance they are valuable for long voyages. It is pickled when half grown. The seeds, like those of the other cucurbitaceous fruits, contain much farinaceous matter, blended with a large portion of mild oil. The natives dry and grind them into a meal, which they employ as an article of diet; they also express a mild oil from them, which they use in food and to burn in their lamps. The seeds are highly nourishing, and well deserving of a more extensive culture than is bestowed on them at present. The powder of the toasted seeds mixed with sugar is said to be a powerful diuretic, and serviceable in promoting the passage of sand or gravel. In Roxburgh's time, in the Guntur Circar, these seeds formed a considerable branch of commerce.—*Roxb.; Cal. Ex.* 1862; *Honig.*

CUCURBITA, a genus of the Cucurbitaceæ, which includes all pumpkins, gourds, squashes, and vegetable marrow, and of these there are innumerable varieties.

C. moschata, *Duchesne*, is the musky gourd.

C. melopepo, *Linn.*, the squash gourd, can be stored for months. It is supposed to be a variety of C. pepo.

C. pepo, *Linn.*, the pumpkin, is largely grown in particular localities. Its naturalization in desert tracts would be a boon.

C. aurantia. —? Yin-kwa, CHIN. A deep golden-coloured gourd of Cheh-kiang. It is rather more tender than the other species.

C. lobata. Tinda, PANJ. In the Panjab this is a small round gourd when young, at which time it makes a most delicious vegetable for the table; the fruit is not bigger than a small turnip.—*Powell; Eng. Cyc.; Smith.*

CUCURBITACEÆ, a natural order of climbing or creeping plants, the gourd tribe, chiefly natives of hot countries, ranged by Meisner under 35, and by Endlicher under 28 genera. Of these, there occur in Egypt, Abyssinia, and Arabia 8, in Astracan and Persia and the Levant 3, in China and Japan 5, and in the East Indies 160 species, of which 46 are natives of India,—achmandra, benincasa, bryonia, bryonopsis, citrullus, coccinia, cucumis, cucurbita, erythropalum, herpetospermum, gymnopetalum, karivia, laginaria, luffa, melothria, momordica, mukia, pilogyne, sicyos, trichosanthes, Zehneria. Some of the species afford cathartics of remarkable power, others have useful edible fruits. The fruit varies much in size, form, and external characters, but is generally fleshy within, and its pulp is often so saturated with water that it cannot be dried. The roots of most of the order contain starch,

often associated with an acrid poisonous matter, which can be separated by washing the powdered root with water, in which the acrid matter dissolves, while the starch is left. The seeds of most of the order are of a mild sweet taste, give good emulsions with water, and yield a fixed oil by expression. Few of the plants of this order are indigenous in Europe. In tropical countries this order gives the inhabitants a large portion of their food, which it often affords of the finest quality in the most arid deserts, or on barren swamps and islands. In Persia, China, and Kashmir, they are cultivated on the lakes, on the floating collections of weeds common in these localities; in India they are very abundant, either in the wild or cultivated state. According to Dr. A. Hunter, the Cucurbitaceæ abound in fibres of great length. The following are the chief dietetical species :—

Cucurbita maxima. The seeds yield oil by expression, and are considered cooling.
C. ovifera, *L.* Vegetable marrow.
Benincasa cerifera, Peetha.
Cucumis melo, melon, Kurbooza. Seeds oily, and readily become rancid.
C. Madaraspatensis, Roxb. Fl. Ind. iii. p. 723.
C. patescens, wild, common near Saharunpur; becomes aromatic on ripening.
C. momordica, Phoot.
C. sativus, cucumber, Kheera. Fruit contains sugar; seeds yield a mild oil.
C. utilissimus, Kukree.
Luffa pentandra, Ghia.
L. acutangula, Kalee-tori.
Momordica charantia, Kurella. Fruit slightly bitter.
Trichosanthes anguina, Chuchinga.
T. dioica, Palwal.
T. cucumerina, Junglee-chuchinga.

CUCURBITA MAXIMA. *Duch.*

Cucurbita melopepo, *Roxb.* | Pumpkin; Gourd.

Mitha kaddu? . .	HIND.	Pushiny kaia, . . .	TAM.
Halwa kaddu? .	,,	Gumaddi kaia, . .	TEL.

Cultivated throughout India, in Kashmir, up to 6000 or 9000 feet, and in Ladakh up to 10,500 feet. It is made to trail over houses and trees. It needs much water and good soil. The fruit is very large; when boiled, it tastes like a young carrot, and is used in various ways; its leaves are boiled as greens. This gourd is presented with great ceremony in China to married childless women, on the evening of the festival of mid autumn, which happens on the 15th of the 8th month of the Chinese year. In India the tallow gourd is presented to a wedded pair.—*Voigt; Stewart; Gen. Med. Top.*

CUCURBITA OVIFERA. *Linn.*

Vegetable marrow, ENG. | Simai-pusini kai, . TAM.

This is the most wholesome of the Cucurbitaceæ, and is largely grown by the market gardeners of India. It is said to be indigenous at Astracan; it is an excellent vegetable, of easy culture in good rich soil.—*Jaffrey; Voigt.*

CUDBEAR is the Tsze-fen and Shih-jui of the Chinese. It is a powder procured from the Lichen Tartaricus, a plant found in Iceland, used in dyeing violet, purple, or crimson. Its colours are not durable when it is employed alone, and it is therefore used as a body to other expensive dyes, as indigo, cochineal, etc., making them more lively. It is used but little by the Chinese, and the demand in that market is not great.—*Compendious Description.* See Dyes.

CUDDALORE, a town on the Coromandel coast, in lat. 11° 42′ 45″ N., long. 79° 48′ 45″ E.; population, 40,464. It is in the South Arcot district, and has the three parts of old Cuddalore, Munja Coopum or New Town, and Fort St. David, the last of which, in 1684, Sumbaji gave permission to build. In 1702 the fortifications were rebuilt; and after the capitulation of Madras to La Bourdonnais in 1746, Fort St. David became the seat of government. The French advanced against this fort in 1746, but were defeated by Mahfuz Khan. Dupleix besieged it, but retreated; and he subsequently, in 1749, failed in a night attack on the town. Major Lawrence made it his headquarters. In 1758 Lally took Cuddalore town without opposition; and on the 2d June 1758 Fort St. David surrendered, and the fortifications were razed. In 1760 it was retaken by Colonel Coote, but in 1782 was again taken by the French under M. Bussy.—*Findlay.*

CUDDAPAH, a town in lat. 14° 28′ 49″ N., and long. 78° 51′ 47″ E., which gives its name to a revenue district of the Madras Presidency, lying between lat. 13° 25′ and 16° 20′ N., and long. 77° 55′ and 79° 40′ E.; area, 8367 square miles; population, 1,351,194. It has the districts of Kurnool and Guntur on the north, and Mysore and North Arcot on the south. The river Pennar enters the district at Tallapodatoor, and, after many windings, passes by Sidhout within nine miles from Cuddapah town, and flows in an easterly course to the Bay of Bengal.

There are diamond mines about 7 miles north-east of the town of Cuddapah, on both banks of the Pennar. Iron ore is abundant in the hills. Cotton, wheat, and indigo are the chief crops. This district formed part of the territories of the Bijanagar dynasty. In A.D. 1589 it fell to the armies of the Kutub Shahi dynasty of Golconda, who sacked the city, and broke the idol of the great temple. It was afterwards under the Adal Shahi rulers of Bijapur, later on taken by Hyder Ali about A.D. 1779, and its ruler, Halim Khan, carried captive. In 1800 it was ceded by the Nizam to the British. The chief towns are Sidhout, Jummul Madagoo, Badwail, Pulgooralupully, Giddalore, and Jungam-razpillay. In the district are 103,676 Mahomedans and 4973 Christians.

The non-Aryan migratory tribes are the Yanadi, a hill tribe of small stature, determined plunderers of the shepherd flocks, but are valuable as foresters.

The Yerkala are wholly migratory and predatory; steal into houses at night, and wrench the jewels from the ears of the women and children.

The Chenchuwar, a physically fine race of men, but incorrigibly predatory and regardless of human life.

The Sugoli, a wandering, pilfering race, who have a picturesque costume.—*Imp. Gaz.*

CUDDUNG of Coorg, a breastwork.

CULCURNI, a Tamil accountant.

CULITLAWAN BARK is obtained from several species of cinnamomum trees.

CULLEN, GENERAL, of the Madras Artillery, long a Resident at the court of the raja of Travancore; for half a century a contributor to physical science in India. He wrote on the Geological

Features from Madras to Bellary, Mad. Lit. Trans. 1827, i.; Account of the Fall of Rain at Different Stations on the Western Ghats, Rep. Brit. Ass. 1844, 1846, ii. 23; On the Influence of Trees on Climate, Mad. Lit. Trans. xv. 450. Born 17th May 1785. He died at Allepey, 1st October 1862.

CULLENIA EXCELSA. *W. Ic.*

Kattoo-bodde, . SINGH. | Malai konji maram, TAM.
Kattoo heriteya, . „ | Durio Zeylanicus, *Gard.*

A large tall tree of the southern part of the Peninsula of India, and common in the central province of Ceylon, at an elevation of from 2000 to 5000 feet; trunk straight, from 60 to 80 feet high. Wood white, rather open-grained, apparently not very good, but the outside wood only was examined. Under the microscope, its longitudinal section is very peculiar.—*Wight; Gibson; Thw.*

CULLEN'S LIQUID, for preserving wood and iron, is a mixture of two measures (by bulk) of coal-tar to one measure of quicklime and one of powdered charcoal. Lime is freely dissolved in coal-tar, with which it forms a cement which takes readily to wood, brick, iron, or other building materials, however wet, and which sets with nearly the cohesion of mortar or hydraulic lime. With the addition of the charcoal, mixed in an exceedingly fine state, it is found that white ants, which attack and destroy creosoted wood, were effectually excluded, carbon, it appears, being especially poisonous to them. Six pieces of deodar, or Himalaya pine, were buried in a place particularly infested with white ants, three of the pieces being protected by Cullen's preparation, and the three others being left in their natural state. At the end of five months the blocks were dug up, when those which had been coated were found to be as sound as when put down, while those which had been left unprotected were found riddled with the perforations of the ants.

In the case of iron, creosote is believed to be a complete protection in ordinary soils, but in saltpetre soils is said to be of no use whatever. Six pieces of thin iron were buried, three being coated with Cullen's preparation, while the others were left as they were cut from the original plate; the coated iron was completely protected for the time tried, whereas the pieces put down in their ordinary state were found to have been much rusted.

CULLUKA, an ancient Hindu commentator on the book of Menu, the Hindu lawgiver.

CULTIVATORS of the soil in British India are known as the ryot and the zamindar, the former being an Arabic word, the latter from the Persian. The Tibetans style them Glupa. In India, the chief cultivating races are the Jat, Kapa, Khassa, Kunbi, Kurmi, Mala, Wakkala, Vallalar, and the bulk of them are co-proprietors with the rulers. Menu says cultivated land is the property of him who cut away the wood, or who cleared and tilled it,—an ordinance binding on the whole Hindu race, and which no international wars or conquest could overturn. In Bengal, a man with a helping boy, with a plough and pair of bullocks, will cultivate as much as three acres, or even more. Throughout India their crops are designated by the seasons at which they occur, as Bhaduwi, Kharif, Rabi.—*Tod's Rajasthan*, i. p. 496. See Agriculture; Crops; Soil.

CUMBHA, in Hindu astronomy, the solar sign Aquarius. In explanation of the analogy between the vessels emblematic of the Isis of the Nile and the Ganges, there is a festival sacred to the sage Agastya, who presides over the star Canopus, when the sun enters Virgo (Kaniya). The Camacumpa is then personified under the epithet Cumbha-yoni; and the votary is instructed to pour water into a sea-shell, in which, having placed white flowers and unground rice, turning his face to the south, he offers it with this invocation, 'Hail, Cumbha-yoni, born in the sight of Mitra and Varuna (the sun and water divinities), bright as the blossom of the cusa (grass), who sprang from Agni (fire) and Maruta.'

CUMBI, TAM., TEL., Gardenia lucida, yields the Dikamilli or Cumbi-pisin, a strong, disagreeable-smelling gum-resin, procurable in most Indian bazars. It is much used by native doctors as an external application, when dissolved in spirits, for cleaning foul ulcers. It is used by some European practitioners in case of worms in children.

CUMBLI, HIND., also written Kamli, Cumul, and Camal, and also called Cameline, is from the Sanskrit Kamal, a blanket, and is a coarse woollen blanket worn by the peasantry of all India, and sold at Rs. 1½ to 100. Cumblis are woven in almost every district of India of the wool of the country, which is spun by hand. The yarn is sized with the juice of the common squill; the woof is beaten with a hand batten (in the way that sailors adopt in forming mats for protecting the rigging), no reed being used; a finer description of cumbli, of which the sepoy cloaks were formerly made, is manufactured at Bellary or in its neighbourhood. Mysore cumblis of superior quality, in black and white colours, are sold at from Rs. 25 to 100 each; ordinary sizes, Rs. 4 to 20 each. Bellary cumblis are well made, but are not of so high value as those of the Mysore district; they are 6 cubits long by 3. The cumbli is usually made in pieces of two or three feet broad, and five or six or more long, and generally very coarse, of a dark or black colour. Sometimes, however, they are manufactured larger and finer, and striped or spotted black and white. There may be some connection between the Sanskrit word Kamal and the Grecian Chlamus and the Latin Chlamys. It is barely possible, also, it may not be unconnected with the Arabic Kamis, from which we have the Italian Camicia, the Portuguese Camisa, and the French Chemise. The Chlamys was generally, like the Cumbli, made of wool, and in shape it was much the same, being half the breadth of its length. A similar connection may perhaps exist between the Persian and Hindi Suya, the Latin Sagum, and the modern Spanish Saya. Good cumblis are made in Ulwar, and in the neighbourhood of Meerapur in Meerut. The Sansla cumbli of Meerut sometimes sells as high as 25 rupees. It is made of the wool of lambkins, shorn about three days after their birth.—*Elliot, Supp. Gloss.; Hindu Infanticide*, p. 195.

CUMBUM, a town in lat. 15° 34′ 15″ N., and long. 79° 91′ E., in the eastern part of the Kurnool district; has a tank of 15 miles circumference, formed by damming up the Gundla Kama river.

CUMIN. The black cumin of Scripture is the Nigella sativa, the μελάνθιον of Hippocrates and Dioscorides. The Helleborus niger, however, has also been named cumin.

CUMIN SEED, Cuminum cyminum.

Kuminon, ...	GR.		

Cumin seeds, the fruits of Cuminum cyminum, are of an ash-grey or light brown colour. Taste warm, but not so agreeable as anise. It is extensively cultivated in the East, but has long been introduced into the south of Europe, Sicily, and Malta. It is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 7000 to 9000 feet, and its seeds are exported to the plains. 16 cwts. of the fruit yield about 44 lbs. of the oil, which has a pale yellow colour, and is limpid, of a disagreeable smell and acrid taste ; sp. gr. 0·345. The seeds are used as a condiment in India, and the oil is used in medicine ; it is a stimulant carminative. The seeds were formerly much employed as an external application in emplastrum and cataplasma cumini, and still by Jews in the process of circumcision. The seed is particularly prized by the Mahomedans, who season their cakes with it.—*Ainslie ; Roxb. ; Royle ; Stewart ; Mason ; O'Sh.*

CUMMUM, a town in the Hyderabad dominions, where seams of coal have been struck.

CUMPAS. —? A light, brown-coloured wood of Penang, a large tree, used only for planks.

CUMRBAND. HIND. Waist-belt. Kamarbāndhna means literally, to gird up the loins.

CUNDALAH PALLAH. —? A bamboo-coloured wood of Travancore, used for sandals.

CUNEIFORM CHARACTER, also called the arrow-headed, also the wedge-shaped character, was used for the Bactro-Medo-Persian language of the dynasty of the Achemenidæ. It was first observed at Be-situn, a little village at the foot of rocky mountains, which are covered with bas-reliefs. Cuneiform or wedge-like writings have been discovered on the solitary monument of Cyrus, on the Murghab, on the ruins of Persepolis, on the rocks of Be-situn, near the frontiers of Media, and on the precipice of Van in Armenia. Grotefend in 1802 ascertained that these were letters, and to be read from left to right ; but Munter, Tychsen, Burnouf, Lassen, Hinch, Oppert, Norris, Schrader, Le-Normant, the Rev. A. H. Sayce, Sir Henry Rawlinson, and George Smith, have laboured so that we now have translations, grammars, and dictionaries. Mr. A. H. Sayce, while reserving his opinion on the subject of the early connection of the Chinese and the primitive Accadian population of Chaldæa, says : 'The cuneiform characters of Babylonia and Assyria are, as is well known, degenerated hieroglyphics, like the modern Chinese characters. The original hieroglyphics were invented by the Accadians, before they descended into Babylonia from the mountains of Elam, and I have long been convinced that they were originally written in vertical columns. In no other way can I explain the fact that most of the pictures to which the cuneiform characters can be traced back, stand upon their sides. There is evidence to show that the inventors of the hieroglyphics used papyrus, or some similar vegetable substance, for writing purposes, before the alluvial plain of Babylonia furnished them with clay, and the use of such a writing material will easily account for the vertical direction in which the characters were made to run.'

The inscriptions in the Naksh-i-Rustum is a list of the Iranian nations subject to Darius ; the Persians attribute them to the chisel of their famous sculptor Farhad. A description of them is to be found in Sir John Malcolm's Persia. Enormous marble capitals of columns are to be seen at Be-situn. There are two tablets, the one containing a mutilated Greek inscription, declaring it to be the work of Gotarzes ; the other a Persipolitan sculpture, adorned with nearly 1000 lines of cuneiform writing, exhibiting the religious vows of Darius Hystaspes after his return from the destruction of Babylon, on the revolt of its udapati, Nebuchadnezzar, the pretended son of Nebunet. Both Ctesias and Isidore mention a statue and pillar of Semiramis at Baptane, but the sculptures of Semiramis and the inscription in Syriac characters have wholly disappeared. Baghistan is traditionally described as the pleasure-grounds of Semiramis. According to Sir H. Rawlinson, D'Anville first suggested the identity of Be-situn with the Baghistane of the Greeks, and there are good grounds, from the ancient notices of this place, for supposing him to be correct. Etymologically considered, the evidence is even more striking. To solve all difficulties, it may perhaps, he adds, be admitted that the sculpture did really exist in the lower part of the rock, scarped by the Assyrian queen ; and that Khusru Parvez, when he was preparing to make the scarped surface the back wall of his palace, and for that purpose began to excavate deeper in the mountain, destroyed the sculptures, and removed all further trace of them. With regard to the pillar of Semiramis, it is very curious that an oriental writer of the 15th century should describe the rock of Be-situn from his own observation, as though it were sculptured in the form of a minareh or minaret. Certainly nothing of the kind now remains. Their language is ancient Persian, before that of the Zend, which represents the Persian language previous to the time of Darius. General Ferrier says the existence of bricks with cuneiform characters among the rivers of Balkh, had been remarked by previous travellers, and, he adds, is of much interest, as no other similar relics are known so far to the east. Sir Henry Rawlinson suggests that they may belong to the Kushan (a famous Scythian race), who held Balkh in remote antiquity, and whose bricks, stamped with cuneiform Scythic legends, are also found at Susa, and on the shores of the Persian Gulf. M. Ferrier found great numbers of baked bricks, nearly three feet long and four inches thick, scattered about the citadel of Furrah, an ancient town which was plundered by Chengiz Khan. That their origin was certainly anterior to that of the town, was plainly indicated by the inscriptions upon them, in the cuneiform character. The existence of bricks with cuneiform characters at Furrah is very important, and is not mentioned by any other traveller. The size of the bricks is also remarkable. The only place where bricks of so large a size have been found, is in the kitchen of Sardanapalus, at Calah or Nimrud. Bunsen says the first cuneiform character was Median or west Iranian, and is to be distinguished from the

language of the Zend books, which is east Iranian, or Old Bactrian worn down.

Cuneiform inscriptions of Armenia, Azerbijan, and Elymais, are in Scythic or Turanian dialects. The third column of the trilingual inscriptions of the Zagrus range is also Scythic.

A clay tablet has been found at Cappadocia, relating to the gift of certain silver articles to the sun-god. The character is a peculiar kind of the cuneiform; and tablets with the same character have been found by Mr. Rassam in 1880 at Kougunjuk. From this it is supposed that Cappadocia also had a clay library. A collection of 5400 cuneiform tablets were discovered by Mr. Rassam at Sippara, near Babylon. It is supposed that these tablets are the library mentioned by Berosus, which contained antediluvian records copied from earlier documents by King Sargon I., who lived 1800 years B.C.—*Bunsen*, iii. pp. 457, 570; *Ed. Ferrier, Journ.* pp. 207, 393; *G. Rawlinson*, ii. p. 345.

CUNG-QUA, a resting-place for travellers, or rather for officers of Government, in Lin-Choo. The Cung-qua corresponds very nearly to the Turkish khan and the Indian sarai, except that, being used only by persons of some consideration, it is in every respect far more neat and elegant. The house resembles a private dwelling of the better class.—*American Expedition to Japan*, p. 189.

CUNNINGHAM. Four brothers of this name, sons of Allan Cunningham, sought a career in India, two of whom rose to distinction.

Cunningham, J. D., an officer of the Bengal Engineers, an extensive contributor, chiefly on archæological subjects, to the Journal of the Bengal Asiatic Society. A distinguished antiquary, statist, and geographer. Resident at Bhopal; ob. 1851. Author of Description of Kunawar, in the Bl. As. Trans. xiii. part 1, 1844; On the Ruins of Putharee, ibid., 1848, xvii. part 1, 305; On the Lingam of Bhojpur, ibid. 154; Notes on the Antiquities within the Districts of the Bhopal Agency, etc., ibid., 1847, p. 739; History of the Seikhs, Lond. 1829; Cal. Rev. No. xxii.

Cunningham, General A., of the Bengal Engineers, author of Discovery of Buddhist City of Samkassa, Lond. As. Trans. vii. p. 242; Journal of a Trip through Kulu and Lahul to the Chumureri Lake, in Ladakh, Bl. As. Trans. 1848, xvii. 201; Memorandum detailing the Boundary between the Territories of Maharaja Gulab Singh and British India, etc., ibid. 295; Verification of the Itinerary of Hiwen Thsang through Ariana and India, ibid. 476; Proposed Archæological Investigation, ibid. 535; Description of Ancient Gems and Seals from Bactria, the Punjaub, and India, ibid., 1841, 147; Essay on the Arian Order of Architecture, as exhibited in the Temples of Kashmir, ibid., 1848, 241; Descriptions of, and Deductions from the Consideration of, some new Bactrian Coins, ibid., 1840, ix. pp. 867, 1217; Bhilsa Topes, Lond. 1858. In the year 1871 he was appointed Superintendent of the Archæological Survey of India, and has printed annual reports; subsequently the Rev. James Burgess was appointed to the Survey of the Bombay Presidency.

Colonel Francis Cunningham, the youngest son, joined the Madras army, and almost immediately took part in the Afghan war, and was in Sale's brigade. He was one of the besieged garrison of Jalalabad.—*Dr. Buist's Catalogue.*

CUNNINGHAMIA LANCEOLATA. The lance-leaved pine. In parts of China is in great abundance; indeed, this species, and the more common Pinus Sinensis, are almost the only trees of any size which grow in some mountainous districts.—*Fortune's Wanderings*, p. 38.

CUNNINGHAMIA SINENSIS. *R. Br.*

San-muh, Sha-muh, CHIN. | China pine, . . . ENG.

Grows in China and Japan, at a distance from the sea-coast. Timber valued for making coffins, flooring, furniture, house-frames. It is less liable to the attacks of insects than the Pinus Sinensis, but in damp ground is less suited for piles, particularly if exposed alternately to air and damp. Its charcoal is used for gunpowder.—*Smith.*

CUP.

Coupe; Tasse; Gobelet, FR.	Cappa; Tazza, . . . IT.
Becher; Schluck, . GER.	Bicker, ... SC.
Piala, ... HIND.	Copa; Taza, ... SP.

Several of the drinking races of India and Asia use the cup or piala to welcome the coming guest. Colonel Tod tells us (p. 377) regarding the love of strong drink and indulgence in it to excess, so deep-rooted in the Scandinavian, Asi, and German tribes, and in which they showed their Getic origin, that the Rajput is not behind his brethren either of Scythia or Europe. Though prohibited by ordinances which govern the ordinary Hindu, the Rajput welcomes his guest with the munwar piala, or cup of request, in which they drown ancient enmities. The heroes of Odin never relished a cup of mead more than the Rajput his madhva; and the bards of Scandinavia and Rajwara are alike eloquent in the praise of the bowl, on which the Bardai exhausts every metaphor, and calls it ambrosial, immortal. The Bard, as he sips the ambrosia, in which sparkles the ruby seed of the pomegranate, rehearses the glory of the Rajput race. Even in the heaven of Indra, the Hindu warrior's paradise, akin to Valhalla, the Rajput has his cup, which is served by the Apsaras the twin sister of the celestial Hebe of Scania. 'I shall quaff full goblets amongst the gods,' says the dying Getic warrior, 'I die laughing,' are sentiments which would be appreciated by a Rajput. Cups in use with the Tibetans are made of maple knots, produced on the maple by the Balanaphora. Those in use by the ultra-Gangetic races in Burma, and the Shan States, are lacquered bamboo; those of China and Japan are of porcelain.—*Rajasthan.*

CUPANIA CANESCENS. *Pers.*

Molinæa canescens, *Roxb.* | Sapindus tetraphyllus, *Val.*
Amba curb, ... MAHR.

Cupania is a genus of plants belonging to the natural order Sapindaceæ. C. pentaphylla is figured in Wight's Icones; C. lævis grows in Bourbon and Mauritius; C. Madagascarensis grows in Madagascar. C. canescens is a tree of the Circars and Kandalla, and common in the Upper Ghat jungles of the Bombay side. Wood of average quality, white; not equal to Sapindus rubiginosus, and does not bear exposure.—*Drs. Roxb., Gibson, Voigt*, p. 94.

CUPANIA SAPIDA. *Cambess.* Blighia sapida, *Kon.;* a native of Guinea, cultivated in India for its fruit. It is the Akee of Africa, and was introduced into the W. Indies by Bligh.—*Voigt.*

CUPI. TAM. An article of female jewellery worn on the head.

CUPID, the Cupidon of the French; Cupido, Liebesgott of the Germans; Kama of the Hindus. Amongst the Hindu deities Kama takes the place of Cupid. Ananga is a poetical epithet of the Hindu Cupid, — literally, incorporeal, from a, privative, and Anga, a body.—*Rajasthan*, i. 255.

CUPPAS. HIND. Cotton plants; bags for cotton. Cuppasia, cotton seeds.

CUPPAY MAYNIE. SINGH. A plant, according to the natives, with which cats are so enchanted that they play with it as they would with a captured mouse, throwing it into the air, watching it till it fall, and crouching to see if it will move. This seems the billi-lotan, the Acalypha Indica, one of the cat-rolling plants, species of valerian, melissa, or nepeta.—*Tennant, Ceylon.*

CUPPUM. TAM. A fishing hamlet.

CUPRA, a human skull, the calvarium, in Hindi dialects pronounced cupar. The cup of the Scandinavian worshippers of Thor, the god of battle, was a human skull, that of the foe, in which they showed their thirst of blood, borrowed from the chief of the Hindu triad, Har, the god of battle, who leads his heroes in the red field of slaughter with the cupra in his hand, with which he gorges on the blood of the slain.—*Tod.*

CUPRESSUS, a genus of plants of the natural order Pinaceæ, of which there are several species. C. Australis, *Pers.*, is a tree of New Holland; C. fastigiata, *Wall.*, C. funebris, *Fortune*, of China and the Himalaya; C. glauca, *Lam.*, the Goa cedar tree of the gardens of Bombay and the Dekhan, a name also applied to the C. Lusitanica, C. sempervirens, *Linn.*, C. horizontalis, the spreading cypress, a handsome species. The common cypress grows in the Himalayas, in Italy and the S.E. of Europe, and in Mexico and the southern parts of N. America. C. thuyoides is the white cedar of N. America, where its chips are used medicinally as a stomachic; and C. torulosa, *Lamb*, is the twisted cypress of the Himalaya, Bhutan, and Niti.—*Voigt; Stewart; Fortune; Riddell.*

CUPRESSUS FUNEBRIS. *Fortune.* The funereal cypress; grows in the Himalaya and in China. It is a most beautiful tree, a weeping cypress. Fortune says that it rises about sixty feet in height, having a stem as straight as the Norfolk Island pine, and weeping branches like the willow of St. Helena. Its branches grow at first at right angles to the main stem, then describe a graceful curve upwards, and bend again at their points. From these main branches others long and slender hang down perpendicularly, and give the whole tree a weeping and graceful form. Its stem is perfectly straight, like the Cryptomeria, and its leaves are formed like those of the arbor-vitæ, only more slender and graceful.—*Fortune's Tea Dist.*

CUPRESSUS GLAUCA. *Lam.*

C. Lusitanica? | C. pendula?

The Sarav, or Goa cedar, is a tall, elegant, and graceful tree, well adapted for border walks in a garden, being always green, and a favourite with the natives of India. It grows easily, and is generally planted alternately with the areca or betel-nut tree. Slips, if taken off before the commencement of the rains, and planted in beds shaded from the sun, take root; each slip should be six inches apart, and if common care is used, one-fourth of the plants will strike and grow. After that they may be put out in nursery beds, at the distance of one foot from each other, until required for transplanting to where they are to remain. Its leaves have a singularly glaucous colour.—*Riddell.*

CUPRESSUS OBTUSA. *Von Mueller.* Retinospora obtusa, *S. and Z.*, the Hinoki of Japan, forms a great part of the forests of Nipon; attains a height of 80 feet, with a stem 5 feet in circumference. The wood is white-veined and compact, and assumes when planed a silky lustre, used for temples.

Cupressus pisifera, *Von Mueller*, Chamæcyparis pisifera, *S. and Z.*, is a very hardy tree of Japan, rising 30 feet high, stem 3 feet in diameter, of beautiful aspect and quick growth.—*Von Mueller.*

CUPRESSUS SEMPERVIRENS. *Willde.*

Saras, ... DUKH. | Saro, Sarv, HIND., PERS.

The Fruit.

Hauber, Maju-phal, HIND. | Mai-sabz, Saro-bij, HIND.

The cypress tree is a native of the warmer parts of Europe, though it has long been transferred to gardens for the sake of its deep-coloured evergreen branches and leaves. The gates of Constantinople, famous for having stood from the time of Constantine to that of Pope Eugene IV., a period of 1100 years, were of cypress wood. It is hard, elastic, and strong, resists worms, and its odour repels insects. The tree grows in the outer Himalaya up to 5000 feet, and attains a girth 6 to 8 feet, and a height of 40 to 45 feet; it also grows at Kābul, but Dr. Stewart says its wood is of no especial value there. Its fruits were formerly used in medicine, but are now obsolete. Oriental physicians used to send their patients labouring under lung diseases to breathe the air of Candia, where the cypress was abundant, in the persuasion that the emanations were particularly wholesome. The precise period or the age to which the tree lives has not been clearly ascertained. In some countries this tree is planted over the graves of the dead as an emblem of immortality.—*O'Sh.; Irvine; Eny. Cyc.; Book of Trees; Stewart; Hogg; Voigt.*

CUPRESSUS TORULOSA. *D. Don.*

Deodar, . BEAS, SUTLEJ. | Devi diar of . . . RAVI.
Tang-shin, ... BHOT. | Galla of . . . SUTLEJ.
Nawir, Neur, Lewar, PANJ.

This tree grows on the Ravi and Beas, on the outer hills near the Sutlej, in Kulu, in Naini Tal up to 8000 feet; and Dr. Stewart had seen a tree 120 feet high and 15 feet in girth. It grows also in Bhutan and Niti. In Naini Tal it is used for roofs. In its eastern localities, the tree is deemed sacred, and is not felled; and in Kulu images are made of its wood. It occurs in the N.W. Hima-

laya in a solitary clump at the junction of the Budhil with the Ravi, but is not found further to the west. It is found in the Sutlej valley between Rampur and Sungnam, at an elevation of 6000 to 8000 feet. The wood is hard, elastic, strong, resists worms, and its odour repels insects. Its duration is very considerable. — *Fortune's Tea Districts; Stewart; Voigt; Cleghorn, Panj. Rep.*

CURAO, also written Karao, seemingly from Karana, to cause to do, to compel, is the term given among the Jat, Gujar, Ahir, and other non-Aryan races, in N.W. Hindustan, to concubinage generally, but more especially to marriages of widows with the brother of a deceased husband. The practice, which is also known to the eastward by the name of Oorhuree, in the Dekhan of But'hee, and in other provinces by the name of Dhureecha, is followed among these races, but is not very openly confessed even among them, as some degree of discredit is supposed to attach to it. It is only younger brothers who form these connections, elder brothers being prohibited from marrying their younger brothers' widows, but among the Jat of Dehli even this is not prohibited. The practice has been common among several nations of the East. The Jews followed this custom; in Egypt it was admitted for a childless widow to cohabit with a brother of the deceased husband; and when the laws of Menu were enacted, Curao appears to have been a recognised institution. But, as is not unusual with the institutes of Menu, there is much contradiction between the enactments relating to it. From a consideration of all the passages on the subject, it appears that failure of issue was the point on which the legality turned. He who was begotten according to law on the wife of a man deceased, or impotent, or disordered, after due authority given to her, is called the lawful son of the wife (ch. ix. 176). From the fact of Draupadi marrying the five Pandu brothers, we learn that polyandry must have prevailed amongst the races of that period; and if polyandry, the practice of Curao was no doubt not uncommon; indeed, Vyasa, the compiler of the Mahabharata, was himself appointed to raise up offspring to his deceased brother. There is perhaps no circumstance which so strongly shows the northern descent of the deified heroes as this marriage. Herodotus tells us that the practice prevailed among the nomadic Scythians, as it does at present among the Bhotia. The practice is adopted also by the Nair race of Malabar, between whom and the people of the Himalaya, Wilson traces the obscure vestiges of a connection. Amongst the Jat, Gujar, and Ahir, children born Curao are considered legitimate, and are entitled to inheritance accordingly. Children begotten by the woman previous to Curao, except in the case of fraternal Curao, are known by the name of Kudhelura, and do not inherit the property of the father-in-law.—*Elliot, Sup. Gloss., quoting Recherches Phil. sur les Egyptiens et les Chinois; Selections from the Mahabharata*, pp. 8 and 66.

CURARE or Wourali of Guiana, prepared from the bark of Strychnos toxifera, *Schomb.*, a virulent poison used by the Indians to tip weapons for war and the chase.

CURB, also Kurubar, the Curumbar race. See Curumbar; Kurumbar.

CURBAN. ARAB. A sacrifice. See Kurban.

CURCULIGO, a genus of plants of the nat. ord. Amaryllaceæ, the narcissus tribe. In S.E. Asia are C. brevifolia, ensifolia, graminifolia, latifolia, Malabarica, orchioides, pauciflora, plicata, recurvata, Sumatrana. C. brevifolia is the Musli-kund of Bombay.—*Roxb.* ii. p. 143.

CURCULIGO LATIFOLIA. Lambay, MALAY. A broad-leafed plant of Borneo, with a yellow flower. Its fibres are woven into a strong cloth. —*Burbidge*, p. 155.

CURCULIGO ORCHIOIDES. *Gærtn.*

Telnur mudul, . . BENG.	Nila pana, . . MALEAL.
Tamuli, ... ,,	Nilapanay kalangu, TAM.
Siah musli, . . . DUKH.	Nalla-tadi gadda, . TEL.
Nia musli, . . . HIND.	Nalla-atta gadda, . ,,

This plant grows in the Eastern Archipelago, and in all parts of India. Its tuberous and wrinkled root is in a slight degree bitter and mucilaginous to the taste, and is prescribed in electuary.—*Roxb.; Ainslie.*

CURCULIONIDÆ, a family of coleoptera. A large curculio (Rhynchophorus, *Sach.*) nearly as large as the stag-beetle of Great Britain, and called the red beetle, from a red mark on the upper part of its breast, is said to destroy the cocoanut tree. See Insects.

CURCUMA, a genus of plants of the nat. order Zingiberaceæ, growing in the south and east of Asia. The tubers of many species furnish a fecula, which is sold as East Indian arrowroot. C. angustifolia, *Roxb.*, grows in Travancore, the N. and S. Konkans, Nagpur, and Benares, and is that commonly used for the East Indian arrowroot. C. caulina, *Graham*, of the Mahabaleshwar hills, furnishes the Mahabaleshwar arrowroot. C. pseudo-montana, *Graham*, yields Ratnagherry arrowroot, and is probably Roxburgh's C. montana, and Royle's C. kushoor of Sirmore and Bissehur. C. decipiens, *Dalzell*, C. zedoaria, *Roxb.*, and C. amada, *Roxb.*, grow on the western side of peninsular India, and all yield feculæ. C. rubescens, of Bengal and Travancore, and C. leucorrhiza, are similarly used. The species known in the south and east of Asia are about forty in number,—æruginea, amada, angustifolia, aromatica, attenuata, cæsia, caulina, comosa, cordata, elata, ferruginea, grandiflora, latifolia, leucorrhiza, longa, montana, Neilgherriensis, ornata, parviflora, petiolata, plicata, pseudo-montana, reclinata, Roscoeana, rubescens, strobilina, viridiflora, xanthorrhiza, zedoaria. The particles of East India arrowroot are very unequal in size, but on the average are larger than those of West India arrowroot. — *Roxb.; O'Sh.; Voigt; Birdwood; Drury.*

CURCUMA AMADA. *Roxb.* Mango ginger.

Amada, ... BENG.	Aru kanla kachoram, TEL.
Tommon munga, MALAY.	Shadgrandika, . . ,,

A plant of Gujerat, Konkan, Bengal, and Java. The root is called mango ginger, from its peculiar smell while fresh. It is a gentle stimulant, but now only used as an article for seasoning food. Aru kanla, meaning 'six eyes,' and Shadgrandika, 'six-jointed,' are also syns. of C. caesia, and probably refer more correctly to C. zedoaria, or 'long zedoary.'—*Roxb.; Voigt; O'Sh.*

CURCUMA ANGUSTIFOLIA. *Roxb.* i. p. 31.

Tikhur, Tikor, . . HIND.	Kua, Kogha, . MALEAL.
Kughai, . . . MALEAL.	Kua-maoo, . . . TAM.
Kuay kalung, . . ,,	

Narrow-leaved turmeric, grows wild in all the hilly parts of the centre of the Peninsula, in Central India, in the forests, extending from the banks of the Sone to Nagpur, abundantly on the Malabar coast, and is very generally cultivated. Its tubers are found at the end of fleshy fibres, which meet together, forming a crown, and they yield part of the East Indian arrowroot of commerce. The method of preparing arrowroot is substantially the same, from whichever plant it is extracted. The commercial value of the East Indian farina is very much below that of the Maranta arrowroot. It is less used as an article of diet, but is largely bought by the starch makers of London. The tubers should be planted in a good rich soil, about one foot apart, just before the rainy season, and taken up as soon as the leaves are dry. Rats, porcupines, and wild hogs are very destructive to it, both when first planted, and also when ripe. Such tubers as are required for seed should be kept in a dry place in sand.—*Roxb.; O'Sh.; Simmonds; Eng. Cyc.; M. E. J. Reports; Ainslie; Rohde, MSS.*

CURCUMA AROMATICA. *Salisb.*

Curcuma zedoaria, *Roxb.* | Wild turmeric.
Bun haldi, . . . BENG. | Jungli haldi, . . HIND.

Grows in China, the islands of the Eastern Archipelago, Malabar, and Bengal, and its root is used as a perfume, and also medicinally. It possesses tonic and aromatic properties.—*Roxb.*

CURCUMA LEUCORRHIZA. *Roxb.* Tikur, HIND., BENG. Grows wild in the forests of Behar and at Bhagulpur. Arrowroot is made from its long straight roots, often a foot in length, and of a pale yellow inside, by rubbing them on a stone or beating them in a mortar, after which they are rubbed in water by the hand, and strained through a cloth; the fecula having subsided, the water is poured off, and the arrowroot dried for use.—*Roxb.; Voigt; O'Sh.; Eng. Cyc.*

Turmeric is grown all over India and the Archipelago, frequently along the edge of fields of ginger, in the Panjab, Siwalik tract, and outer hills, from 2000 to 5500 feet, up to the Ravi at least, and occasionally beyond that. It has large whitish flowers, with a faint tinge of yellow, the tuft greenish white. In cultivating it, the ground must be rich, friable, and so high as not to be drowned in the rainy season,—such as the Bengali ryots about Calcutta call danga. It is often planted on land where sugar-cane grew the preceding year, and is deemed a meliorating crop. The soil must be well ploughed and cleared of weeds, etc., and in April and May, according as the rains begin to fall, the soil is raised into ridges 9 or 10 inches high, and 18 or 20 broad, with intervening trenches 9 or 10 inches broad. The cuttings or sets, consisting of small portions of the fresh root, are planted on the tops of the ridges, at about 18 inches or 2 feet asunder. One acre requires about from 900 such sets, and yields in December and January about 2000 lbs. weight of the fresh root. The tubers are a deep orange inside, bitter, and aromatic. The colouring matter of the dried root is bright yellow, soluble in alcohol and water, and changed to a deep red by alkalies. It is employed by the wool-dyers for compound colours of yellow, as for cheap browns and olives; as a yellow dye it is employed only in silk. In 1880-82 only 70,783 cwt. were exported from India. White paper dyed by an alcoholic tincture of turmeric is a very sensitive test for alkalies. The root enters into many of the religious ceremonies of the Hindus. The entire, or the corners, of every new article of dress, whether of man or woman, are stained before wearing it with a paste made of the root and water. Mixed with lime, it forms the liquid used in the Arati ceremony for warding off the evil eye. Women use it largely as a cosmetic, and some smear all the body with it as a detergent. It is a mild aromatic and carminative, and is largely used as a condiment in curries; the paste is applied to foul ulcers. Clothes dyed with it are deemed a protection against fever; and the Javanese make an ointment of the pounded roots, and rub it all over their bodies as a preservative against fever. With it, in conjunction with lime-juice, the Hindus of the sect of Vishnu prepare their yellow tiroochoornum, with which they make the perpendicular mark on their foreheads.—*Ainslie; Roxb.; O'Sh.; Royle; Dr. Shortt.*

CURCUMA RUBESCENS. *Roxb.* A native of Bengal, Chittagong, Burma, and Pegu. All the parts of the plant have a pleasant aromatic smell when bruised. The root is highly aromatic. Its chief use is for the preparation of tikor, a very fine fecula, like arrowroot, which in Travancore constitutes an important article of food.—*O'Sh.*

A native of Bengal, Chittagong, Java, and China. This is the round zedoary, all kinds of which resemble ginger in their medicinal qualities, but are inferior to it in strength and agreeableness of flavour. Its flowers are largish, of a deep yellow, and at the top a bright crimson tuft. This plant is supposed also to yield the long zedoary of the shops; the powdered root is mixed with the powder of Cæsalpinia sepan to make the 'abir' or 'shagoo,' the red powder thrown about by Hindus in the holi festival; the root is also used medicinally.—*Roxb.; Voigt; O'Sh.*

CURDUCHIA or Kurdistan, the ancient Carduchia of Xenophon, a country which, from its strength and position, commanded all the western part of Persia. It is inhabited by nomade tribes, who, though tributary to Turkey, and professing Mahomedanism, are virtually independent. Sir John Malcolm travelled through their country in 1810, and formed the opinion that they had remained unchanged in their appearance and character for more than twenty centuries.—*Malcolm's Persia*, i. p. 105; *Chatfield's Hindustan.*

CUREA. HIND. A village, from the Arabic Karyah, assembling together, a concourse. The word is preserved in Cureat Mittoo, Cureat

Seek'hur, Cureat Dost, and Cureat Mendhoo, the names of parganas in the province of Benares.

CURIA MURIA ISLANDS, on the Mahra coast of Arabia, were ceded to the British in 1854 by the Imam of Muscat. They are only valuable for deposits of guano.

CURIOSITIES, or Curios.

Ajaibat, . AR., PERS., H.	Curiosita, ... IT.
Curiosité, Rareté, . FR.	Curiosidad, . . . SP.
New-gierde, . . . GER.	

Under the general term Curios are included a great variety of articles. In China they consist chiefly of such things as please the fancy, and are for the most part procured for ornamental purposes,—vases, pots, jars, cups, images, statuettes, ornamental screens, plates, boxes of copper, iron, bronze, clay, silver, porcelain, stone, lacquer-ware, or wood of every shape, size, and variety of workmanship, rings, stands, and pedestals, lanterns, scrolls, etc. — *Morrison's Compend. Descrip.; Williams' Middle Kingdom*, ii. p. 400.

CURLEW ISLAND, a name of Kalagouk, in the Gulf of Martaban, 30 miles south of Amherst. It is 8 miles long. Cavendish Island, at its extreme south end, is half a mile in length. The greatest breadth is 1¼ mile. On its highest point, about 500 feet above the sea, are remarkable trees, a point for navigators making the coast. Alguada lighthouse was built of stones from this island. The editor visited it in 1863, and reported it as wholly unsuitable for a sanatorium.

CURMA, in Hindu mythology, the second incarnation of Vishnu in the shape of a tortoise.

CURMBOLE. MALAY. A tree of the Canara forests, which grows to about 12 or 18 inches in diameter, and from 15 to 30 feet high. It is used by the natives for house-work, and is considered a useful and durable wood.—*Edye, M. and C.*

CURNUM. TAM. A village accountant.

CURRANTS.

Raisins de Corinthe, . FR.	Passulæ Corinthiaceæ, LAT.
Korinthen, . . . GER.	Korinka, Opoek, . RUS.
Uve-passe de Corinto, IT.	Pasas de Corinto, . . SP.

The currants of commerce consist of the small dried grape, or berry, of species of vine, cultivated in the Morea, Ionian Islands, and some parts of Persia, etc. A currant, like the European red currant, called rasta, is largely eaten by the people of the Upper Panjab. Currants (zirishk), both acid and sweet, the former being the fruit of the berberry dried, and which resembles European currants, are brought from Kābul and other hill places. The zirishk currants are of two kinds, somewhat alike in appearance,—one is sweet, and grows in Kābul, etc., being a species of small-fruited vine (vitis); the other is acid, being the dried berberry. Sweet currants, basho, (Tibetan), from species of vitis, are imported from Balti. Bengal currants are the fruit of Carissa carandas.—*Faulkner; M'C. Com. Dict.; Powell, Handbook.* See Vitis.

CURRENCY NOTES in circulation throughout India have increased as under:—

CURRIE, SIR FREDERICK, BART., twice Governor of Bombay, Chairman of the Board of East India Directors, Vice-President of the India Council. He was born the 3d of February 1799. He entered the Bengal Civil Service in 1817. He became Secretary to the Government of India in 1842, and accompanied Lord Hardinge in his campaign across the Sutlej in 1845, and the following spring. He was created a baronet December 17, 1846, immediately after the battles of the Sutlej. In April 1854 he was nominated one of the Court of East India Directors, was chosen Chairman of the Company in 1858, and held that appointment until the cessation of the functions of that body, on the 1st of September 1858.

CURRY. 200 years before the Portuguese had appeared in the Indian seas, Ibn Batuta describes the natives of Ceylon as eating curry, which he calls in Arabic Conchan; in modern Arabic, Idaan is the name. In the Rajavali, also, this article of diet is mentioned as in use in Ceylon in the 2d century of this era. Nevertheless, several writers have suggested that the word has been introduced from the Portuguese. The name is probably from the Tamil word Kadai or Karai, a bazar; and Tamil children in the Peninsula sing a nursery song:

'Kai viss ammah kai viss,
Kadi ki polam kai viss.'

'Swing your hand, mother, swing your hand;
Let us go to the market, swing your hand.'

Curry in Urdu is called Salin, in Tamil Karri, in Telugu Koora, in Persian Nan-khurish. Curry is daily used in every family on the Indian sea-coast, wherever the Bengali, the Tamil, Telugu, and Mahratta people have spread, and in greater or less quantity according to the means of the family, always with vegetables and with mutton or fowl, as they can afford. The ingredients are usually brought fresh from the market daily, but Europeans in India often grind and keep the dry materials in powder. There are very numerous receipts, but almost every household has one of its own, and up to the middle of the 19th century many houses prided themselves on their curries. The curry powders of India are articles of considerable commercial traffic; 32,550 cwt. of curry stuff was imported into Ceylon, chiefly from India, in 1851. The usual ingredients for curry stuffs are: aniseed, allspice, cardamom, cloves, mace, nutmeg, cinnamon, coriander, cumin seed, black pepper, mustard seed, chillies, turmeric, fenugreek, garlic, onions, ginger dry and green, poppy seed, long pepper, asafœtida, chironjie nut, turmeric, almond, cocoanut, ghi, butter, salt, tamarind, lime-juice, mango. Cocoanut milk is much used on the coast in forming the gravy to many curries, especially fish and prawns, as well as the oil fresh expressed from the nut when grated. If the curry is to be dry, the onions must be fried brown in ghi or butter, and the ingredients ground to a paste with water mixed in the same, the meat and fowl added, stirring the whole until the gravy and butter are absorbed. For a gravy curry, cut the meat or fowl into slices, put the ghi into a stew-pan over the fire with the sliced onions, and dress them; then add the meat with the ground ingredients, and some water or broth; mix well together, and let the whole simmer gently until the meat is properly done. Chundu is made with meat or fowl that has been previously dressed. It is to be minced up and added to chopped onions fried in ghi, with whole red chillies, and the other curry ingredients well mixed together; the

frying is continued until the meat is perfectly brown and the gravy quite absorbed. Dr. Riddell gives the following ingredients for four curry powder receipts :—

	No. 1.	No. 2.	No. 3.	No. 4.	
Coriander seeds,	20 lbs.	12 lbs.	3 lbs.	1 lb. 0 oz.	To be well roasted.
Turmeric,	4 ,,	2 ,,	1 ,,	1 ,, 2 ,,	Pounded.
Cumin seeds,	1 ,,	2 ,,	½ ,,	1 ,, 0 ,,	Dried and ground.
Fenugreek,	1 ,,	1 ,,	½ ,,	0 ,, 4 ,,	
Mustard seed,	1 ,,	1 ,,	½ ,,	...	Dried and cleaned of husks.
Ginger, dried,	2 ,,	2 ,,	½ ,,	1 ,, 0 ,,	
Black pepper,	2 ,,	1 ,,	1 ,,	1 ,, 0 ,,	
Dried chillies,	1 ,,	2 ,,	1 ,,	0 ,, 12 ,,	
Poppy seed,	2 ,,	2 ,,	1 ,,	0 ,, 12 ,,	
Garlic,	2 ,,	1 ,,	1 ,,	0 ,, 12 ,,	
Cardamoms,	2 ,,	1 ,,	1 ,,	0 ,, 8 ,,	
Cinnamon,	2 ,,	1 ,,	1 ,,	0 ,, 8 ,,	

Salt in proportion to be added when using the curry stuff. The whole to be cleaned, dried, pounded, and sifted; then properly mixed together, and put into bottles, well corked. A table-spoonful is sufficient for chicken or fowl curry. Another very simple receipt is powdered turmeric, 22 tea-spoonfuls; red dried chillies or cayenne pepper, 8 tea-spoonfuls; coriander seed, cumin seed, dried cassia leaves (tejpat), each 12 tea-spoonfuls, and mix together.—*Riddell's Domestic Economy*, p. 404; *Simmonds' Com. Prod.*

CURRYING of leather is practised among the natives of India, by the Chamar and Chuckler, by whom every operation is conducted, from the skinning of the beast to the binding of a pair of shoes. He shaves the hide or skin down with his knife, beats and rubs it with a maul, and blackens it with iron liquor, to which plantain root and conjee water are sometimes added; sometimes a little lamp-oil is used.—*Rohde, MSS.*

CURU, the founder of the race who contended with the Yadu for dominion in Hindustan, in the war famed as on Kuru-khet, which is described in the Sanskrit poem the Mahabharata. Curu had two sons, Sudina and Parikhita. The descendants of Sudina terminated with Jarasandha, whose capital was Rajagriha, the modern Rajmahal, on the Ganges, in the province of Behar. From Parikhita descended the monarchs Santana and Balica; Santana producing the rivals in the great war, Yudishtra and Duryodhana, the other the Balicaputra. Duryodhana, the successor to the throne of Curu, resided at the ancient capital Hastinapura; while the junior branch, Yudishtra, founded Indraprestha, on the Yumuna or Jumna, which name in the 8th century A.D. was changed to Dehli. The sons of Balica founded two kingdoms,—Palibothra on the Lower Ganges, and Arore, founded by Sehl on the eastern bank of the Indus.—*Tod's Rajasthan*, i. p. 42.

CURU, in Hindu cosmogony, an extensive country to the north of Su-meru, supposed to be the same as Siberia.

CURUMBAR. A race of this name are the earliest known occupants of Dravida desam, the modern Karnatic and Coromandel. They seem to have established numerous petty principalities over the whole Peninsula, which were ultimately absorbed in the Chola empire. Numerous sites attributed to this race, and still called Curumbar Cot, are to be met with. Small communities of the tribe are found to this day in the less accessible hills and forests of many parts of the Peninsula.

CUSA GRASS, Poa cynosuroides.

CUSBHARA, also written Casbhara, the designation of the artisans who work in bell-metal; from Kanso, bell-metal, and Bharna, to fill. They are also employed in fusing precious metals and making ornaments which require to be formed in moulds. They comprise one of the subdivisions of the Sonar or goldsmiths, of which, in Hindustan, the others are, Muthoorea Myr, Khuttrea, Kumethika Lahourea, Poorbea, Canoujea, Mahour, Muhamunea, Agurea, Birpoorea, Chhyneewan, Mungorea. Of these, Muthoorea ranks the highest. The Cusbhara is below them all. Amongst these tribes there is a secret language, which is adopted for the purpose of concealing their fraudulent acquisition of property.—*Elliot, Supp.*

CUSCUS. HIND. Poppy seed; properly, Khash-khash.

CUSCUS ROOT.

Bala, ... DUKH.	Viratara, . . . SANSK.
Usir, ... GUJ.	Vetti vayru, . . . TAM.
Khas, ... PERS.	Curu varu, . . . TEL.

Anatherum muricatum, *Retz*, roots are used for making screens, tatties, punkahs, large fans, or covers for palanquins; and, when wetted, a very fragrant smell issues.

CUSCUTACEA, an order of twining, parasitical, leafless herbs; many species occur in the south and east of Asia,—aggregata, Arabica, australis, capitata, carinata, Chinensis, corymbosa, grandiflora, hyalena, longiflora, macrantha, pedicellata, planiflora, reflexa. They twine on various trees, and are found up to 9000 feet in the Himalaya and Afghanistan. C. longiflora is the Nilathari of Kaghan.

CUSCUTA EUROPÆA and C. Chinensis are the T'u sz-tsze of the Chinese, dodder of the English. The seeds are small and round, of the size of black mustard-seed, and are given in blenorrhœa and leucorrhœa. The young shoots are used externally as washes.—*Smith, Chin. Mat. Med.*

CUSCUTA MACRANTHA. *Don.*

Nila-thari, . of JHELUM. | Amil, ... CHENAB.

Grows up to 9000 feet, up to the Indus. It is found on Populus, Salix, Spirea, Lonicera, Desmodium, Urtica, and Polygonum; and, like some of the other species, it exhales at times a very strong scent. It is eaten by cattle and goats. Edgeworth mentions that the mountaineers believe that crows pluck sprigs of this and of C. anguina, *Edg.*, to drop into water, where they become snakes, and so furnish food for themselves. Madden states that the natives promise boundless wealth to him who finds the root of it; while others, again, believe that the possession of its root will confer the gift of invisibility.—*Drs. Roxburgh, J. L. Stewart, Voigt.*

CUSCUTA PEDICELLATA. *Led.*

Amlu, . . . CHENAB.	Zrand, . . . KANGRA
Kwi klapot, . KANGRA.	

This is found on the genera Morus, Leptopus, Plectranthus, Polygonum, Artemisia, etc., in Kashmir, etc., from 4000 to 5000 feet, and was got in Afghanistan by Bellew on tamarisk, Alhagi, and Peganum.—*Stewart.*

CUSCUTA PLANIFLORA. TEN. Found in fields of Kashmir lucerne, at Googaira, in Montgomery, and it is common in Lahoul and Ladakh up to 11,000 feet, growing on Carum, Artemisia, Cinerea, and A. parviflora, Solenanthus, and Perowskia.—*Stewart.*

CUSCUTA REFLEXA. *Roxb.*

C. verrucosa, *Swiet.*

Nira-dhar, . . . GUJ.	Sitama purgonulu, . TEL.

A plant of British India, Panjab, Sub-Himalaya, Sylhet, Gujerat, and the Peninsula, growing on the tops of trees. It is used by alchemists, also in dyeing and in medicine. The whole leafless herb is gathered and dried; it is employed either in mixture or infusion as a laxative in fever, as an anthelmintic, and also as an alterative in cancer.

CUSH and Lava were the two elder sons of Rama, and from Cush descended the Cushwaha princes of Nirwar and Amber.—*Tod; Elliot.*

CUSH, a descendant of Hasti of the Lunar race, had four sons; one of whom, Cushnabha, whose descendants are styled the Kausika or Kusika, founded Muhadya on the Ganges, afterwards changed to Canyacubja or Canouj, which maintained its celebrity until the Mahomedan invasion of Shahab-ud-Din (A.D. 1193), when this overgrown city was laid prostrate for ever. Ferishta states it in the early ages to have been twenty-five coss (35 miles) in circumference, and that there were 30,000 shops for the sale of betel-nut only, and this in the 6th century, at which period the Rahtor dynasty, which terminated with Jye-chand in the 12th, had been in possession from the end of the 5th century. Cushamba founded a city, which he called after his own name, Causambi, and its name was in existence in the 11th century. The other sons of Cush built two capitals, Dharmarunya and Vasumuttee, but of neither have we any correct knowledge.—*Tod; Elliot.*

CUSHITE, a race of Arabs who first gave their name to a part of Arabia; they afterwards crossed the Red Sea, and settled in Ethiopia. In ancient times, the Cushite and Joktanite occupied Arabia felix, when the Ammonite and Ishmaelite dwelt in A. deserta, and the Moabite, Edomite, Nabathæan, Midianite, and Amalekite in A. petrea.

CUSTARD APPLE is the fruit of the Anona squamosa. Sour-sop is the Anona muricata. The custard apple is a favourite fruit, and its shrub grows in the Dekhan with little care. Its seed, called sherifah, disperses vermin. Flies are reported never to settle on the tree or its fruit, though ants will attack both. Bugs have a great antipathy to the leaves of the custard apple, and are said to quit a bed in which they are placed.—*Tennant's Ceylon; O'Sh.; Hooker, Him. Journ.*

CUTCH, including the Runn, extends between lat. 22° 47′ and 24° 40′ N., and long. 68° 26′ and 71° 45′ E., and in 1871 had a population of 487,305. It is bounded to the north by the Great Runn, beyond which is the Thur or Little Desert; to the S.W. and S. by the Gulf of Cutch and the Indian Ocean; to the E. and S.E. by the district of Gujerat; and to the N.W. by the eastern branch of the Indus and Sind. Its extreme length is 180 miles, and breadth 50 miles. Its area is 6500 square miles, while that of the Runn and its islands is 9000 square miles. All between the Aravalli mountains and the Indus, from the Sutlej or Hysudrus on the north to near the sea on the south, is a waste of sand, in which are oases of different size and fertility, the greatest of which is around Jeysulmir. Cutch intervenes as a narrow strip of land between the desert and the sea, and makes a sort of bridge from Gujerat to Sind.

South of the Indus, the land becomes sandy, gradually sloping to the sea, first as a plain covered with a series of billows of sand; then as the level Runn up to the mountains of Cutch, the extent being from 500 to 600 miles in length, and varying from 70 to 150 miles in breadth, on which a considerable population dwells. The Runn itself is 150 miles from east to west, and about 40 miles broad; but there is a prolongation of the Runn towards Ahmadabad, and a very narrow line to the Gulf of Cambay. It is almost level, and a little water, from the banking up of the sea by the Sirmunur, converts it into a very shallow lake of a foot or two deep, and 40 to 60 miles broad; but in the dry season its saline sand and clay soil are hard like a slate billiard-table, and the mirage is so incessant as to deceive ordinary travellers. None but experienced guides can travel there.

The Put district, immediately north of the Runn, is less saline, and is cultivated. The district north of the Runn, extending from 500 miles up to the rivers Indus and Sutlej, is called the Tur or Thur, on which are billows or hills of sand 400 to 500 feet high above the sea-level, and 200 to 300 feet above the plain. Sir B. Frere alludes to these as of volcanic origin. The other part of Cutch is an irregularly hilly tract, completely isolated by the Runn and the sea. On the southern coast the country is a dead flat, covered with rich soil, but the northern part has three distinct ranges of hills running from east to west. The central of these ranges consists of sandstone, limestone, and slate-clay, with beds of coal; the hills north of it have numerous fossils; and those on the south, and all the face of the country near them, are covered with volcanic matter.

In 1819 Cutch was devastated by an earthquake. A dyke was thrown up, 50 miles long, 16 broad, and 18 feet high, which has been named Allah Band, the dyke of the Lord. Denodur, the largest and highest hill in Cutch, is situated near the shores of the Runn. It is an extinct volcano; its crater is still apparent, and in the north side is a large gap. It is said to have been active during the earthquake of 1819. On a level spot near the village of Wage ka Pudda are several small craters, circular spaces surrounded by basalt. And several other small basins have been blown out in the surrounding table-land, forming inverted cones about 15 or 20 feet in depth. Numerous fossils occur in the sedimentary rocks. The land at Mundavee, Moondrah, Budraseer, and other seaports, up to the Gulf of Cutch, has been gaining on the sea. Some of the creeks and inlets penetrate 6 or 7 miles from the coast, through a tract covered for miles in extent with shrubs. At low water these plants are exposed to the roots, but at high tides merely their upper branches are visible, so that the boats sail through a marine

forest, the sails and yards frequently brushing against the boughs of the trees, and the sailors have often to force their boats through the upper branches. The stems and branches are covered with crustacea and mollusca, whilst numerous waterfowl occupy the higher branches.

The Cutchi dialect of Hindi is used, but Gujeratti, Hindustani, and Persian are also known, though little used. On the death of Rao Lakhpat, his sixteen wives burnt themselves on his funeral pile, and their tombs, built in a beautiful group, stand close to the British Residency. The title of the ruler is Mirza Maha Rao, Sri Khengarji. The inhabitants of Wagad or Eastern Cutch have been notorious pirates. Sati and female infanticide were frequent. In 1868 the proportion of males to females was 1·04 to 1.

Its people are chiefly followers of the Hindu religion; and the ruling race are Jharija Rajputs, derived at a comparatively recent date from Tatta in Sind, from a common ancestor, Humerjee, whose son, Rao Khengar, acquired Cutch before the middle of the 16th century.

A. Rajput Grasia, viz. :—

Cultivators and Labourers.
1. Ahir.
2. Rehbari.
3. Kumhar.
4. Lowanna.

Mahomedans :—
1. Khojah.
2. Mehmun.
3. Meyanna.

The Jhalla are Rajputs of Sindian origin; and there are tribes of Lowanna, Ahir, and Rehbari. The Bhattiah, of Sindian origin, are a fair, handsome race, skilful and industrious mechanics, and found in all the ports of Eastern Africa, Arabia, and Western India. The Kaba is a piratical tribe in the Gulf of Cutch. The Khosa are a marauding tribe on the Thul desert between Hindustan and Sind. The ancient Cutch people were the Odomboeræ of Pliny.

There are also Brahman tribes, Soda Rajputs, Mahrattas, Bhils, Kols. The language of the hunters and tanners, the Dedh, is a dialect, but the language of Lar is purest. Iron ore occurs in various parts, but has been mined chiefly at Doodye, opposite the S.W. end of the Bunnee, where it occurs in small lumps, spongiform and friable. Coal has been found in various places, and has been used. Alum is manufactured from shale near Mhurr.—*Tr. Bo. Lit. Soc.* ii. p. 222; *M'Murdo's Cutch in* 1815; *Burnes' Bokhara; Grant, Geology; Sir Bartle Frere on the Runn of Cutch.*

CUTCH, Catechu.

Kat'h, ... Beng.	Kat'ha, ... Hind.
Shah, ... Burm.	Kachu, . . . Malay.

Cutch, catechu, gambier, and terra japonica, are commercial terms for the inspissated aqueous extracts from the wood of the Acacia catechu and from the leaves of the Uncaria gambir. A few years ago the terms were employed synonymously; but they are now, for the most part, used in trade somewhat distinctively, though not uniformly in the same sense. The catechu and gambir imported into Great Britain in 1881 was 33,011 tons.

CUTCHERRY. Anglo-Hind. An office of a revenue magistrate, a bureau, a court of justice.

CUTCH GANDAVA is the plains of Baluchistan. See Tor.

CUTCHWAHA. Prithi-raj was rao of Amber, a name now set aside by Jeypore. The twelve sons of this prince formed the existing subdivisions or clans of the modern Cutchwaha, whose political consequence dates from Humayun.—*Tod's Rajasthan*, i. p. 299.

CUTLERY. Salem and Trichinopoly afford evidence of the skill with which this description of manufacture can be carried on. At the Madras Exhibition of 1855, the daggers exhibited from the northern division exhibited in a high degree the proficiency of the operatives in that part of the Madras Presidency. Salem cutlery may compete with that of Europe.—*M. E. J. R.*

CUTTACK (Kataka, the fort), a British district in Orissa, lying between lat. 20° 1′ 50″ and 21° 10′ 10″ N., and long. 85° 35′ 45″ and 87° 3′ 30″ E., with an area of 3858 square miles, and a population in 1872 of 1,494,784. The Mahanadi river, aided by some of the large streams from the north, has formed a rich delta. From the town of Puri, containing the great temple of Jaganath, to the Dhamrah mouth, there is a deltaic tract fully 50 miles broad, and which comprises nearly the whole of the Cuttack district, great part of that of Puri, and a portion of that of Balasore. In addition to the low districts, Orissa has an enormous tract of hilly country of the interior, the population of which is partly Oorya and partly aboriginal. The people of Orissa have a language with a character peculiar to themselves. There are 18 estates known as the Cuttack Tributary Mahals, with an area of 15,000 square miles, viz. Angool, Autgarh, Autmalik, Banki, Barumba, Boad, Dhenkanal, Duspulla, Hindole, Keonjhur, Kundiaparra, Mohurbhunj, Nilghur, Nyagarh, Narsinhpur, Ranpur, Talchir, Tigeria. Angool and Banki were annexed for the misconduct of the rajas. The other sixteen tributary rajas administer civil and criminal justice, controlled by the Superintendent. The most powerful are the rajas of Mohurbhunj and Keonjhur, both of whom rendered good service during the mutinies. Cuttack has been subjected to great vicissitudes. Frightful inundations occurred in 1823 and 1831; on one occasion causing a destruction of lives estimated at 10,000, and the entire population of 300 villages is said to have been destroyed. In 1867–68, in Cuttack, Puri, and Balasore, famine raged with great intensity, and continued longest. Manbhum, Singbhum, Midnapur, Bankura, Raniganj, Bardwan, Hoogly, Howrah, Nuddea, also suffered. Mr. Ravenshaw estimated the loss in Orissa at not less than one-fourth of the population. The aboriginal tribes are Kandh, Bhumij, Kol, and Savara, the last numbering 16,589, all of them very poor. Of the Hindus, the Khasa cultivators are 156,308, the Khandait militia 254,762, the Mastane 15,526, the Goala 11,728, and Rajputs 10,728.

CUTTÆKARE, Giant's Tank in Ceylon.

CUTTEAMUNDOO is the juice of the plant

Akoo chenroodoo, or Euphorbia cattimundoo, *Elliot;* it is common in the Northern Circars, and is also called Brama Chemoodoo. At the Madras Exhibition of 1855, Mr. Elliot exhibited seven articles, basin, ewer, tumbler, etc., made of cutteamundoo gum, moulded with the hand, without any preparation. The fresh juice is used as a vesicant, and also as a cement for fastening knife handles, etc.—*M. Ex. Jur. Rep.*

CUTTLE-FISH or Squid, the Wu-tsih-yu and Meh-yu of the Chinese. The cuttle-fish inhabit all the great oceans, and abound in the warmer latitudes. They feed on crabs, squills, and molluscs, breaking down the carapace or shells of these animals with their beak-like jaws, and their strong muscular stomach completes the comminution. In 1882 one was stranded at Cook's Strait 7½ feet long, 9 feet 2 inches circumference, its head 4¼ feet in diameter; its longest arms measured 25 feet, the smaller ones 12 feet long. The economic products are a deep pigment, known as Roman sepia, which in the cuttle-fish is contained in a bladder at the bottom of the abdominal sac; also the cuttle-fish sepium, or shell, or bone, called by the French Biscuit de mer. The cuttle-fish is particularly abundant on the coasts of China, and are there much used as food, as also are species of Octopus, Haliotis, Turbo, Hiphopus, Tridacua. Adams says some monodonta taste quite peppery.

Cuttle-Fish Bone.

Hai-piau-siu, . . CHIN.	Samudrapu nurugu, TEL.
Darya ka kaf, . . HIND.	Sorupenka, . . . ,,
Kaddalnoray, . . TAM.	

In Sepia officinalis, the soft parts are supported by a firm calcareous bone, the cuttle-fish bone of the shops; and in all the naked cephalopods (not including Ocythoe) now existing, some rudiment at least of a bony, horny, or cartilaginous support is to be found. Cuttle-fish bone is found on all the coasts, and is used for rubbing down paint, etc., by the painters; also for the purpose of cleaning and polishing the surface of silver and other metals. The Chinese formerly engraved these bones, or inlaid them as ornaments.—*Smith; Eng. Cyc.; Rohde's MSS.; Ains.*

CUTTONORA, the Cuttiara of Ptolemy, supposed to be either Calicut or Cochin, whence pepper was exported to Barace.—*Ind. in 15th Cent.*

CUTTY. TAM. The term applied in Southern India to the iron bloom of native manufacture.

CUTWA, a town on the Bhagirathi river, Arrian's Katadupa. Indeed, Katwadweep and Agradweep and Nabadweep all refer to a period when they must have been regular dweep or islets, to have received such names. To the vaishnava sect, Cutwa is a sacred place of pilgrimage; there, Chaitanya, flying from the roof of his parents, and leaving behind his wife, embraced the Dandi sectarianism, to shake off the obligations of society and the cares of a secular life. He was initiated into its rites by a Gosain, named Kesab Bharuty; and the hairs shaven from his head on the occasion are yet preserved in a little white temple.—*Tr. of Hind.* i. p. 49.

CUTWAL, a military police officer; the police officer of a military bazar. The word is properly Kot-wal, a fortress holder.

CUVERA, the Hindu god of riches.

CUVIER. Baron Cuvier and M. Valenciennes' Histoire Naturelle des Poissons, published in Paris in 1828 and following years, contained much information as to Indian fishes.

An erect annual; cultivated during the cold months in gardens for the little flat pods, which are used in curries as a substitute for French beans; grows from 2 to 3 feet high; the pods are seldom very tender, but are esteemed a good vegetable.—*Mason; Jaffrey; R. Br.*

CYATHEA, a genus of the tree-ferns, tropical plants. Many tree-ferns rise to a height of 20, 40, or even 60 feet in their native forests, supporting magnificent crowns of gigantic fronds, in some species 15 to 20 feet in length. C. spinulosa, *Wall.*, occurs in Nepal, Khassya, S. India, and Tenasserim, and in Ceylon C. sinuata, *Hook.*, and several others. C. Siamensis, of Prome, yields a whitish gum. C. Rumphii, *Miq.*, of S. India, Andamans, Burma, and Tenasserim; its wood yields a starch. The seeds of C. sphærica are ground into flour. The better known tree ferns are Cyathea aculeata, arborea, dealbata, muricata, hemitelia, horrida, and Karsteniana, Alsophila armata of the W. Indies, A. Cooperi of Queensland, and A. excelsa of Norfolk Island; also Angiopteris pruinosa and Blechnum Brasiliense. C. dealbata grows abundantly in New Zealand on the declivities of the hills, under the shade afforded by the forests. The natives use the trunk of this fern as posts in the erection of their dwellings, and they are very durable,—the medullary portion soon decaying, but the exterior lasting for several years. C. medullaris, the tree-fern of Norfolk Island, is about twenty feet in length, and presents a beautiful appearance.—*Dr. Bennett, Australasia.*

CYATHEA ARBOREA.

Aspidium arbor., *Moon.* | Æt-musana, . . SINGH.

This fern rises in Ceylon 25 to 30 feet. Its stem makes beautiful walking-sticks. The section of this tree-fern displays well the structure of an acrogenous stem, hollow in the centre, marked on the outside by the scars of the fallen leaves, and showing the elongation of the axis by junction of the petioles.—*Madras Hort. Garden; M. E. J. R.*

CYATHOCALYX ZEYLANICUS. *Champion.*

Kakalas, ... SINGH. | Eepettas, . . . SINGH.

The light lacquered Kandyan walking-sticks are said to be made from this Ceylon tree.—*Fergusson.*

CYATHULA ORBICULATA, C. capitata, and C. tomentosa, sand-binding plants of the Peninsula.

CYAXARES was the name by which the Greeks designated Vakistar, king of the Medes. In alliance with the king of Armenia, and Necho, king of Egypt, B.C. 609, took and destroyed Nineveh, and its sovereign, Assur-ibl-ili, set fire to his palace, and, with all his wives, burned himself.

CYBELE. See Osiris; Saraswati.

CYBIUM GUTTATUM. Tora-Malu, SINGH. One of the scomberoid fishes, known to Europeans as the seir fish, is the finest table fish of Ceylon. Its flesh is white, but resembles that of the salmon

in firmness and flavour. C. Commersonii, *Lacep.*, is another of the seir fish.

CYCADACEÆ, a natural order of plants, of which Lindley makes four genera and includes about fifty species. They have a simple cylindrical trunk, which increases by the development of a single terminal bud, and is covered by the scaly bases of the leaves. There are several known species of Zamia and Cycas, some of which grow in India, and in the islands of the Eastern Archipelago. They all abound in a mucilaginous nauseous juice, and the soft centres of Cycas circinalis and C. revoluta are convertible into a kind of sago. The species of Encephalartos are called Kafir bread. The seeds of Dion edule yield starch in Mexico. A similar substance, under the name of sago, is obtained from species of Zamia in the Bahamas and other West India islands; in Japan, from Cycas revoluta; and in the Moluccas and Southern India, the Cycas circinalis yields a coarse kind of flour, and also yields a transparent gum. The plants are propagated by suckers. A trunk of the order has been found in the lower greensand, Kent, and at Portland. None are now native in Europe. C. Normanbyana, *Von Mueller*, is a Queensland species; and C. sphærica, *Roxb.*, is a tree of the Moluccas. The fruit of Cycas angulata, *R. Br.*, forms a food of the Australian aborigines during a portion of the year. They cut it into thin slices, which are first dried, afterwards soaked in water, and finally packed up in sheets of tea-tree bark. In this condition it undergoes a species of fermentation, the deleterious properties of the fruit are destroyed, and a mealy substance with a musty flavour remains, which the natives of Australia probably bake into cakes. They appear also to like the fruit of the Pandanus, of which large quantities were found by Dr. Leichardt in their camps, soaking in water, contained in vessels formed of stringy bark. The tree grows 70 feet high.—*Simmonds; Von Mueller; Roxb.; Voigt; Eng. Cyc.*

This very handsome tree in appearance resembles the palm tribe. It grows in Ceylon up to 1500 feet, is common on the Malabar coast from Tellicherry to the foot of the Ghats, and occurs northwards towards Bombay; is also common in the Karen forests of Tenasserim, in Cochin-China, China, Sumatra, Java, and the Moluccas. It resembles a dwarf cocoanut tree; its blossoms are yellow. In Sumatra the cabbage and the young shoots are eaten. It yields a gum resembling tragacanth, also a kind of sago; and a flour called Indapodi is obtained by the Singhalese, by pounding the fresh kernels. These are cut in slices, and well dried in the sun before they are fit for use, otherwise when eaten they are intoxicating, and occasion vomiting and purging.—*Mason's Tenasserim; O'Sh.; Thw. Zeylan.; Marsden's Sumatra*, p. 89; *Rumphius*, i. p. 22.

CYCAS PECTINATA, *W.*, is a sago palm which grows in Sikkim, on the flats by the Ranjit streams. Its stem is ten feet high, with a beautiful crown of foliage.—*Hooker*, i. p. 151.

CYCAS REVOLUTA. *Thunb.* A native of China and Japan; a kind of starch, the Japan sago, is obtained from the cellular substance. The whole plant yields a copious mucilage, which hardens into a transparent gum. Is is the most northern member of the order of plants.—*O'Sh.*

CYCLAMEN, *sp.*, sow bread. The poisonous, acrid Hai-yu of the Chinese is dedicated to their goddess Kwan-yin.—*Smith.*

Cyclamen Europæum. *W.*

CYCLAS STURCIPENNIS, a weevil of Ceylon, very destructive to agricultural produce.

CYCLE.

Cycle, Course, . . FR.	Rivoluzione, Corso, . IT.
Zirkel, Cyklus, . . GER.	Circle, Ciclo, . . . SP.

Eastern races have chronological cycles. The Chinese astronomical cycle of 60 years, in use since the 61st year of Hoang-ti, is the most ancient form of a primitive and very simple equation of lunar and solar years. Its 76th recurrence fell in 1864. The Triakon tæteridæ of the Egyptians, of 30 years, led to the cycle of 60 years. There were Indian cycles of 5 years, the result of a rude equation; the Chaldee cycle of 600 years was of later date. The 12-yearly zodiacal cycle is in use amongst the Mongol, Manchu, and Igurian Tartars, and amongst the inhabitants of Tibet, the Japanese, and the Siamese. Amongst the Tatar populations, however, this is a cycle of 60 years (12×5). The cycle of the Chaldees was of 60 years, but they had one of $60 \times 10 = 600$, which grew out of the great patriarchal year. The oldest cycle known to the Greeks was one of 9 years, which gave way to the Metonic cycle of 19 years; but one of 60 years was in use amongst the Semitic and Iranian races of primeval Asia, as well as amongst the Chinese. Plutarch considers the 60 years' cycle as the original one known to all astronomers. The Apis cycle was of 25 years; and 59 of these make up the Sothaic year of 1460 years, with 15 years over; the Phœnix cycle was 500 years.—*Bunsen.* See Chronology.

CYCLEA BURMANNI. *Arnott.*

Cocculus Burmanni, *D.C.*	Menispermum peltatum,
C. peltatus, *D.C.*	*Gart., Lam.*
Cissampelos discolor, *Wal.*

Cyclone is the term now applied to the furious tempests formerly called taifun, typhoon, or hurricane, because of their being uniformly found to be whirlwinds, and from the Arabic Touf, circumambulation. Cyclones are of frequent occurrence from 109 miles N. to 120 miles S. of Madras, and between 1746 and 1881, 17 disastrous cyclones have been recorded. The first written notice is from the pen of Colonel Capper, a Madras officer, who describes them as whirlwinds of immense size, not less in diameter than 120 miles, and having their vortex near Madras or Pulicat. Other authors have followed since that date, 1801, offering theories and explanations of the phenomena,—Redfield and Espy in America; Dr. Thom, 86th Regiment; in Mauritius, Messrs. Bousquet, Hare, and Dove, Colonel Reid, Mr. Piddington of Calcutta, and many others. But, from the data furnished by their writings, it was left for Colonel Reid to form the law by which practical action has been given, and his position has been greatly extended and made easy by the intelligent labours of Mr. Piddington. The usual names, tempest, gale, hurricane, typhoon, being calculated to lead to confusion, a new term was sought for storms coming under the new law, and the word cyclone was selected, derived from the Greek Kuklos, as neither affirming the circle to be a true one, though a circuit be complete, yet expressing sufficiently the tendency to circular motion in these meteors. Colonel Capper put forward the view that the storms of the Indian Ocean were rotatory. Mr. Redfield and Professor Dove further developed that theory; and Colonel Reid discovered the fact that the rotation of these storms in the N. hemisphere was N.W. to S.E., or opposite to the direction of motion of the hands of a watch with its face upwards, and that the reverse is the case in the S. hemisphere. Mr. Espy of Philadelphia ascertained that in cyclones there is an indraught or centripetal force; and Professor Dove explained the opposite direction of rotation in the northern and southern hemispheres, by what he called the law of gyration.

The subsequent writers on cyclones and their laws, have been Professor Taylor, Sir John Herschel, Mr. Blanford of Calcutta, Mr. Meldrum of Mauritius, and Mr. Willson. Professor Taylor's theory was that cyclones originate from an upward expansion of the air, produced by local heat; that this is followed by an indraught of air, and that the rotatory motion of the earth produces spiral movement round a centre, over which a continuous upward movement of the air takes place. This theory was adopted by Sir John Herschel in his work on meteorology. Messrs. Meldrum and Willson are of opinion that they are primarily due to lateral and opposite currents of air. Mr. Blanford ascribes their cause to a local atmospheric depression arising from condensation of vapour, and so causing an indraught of air to the place of origin. Mr. Elliot favours a modified form of Mr. Blanford's theory (Geog. Mag., June 1877). Mr. Blanford's theory is in accordance with the present views of the London Meteorological Office, viz. that the winds blow from all quarters into every central area of lowest barometrical pressure. The workers and their contributions to this subject have been numerous.

From 1839 to 1851, Henry Piddington of Calcutta contributed largely to the history of hurricanes; and it was he who discovered that in India to the north of the equator they are circular, moving from right to left, and are progressive, and he made out the tracts on which they move, and their rates. Captain Carless and Dr. Thom, 86th Foot, gave an account of the great hurricane of April 1847, in which the Cleopatra, Captain Young, was lost.

Dr. George Buist collected accounts of hurricanes on the west coasts of India from 1647 to 1859, and wrote careful memoirs on the subject of cyclones. Lieutenant Fergusson published an account of the cyclone of 1862. Mr. Franklin, at Madras, published an account of the storms of 20th October and 25th November 1846, with diagrams. Lieutenants Mullins and Hemery described the cyclone at Nellore and Cuddapah of 2d November 1847. An account of the Calcutta cyclone of 1864 was drawn up by Colonel Gastrel and Mr. H. F. Blanford, with a list of recorded storms in the Bay of Bengal, from 1737 to 1865.

Of 73 cyclones in the Bay of Bengal, notices of which occur in old records, in Mr. Piddington's works, or which Mr. H. F. Blanford himself recorded in recent years, he says the distribution in the several months were as follows:—January, 2; February, 0; March, 1; April, 5; May, 17; June, 4; July, 2; August, 2; September, 3; October, 20; November, 14; December, 3. All that occurred between November and the end of April had been restricted to the south of the bay; and the same is to be said of the greater part of the November storms. May and the first half of June, and October with the first week of November, are the only periods in which cyclones can be said to be prevalent in the north of the bay, though they occur occasionally in the intervening months, that is, during the south-west monsoon (p. 623).

Captain Taylor, R.N.R., Master Attendant at Madras, writing on the Bay of Bengal, says ships exposed to the cyclone experience, after fearful weather from one quarter, a short rest, during which the sun or stars are visible overhead, after which the storm comes on again from the opposite quarter. The wind observes in all cases the same relative bearing,—on the north side of the cyclone the wind is always east, on the east side the wind is always south, on the south side the wind is west, and on the west side the wind is north. And these storms always come up more or less from the south-east, and pass away to the north-west.

Madras city and its adjoining coast have suffered repeatedly from cyclones. They seem to travel up from the E.S.E., and progress rapidly in a W.N.W. direction, until they touch the land, and there they assume a westerly or W.S.W. course. Their diameters are about 150 miles, and they revolve in a direction contrary to the hands of a watch.

At midnight of the 2d—3d October 1746, 23 days after the surrender of Madras to M. de la Bourdonnais, a cyclone burst on this town. The ships Duc d'Orleans, Phœnix, and Lys put to sea, but foundered, and in them upwards of 1200 men were lost; the Mermaid and Advice, prizes, shared the same fate; the Achille and two other vessels of war were dismasted; and of twenty other vessels of different nations in the Madras roads, all were either wrecked or lost at sea.

A cyclone occurred off Cuddalore on the night

of the 12th—13th April 1749. It blew from the N.N.W., and continued all the next day. H.B.M. ship Pembroke was wrecked on the Colerun shoal, a little off Porto Novo, and only 12 men were saved. The Namur foundered in shoal water not far from Devicottah, when 527 officers and men were drowned. Off Fort St. David, the E.I. Company's ships Lincoln and Winchelsea, and almost all the small vessels, were lost.

On the 31st October 1752, a violent hurricane was experienced.

On the 1st January 1761, a violent hurricane occurred at Pondicherry. At that time the British were besieged by sea and land. Of eight sail of the line, two frigates, a fire-ship, and a ship with stores, the Norfolk escaped. The Panther, America, Medway, and Falmouth were dismasted, but rode out the gale; the Newcastle, Queenborough, and Protector ran ashore; and the Duc d'Aquitaine, the Sunderland, and the Duke foundered, and of the crew of 1100, all but 7 Europeans and 7 natives perished.

On the 21st October 1773, a violent hurricane visited Madras, when the ships that remained at anchor all perished.

On the 20th October 1782, a gale began from the N.W., and the following morning 100 small country vessels were stranded on the beach. H.M. ships Superb and Easter were dismasted, and got to Bombay with jury masts. At that time the ravages of Hyder Ali had driven the people into Madras, and sickness followed the cyclone, during which Lord Macartney, the Governor, nobly exerted himself to mitigate their sufferings.

On the 27th October 1797, a heavy gale occurred, in which the barometer did not fall below 29·465.

On the 5th December 1803, H.B.M. ship Centurion, on her passage from Trincomalee to Madras, and the Albatross, were dismasted in a cyclone, which raged from midnight till 5 P.M.

On the 10th December 1807, a hurricane burst over Madras, and was accompanied by a storm-wave, which inundated the whole of Black Town.

On the 2d May 1811, in a violent hurricane at Madras, the Dover frigate and Chichester storeships were lost, and 90 vessels went down at their anchors; only two vessels which put to sea were saved. During this cyclone the surf broke in 9 fathoms water, 4 miles from shore.

On the 24th October 1818, a cyclone commenced with the wind from N., and, after increasing in violence, suddenly lulled, but as suddenly blew from the S. Its vortex passed over the town. It travelled west. The barometer fell to 28·78.

On the 9th October 1820, a cyclone commenced at N.W., and veered to W. and S.W. The barometer fell to 28·50. It passed north of Madras, and travelled west.

On the 30th October 1836, a gale set in from the north. At 4 P.M. it blew violently from the N.N.W. and N. After a half-hour's lull, it blew at 7.30 P.M. with redoubled violence from the south, and at this time the barometer was 28·285. The vortex passed over the town.

In May 1843, another hurricane occurred, the brunt of which was felt out at sea, and several vessels were lost. Those that remained at anchor rode it out.

On the 25th November 1846, a hurricane occurred during which the pressure plate of the Observatory anemometer broke at a pressure of 40 pounds registered; and the force of one heavy gust was computed at 57 pounds per square foot. The large iron wind-vane of the Observatory was bent to a right angle, and one of the flat piers on the Elphinstone Bridge was blown over.

Of these fifteen cyclones, one each occurred in January and in April, two each in May and December, and nine in October.

On the 1st November 1864, a cyclone, accompanied by a storm-wave, swept over Masulipatam, rising 12 and 13 feet above the ordinary high-water mark, and rushing inland for nine miles (in one instance for 17 miles) from the shore, submerged an area of 780 square miles, and about 30,000 of the population were drowned.

A cyclone occurred at Madras on the 2d May 1872, when nine British and 20 native ships were driven on shore, and 19 lives were lost.

A cyclone occurred at Vizagapatam on the 7th October 1876, and another at Bakarganj.

1822, 6th June, in Bombay a great tidal wave; 100,000 people perished.

A cyclone occurred at Bombay in 1837. Another on the 1st and 2d November 1854. At midnight the wind rapidly increased in force from 15 pounds pressure on a square foot of surface till 3 A.M. of the 2d November, when it inclined a little more to the south, and increased in pressure to 35 pounds.

Amongst the calamities that have overtaken the Sunderbuns, have been great inundations caused by cyclones. About the year 1584, the tract lying between the Horinghatta and the Ganges, known as the Bakarganj or Burrisal district, was swept by an inundation, succeeded immediately afterwards by an incursion of Portuguese and Mugh pirates. In June 1622, this same tract was again inundated, 10,000 inhabitants perishing, and many houses and much property destroyed.

In the Gentleman's Magazine for 1737, mention is made of a storm and inundation at Calcutta, from which 300,000 lives were lost. In A.D. 1736 the Megna rose six feet above its usual level at Luckipur. A cyclone of 1831, over Calcutta, swept away 300 villages and 11,000 people. Occurrences of cyclones have been recorded at the mouth of the Megna on the 6th and 9th June 1822, on the 1st November 1867? on the 16th May 1869, and 1st November 1876.

In A.D. 1833, Saugor Island was submerged 10 feet; the whole of the population, between 3000 and 4000 souls, together with some of the European superintendents, perished; at Kedgeree, a building 18 feet high was completely submerged, and the Duke of York East Indiaman was thrown high and dry in the rice-fields near Fultah in the Hoogly. In A.D. 1848, the island of Sundeep was submerged. A cyclone is mentioned as occurring in Calcutta in 1859, attended with a great loss of life. A cyclone of the night of the 5th October 1864 came from the sea, passed over Calcutta, and foundered and stranded steamers and ships of 2000 tons burden, and swept away every tree and building in a tract 300 miles long. This one, originating near the Andamans, travelled in a north-west direction, and struck the coast of Bengal at the Balasore roads and Hidgeli. Thence it passed over Calcutta on the 5th October, over Kishnaghur and the Bogra district, and finally expended its strength in the Garo Hills. The wind destroyed much, but it brought with it

a storm-wave 30 feet high, which flooded the country for a distance of 8 miles on both sides of the Hoogly river. In Calcutta, and in Howrah, on the right bank of the Hoogly, the partial or complete destruction of 196,481 houses and huts told a sadder tale than even the violent death of human beings. But widespread ruin swept over the fertile tracts of Midnapur, and over the Sunderbuns, which had been recovered from total inundation by the efforts of a quarter of a century, and the expenditure of millions of rupees. In many districts there, no less than three-fourths of the whole population, their cattle and other property, were engulfed in sudden destruction. Had the Hoogly been the Thames, and London—not so densely populated—Calcutta, a cry would have gone up which would have thrown the earthquake of Lisbon and similar catastrophes, famous in history, into the shade. In all, about 200 ships were lost, and 70,000 persons perished.

The inhabitants of the large fertile islands in the estuary of the Megna, Shahbazpur, Hattiah, and Sundeep, full of rice grounds and cocoanut grooves, are not unfamiliar with the dangers of their marshy home, for since 1822 there have been at least seven cyclones; but the islands stand fairly high above the water, and it has been the storm which has caused most damage, though it generally gives notice of its approach long beforehand, by the unnatural hush in the air, and the livid colour of the sky, but on the night of the 31st October 1876 there was no warning. A violent north wind prevailed from 10 P.M. of the 31st October to 3 A.M. of the 1st November, and brought down the river water more rapidly than usual. The tidal wave was unusually high, and the north wind was followed by S.W. and west winds, which propelled the storm-wave into the converging water area of the estuary. It was full moon on the 31st October, and the usual tidal bore occurred at 11 P.M.; and before the water flowed off, one or two storm-waves followed from the S.W. about 3 A.M., and between 4 and 5 A.M., causing a second and third inundation, covering the islands with from 10 to 45 feet of water. The waters continued to rise till 4 A.M., when they began to subside. The inundation caused bad food and bad water. It was shown that 165,000 people were drowned, and subsequently 75,000 died of cholera. South of the equator, they occur in the months of November to May, and travel to the W.S.W.; and afterwards, but not always, to the southward and S.E., the wind invariably moving round a central space (which is usually characterized by a calm) from left to right, or with the hands of a watch; while the storm, which has a diameter of 1 to 1500 miles, moves onwards at the rate of 1 to 20 miles, but more frequently 4 to 7 miles an hour, for a period varying from a few hours to ten days, attended with torrents of rain, and its northern half often with lightning. Dr. Thom showed that, south of the equator, these rotatory storms are always generated between the N.W. monsoon and S.E. trade wind. They occur only during the S.W. monsoon months, and their rise and progress are intimately connected with the S.E. trade wind and N.W. monsoon, two opposing winds. With ships, the safest course is to lie to and watch the barometer and wind till the bearing of the centre be known with some certainty.—*Geog. India*, p. 191; *Moral and Mat. Prog.*

CYCLOPES are supposed by Pococke to be the Gucla-pes from the Jumna or Guckla-des. This derivation would designate them as a pastoral race, from Go, SANSK., a cow; but their great irrigation works denote them an agricultural population. Such a race at some remote time occupied Baluchistan, and raised great irrigation structures similar to those in Greece, and in the Peninsula of India. At Bodegli is a mound with Cyclopean substructures. Lieutenant Aytoun, in his Geological Report on a portion of the Belgaum Collectorate, given in Carter's Geological Papers on Western India, p. 392, mentions that certain gorges in the hills had been artificially bunded, and present one or two points of slight resemblance between the Pelasgi, the builders of the Cyclopean walls of Greece, Italy, etc., and the Ghorbasta builders of Baluchistan, suggesting that they might have been a kindred people, with kindred habits. The Pelasgi came from Asia, not from Asia Minor, not from Syria, not from Assyria, not from Persia, but probably from that birthplace of emigration, the tract north and north-east of Persia.

The Ghorbasta builders probably came from the same tract, and were not Mekranees, nor Persians, nor Assyrians. The Pelasgi existed only a few generations in Greece (about 250 years), before they were turned out by the Hellenes; they must therefore have brought with them, when they entered the country, their propensity for building massive walls, and commenced their work almost immediately on arrival. It was probably the same with the wall builders of Baluchistan; they only remained in the country long enough to allow them to extend northward as far as Kelat, when, meeting with the Mulla pass, they debouched into the plains. Their art was a fully developed one before they arrived there to carry it out. The Pelasgi arrived in Greece about 1800 B.C. This date seems to accord roughly with the advent of the unknown Ghorbasta into Jhalawan. The Ghorbasta structures, however, when compared with the Cyclopean remains of Greece, are slight, most roughly executed and insignificant; yet they evince a like instinct and habit in two races which probably came originally from the same region. The tank at Cumbum, the Husain-Saugur tank at Secunderabad, the Oossoor lake or tank near Bangalore, are each about 7 miles in circumference. Their date is not known. The Mir Alam lake at Hyderabad, constructed during a famine to provide food, cost £130,000, and has a steamer on it; and a great lake, formed in a famine by the damming up of the Goomti river, cost £1,500,000.—*Dr. Cook in* No. 6, *Bombay Med. Transactions.*

CYCLOSTEMON MACROPHYLLUS. *Bl.*
C. Zeylanicum, *Bailley.* | Sphragidia Zeylanica, *Thw.*

This large tree is very common in the dense moist forests of the Animallays, 2000 to 4000 feet

elevation; and in Coorg at the waterfalls near Mercara, 4000 feet; and in other parts of the Western Ghats, Travancore, etc. It is found also in Ceylon at 5000 feet, and Java. Indian specimens (Var. B. sessiliflora) have the flowers sessile; the timber is very hard.—*Thwaites; Beddome.*

CYDONIA JAPONICA. *Pers.*

Hai-hung, Hai-t'ang-li, Hai-t'ang pu, CHIN.

The Cydonia genus of plants belongs to the natural order Pomeæ. C. Japonica is a beautiful flowering tree, originally from Sin-lo on the Yellow Sea, now largely cultivated in China; and Sze-chuen produces fine sorts, one variety being called Ts'iu-hai-t'ang.

CYDONIA VULGARIS. *Pers.* Quince.

Pyrus cydonia, *Linn.* | Pyrus tomentosa, *Roxb.*
Safarjal, . . . ARAB. | Bihi, . . HIND., PERS.

This small, crooked, and much branched tree grows in the south of Europe, in Persia, Afghanistan, Kashmir, in the N.W. Himalaya, in Hindustan, and is cultivated from Kābul to Kashmir. Flowers few, of a white or rose colour. The fruit is of a yellow colour, downy, and remarkable for its fine odour. The seeds, called Bihi-dana, are in great use medicinally, being brought into India from Persia, Kābul, Kandahar, and Kashmir, and are highly valued as a demulcent tonic. The fruit contains some astringent matter. It is now made into a preserve, or used for flavouring the preserves of other fruits. There is a 'tursh' or bitter, and a 'shirin' or sweet quince.—*Dr. Royle; O'Sh.; Roxb.; Voigt; Stewart; Cleghorn.*

CYGNIDÆ, the swan family of birds. Cygnus olor is the mute swan, of which C. immutabilis is the wild race. Cygnus musicus is the Cygnus ferus, or Hooper swan, and is found in N. Europe, Asia, and N. Africa. It is migratory, and one specimen was obtained in the valley of Nepal.

CYMBIDIUM, a genus of plants belonging to the Orchiaceæ, all of them with beautiful flowers.

C. alatum, *Roxb.*, of Sunderbuns and Chittagong, has pale sulphur flowers.

C. aloifolium, *Swtz.*, the Paras, the Epidendron aloifolium, *L.*, Aerides Borassii, *Sim.* Flowers large dull purple, white-edged, on most of the hills of India; a beautiful plant when in flower, and blossoms in April.

C. aphyllum, *Swz.*, the Limodorum aphyllum, *Roxb.*, with yellow flowers; Coromandel coast.

C. giganteum, *Wall.*, the Limodorum longifolium, *Buch.*, grows on the Khassya and Nepal hills.

C. pendulum, *Swz.*, the C. crassifolium, *Wall.*, and the Epidendrum pendulum, *Roxb.*, grows in the Khassya hills, and in the Peninsula of India.

C. triste, *Willde*, grows from Nepal and Ceylon to Japan and N. Caledonia, has small pale green flowers. It is the Epidendrum teres of *Thunb.*, E. triste, *Forst.*, and Linsia teretifolia, *Gaudichaud.*

C. lancifolium, *Hooker*, grows in Nepal; and C. Gibsonii, *Wall.*, C. inconspicuum, *Wall.*, C. Masterii, *Wall.*, and C. striatum, *Wall.*, grow on the Khassya hills. Wight also gives C. erectum, C. tenuifolium, and C. tesseloides.

CYMBIRHYNCHUS MACRORHYNCHUS, called by the Malays the rain bird, is the most beautiful of the Malacca birds, and is known to naturalists as the blue-billed gaper.—*Wallace.*

CYMBOPOGON LANIGER. *Desf.*

Khawi; Panni, . PANJ. | Injani, ... PANJ.
Solara, ... ,, | Bur . . of HARRDANA.

Root Sheaths.

Azkhar; Mirchiagand, H. | Lamjak katran, . HIND.

Dr. Stewart says (p. 253) this and C. iwarancusa are not uncommon in many parts of the plains.

CYNANCHUM (from κύων, a dog, and ἄγχω, to strangle), a genus of plants belonging to the natural order Asclepiadaceæ. The species are herbs or undershrubs, with opposite leaves and mostly twining stems. Dr. Wight gives C. alatum, callialata, pauciflorum. The Populus Euphratica, a species of Cynanchum, Chloris barbata, and Cyperus aristatus, all ascend to 11,000 feet in Ladakh. Peganum harmala attains 9000 feet. The leaves of C. argel of Upper Egypt in small doses are purgative, and they are much used in Egypt for adulterating senna. C. ovalifolium of Penang yields abundance of very fine caoutchouc. —*O'Sh.* p. 51; *Eng. Cyc.* p. 275.

CYNARA CARDUNCULUS. *Linn.* The cardoon; is similar to the garden artichoke, but grows much higher, though cultivated similarly to the artichoke.

CYNARA SCOLYMUS. *Linn.* Artichoke.

Kirshuf, Kharsjuf, . ARAB. | Kanjir, . . HIND., PERS.

The artichoke has very large flowers, of a violet blue colour, and is grown in many gardens of the Dekhan.

CYNIPS, gall-producing insects, puncture and lay their eggs in large numbers in the fruits, seeds, and leaves of plants, and the excrescences are known as galls. A species on the Himalaya affects the oak.

CYNOCEPHALUS. *Cuv.* A genus of quadrumanous mammals, known as baboons, meaning in the Greek dog-headed. Its most marked characters consist in the great prolongation of the face and jaws, and in the truncated form of the muzzle, which give the whole head a close resemblance to that of a large dog. In their native mountains, the ordinary food of the baboons is berries and bulbous roots; but in the vicinity of human habitations they make incursions into the cultivated fields and gardens, and destroy a still greater quantity of grain and fruits than they carry away with them. C. hamadryas, *Linn.*, the derrias, is found in Africa and Arabia. It measures upwards of 4 feet when standing erect.

CYNOCTONUM PAUCIFLORUM. *Dec.*

Cynanchum pauciflorum, *R. Br.*

Chagul-pati, . . BENG. | Kang-koombala, . SINGH.

Very common in the central province of Ceylon and India. The Singhalese eat the young leaves of this and of many other plants of this natural family, in their curries.—*Thw. Zeyl.* p. 195.

CYNODON DACTYLON. *Pers.*

Panicum dactylon, *Linn.* | Agrostis linearis, *Retz.*

Durbha,	BENG., HIND.	Hurrum pillu,	TAM.

Khabal, Khabbar,	PANJ.	Barawa,	TR.-IND.
Durva,	SANSK.		

The Harryallee grass of India and Europe is considered, in India, the best for cattle. The root creeps through the loose soil to a considerable extent, and has strong fibres at the nodes. The stem rarely exceeds six inches in height. Florets are all on one side of the spike-stalk, awnless, purplish, and ranged in two close alternate rows. All the stems which lie near the ground take root, and by this means, though an annual plant, it increases and spreads very wide. It yields abundance of seed, of which small birds are very fond.

It is grown for hay; and it is good to allow the seed to ripen before the hay is cut, as it then propagates itself by seed, in addition to the runners. This grass is found in Great Britain, but its produce and nutritive properties are there comparatively insignificant, while in India it constitutes three-fourths of the pasture. Sir W. Jones observes (As. Res. iv. p. 242) that it is the sweetest and most nutritious pasture for cattle, and its usefulness, added to its beauty, induced the Hindus, in their earliest ages, to personify it as the mansion of a benevolent nymph. The A't'harvana Veda thus celebrates it: 'My Durva, which rose from the water of life, which has a hundred roots and a hundred stems, efface a hundred of my sins, and prolong my existence on earth a hundred years.'

It is the principal one of the Indian grasses, and is perhaps the most generally diffused, possessing much nourishing property in its long stems, no less than in its leaves. It endures the greatest elevation of temperature, as its roots penetrate far below the surface; and although, during the dry hot season, giving no sign of life, it puts forth its tender leaves on the first approach of the rains. It grows throughout the year, and lawns and pastures of moderate extent are made by planting pieces of the creeping stems. It is also much used for forming a covering for the banks of rivers, ramparts, and esplanades. The young and tender leaves are used in chatnis, and are considered very pleasant; the roots make a cooling drink. It is also one of the most abundant grasses on the Tenasserim coast, but it is much less conspicuous than many others.—*Mason; Cleghorn; Jaffrey; Von Mueller.*

CYNOGALE BENNETTI, a rare otter-like animal of Borneo. It has a very broad muzzle, clothed with long hairs.—*Wall.* i. 39.

CYNOGLOSSUM, a genus of the borage tribe of plants, growing in Bengal and Northern India. C. diffusum, canescens, Falconerianum, furcatum, marifolium, and racemosum, pretty little annuals, flowers mostly blue, purple, white and purple; grow in any common soil.—*Riddell; Roxb.*

CYNOGLOSSUS LINGUA. *B. Ham.* The sole.

CYNOMETRA BIJUGA. *Spanoglie.* A timber tree of the Sunderbuns.

CYNOMETRA RAMIFLORA. *Linn.*

Cyn. cauliflora, *Wall.* | Iripa, ... MALEAL.
Nam-nam, . . MALAY. | Galmendora gass, SINGH.

A tree which attains a height of 60 feet in Ceylon, Malabar, Java, the Moluccas, and Sumatra. A cubic foot when seasoned weighs 56 lbs., and it is said to last from 15 to 60 years; sp. gr. ·896. It is used for bridges and buildings, and is the best suited of the Ceylon woods for under-ground purposes. Its roots, leaves, and an oil from the seeds are used medicinally. Chips of the wood infused in water give a dark purple dye.—*Mr. Mendis, Useful Plants; Thwaites; Beddome.*

CYNOMETRA TRAVANCORIA. *Bedd.* This is a straight tree of great height and very beautiful foliage, particularly when in young leaf. It grows on the Tinnevelly and Travancore mountains at 2000 to 3000 feet elevation.—*Beddome.*

CYNOMORIACEÆ, *Lindl.*, an order of leafless parasitic plants. Wallich says a species of the Cynomorium, a fungus-like genus, is parasitical on the roots of trees in the Tenasserim Provinces, and valuable as a styptic.—*Mason.*

CYNOPITHECUS NIGRESCENS, the black baboon monkey of Celebes.

CYPERACEÆ, the sedge tribe, a natural order of plants, found from the arctic to the antarctic circle, in marshes, ditches, and running streams, in meadows, on heaths, in groves and forests, on the sea-shore, and on mountain summits, wherever phænogamorous plants can exist. In Griffiths' Herbarium are 345 species of Indian Cyperaceæ, collected from the Himalaya to Mergui. The most useful of the tribe are species of Cyperus, Euphorium, and Papyrus, *q.v.*

A. Cypereæ.

Cyperus alopecuroides, *Rottler*, Himalaya.
angustifolius, *Buch.*, Bengal.
aristatus, *Rottler*, Peninsula of India, Bengal.
articulatus, *Linn.*, Peninsula of India, Bengal.
bulbosus, *Vahl.*, Coromandel.
canescens, *Vahl.*, Peninsula of India.
casteneus, *Willd.*, Peninsula of India, Bengal.
compressus, *Linn.*, W. and E. Indies, Penin., Beng.
corymbosa, *Roxb.*
difformis, *Linn.*, Greece, Egypt, S. Asia, the Behooa.
distans, *Linn.*, W. and E. Indies, P. of India, W. Africa.
dubius, *Rottler*, P. of Ind., Ben., ch'hoto gothoohee.
exaltatus, *Retz*, Peninsula of India, Bengal.
haspan, *Rottler*, Peninsula of India.
hexastachyus, *Rottler*, Arabia, East Indies.
inundatus, *Roxb.*, P. of Ind., Bengal, patee.
iria, *Linn.*, P. of Ind., Beng., Nepal, China, Manilla.
niveus, *Retz*, Bengal, Monghir, Kamaon.
pectiniformis, *Rom.*, Coromandel.
pertennus, *Roxb.*, Bengal, the nagur-moothi.
pleuranthus, *Nees*, Coromandel.
polystachyus, *Rottler*, Peninsula of India, Australia.
procerus, *Roxb.*, Peninsula of India.
pulvinatus, *Nees*, Peninsula of India, Bengal.
pumilus, *Linn.*, Peninsula of India, Bengal.
pygmæeus, *Vahl.*, P. of Ind., Beng., Ava, the jal-muti.
racemosus, *Retz*, Penin. of India, Bengal, Penang.
Roxburghii, *Nees*, Peninsula of India, Bengal.
sanguinolentus, *Vahl.*, Konkan, Bengal, Nepal.
seminudus, *Roxb.*, Bengal.
tenuiflorus, *Rottler*, Peninsula of India.
tortuosus, *Roxb.*, Circars.
venustus, *R. Brown*, Pen. of Ind., Australia, Java.
verticillatus, *Roxb.*, Pen. of Ind., Bengal, Nepal.
Papyrus dehiscens, *Nees*, P. of Ind., Beng., Chumatee-patee.
elatus, *Nees*, Ceylon.
pangorei, *Nees*, P. of Ind., Beng., mador katee.
tegetiformis, *Arnott*, Bengal.
Mariscus cyperinus, *Vahl.*, Ascension, Mauritius, China, Bengal.
dilutus, *Nees*, Peninsula of India, Bengal.
Kyllingia monocephala, *Linn.*, E. Indies, China, Nepal, Archipelago, Australia.
triceps, *L.*, Pen. of India and Malacca, Bengal.
Courtoisia cyperoides, *Nees*, Peninsula of India.

B. Hypolytreæ, *Nees.*

Anosporum monocephalum, *Nees*, Beng., gothoobee.

C. Scirpeæ, *Nees.*

Abildgaardia Rottbolliana, *Nees*, Pen. of India, Bengal.
tristachya, *Vahl.*, Peninsula of India.
Fimbristylis æstivalis, *Vahl.*, Pen. of India, Bengal.
argentea, *Vahl.*, Peninsula of India.
ferruginea, *Vahl.*, Bengal.
pallescens, *Nees*, Bengal.
Royleniana, *Nees*, Sunderbuns, Bengal; the talnooroo is the variety microstachya.
Schœnoides, *Vahl.*, P. of Ind., Beng., keshuri-mulunga.
Trichelostylis autumnalis, var. Indica, *Roxb.*, Bengal, the kuratiya-yuvanee.
complanata, *Nees.*
miliacea, *Ness*, Bengal, the buro-yuvanee.
quinquangularis, *Nees*, Bengal.
tenella, *Nees*, Peninsula of India, Bengal.
tetragona, *Nees*, Bengal.

Isolepis articulata, *Nees*, Bengal.
barbata, *R. Br.*, Peninsula of India.
incurvata, *Nees*, Bengal.
prolongata, *Nees*, Bengal.
setacea, *R. Br.*, Europe, Bengal, Australia.
squarrosa, *Vahl.*, Bengal, the chhoonchoo-moormoori.
supina, *R. Br.*, Bengal, Nepal, Australia.
Hymenochæte grossa, *Nees*, Bengal.
Scirpus junciformis, *Nees*, Bengal.
kysoor, *Roxb.*, Bengal.
Eleogenus capitatus, *Nees*, Rio Janeiro, Pen. of India, Bengal, New Holland.
Limnochloa acutangula, *Nees*, Peninsula of India.
Plantaginea, *Nees*, Ceylon, Peninsula of India.
tumida, *Nees*, Bengal, Peninsula of India.

D. Sclericæ, *Nees.*

Scleria lithosperma. *Willd.*, Ceylon, Pen. of India.
tesselata, *Willd.*, Ceylon, Pen. of India, Nepal.

E. Caricæ, *Nees.* Several species of Carex have been introduced into India.

Carex Indica, *Willd.*, Nepal.
Uncinia Nepalensis, *Nees*, Himalaya.
Remirea Wightiana, *Wall.*, Peninsula of India.
Hemicarpha isolepis, *Nees*, Peninsula of India.
Lipocarpha lævigata, *Nees*, Peninsula of India.
triceps, *Nees*, Coromandel.
Hypolytrum giganteum, *Wall.*, both Pens. of India.
Fuirena ciliaris, *Roxb.*, Coromandel.
pentagona, *W. and A.*, Peninsula of India.
dichostylis Micheliana, *Nees*, Nepal, Europe, Asia Minor.
Chætocyperus limnocharis, *Nees*, Coromandel.
Echinolytrum dipsaceum, *Desv.*, Peninsula of India.
Malacochæte pectinata, *Nees*, Peninsula of India.
Eriophorum arundinaceum, *Wall.*, Penang.
comosum, *Wall.*, Nepal.
Rhynchospora Chinensis, *Nees*, China, Nepal.
Morisia Wallichii, *Nees*, Nepal.
Haplostylis Meyenii, *Nees*, China, Ceylon.
Cephaloschænus articulatus, *Nees*, Pen. of India.
Hypoporum pergracile, *Nees*, Sylhet.
Corbesia laxa, *Nees*, Nepal.
Trilepis Royleana, *Nees*, Himalaya.

CYPERUS BULBOSUS. *Vahl.*

C. jemenicus, *Roxb.* | C. capitatus, *Retz.*
C. geminatus, *Ainslie.*
Shilandi arisi, . . TAM. | Puridampa, . . . TEL.
Purigaddi, . . . TEL.

This plant grows on the Coromandel coast near the sea; its roots are used as flour in times of scarcity, and they are also eaten roasted or boiled. Dr. James Anderson, in an excursion to the southern part of the Peninsula of India, discovered that the Shilandi arisi, growing in sandy situations by the seaside, and requiring but little water, was the common food of the natives during a famine, and when other grains are scarce. It is nutritious, pleasant to the taste, and makes a pudding somewhat resembling that made of sago. —*Ainslie, Useful Plants; Roxb.; O'Sh.*

CYPERUS CORYMBOSA. *Roxb.* Rot ball, in India used for mats.

CYPERUS ESCULENTUS. *Linn.*

Sha-ts'au, . . . CHIN. | Hiang-fu tsze, . . CHIN.

In China the shoots are used to make hats and matting; its tubers are there in much request for food. The toasted roots have been used as a substitute for coffee, and yield a preparation resembling chocolate. The cultivation of the plant deserves attention for its considerable alimentary value.—*O'Sh.* 628; *Von Mueller; Smith.*

CYPERUS HEXASTACHYUS. *Rottl.*

Var. α. Communis. | *Var.* β. Pendalus.
Var. α. Rotundus, *Roxb.*

Sab, ... ARAB. | Tsau-san-ling, . . CHIN.
Moothoo, BENG., HIND. | Moostaka, Motho, DUKH.
Nagor mootha, moothi, ,, | Kora, ... MALEAL.
King-san-ling, . . CHIN. | Bhadra muste, SANS., TEL.
Kalandura, . . SINGH. | Mustakamu, . . . TEL.
Kore, Koray, . . TAM. | Parinvelamu, . . ,,
Kai vartaka musta, TEL. | Sakha-tunga, . . ,,
Gundala, Gundra, . ,, | Tunga muste, . . ,,
Bhadra tunga gaddi, ,, | Funarus, . . YUNNANI.

Var. α. C. rotundus, *Linn.*, *Roxb.*, grows in all Southern Asia, from Arabia to China, Java, and N. Holland. Its tuberous roots are sold in the bazars at 2 annas the pound, and used by perfumers, under the name of nagor moothi, on account of their fragrance. Hogs are very fond of them. Cattle eat the grass. In the Ho-nan, Shen-si, Hu-peh, and Sze-chuen provinces of China its fibres are woven into cloth. In India and China its fresh tubers are deemed medicinal.—*Smith; Roxb.; Voigt; Fl. An.; G. M. Top.; O'Sh.*

CYPERUS INUNDATUS. *Roxb.*

C. procerus, *Roxb.* | C. bacha, *Buch. Ham.*
Pati, ... BENG. | Potupullu, . . MALEAL.

Found in great abundance on the low banks of the Hoogly near Calcutta, and of rivers in the south of India, where the tide rises over it. It thrives most luxuriantly, and helps to protect the banks from the rapidity of running water.—*Roxb.*

CYPERUS PAPYRUS, of the Egyptians, is still called babier in Syria. It is about 15 feet high. The pith-like tissue of the larger flowering-stems, cut into thin strips, united together by narrowly overlapping margins, and then crossed, under pressure, by a similar arrangement of strips at right angles, constituted the papyrus of antiquity. This paper is but little liable to decay. Pliny, for instance, relates that the book of laws of Numa Pompilius was found in Rome in a high state of preservation, after having been buried nearly six centuries in the earth.—*O'Sh.* p. 628.

CYPERUS PERTENNIS. *Roxb.*

Nagor moothi, Naga, BENG. | Kola tunga muste, . TEL.

Roots aromatic; employed as a hair perfume. —*Roxb.; Voigt.*

CYPRÆIDÆ, the Cowry family of shells, the Porcellanen of the Germans, and Porcelaines or porcelain shells of the French. Cypræa argus occurs at Ceylon, and a pair was once sold for four guineas. C. moneta is used in many parts of the East as a circulating medium, and for ornamenting the dress of several races, and the trappings of animals. 4 cowries = 1 ganda; 80 cowries = 1 pan.

CYPRESS.

Pien-peh, . . . CHIN. | Sarv, . . HIND., PERS.
Cypres, ... FR. | Cypresso, ... IT.
Cypresse, . . . GER. | Cipres, ... SP.
Tirzah, ... HEB.

The Chinese cypress Tien-peh is the Cupressus thyoides. The cypress-wood of Cupressus sempervirens, *L.*, is aromatic, compact, and almost imperishable. It is an evergreen forest tree, a native of the south-eastern parts of Europe, particularly of Italy, Mexico, and the southern parts of N. America.—*Cleghorn, Panj. Rep.* p. 63.

CYPRINIDÆ, a family of fishes of the order Physiostomi, the species of which are distinguished by their having the mouth small. The family is classed into fourteen groups, viz. Catostomina, Cyprinina, Rhoteichthyina, Leptobarbina, Rasborina, Semiplatina, Xenocypridina, Leuciscina, Rhodeina, Danionina, Hypophthal, Michthyina, Abramidina, Homalopterina, Cobitidina, in which are 110 genera, and about 690 species.—*Engl. Cyc.* p. 219. See Fishes.

CYPRUS, an island in the Mediterranean, near the coast of Syria; taken by the Turks from the Venetians in 1570. Its length is 140 miles, and its greatest breadth 60, pervaded by a chain of mountains, the highest of which is called Olympus. The soil is an excellent fertile clay. It was transferred to Great Britain in 1879.

CYRTOPHYLLUM FRAGRANS. The Anan of the Burmese, grows in Moulmein. Is one of the Nux vomica tribe, and one of the hardest, most compact, and heaviest woods known.—*Cal. Cat. Ex.* 1851.

CYRTUS INDICUS. *Bloch.* A fish of the Indian seas, of which large quantities are dried, and consumed by the natives of India.—*Cantor.*

CYRUS RIVER. The principal streams of the province of Fars are the Bendamir or Araxes, which receives the Kur-ab or Cyrus, as it falls into lake Bakhtegan; and the Nabon, whose course is from Firozabad southward to the Persian Gulf. In this country are also the higher parts of the two branches of the Tab.

CYRUS THE GREAT. A cylinder of this monarch, which was sent to Britain after Mr. Hormazd Rassam's return, was the most interesting historical record in the cuneiform character till then brought to light. It is in the Babylonian script, and was discovered among the ruins of the Birs Nimrud, the ancient Borsippa. The cylinder is 9 inches long by 3¼ inches in diameter, and must originally have been covered with 45 long lines of text. The writing is very minute, and it is computed that the inscription would run to about 130 lines of the average length. Unfortunately the beginning was wholly lost, with the exception of a few scattered signs. It is found to relate to the very moment of that great historical event, the capture of Babylon by the founder of the Persian universal monarchy. Nabonidus has abandoned his capital, which has fallen into the hands of Cyrus, though he is still struggling against his fate in Babylonia. The Guti, and a people whose name is taken to be equivalent to Blackheads, are described as his subjects, and the god Merodach has delivered king Nabonidus into his hands. In a proclamation issued by Cyrus upon the taking of the city, the king repeats in the first person the principal allegations of the preamble. It is partly mutilated, but the beginning, 'I am Cyrus,' with his genealogy in full, and his description of himself as 'king of Gyndia,' etc., can be pretty clearly made out. Cyrus is made to speak of his reparation of the temples of Babylon, and of the favours conferred upon him by Merodach, Bel, and Nebo, in answer to his prayers to them; of the homage paid him by distant nations, and of the gatherings of the people in the city to acclaim him king. Sir Henry Rawlinson said this new text settled for ever in favour of Herodotus, as against Ctesias (in Diodorus), the genealogy of Cyrus. He was fifth in descent from Achæmenes, next to whom came Teispes, then Cyrus the grandfather, and Cambyses, the father of Cyrus the Great. The succession was direct, not indirect, as Professor Oppert has maintained. The inscription styles the native country of the Persians 'Assan,' which Sir Henry Rawlinson seems to think was in the plains between the modern Shuster and the Persis of the classical writers. An important religious centre, named Calana in the inscription, he referred to the Calneh of Genesis and the Calno of Isaiah. Cyrus evinced sympathy with the Jews, as is shown by Isaiah xli. 2, xliv. 28, xlv. 1, and Ezra i. 2 to 4.

CYSTICERCUS or Scolex, from Kustis, a bladder, and Kerkos, a tail, is a hydatid or larval form of a cestoid worm, called in its sexually matured state, Strobila, the C. tænia mediocanellata. When the flesh of an animal in which it is contained has been received into the human alimentary canal, the Cysticercus can be developed into a tape-worm.

D

D, as sounded in the English language, has letters with corresponding powers in Arabic, Persian, Hindustani, Sanskrit, Hindi, Mahrati, Gujerati, Bengali, Uriya, Telugu, Karnata, Tamil, and Malealam. In all these tongues, however, there is also a softer-sounding d. The English compound dh also, the Tamil tongue excepted, has corresponding letters, simple, modified, or compounded, with both soft and hard sounds; d and r, in several of the Indian tongues, are, moreover, so pronounced as to be difficult for a European ear to catch their niceties; and d and r are therefore frequently confounded. D and r are not used by the Chinese, who use the liquid l for r.

Some nations of Europe, with a soft pronunciation of the letter j, require to prefix d to that letter for the correct pronunciation of such words as Jamal, a camel; thus Djamal. Vambery used dj for the Arabic chim. Dh is changed by the Siamese to th.—*Wilson; W. W. Hunter.*

DAB. HIND. Poa cynosuroides, the sacred grass of the Hindus; is generally applied only to the first shoots of the Koosh grass; it is called Dubsa in Rohilkhand, and is used by Hindus in their religious services.

DAB. HIND. of Kohat. A moist soil.

DAB or Dabhū. HIND., TAM., TEL. A small copper coin; money in general.

DABBATU-l-ARZ. ARAB. The second beast mentioned in the Revelation. Mahomedans believe it will issue from a mountain in Mecca, with the staff of Moses and the seal of Solomon. With the first it will strike the believer, and with the latter it will stamp the face of the infidel with the words, 'This is an infidel.'

DABGAR, a low caste of non-Aryans, who manufacture large leathern vessels for holding ghi or clarified butter (dabbar), and of vessels in which atta and ghi are deposited.—*Sherring.*

DABHA, a town in the Chanda district of the Central Provinces, lat. 19° 38′ N., long. 49° 42′ E. The people manufacture tasar silk handkerchiefs, coloured cloths, and silver snuff-boxes. The population is almost wholly Teling.—*Imp. Gaz.*

DABHA, petty state of Mahikanta; estimated population in 1875, 1612. The ruler is a Mukwana Koli, a convert to Islamism. The religion of the Miah race of Dabha is a mixture of that faith and Hinduism; they give their daughters in marriage to Mahomedans of rank, and marry the daughters of Koli chiefs. They burn their dead.

DABHOI, the ancient Dharbhavati. A town in the territory of the Gaekwar of Baroda, 15 miles S.E. of Baroda; lat. 22° 10′ N., long. 73° 28′ E.;

population (1872), 14,898. In the town is a place called Mamadokri, where stands a Khisni tree, through whose hollow trunk no guilty person can pass.—*Imp. Gaz.*

DAB-i-AKBAR. ARAB. In astronomy, the constellation of the Great Bear. Dab-i-Saghir, the Lesser Bear.

DABISHLIM, an ancient Hindu raja, by whose orders the fables of Pilpai were composed.

DABISTAN, the School of Literature, a learned work on the various religions of Asia. It is in the Persian language. It contains a dialogue between a Brahman, a Mahomedan, a Zoroastrian, a Jew, a Christian, and a Philosopher. The representative of each religion brings forth his arguments, which are successively condemned,—some on account of the vicious character of their founders, and all for the absurdity of their doctrines, and the want of proof of their alleged miracles. The Philosopher winds up the discourse by recommending a system which shall have no ground but reason and virtue. It was translated by Colonel Kennedy in Tr. Bombay Lit. Soc. ii. p. 247; also, though not very accurately, by Shea and Troyer, for the Oriental Translation Fund (Paris, 1843). The author, Mohsin Fani, belonged to the sect of Sipasi or Abadi, a branch of the Parsees, and wrote in India during the latter half of the 11th century of the Mahomedan era. His account of the Zoroastrian religion is exceedingly full and accurate; and he also gives a good description of the Hindu and Muslim systems, as well as of the Sufi and other philosophical sects.

DABKAI, a goldsmith who flattens gold wire into tinsel and spangles.

DABLING—Dubling, two villages in Bushahr State, Panjab; in lat. 31° 45′ N., and long. 78° 39′ E., and 9400 feet above the sea, on a belt of arable land near the left bank of the Sutlej. The cliffs on the opposite side of the river rise to a sheer elevation of 6000 or 7000 feet. The population have the Chinese Tartar type of physiognomy, and profess Buddhism. The path between the two places, a mile apart, is rendered practicable by means of wooden scaffolds fastened against the face of the precipice.—*Imp. Gaz.*

DABOU, a small weight of Masulipatam, equal to 191 grains.

DABRAY JOGI, also called Dabray Bajanawala, and Bal Santa ka Jogi, a class of Hindu mendicants who sound the dabra.

DABUL or Debul, a seaport town on the Malabar coast, eight miles south of Severndrug. This port was burned about 1508 by the Portuguese viceroy, Almeyda. He came to India in 1505, the successor of Dias, Vasco da Gama, and Cabral. On his arrival, he concluded a defensive treaty with the king of Vijayanagar; but the Venetians, who up to that time had monopolized the trade with India, jealous of the growing power of the Portuguese, instigated the king of Egypt to oppose their progress. He accordingly sent a fleet under Mir Hukum, who, in conjunction with the fleet of Gujerat, bore down upon Lorenzo, son of Almeyda, and defeated him in 1508, Lorenzo falling in the fight. Almeyda, to avenge his son's death, burnt the port of Dabul, and defeated the enemy in the harbour of Diu, and then concluded a treaty.

DACCA. There are two towns of this name, one Dacca Jalalpur to the north of Ballargunj, and Dacca proper, between Dacca Jalalpur and the Megna river. The latter gives its name to the whole district, which is one uniform level of rich alluvial soil, annually inundated by the overflow of the great rivers. The villages are built upon mounds of earth artificially raised above the flood. During the rainy season, this tract presents the appearance of a continuous sheet of green paddy cultivation, through which boats sail to and fro. The chief means of communication at all times of the year is by water. The bordering rivers are the Ganges or Padma, the Jamuna or Brahmaputra, and the Megna. The city of Dacca is situated on the north bank of the Buriganga river, in lat. 23° 43′ N., and long. 90° 25′ 25″ E. The town extends along the bank of the river for a distance of nearly 4 miles, and inland, towards the north, for about 1¼ mile. The ruins of the capitals and palaces of the Bhuiya rajas lie scattered throughout Eastern Bengal, along the line of the Brahmaputra valley; and their memory is still cherished in the household tales of the Hindu peasantry. The Mahomedans first entered Bengal in 1203 A.D.; and two most celebrated of their viceroys are Mir Jumla, the general of Aurangzeb, who failed disastrously in his expedition to Assam, and the nephew of the Nur Jahan Begum, Shaista Khan, who broke the power of the Portuguese, and annexed Chittagong to the Moghul empire. Dacca has numerous Hindu temples and many Mahomedan mosques for the large Musalman population, with churches and schools of the various Christian sects. The Roman Catholics are under the spiritual guidance of priests from Goa and elsewhere, with churches of their own and old Portuguese names. Formerly they used to intermarry with the natives, but of late years they seek alliances amongst their own people. Their complexions are very dark, and their customs semi-oriental; but they supply Calcutta with excellent domestics. The English, the French, and the Dutch had established factories about the middle of the 16th century, when the city was visited by the French traveller Tavernier. Cotton, jute, and safflower may be considered staples of the district. The indigenous cotton has long been cultivated along the banks of the Megna from Feringybazar to Edilpore in Bakarganj, a distance of about forty miles; on the banks of the Brahmaputra creek (the ancient channel of the river of the same name), and along the Luckia and Banar. It presents different shades of quality, the finest of which is named photi, and is the material of which the delicate Dacca muslins are woven. It is described by Roxburgh as differing from the common herbaceous cotton plant of Bengal in several particulars, but chiefly in having a longer, finer, and softer fibre than it. Three pieces of muslin, made to be presented to the Prince of Wales, measured each 20 yards by 1 yard, and weighed 3½ ounces. Next to fine muslins and embroidered fabrics, silver filagree work is that for which Dacca is most celebrated. This art is also practised in great perfection at Cuttack, and in Sumatra and China. The articles usually made at Dacca are ladies' ornaments, such as bracelets, earrings, brooches, chains, necklaces, etc., and the attar-dans and small boxes for natives. The design best adapted for displaying the delicate work of filagree is that of a leaf. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece

of bamboo for a blow-pipe, small hammers for flattening the wire, and sets of forceps for intertwisting it. The drawing of silver and gold (*i.e.* silver wire covered with gold), used as thread in embroidery, is extensively carried on here. Benares is also celebrated for this art. There are several varieties of silver and gold thread (badla) made at Dacca, as kalabatoon for the embroidery of muslins and silks, goshoo for caps, and covering the handles of chauris; sulmah for turbans, slippers, and hookah-snakes; and boolun for gold lace and brocades. Some of it is drawn almost as fine as a hair. In the time of Aurangzeb a quantity of this article was made yearly for the court at Dehli. A hundred sticks covered with it, and plain gold and silver badla to the amount of £2000 in value, appear among the items composing the mulboos khas nuzr, which was annually sent to the emperor. Shawls, violins, shell ornaments, and idols are largely manufactured. Amongst Mahomedans, the name of Dacca was Jahangirnagar.—*Dr. Taylor.*

DACELLO PULCHELLA, a kingfisher. Their feathers are much prized by the Chinese, who make them into fans.

DACOITY, a legal term of British India for a system of robbery by gangs of people of the country. It is derived from Daka, the verb being Daka parna, to plunder. In India, thugs and dacoits who had been tried and convicted as having belonged to a band of thug murderers or dacoits, but who, having made a full confession of their crimes (in some individual cases amounting to the murders of as many as eighty persons), and having denounced their associates, received a conditional pardon. Originally, in the criminal code of India, Dacoity was applied to the armed bands who plundered, but it and the term Thuggee are now applied to several well-defined classes, and in times of scarcity many of the unemployed may join. Amongst the predatory races were the Budak of the Nepal Terai, also the Dasadh of Behar, who used to make frequent predatory excursions into Lower Bengal, the Bind of Ghazipur, the Nath, the Ahir, Boria, Kurmi, Gujar, and a host of low castes. In the Panjab, dacoity generally assumed the form of cattle-lifting. The Meena were active and energetic, and were concerned in most of the dacoities of Northern India. And in the S.W., the Santal with his club, long bamboo spear, and terrible battle-axe, often swept down on the plains of Birbhum, Hazaribagh, and adjacent districts, and the flare of their torches or light of the burning huts gave the first warning. The leaders of a dacoity band in Central India carried with them an axe with a highly-tempered edge, sacred to Bhawani.—*People of India*, vii.

DACRYDIUM, a genus of coniferous plants, growing in New Zealand, Tasmania, and New Caledonia. They are valuable timber trees, growing to a great height.

D. Colensoi, *Hooker*, of N. Zealand, attains to 50 feet, yielding hard and incorruptible timber.

D. cupressonum, *Solander*, also of N. Zealand, the rima or red pine of the colonists, attains to 200 feet, with pendulous branches, yields a hard, valuable wood.

D. Franklini, *Hooker, fils*, the huon pine of Tasmania, has a height of 100 feet, circumference 20 feet; its wood highly esteemed for shipbuilding and artisans' work.—*J. Backhouse.*

D. Kirkii, *F. v. Mueller*, the manoao of N. Zealand, a pyramidal tree, attaining 80 feet in height, has a reddish-coloured timber.

D. Taxifolium, *Solander*, the kaka terre of New Zealand, grows in low marshy ground. Its foliage resembles the yew, and it grows to 140 or 180 feet in height.

—*Jam. Ed. Jour.* 1825, xiii. p. 378; *Ferdinand von Mueller.*

DACTYLOPTERUS. *Lacépède.* A genus of fishes belonging to the order Acanthopterygii and family Loricati; Trigla volitans, *Linnæus*, commonly called the flying gurnard and flying fish. Another species inhabits the Indian seas, and is the Dactylopterus orientalis of Cuvier.—*Eng. Cyc.*

DAD. PERS., HIND. Literally, a gift; a postfix and prefix much in use, as Khudadad, given by God, the Theodotus of the Greeks, and Dev-dutt of the Hindus.

DAD. PERS. Justice; petition; representation. Dad-khah, a plaintiff for justice. Dād-sitadan, taking vengeance. Dad-khah means one seeking justice. It was the title of the earlier viceroys of Central Asia, and is still used in Khokand and Eastern Turkestan. Dad-Mahal, lit. palace of justice.—*Vambery, Bokhara*, p. 317.

DADAP. MALAY. A tree of the Archipelago, planted in the coffee grounds of Java to shelter the young coffee trees.—*M'Nair.*

DADAR, a town and valley in Cutch Gandava, lat. 29° 28′ N., and long. 67° 34′ E., 35 miles N.W. from Bagh, and 5 miles from the eastern entrance of the Bolan pass, on the river Bolan, surrounded by hills. In the first week of May, the thermometer ranges from 64° to 120°. It is separated from the great plain of Cutch Gandava by a line of jabbal or low hills. Dadar is excessively hot, and a Persian couplet runs, 'Ai Allah, dozakh ki sakhti, chon Dadar hasti?' 'O Lord, why did you make hell when you have Dadar?'

DADH or Dat. MAHR. Ground prepared by burning for being planted; the weeds and grass are strewed over it to be burned.

DADHALYA, a petty state in Mahikanta. The family are Sesodia Rajputs, who originally came from Udaipur (Oodeypore) in Rajputana.

DADUNGAWU, a tutelary spirit of the Java hillmen.

DADU PANDURANG, RAO BAHADUR, a learned native of Bombay, and religious reformer, who died 17th October 1882, aged 68. He mastered Mahrati, Gujerati, Urdu, Sanskrit, English, Persian, Telugu, Tamil, etc., and at an early age composed a complete Mahrati grammar, published a school atlas, a work entitled The Wiping of the Tears of the Widows, Grammar of the Persian, and another of the Sanskrit; the Kekavali, The Cosmopolitan Arya, and The Hindu Gentleman's Reflections. He was the founder of the Paramhans Sabha, which led to the formation of the Prarthana Samaj'h.

DADU PANT'HI, a Vaishnava sect of Hindus, whose tenets are derived from Ramanand, after whom, Dadu, its founder, is said to be the fifth spiritual guide. Their worship is restricted to the Japa, or repetition of the name of Rama, as the deity negatively described in the Vedanta theology. They have no temples or images. Dadu was born at Ahmadabad about A.D. 1600, and is said to have been a cotton-cleaner there and at Ajmir. They carry a rosary, have no frontal mark nor mala, but wear a round or four-cornered hat. They are said to be numerous in Marwar

and Ajmir. Their chief place is Naraina, 40 miles from Jeypore. They are classed as (*a*) Virakta, who go bare-headed, and have but one garment and one water-pot; the (*b*) Naga, who carry arms and serve Hindu princes, making good soldiers; the (*c*) Bhistu Dhari, who follow the avocations of ordinary life. They burn their dead at dawn.—*Wilson.* See Dadu; Vairagi.

DÆDALUS SHOAL, called by the Arabs Abdul-kheesan, in lat. 24° 55′ 30″ N., and long. 35° 50′ 30″ E. A submerged coral reef in the Red Sea, 1200 yards long and 450 yards broad, with six inches of water, on which, in 1862-3, a lighthouse was erected.—*Findlay.*

DAEE, a sect met with at Gajer, Makran, Kej, and Turbot. They resemble the Brahui in appearance, and wear the same dress. Portions of certain of the Brahui tribes are Daee, such as the Sageta, Takee, Shadu, Laee, Marbrow, etc. They have a mullah or priest, and a book. They say that they originally came from the westward near Kej, where there is a town called Turbot. The sect abounds in Makran, and has extended east. At Turbot is a little hill of circular form, called by them Koh-i-murad, on the summit of which is their principal masjid, where they meet at stated times to perform their rites. Professor Wilson, in his Ariana Antiqua, p. 141, mentions the Daee, amongst other Scythian tribes, as associated with the Massagetæ; and in a map attached to Digby's translation of Quintus Curtius, their position is fixed a little south of the Jaxartes. This coincidence of association with the Sageta and Sakæ, both then and now, is worth remarking.

DÆMIA EXTENSA. *R. Brown.*

Cynanchum extensum, *Jac.*	C. bicolor, *And.*
C. cordifolium, *Retz.*	Asclepias echinata, *Roxb.*
Chagal-banti; Ubrun, BEN.	Vela parti; Utamani, TAM.
Sagoani, ... HIND.	Jutuga, ... TEL.

This plant is used medicinally. Its fibre, known commercially as ootrum fibre, is a promising substitute for flax. It is soft, white, silky, and strong, and can be procured in considerable quantities in Southern India.—*M. E. Jur. Rep.*

DAEN or Dawan. HIND. Tying a number of bullocks together for the purpose of treading out the grain from the ear.—*H. Elliot.*

DAENDELS, HERMAN WILLIAM, born at Hattem in Guilderland, 21st October 1762; died at New Guinea, 1818. He was Governor-General of Dutch India, and formed the great military road of Java.—*Max Havelar.*

DAERD, a class of agricultural slaves in Kanara.

DAF. HIND. A hand-drum, a tambourine, the only lawful musical instrument for Musalmans. Dafli, a small tambourine.

DAFFADAR. PERS. An officer in the native irregular cavalry; the title of a native military or police officer; a native non-commissioned officer of cavalry of the Indian army.

DAFLA. HIND. A tambourine. Daira, a large tambourine.

DAFTAR. HIND. A record, a register, an account; an office in which public records are kept. A volume, a book of gold or silver leaf. Daftardar or Daftari, a record keeper, a registrar, an accountant, a gold-beater.

DAG. HIND. of Kohat. Land cultivated only once in three years.

DAGA, a boat used on the Indus.

DAGGER. The daggers in use in S.E. Asia are of many shapes, and all with individual names. One of a particular shape is the official weapon in modern Indian courts. A drawing of 'the dagger of ministry' is given in the last volume of Duff's History of the Mahrattas. Those usual in British India being the jambiya, bichwa, pesh-kabz, khanjar, katar, etc.—*Hind. Theatre.* See Arms.

DAGH. TURKI. A hill, a mountain. Alajah Dagh, or variegated mountain, is near Ararat.

DAGHA. HIND. Deceit, fraud. Dagha-bàz, a thief, a swindler.

DAGHDA, mother of Zoroaster, founder of the Parsee religion.

DAGHESTAN, a province in the Caucasus subjected by Russia after a war of 20 years. The men of Daghestan are intelligent, and were at one time, with the exception perhaps of the Circassians, the most warlike of the races of the Caucasus. Unlike the other inhabitants of the range, they are extremely industrious, and have even shown themselves capable of organized labour requiring considerable skill. During the war, Schamyl was able to erect a cannon foundry in their country. Elburz is 18,526 feet; Great Ararat, 16,916; Little Ararat, 12,840 feet.

DAGOBA or Dhatugarbha. SANSK. A Buddhist bone or relic receptacle. The term is from Da, Datu, or Dhatu, a relic; Garbhan, a shrine; and was in use by Indian Buddhists. At Anaradhapura, in Ceylon, are several dagobas. They were built at from B.C. 307 to A.D. 276, and end in a terminal Tee, in the form of a cube supporting a pointed spire. They are the Tibetan Dungten, a relic monument which is still erected in Tibet over the body or the ashes of the lamas. The ancient edifices of Chichen, in Central America, bear a striking resemblance to the topes or dagobas of India. The dagoba is the descendant of the sepulchral tumulus of the Turanian races, whether found in Etruria, Lydia, or among the Scyths of the northern steppes. See Chaitya.

DAGON. BURM. A corruption of the Talain words Ta-kong. The Shooay Dagon is a Buddhist temple of Rangoon, which rises from the summit of a scarped hill to a great height.

DAGON, the fish-god of the Assyrians, possibly the source of the fish avatar of the Vaishnava.

DAGOORAN, a shrub of Jullundhur. The wood is used as fuel, and the leaves are given to buffaloes as fodder.—*Comr. Pillr. Dur.*

DAGOOTHA. BURM.? A crooked timber in Tavoy and Mergui, floats in water, and used for building boats, for planks of houses, ladders, etc., but is liable to attacks of worms and dry-rot.—*Captain Dance.*

DAGSHAI, lat. 30° 53′ 5″ N., and long. 77° 5′ 38″ E., a military station 16 miles S.S.W. of Simla. The cantonment is 6025 feet above the sea, on a bare and treeless height.—*G. T. S.*

DAH. PERS. Ten. Dah'm, the tenth. In the Panjab, Dah-mahi-dar, farm servants hired for ten months. Daha, also Ashra and Ashora, the first ten days of the Maharram, which Shiah Mahomedans pass in sorrow. Sunni Mahomedans erect tabuts in reverence of Hasan and Husain, sons of Ali.

DAH. HIND. In the N.W. Himalaya, a clod-crusher, a flat beam of wood dragged over the fields to smooth clods. It is the Sohaga of the plains.—*Powell.*

DAH, a heavy weapon made use of by the Bhot and Burmese races, as a sword in war, and in peace for felling trees or cutting up firewood; the friction on the handle is very great.

DAHI. HIND. Coagulated milk; sour milk.

DAHIA. HIND. A Jat tribe in Dehli district.

DAHINA or Dakshana. HIND. The left.

DAHIR, the takhallus or literary name of Mirza Salamat Ali, who lived in Lucknow in the 19th century. He was at one time a papermaker. He was famed for his marsia or elegies, and was known as the Tuti-i-Hind, the parrakeet of India. He died about A.D. 1875.

DAHIR, Desput, or lord of Debeil, from Des, a country, and Put, the head. He was a ruler over the country of the Indus (about A.D. 711, A.H. 92), whose capital was at Alor, near Bakkar; but he possessed Multan and all Sind, with perhaps the adjoining plain of the Indus, as far as Kalabagh. Hejaj, governor of Basra, sent a force against him under his nephew, Muhammad Kasim, who took Dewal, defeated and took prisoner a son of Dahir, advanced on Nerun, now Hyderabad, and took Sehwan. He subsequently advanced on Alor, where he encountered Dahir, who was defeated and slain. His widow defended the city; but ultimately the women devoted themselves to the flames, which they lighted themselves. The Rajput garrison bathed for the sacrifice of themselves, and perished fighting. The city was taken by assault; all the men in arms were slaughtered in the storm, and the women and children reduced to bondage.—*Elphin.* p. 262. See Muhammad Kasim.

DAHLAN, a tribe of Tuga in the Upper Doab.

DAH-MUSHT. HIND. A broad variety of Kashmiri paper, lit. of ten handbreadths.

DAHNAJ. ARAB. A stone described by Abu Zaid as resembling an emerald.

DAHYA. HIND. The Shum or Kumari or Daho system of cultivation carried on by hill tribes. The land is prepared by burning the grass and brushwood on it. The seed is then sown in the ashes.

DAI. PERS., HIND. A wet nurse, an accoucheuse, a midwife. The British in India use the word Ammah for a wet nurse. Dai-dud'h pilai, a wet nurse. Dai-janai, a midwife.

DAIJA, literally lamp-holders; the term applied to the handmaids who invariably form a part of the Rajput Daija (Rajasthan, i. p. 628), dowry or portion, which the Hindu wife brings a husband in marriage. It is the Maritagium of the civil law. Wilson, in a note to Mill's India (i. p. 447), says that 'amongst the Hindus the practice of purchasing a bride by a dower is apparently of modern growth, and a violation of the law.' There are, however, passages in Menu on the subject which would imply the observance of both practices; and the same may perhaps have continued till the time of the Greek invasion, for Arrian (Indica, cxvii.) says the Indians neither took nor gave money in marriage; while Megasthenes (Strabo, lib. xv.) says their wives were purchased for a yoke of oxen. Amongst the agricultural tribes in the N.W. Provinces, the present practice is most usual for the bride's father to purchase the bridegroom, so that the man receives the dowry or Daija, which consists for the most part of money and household utensils. Thus, even when the daughter of Jye-chand was forcibly abducted by Prithi-raj, her father sent to him the richest gems, the fruits of the victory of Beejy Pal, inestimable wealth, pearls, elephants, and dyes. This custom, the fruitful source of female infanticide, arises from the almost universal desire to obtain for the daughter the privilege of marrying into a higher family, which is only to be acquired by purchase. Sometimes, indeed, an imaginary purchase is made, similar to that which took place at certain Roman marriages, under the name of Coemptio, though of course not with a view of securing the peculiar kind of privileges which the Coemptio gave, but merely as a type of a custom of which the breach is thought preferable to the observance. This subject is noticed in Steele's Summary of the Law and Customs of Hindu Castes.—*Elliot.*

DAIMACHAS, an ambassador sent by Seleucus, or by his son Antiochus Soter, to Bimbasara, son of Chandragupta. He was regarded by Strabo as the most lying of all the Greek historians of India. See Vindusara.

DAIMIO or Daimiyo, a hereditary prince of Japan territorial nobility, who, until the revolution in 1869, had extensive jurisdiction, with revenues estimated at 10,000 koku of rice. The words mean Great Name. The nobility are now designated Ku-wa-zo-ku. Each Daimio had a particular crest, which was marked upon all his effects, from his gateway to the lacquer made for his own use, like the European dinner or breakfast sets. Besides a private crest, each Daimio had a public one, to be put upon all china or lacquer made on his estate. When buying lacquer with both crests upon it, you know that it had been in use in the Daimio's family, and that either he has been in immediate want of money, and has therefore sold some of his household furniture, or that he has had as much use as was required out of the article. The Gorogio was the council of five Daimios, who were in fact the executive government, and with whom all the foreign ministers had their transactions.—*Frere, Antipodes*, pp. 419, 447.

DAIN, also Daina. BENG., HIND. A witch. PERS., debt; BURM., a league, 2¼ miles.

DAINGNET, of whom there are 1995 in the Akyab district, are in feature somewhat like the Gurkhas of Nepal, and differ from the hill tribes of Akyab. They dress in white, wear their hair at the back of the head, and do not tattoo their bodies. They do not intermarry with other races, and dwell among the hills of the Yetthaydoung township, near Chittagong frontier, across which they are said to have come into Arakan. Their language is said to be connected with Nepali. A few speak that tongue; some can talk Bengali, and some have acquired Arakanese. The returns of 1872 show 3542 Daingnets resident at that time in the district of Akyab.

DAIR, a town north-west of Bussora, remarkable for a colossal tower of beautiful structure. Ibn-ul-Wardi in the Khassila-ul-Ajaib says that strange sounds are occasionally heard to proceed from its interior. Great antiquity is attributed to this minaret by all the natives of the country. —*Mignan's Travels*, p. 239.

DAIRA. HIND. The largest variety of tambourine, being from a foot and a half to two feet in diameter, played upon with a stick.

DAIRI, until 1869, amongst the Japanese, the

ecclesiastical head of the government, who resided at Miako. See Kio; Kobo.

DAISY, the little perennial plant called Bellis perennis by botanists. In India cultivated by the British as a souvenir of home.—*Jaffrey.*

DAITYA, a Hindu term used in various ways, but generally to designate a different and hostile race of ancient days. In the Mahabharata they are spoken of as aborigines, and others of them as having power on the sea-coasts. In other places the term is made applicable to the Buddhists; and the mythological wars of the Daitya against the Devata are supposed to be the hostile operations against the Aryan race carried on by some of the races anciently in the Peninsula of India who opposed the advancing Aryans. In Hindu mythology the Daitya bear the same character as the Danava. When the Deva obtained the cup of Amritsar in churning, the Daitya rose in arms to seize it, but were defeated and driven back, according to the myth, to Patala or hell, but they subsequently acknowledged the supremacy to the holders of the discus and mace. The wars between the immigrant Aryan and the Daitya were thus changed in the course of years into mythical wars between gods and demons.—*Wheeler, Hist. of Ind.*

DAITYA, in Hindu Mythology, the giant sons of Diti. Daitiyari, from Ari, an enemy. Daitya-guru, from Guru, a teacher.

DAIVAKA or Daivajna, astrologer caste of Brahmans.

DAJIL, one of the three eastern sections of Baluchistan. It borders on the river Indus. The town of Dajil is in Cutch Gandava.

DAJJAL. ARAB., HIND., PERS. Antichrist. The Mahomedans believe in Antichrist, whom they term the false or lying Christ, al-Masih-ud-Dajjal. He is to be one-eyed, and marked on the forehead with the letters KFR, signifying infidelity. They say that the Jews give him the name of 'Messiah bin Daood,' and pretend he is to come in the last days, and to be lord both of land and sea, and that he will restore dominion to them. According to the traditions of Mahomed, he is to appear just between Al-Iraq and Syria, or, according to others, in the province of Khorasan. They add that he is to ride on an ass, and that he will be followed by 70,000 Jews of Isfahan, and continue on earth forty days, of which one will be equal in length to a year, another to a month, another to a week, and the rest will be common days; that he is to lay waste all places, but will not enter Mecca or Medina, which are to be guarded by angels, and that at length he will be slain by Jesus, who is to encounter him at the gate of Lud. It is said that Mahomed foretold Antichrists to the number of about thirty, but no one of greater note than the rest.—*Lane.*

DAJLA, the river Tigris.

DAK. HIND.; Tawal, TAM. The post, mail; to travel by dak, meaning as fast as the post, was performed in palanquins, or in carriages, or on horseback. Also the mail or postal arrangements of India, where railroads, carts, horses, and men-runners are employed to carry the mails.

DAKA. SIND. A water-wheel for irrigation.

DAKAR. HIND. of Cis-Sutlej. Low-lying, stiff clay land.

DAKAUT, also Dakautiya. HIND. Hindus born of or descended from a Brahman father and Goalin mother. They subsist on alms collected on a Saturday, and are astrologers, fortune-tellers, and the like.

DAKH. HIND. Vitis vinifera; grapes, especially the wild vine, also raisins. Kagh-dak'h designates the currants of Ribes rubrum, and Gidar dak'h, the fruits of Cissus carnosa, Sageretia oppositifolia, and Prunus padus. Dakh-ka-mad'h, wine.

DAKHILAH. PERS. In accounts, an entry; also a receipt for money.

DAKHMA. ARAB. A coffin, a vault, a place for the dead; the tower of silence, the place of lodging the bodies of the Parsee dead, vernacularly Dokhma, or tower of silence.

DAKINI. HIND. A witch, a female goblin. In Hindu mythology also called Asra-pas, or blood-drinkers; a kind of female imp, attendant on Kali, and feeding on human flesh.

Dakin-raya, a forest deity in Saugor island. After a battle in which Bugtea, a Rahtor chief, charged through Abhye Singh's army, the Rajput poets sang of his deed,—Is it the battle-cry of Kali, the hissing of Sehesnag, the denunciation of Kalispur, or the war-shout of Hanowanta? Is it the incarnation of Nur-sing, or the darting beam of Surya? or the death-glance of the Dakini? or that from the central orb of Trinetra?—*Rajasthan*, ii. p. 111; *Dowson.*

DAKOTA, also Dakocha, also Dakaut, in the Mahratta country, a tribe who follow fortune-telling; almanac-makers. They claim descent from a Brahman father by a cowherd mother.

DAK-PA, also called Bruk-pa, a Bhot race.

DAKRA, a poisonous root of Nepal, made up with grain into balls, and so employed to poison elephants.

DAKSHA, author of a law treatise; is mentioned in the Mahabharata. He lived as a hermit on Mount Vrindha.—*Ward*, iv. p. 27.

DAKSHA, in Hindu mythology, was an avatar of Brahma upon earth in a human shape. There are several accounts, but the myth relating to him indicates a contest between the followers of Siva and Vishnu. Wilson says Daksha was the son of Brahma and father of Sati, whom, at the recommendation of the rishis or sages, he espoused to Siva, but he was never wholly reconciled to the uncouth figure and practices of his son-in-law. Having undertaken to celebrate a solemn sacrifice, he invited all the gods except Siva, which so offended Sati, that she threw herself into the sacrificial fire. To avenge her fate, Siva created Virabhadra and other formidable beings, and sent them to the scene of action, where they disturbed the rites, beat and mutilated the assistants, and even maltreated the gods, till Siva was appeased, and arrested their excesses. Daksha, who had been decapitated in the scuffle, was restored to life, but the head of a ram was substituted for his own. Sati was born again as the daughter of the mountain Himalaya, and was again married to Siva. From this second birth she is called Parvati, the mountaineer, or Girija, the mountain-born. The disturbance of Daksha's sacrifice is a favourite legend with the Hindus.—*Coleman, Hind. Myth.* p. 6; *Hind. Theat.* ii. p. 263.

DAKSHA SAVARNI, in Hinduism, one of the 14 patriarchs who preside successively over the 14 Manwantaras of the Calpa.

DAKSHINA. SANSK. A present to a Brahman on the conclusion of any ritualistic ceremony.

DAKSHINA. SANSK. The right hand; vernacularly Dakhin or Deccan, as the right hand; hence the country to the south, when a Hindu looks towards the rising sun, the south point of the compass, Southern India. Dakshina-Patha, the Sanskrit name for the Dekhan. The Periplus names it Dachinabades. Dakshina-Yana, the sun's southern declination.—*Prin. Ind. Ant.* See Dekhan.

DAKSHINACHARI. SANSK. One who follows the observances (achara) of the right-hand tribe or caste; practisers of the purer forms of the Hindu ritual, as opposed to the Vamachari or left-hand caste.—*Wilson, Gloss.*

DAL. HIND. Any split pulse, hence Tur-ka-dal, Cajanus Indicus; Mung-ka-dal, Phaseolus radiatus, Ph. mungo; Channa-dal, Cicer arietinum. The various dal are greatly used as food by all the richer classes of natives, and many Europeans also like it, generally mixed with rice. Europeans often pronounce the name as if written Dol. The dal of Cajanus Indicus is considered the best.

DAL, the lake or Dal of Kashmir, lies to the north of the chief town, stretching from the base of two hills to the more lofty mountain range which bounds the valley on the north. It is 5 miles long and 2 miles broad, but is only open in its northern half, the end nearest the town being occupied by large islands, with narrow channels between them, in some of which there is a good deal of current. Its waters are discharged into the Jhelum by a considerable stream, which, flowing from its south-east corner, runs to the westward in a course nearly parallel to the southern margin of the lake for nearly a mile, when it turns abruptly south to enter the Jhelum in the middle of the capital of Kashmir.

DAL. BENG., HIND. A coterie, a club, an association. An ornament worn by fakirs. A bough; a basket of leather or twigs. Dali, a present.

DALACA or Dahala, the largest island in the Red Sea, near the coast of Abyssinia, well known for a pearl fishery, in long. 40° 10′ E., and lat. 15° 44′ N.

DALADA. SINGH. The sacred tooth of Buddha kept at Kandy in Ceylon. The original was destroyed by the Portuguese in A.D. 1560. That was probably the tooth of a man; but the object now shown is a piece of discoloured ivory almost two inches long, less than one in diameter, and resembles the tooth of a crocodile rather than that of a man. The name is from Dhata-Dhata. It is greatly revered by the Singhalese Buddhists. Its history is given in the Daladawansa.—*Tennant.*

DALAI LAMA. See Delai Lama; Tibet.

DALAL, a tribe of Jats in the Rohtak Zillah.

DALAN. PERS. A hall with an open front, used by Mahomedans of rank as a reception room. It is the verandah, or roofed but otherwise open space in front of a room.—*Ouseley's Travels*, ii. p. 11.

DAL BALLU GEERA. CAN. A tree of Canara and Sunda, on the elevated plateau between Gungawali and Black River; does not reach a great size. Wood very strong and tough, and sought after for agricultural implements.—*Dr. Gibson.*

DALBEHERA. URIYA. The chief or head of the Goala and other castes.

DALBERGIA, a genus of plants belonging to the natural order Fabaceæ. Dr. Wight describes D. frondosa, latifolia, reniformis, scandens, marginata, rimosa, stipulata, Ujjainensis, robusta, and tamarindifolia. Dr. M'Clelland mentions that in Tenasserim there are four kinds of Dalbergia, all blackwoods, Yindike, BURM., all yielding a heavy timber which will not float, similar to sissoo. These trees are very plentiful in the Tharawaddy and Hlaine districts, also in the lower parts of the Tounghoo district. The timber seldom attains a very large size, and is generally found of a girth of three or four feet. D. cultrata, *Graham*, a tree of British Burma, furnishes a useful oil. D. alata, —? Tsouk-yoa, BURM., a tree of Moulmein, used for tool handles. D. ooata, —? Tsouk yo, BURM., a tree of Moulmein. A tough wood, much used for tool handles.—*Cal. Cat. Ex.* 1862.

DALBERGIA FRONDOSA. *Roxb.*

D. arborea, *Heyne.* Erra pachchari; Pedda sopara, TEL.

In Ceylon, not uncommon in the central provinces and elsewhere up to an elevation of 3000 feet. Grows in the Godavery forests and in the Circars; also in Pegu, where it attains a girth of four feet and upwards; is taller and straighter than the sissoo, and furnishes a strong, useful timber.—*Fl. Andh.; Beddome; M'Clelland; Thw.*

DALBERGIA LATIFOLIA. *W. and A., Roxb.*

D. emarginata, *Roxb.* | Rosewood tree.

Shwet sal; Sit sal, BENG. | Thoda gatti, . . . CAN.
Yendike? . . . BURM. | Blackwood tree, . . ENG.
Sissoo of . . BOMBAY. | Eruputtu; Iti, . . TAM.
Bitti; Biti, . . CAN. | Irugudu; Jittegi, . TEL.

This tree occurs throughout India. It grows to an immense size, the trunk sometimes measuring 20 feet in circumference. It has a very dark, heavy, and strong wood, sustaining a weight of 515 lbs. Everywhere in Southern India this valuable wood has risen much in price, and in 1858 an experimental sowing was made at Nellumbur. The wood is extensively used for cabinet work, knees of vessels, agricultural implements, combs, etc. The wood of the centre of the trunk and large branches is greenish or greenish black, often mottled, or with light-coloured veins running in various directions. It is close-grained, admitting of the finest polish, and is employed in the Madras Gun-carriage Manufactory, for light field beams, cheeks, axle-cases, braces, perches, poles, splinter-bars, waggon perches and framing, light field spokes and felloes. For gun-carriages it is so valuable, that large plantations have been formed in waste places of the North-Western Provinces of Hindustan. In Malabar it is the magnificent tree from which the well-known Malabar blackwood is obtained, and planks 4 feet broad are often procurable, after all the external white wood has been removed. It is one of the most valuable woods of the Madras Presidency.—*Drs. Roxburgh, Wight, Gibson, and Cleghorn; Voigt; Beddome.*

DALBERGIA MOONIANA. *Thw.*

D. lanceolaria, *Linn. fil.* | Nadoong gass, . SINGH.

A great tree, which grows in the southern and central parts of Ceylon, at no great elevation.—*Thwaites' Zeyl.* p. 93.

DALBERGIA OOJJAINENSIS. *Roxb.*

Tunnus; Tewus, . MAHR. | Nemmi chettu, . . TEL.
Ati muktamu, . . . TEL. | Tella motuku, . . . ,,
Manda motuku, . . ,,

A tree 30 feet high, 7 or 8 feet in girth, grows in the warm valleys of the Himalayas, the Kheri

jungle, Dehra Doon, Kamaon, Panjab, Sirmore, in Oudh and the Godavery forests. Found both in the Konkan and inland Bombay forests; especially common in some parts of Kolwan, Kandesh, and the Satpura Hills. Its wood is of great strength and toughness, of a clear dark brown colour; heavy, tough, and durable; is used for naves of wheels, legs of bedsteads, helves of axes; especially applicable for cart-building, ploughs, etc.; seldom reaches a size sufficient to give a plank of 9 inches. The wood of that which grows on the Godavery is valuable, but the tree is rather rare there.—*Voigt; Fl. Andh.; Thompson; Useful Plants; Dr. Gibson; Captain Beddome.*

DALBERGIA PANICULATA. *Roxb.*

Patchalaywood, ANG.-TAM.	Porilla sopara, . . . TEL.
Phassie, ... MAHR.	Tella pachchari, . . „
Putchalai maram, . TAM.	Tella patsaru, . . . „

This tree grows in Moulmein, Assam, Oudh, in the Northern Circars, in the Godavery forests, Coimbatore, at Courtallum, in the Mawul districts, and above the Ghats. In Coimbatore it attains a considerable size, and the timber is said to be strong, and fit for many purposes. It is rather common in most of the Bombay forests, both of the coast and inland. The wood there is light yellow, strong, compact, and fit for many purposes in house-building, agriculture, etc. But Captain Beddome tells us of Porilla sopara (Godavery), Tella patsaru (Circars), TEL., Dalbergia paniculata, that the wood is perfectly useless; it is arranged in rings with softer substance in between the layers. Voigt tells us that it is white and firm, but less useful than some of the other species. The character of the wood would thus seem to vary according to locality.—*Drs. Wight, Gibson, Voigt, Beddome.*

DALBERGIA ROBUSTA. *Roxb.*

D. Krowee, *Roxb.*	D. latifolia, *Gibson.*

This tree grows in Nepal, Assam, and Pegu, where it is very abundant, attains a girth of 4 feet and upwards, and is taller and straighter than sissu.—*Voigt; M'Clelland*, p. 10.

DALBERGIA SISSOIDES. *Grah.*

Rosewood, . . . ENG.	Biti maram, . . . TAM.
Blackwood, . . . „	Vitty maram, . . „
Eatty maram, . . TAM.	Kar-itti, ... „

It is a smaller tree than D. latifolia. Both yield a black wood, and in Madras are indiscriminately called rosewood. The wood contains much oil, which unfits it for receiving paint. Mr. Rohde says that this is one of our best woods for plain furniture, though at Madras it is said to cast about a good deal. Logs are almost invariably faulty in the centre. As a tough, strong wood, it will be found useful, whether curved or straight. Dr. Gibson does not recognise this as a species distinct from D. latifolia.—*Drs. Gibson, Wight, Cleghorn; Mr. Rohde.*

DALBERGIA SISSOO. *Roxb.*

Pterocarpus sissoo, *Roxb.*

Sissoo wood, . . . ENG.	Sheeshum, . . PANJ.

Safeda, ... „	Sissowa, . . . URIYA?
Tali, ... PANJ.	

This tree grows in Bengal, Nagpur, Gujerat, in the hills about Nagotnah, and Kenheri jungles. It is the most valuable hard wood in the Panjab, and grows at 2000 to 4500 feet in the Himalayas. In Nagpur, logs of it are procurable from 10 to 15 feet long, and 2½ to 3 feet in girth, at 6 annas the cubic foot. It is said to attain a great size in Chanda, and is employed in ornamental work, domes of gharries, etc. It was introduced into the Madras Presidency from Bengal, at the recommendation of Dr. Wallich. Its rapid growth recommends it for avenues, for the tree attains perfection in 28 years; it is propagated and reared with facility, and early attains a good working condition of timber. The wood is greyish brown, with darker coloured veins, very strong, but said to be not very durable. It is used in Bengal for gun-carriages, and furnishes shipbuilders with their crooked timbers and knees, being remarkably strong, but not so durable as could be wished. In the Dekhan the wood is used principally, from its strength and natural bend, for native hackeries; when it can be procured long and straight, it makes good shafts for buggies. The wood of the Ajmir tree is very dark and beautifully veined, like rosewood. Flowering time, the beginning of the hot season; the seed ripens about the close of the year.—*Voigt; Captain Macdonald; Mr. Rohde's MSS.; Irvine; Riddell; Roxburgh; Thompson; Stewart; Cleghorn; Captain Sankey.*

DALCHINI. PERS. Cinnamon; the Cassia lignea of the species of Cinnamomum trees.

DAL-DAL, the name of Mahomed's mule; also of the horse of Ali, son-in-law of Mahomed.

DAL-DAL or Dahil. HIND. Bog, quagmire, quicksand.

DALECHAMPIA. Of this genus of plants Wight gives Capensis, Indica, and velutina. D. arborea is Galedupa Indica. D. bidentata, *Blume* (D. Indica, *Wight;* D. velutina, *Wight*), grows at Gonagama, on the lower Badulla road from Kandy, but is not common.—*Thw. Zeyl.* p. 270.

DALECHAMPIA POMIFERA. Douk-ya-mad, BURM. Met with on the banks of streams in the Pegu valley, particularly in the Pommah Choung. The trees are from 3 to 4 feet in girth. Wood red or dark brown, and adapted for cabinet-making.—*Dr. M'Clelland.*

DALHI. HIND. Arable land.

DALHOUSIE. James Andrew Broun Ramsay, tenth Earl and first Marquis of Dalhousie, was born on the 22d April 1812. He was a third son by the heiress of the Brouns of Colstoun in Haddingtonshire. He was educated at Harrow, and subsequently at Christchurch, Oxford, where he was fourth class in classics (1833), and graduated M.A. in 1838. By the deaths of his two elder brothers he became Lord Ramsay in 1832. He was employed in the Ministry of Great Britain, and was Governor-General of India from the 12th January 1848 to the 29th February 1856. The period of his administration was marked by great changes, and posterity has styled him the Great Proconsul. He was naturally prompt and imperious; he was prompt to vindicate his authority, and he had quite a special faculty for making his displeasure dreaded. He never failed to reward good service, though even his friends regarded him with a certain awe; and it used to be said of him, that 'although his height was not imposing, he looked every inch a king.'

On reaching Calcutta, Lord Dalhousie proclaimed his policy: 'We are lords paramount of India, and our policy is to acquire as direct a dominion over the territories in possession of the native princes, as we already hold over the other half of India.'

Soon after his arrival, British officers were murdered at Multan, and Mulraj its governor was in revolt; the Sikhs were defeated, and the Panjab annexed to the British dominions. In 1852 the Government was involved in hostilities with Burma, where British traders had been insulted by the officers of the king of Ava, and in a few weeks the entire coast of Burma was occupied, and before the close of the year the province of Pegu was annexed. From that time to the end of his administration, the Indian Empire enjoyed comparative peace.

During his time a Legislative Council was organized, prison discipline was improved, a system of uniform and cheap postage was introduced, a portion of the Peninsula intersected by railway, and all the large towns brought into immediate connection by means of the electric telegraph, laid down by Dr. (Sir William) O'Shaughnessy, 4000 miles having been constructed and placed in working order between November 1853 and February 1856. The production of cotton, tea, and flax, the breeding of sheep, and the improvement of agricultural implements, all received his attention. The development of the resources of the country in iron, coal, and other minerals was a matter on which he bestowed peculiar care; and measures were also taken for the preservation of the forests, and for making their produce available. A new and uniform survey of the districts was commenced, and the limits of feudatory states accurately defined. Irrigation on a large scale was attended to in Sind, Madras, and Bombay; the navigation of the Ganges, Indus, Nerbadda, and Brahmaputra was improved; grand trunk roads were carried to Dehli, through the Panjab, and to Patna, and others made in Pegu and Sind. A road was also constructed to the frontiers of Tibet, commencing from the plains of the Sutlej, and another put in progress from Arakan over the Yoma ridge to Pegu. The most stupendous work, however, was the Ganges canal, carried out by the skill of Sir Proby T. Cautley. The department of public works was reformed throughout, and colleges founded to train young men specially in civil engineering. Schools and colleges were established and placed under Government inspection. Strenuous efforts were made for the eradication of sati, thuggee, and infanticide. The condition of the British soldier was greatly improved. Provision was also made for both Protestant and Roman Catholic worship on more equal terms, and extensive changes were made in matters of criminal and civil justice. The government of each Presidency, each lieutenant-governor, and the chief officer of every province, were required to send in to the Governor-General an annual administration report of the chief events that occurred within their several jurisdictions, in order to test the progress made by the nation at large. In his last minute, he said: 'No prudent man, who has any knowledge of Eastern affairs, would ever venture to predict the maintenance of continued peace within our Eastern possessions. Experience—frequent, hard, and recent experience—has taught us that wars from without, a rebellion from within, may at any time be raised against us, in quarters where they were the least to be expected, and by the most feeble and unlikely instruments. No man, therefore, can ever prudently hold forth assurance of continued peace in India.' For his success in the Panjab, Lord Dalhousie was raised to a marquisate in 1849; and on his return to Britain in May 1856, the East India Company settled on him a pension of £5000 a year. He had previously been appointed to the wardenship of the Cinque Ports on the death of the Duke of Wellington. He died on the 19th December 1860.

DALHOUSIE, municipal town, cantonment, and hill sanatorium in the Gurdaspur district of the Panjab, in lat. 32° 31′ 45″ N., long. 76° 0′ 15″ E. It occupies the summits and upper slopes of three mountain peaks of the main Himalayan range, east of the Ravi river. The hills consist of rugged granite, and the houses are perched in a few gentler slopes among the declivities.—*Imp. Gaz.*

DALI. Hind. From Daliah, a branch, a tray, on which complimentary presents of food, fruits, or vegetables are placed.

DALIMA. Hind. A class of Tuga in Muradabad.

DALIMBA, a hard, granular, coarse stone of Cuttack, worked into utensils of various kinds.

DAL-KOHLU, a sugar-cane press, in Ambala and Cis-Sutlej.

DAL-LA, or Giant's Peak, in Bhutan, N. of Tanong, in lat. 27° 50′ N., and long. 92° 34′ E. The top of the peak is 22,495 feet above the sea, as trigonometrically measured from Gohatti. This peak is the prominent feature in the Himalaya panorama of Central Assam.—*Schlag.*

DALLAL. Hind. A procurer, a horse-couper, an agent, a broker, a go-between. Dallalah, a courtesan. The Delilah of the Bible, a female go-between.

DALMA, a range of hills in Manbhum, occupied by the Kharria and Paharia. Dalma, its highest hill, is 3407 feet above the sea.

DALMAN, a town on the right bank of the Ganges, 16 miles south of Rai Bareli. It is said to have been founded about the 4th century A.D., by a brother of the raja of Kanouj. It was long in the possession of the Bhar, and the surrounding country was the scene of a protracted struggle maintained by that tribe against the Mahomedans. About 1400 A.D. the Bhar were almost annihilated by Sultan Ibrahim Sharki.—*Imp. Gaz.*

DALME-KATTEA. Singh. Wood-moth, Eumeta Cramerii.

DALOSINGHA, a tree of Ganjam and Gumsur. Ploughshares are sometimes made of it.—*Captain Macdonald.*

DALRYMPLE, ALEXANDER, Hydrographer to the East India Company. He died 1807. He was an active writer.

DALUWAN or Dalaman, the bark of the Broussonetia papyriferas, prepared for writing on.

DALYELL, N. A., and A. Gibson, joint authors of Dalyell's Bombay Flora. Mr. Dalyell contributed several memoirs on botanical subjects, and on the influence of trees on climate.

DAM. Arab. Also Dama, a prayer. 'May it be perpetual.' Dam daulatūhū, dam zillūhū, 'May his prosperity continue.'

DAM, a copper coin of India, now obsolete. In Akbar's time 40 dam of copper were equivalent in account to one rupee, and the dam of copper is itself defined at 5 tank, or 1 tola 8 mashas and 7 rati in weight, which at 186 grains per tola is equal to 323·5625 grains. There seems to have

been 9·29 chitals in each dam, and in the Sheer Shahi rupee 371·8 chitals, instead of the old 320 divisional coins of that name and value, which went to the lighter silver piece of former days. In the Ayin-i-Akbari, and in most revenue accounts, the dam is considered the 40th part of a rupee, but to the common people it is known as the 50th of a tuka; 25 therefore go to a pysa, and 12½ to an adhela. In the time of Alamgir, 46⅔ dam, and later, 80 and 90 dam, went to a rupee.

DAM. PERS. Price, cost. Be-dam, priceless.

DAMA. SANSK. A house. It is Domos, GR.; Domus, LAT.; Domii, SLAV; Daimah, CELT.—*Müller's Lectures*, p. 224.

DA-MA, spelled Mran-ma or Myamma, is that portion of the Burmese race who occupied the country above Prome.—*Mason*, p. 62.

DAMALCHERRY, a pass about 30 miles N. of Ambur, leading from Mysore to the Karnatic. On the 20th May 1740, Nawab Ali Dost fell here in action against the Mahrattas.—*Orme.*

DAMAN is a Portuguese settlement just 100 miles north of Bombay. It has a population of about 50,000, and an area of 82 square miles. The Portuguese, soon after its capture in the 16th century, converted a mosque into a church, and have since built eight other places of worship, besides docks and yards for shipbuilding. The settlement has two forts, and is ruled by a governor with civil and military functions, under the viceroy at Goa. There are some fine teak trees and other timber in the neighbourhood; and in former days Daman was noted for dyed piece-goods, and a flourishing trade in opium with China. The town on the right bank of the river Daman was sacked by the Portuguese in 1531, rebuilt by the natives, and retaken in 1558 by the Portuguese.

DAMAN-i-KOH is the name given to the low hills that form the basis of the higher ranges of the Himalaya, and in which such hill states as Kotahah and others are situated. It means the skirt of the hills, and is applied also to the skirt of the Santal Parganas, and also to the tract between the Suliman mountains and the west bank of the Indus, comprising portions of Dehra Ghazi Khan, Dehra Ismail Khan, and Kohat districts, between lat. 28° 40′ and 33° 20′ N., and long. 69° 30′ and 71° 20′ E.

DAMARA. Wilson's History of Kashmir describes this as an ancient people, as a fierce, intractable race, murderers of king Chakra Varma, and who opposed Lalata Ditya in his advance to the north or Uttara-kuru.

DAMARA or Damru, supposed to be a small hand-drum or rattle, usually seen in the hands of Siva or his avatars. This definition of the emblem is, however, doubtful; it has the appearance of an hour-glass, and rattles of this form are sold in all the bazars of India, and used by religious devotees and others to attract attention. —*Cole, Myth. Hind.* p. 377.

DAMASCUS city is about 2 miles in length, is surrounded by a fortified enclosure, dating back to the time of Selim I., and which was built on the site of the old walls raised by the Arabs in 650. Damascus was the usual residence of the khalifs of the Ommiah dynasty. During the convulsions which at last overthrew the khalifs, it had many changes of rulers, and was destroyed by Timur, A.D. 1400. It has eighteen gates, one of them being called Bab-i-Paulous, or the Gate of St. Paul. Damascus contains many places of worship; the largest and finest being that dedicated to St. John the Baptist. It was thoroughly repaired by the khalif Walid in the year 86 of the Hijira; its doors are of bronze, and beautifully wrought. A Mahomedan tradition says that at the end of the world St. John the Baptist will descend into this building, while Jesus Christ will come to the temple of Omar at Jerusalem, and Mahomed, the prophet of God, to the temple at Mecca. In the great bazar to receive the caravans, from 1200 to 1500 camels may assemble. Damascus was the general rendezvous of from 40,000 to 50,000 pilgrims, who assembled there from all points of Ottoman Europe and Asia, and even from Persia and Turkestan, in order to go with the caravan to Mecca; but most of the pilgrims now go by the Suez canal. Damascus was formerly celebrated for its manufacture of sword-blades, brass work, and peculiar heavy silks of shot colours. The population of Damascus amounts to 180,000 — 130,000 Mahomedans, 30,000 Christians, Greeks or Latins, and 20,000 Jews. The schismatic Greeks have a church of their own, but the Catholic Greeks have not, and perform their religious duties in the three Latin monasteries, viz. the Holy Monastery, that of the Lazzarists, the successors of the Jesuit missionaries, and that of the Capuchins. The Armenians and the Syrians have each a particular sanctuary, and the Jews have three synagogues. Damascus is the residence of a first-class mullah, and of the Greek Patriarch of Antioch, who has forty-two archbishops and bishops under him. The Pasha of Damascus bears the title of Prince of the Pilgrimage, because he was formerly charged to accompany the caravan to Mecca. The plain of Damascus is covered with magnificent gardens, planted with orange and lemon trees, cedars, fig and apricot trees, and shrubs of all kinds. The Baradi, the ancient Chrysorrhœa, a pure and limpid river, divides itself into seven branches, and waters the town and its fine gardens. The nearest seaports are Beyrout and Saida.

DAMASCUS, a commercial and art term, applied to a variegated structure and appearance on iron and steel gun-barrels, daggers, sword-blades, where, as in the Koteli twisted gun-barrel trade, the barrel is made of twisted bars, and nothing can be imagined more elegant. Damascus swords present on their surface a variegated appearance of watering. The blade was formed by mixture in nearly equal proportions of the celebrated wootz and soft iron, which, being welded together and repeatedly doubled, gives the desired appearance. Daggers and sword-blades thus formed are common among the retainers of the hill zamindars in the Northern Circars of the Peninsula of India, the handles of which, formed of iron, are frequently damascened in silver. Atkinson (Oriental Western Siberia, p. 120) says that Colonel Andsoff at Zlatavust had succeeded in manufacturing valuable Damascus blades, weapons combining edge and elasticity. The water was a succession seemingly of small bundles of almost parallel lines, occupying the whole breadth of the blade, the ends of the bundles crossing and mingling at the point of

junction. They are, however, a series of minute curves, forming together lines disposed in bundles articulated together, and dividing the length of the weapon into many sections. They have not the regular articulation of the articulated Khorasani blade, their lines are infinitely finer.—*Rohde, MSS.; Taylor, Saracen*, p. 130; *Powell.*

This is a fabric woven in a loom, with figures of flowers or other objects. The art is said to have been brought from Damascus, hence the name.

DAMASONIUM INDICUM. *Willde.*

Parmi kulla, . . BENG.	Nir veneki, . . . TEL.
Ottel-ambel, . . CAN.	

A pretty flowering annual, a native of sweet waters in India and Archipelago; flowers in the rainy season. The petals are of delicate white, and the long calyx has its corners ornamented with fringes, gathered into a kind of flounce or furbelow.—*Roxb.* i. p. 216.

DAMATHAT. BURM. The book containing the Burmese code of laws.

DAMAYANTI, daughter of Bhima, raja of Vidarbha, was famed for her radiant charms and exceeding grace. She chose Nala, raja of Nishada, at her Swayamvara, by throwing a wreath of flowers around his neck, and two children were born to them. Their story has been told by the poet. Nala took to gambling, and lost all but his wife, and was driven with her to the forest, where he urged her to return to her father's house, and, on her refusing this, he deserted her while asleep. She subsequently went to her father, and, failing to discover her husband's retreat, she declared she would hold another Swayamvara. To this the king of Oudh came, in a chariot driven by Nala, on which Damayante recognised her husband, and they were happily reunited.

DAMBULA or Dambulla, a celebrated rock Buddhist temple near Matellæ, in Ceylon. The temple has been hollowed out of a hill of stone, and, from its antiquity, its decorations, and its magnitude, is by far the richest in that island. It is supposed to have been founded B.C. 246 by Dewanampiya Tissa, the ally of Asoka, and friend and patron of Mahendra, who introduced Buddhism into Ceylon. The roof of the vault is covered with fresco paintings. Some of the statues of Buddha are upwards of 40 feet in length; but there is an admixture of Buddhist and Brahmanical emblems, as the Makara, a monstrous idol, with the trunk of an elephant, the feet of a lion, the teeth of a crocodile, and the ears of a pig, is a prominent figure. It was first endowed 86 B.C. —*Tennant.*

DAMBU TAGH, mountains of the province of Iran, yielding the topaz, beryl, schorl, and gold.

DAM-DUM, a venomous fly in the Phangan pass, the bite of which causes severe irritation.

DAMIETTA, a town in Egypt supposed to have given its name to the dimity fabric. It was long ago suggested that the word dimity is the Greek Dimitos, so called because woven with a double thread in the woof. Professor Skeat has lent his authority to this etymology.

DAM-i-MADAR, called also Dhummul, is a popular ceremony with the agricultural and lower classes in India. It consists in jumping into a fire, and treading it out, with the exclamation of 'Dam-i-Madar, Dam-i-Madar!' that is, 'By the breath of Madar, by the breath of Madar.' It is devoutly believed that not a hair of these devotees gets singed, and that those who have practised the ceremony are secure against the venom of snakes and scorpions. Badi-ud-Din Shah Madar, in honour of whom this ceremony annually takes place, was, according to the Mirat-i-Madaria, a converted Jew. He is said to have been born at Aleppo in 1050 A.D., and to have come to India in the reign of Sultan Ibrahim Sharki, and, having taken up his abode between Cawnpur and Farrakhabad, and expelled therefrom an evil genius called Mukun Deo, who infested the place, he gave the name of Mukunpur to his residence, and was buried there in 1433 A.D., at the good old age of nearly four hundred years. The tomb, which is a handsome structure, was raised over him by Sultan Ibrahim. He is believed still to be alive, and hence is frequently styled Zinda Shah Madar. The prophet Mahomed gave him the power of habs-i-dam, or retention of breath, and hence arose his longevity, as the number of his respirations was diminished at pleasure. There is a class of fakirs called Madaria, after his name. They generally wear black cloth, and are much addicted to the use of intoxicating drugs. A fair is held at the tomb during the first 17 days of Jamadi-ul-Awal.—*Elliot, Supp. Gloss.* See Madaria.

DAMIT, a tutelary spirit of the Javanese.

DAMMAJI GAEKWAR, styled Shamsher Bahadur, the first of the Gaekwar family, who founded the dynasty in A.D. 1720. He was an officer under Khandi Rao Holkar. The Gaekwar made a treaty with the British in 1802. See Mahratta Governments in India.

DAMMAPADAN, a work in Pali, containing moral precepts.—*Hardy, Eastern Monachism.*

DAMMARA, a genus of trees found in Australasia, New Hebrides, New Caledonia, New Zealand, the Fiji islands, Java, Borneo, and Amboyna. Their names are,—Dammara obtusa, *Lindley*, of the New Hebrides and Queen Charlotte's group; D. australis, *Lambert;* D. orientalis, *Lamb.;* D. Nitiensis, Fiji; D. macrophylla, *Lindley*, of New Hebrides; D. Moorii, *Lindley*, of New Caledonia; D. robusta, *Moore*, of the Burnett and Mary rivers of N. Australia; D. ovata, *Moore*, of the Isle of Pines.—*Roxb.; F. v. Mueller; Bennett.*

DAMMARA AUSTRALIS, *Lambert*, is the Agathis australis, the kawri tree of New Zealand, first noticed by Captain Cook. Its wood contains a considerable quantity of resin, and appears to shrink little. The mean girth of the tree is from 3 to 6 feet, and it is from 90 to 200 feet high. It is a close, even, and fine-grained wood of a very uniform texture; its colour is a light-yellowish brown, the lustre silky, the annual rings marked by a line of deeper tints of the same colour. It is used for masts and yards of ships, and seems admirably adapted for internal joiners' work. The bark thick, yielding tears of resin in great profusion. Enormous masses of a similar resin, many pounds in weight, are found in the soil in many places far from where these trees now grow, and are presumed to have the same origin. It is used in varnish-making. The perfectly straight trunk is clear of branches up to 80 or

100 feet, and a diameter 5 to 9 feet.—*Jam. Ed. Jour.* xiii. of 1825, p. 378; *Tredgold; Dr. Hooker; F. v. Mueller.*

DAMMARA ORIENTALIS. *Lambert.*

D. alba, *Rumph.* | Agathis loranthifolia, *Salis.*
Pinus dammara, *Lamb.* |

A tree of Amboyna; it yields dammer.—*Roxb.*

DAMME or Damma, in the Arafura Sea, is a high large island, 70 miles N.N.W. from Sermattan; the island is 15 miles long north and south, and at its N.E. extremity has a volcano, with hot springs.—*Horsburgh.*

DAMMER.

Pa-ma-yi, Lan-t'ang, CHIN.	Dummula, . . . SINGH.
Ral, Rala, . . . HIND.	Coongilium, . . TAM.
Damar, . . . MALAY.	Googhilum, . . TEL.
Yakshadupha, . SANSK.	Tala-gotso, . . . URIYA.

Dammer is a general name for the resins of several different trees, being applied to the Indian copal or gum anime of the Vateria Indica; to the New Zealand copal from the Dammara australis; to the hard brittle resin of the Dammara Amboyna; the brown resin of the Vatica robusta; to the black resin or pitch of the Vatica tumbugaia; and to the resins of species of Canarium, as Canarium pimela (Lan-t'ang, CHIN.), which yields the resin for the Chinese dammer. Agathis loranthifolia, *Salisb.*, grows on the lofty mountains of Amboyna, and, according to Dr. Wallich, in Tavoy. It is a very large tree, used in building. White dammer, a product of this tree, occurs in fragments of variable size, marked with reddish streaks, transparent, amber-like, brittle, with brilliant fracture, very inflammable, inodorous, and tasteless. It hangs from the branches, and resembles stalactites, the pieces being sometimes as large as the hand, and 4 to 8 inches long; some pieces are like anime resin. Dammer is found adhering to the branches, or in masses at the foot of the trees which yield it, or floating in rivers, drifted to them by the floods of the rainy season. It is produced in such abundance, and gathered with so little labour, that its market price seldom exceeds four or five shillings a hundredweight. The natives of the country apply it to most of the uses to which we put tar, pitch, and rosin.

Damar mata kuching, MALAY, Damar daging, and Damar batu, are gum products of the Malay Peninsula and of the Archipelago. Damar mata kuching, when mixed with the miniak kayu, or wood-oil, makes a durable varnish. Damar puteh is white dammer, and Damar selo is another dammer.

The dammers of the Madras Presidency are obtained from trees of the genera Vateria, Canarium, and Vatica. The two former, viz. Vateria and Canarium, yield by far the largest part, if not the whole, of the dammers produced on the western coast of the Peninsula of India, whilst the Vatica genus yields the greater part of that collected in the northern and eastern districts.

The Black Dammer of the Western Coast is from Canarium strictum, the Carpoo coongilium of Ainslie, the Dammara nigra legitima of Rumphius, and the Canari of the Maleala. This occurs in large stalactitic-shaped masses, of a bright shining black colour when viewed from a distance, but translucent and of a deep reddish-brown when held in thin laminæ between the eye and the light. It is perfectly homogeneous, and has a vitreous fracture. Its shape appears to be due to the fact of the balsam having exuded in a very fluid state, and trickled down the trunk of the tree, where it gradually hardens by exposure to the sun, the fresh resin continuing to flow over that already hardened, giving rise to the stalactitic appearance of the huge lumps of resin, the outside of which much resembles the guttering of wax caused by placing a lighted candle in a draught. It is insoluble in cold, but partially soluble in boiling, alcohol on the addition of camphor; when powdered, it is readily soluble in oil of turpentine. Powdered and burnt on the fire, it emits a more resinous smell, and burns with more smoke, than white dammer. The size of the lumps of this resin, together with its colour and the peculiarity of shape already mentioned, suffice to distinguish it from other Indian resins.

The White Dammer of the Western Coast is the Piney resin of the Vateria Indica and allied species of Linnæus and Wight, Choloroxylon daupadu of Buchanan and Ainslie, the Doopada resin of Mysore, and the Piney of the Malabar people. It has two varieties:—

Var. 1. Compact Piney resin, or first sort white dammer, or Indian copal, occurs in large lumps of all shapes, and varying in colour on the outside from a bright orange to a dull yellow, bearing evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard, and bears a great resemblance to amber. Its colour internally is of all shades, from a light green to a light yellow, the green tint predominating in the generality of specimens. It is more soluble in alcohol than black dammer, and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its colour, and amber-like appearance.

Var. 2. Cellular Piney resin, or second sort white dammer, occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell. Has a very cellular structure, which is attributable partly to the mode of collection, and partly to the age of the tree. Notches being cut in the trunk of the trees sloping inwards and downwards, the resin collects in the cavity, and is either permitted to dry on the spot, or is collected and dried by the application of heat. It is of all shades, from light green to light yellow or white, and is usually translucent. Specimens are sometimes seen in which, from the desiccation having been improperly conducted, the resin is more opaque, of a dull green colour, and full of air-bubbles, presenting the appearance of having undergone a partial fermentation. This resin may be recognised by its cellular appearance and balsamic smell; but the balsamic smell, which is due to the volatile oil it contains, is gradually lost by long keeping or constant exposure to the air. On splitting open old and decayed trees, portions of a dark-coloured resin are often found, having the solid consistence of the first variety, but the inferior quality of the second.

The finest specimens of Piney resin are obtained by making incisions in the tree, and are in pale green translucent pieces of considerable size. The resin that exudes naturally usually contains much impurity. In most of its properties it resembles copal, but it possesses qualities which give it some advantages over the latter. Like copal, it is but slightly soluble in alcohol; but, as

Berzelius pointed out in the case of copal, it can be brought into solution by the addition of camphor to the spirit. It is easily soluble in chloroform, and thus might find a small application as a substitute for amber in photographers' varnish. It differs most advantageously from copal, by being at once soluble in turpentine, and drying also without the necessity of the preliminary destructive fusion required by that resin, a process which tends greatly to impair the colour of the varnish. The solution of the Piney resin in turpentine is turbid and milky, but by the addition of powdered charcoal, and subsequently filtering, it yields a solution transparent and colourless as water, and yields a varnish which dries with a purity and whiteness not to be surpassed. The solution in turpentine readily mixes with the drying oils. It is on these properties of the resin that its chance of becoming an article of trade will depend. In price it cannot compete with copal, when supply to the European market is regular and abundant. The ordinary price of the best copal in the English market is but £2, 10s. per cwt. Piney resin yields, on destructive distillation, 82 per cent. of an oil of agreeable odour, but not differing essentially from that obtained from much cheaper resins.

East Indian dammer, which is well known among varnish-makers, though frequently confounded with this, is the product of a very different tree, and is not produced in the Madras Presidency.

Dammers of the Northern and Eastern Districts.—Sal tree dammer, Vatica robusta and other species, occurs in sticks much resembling in shape the black dammer, but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown, the two colours being very frequently blended in the same lump, and giving it the appearance of having a regular grain. It is friable, and differs from the white dammer of the western coast in its inferior hardness, its opacity, and its peculiar form, and from the black dammer in its colour. There are extensive tracts of Vatica jungles in the Gumsur and Cuttack provinces. The Khand and Uriya races, living in and near these jungles, wound trees in several places; the resin issues, and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark colour. The tree is called Guggilam in Telugu, and Tala gotso in Uriya. The Khand and Uriya races make the leaves into the plates from which they eat their food, and also roll up tobacco in them to smoke like a cheroot. In time of famine, the above tribes live on a soup made from the fruit of this tree.

Vatica tumbuggaia grows also to a limited extent on the west coast, but yields little if any of the dammer collected there. It exudes an amber-coloured resin.

The White Dammer of Singapore is the product of Dammara orientalis. The Australian dammer, or kauri or cowri gum, or Australian copal, is obtained from the Dammara australis.

In Rhio Lingga Archipelago, dammer is obtained from the Meranti (Damar vatu), the Meranan (Damar-kruyong) and Balon trees (Damar mata kuching).

In Borneo, also, dammer is produced by many kinds of trees quite different from Marsden's Dammara orientalis. The white dammer is used for the same purposes as gum-copal. Damar mata kuching, or the cat's eye dammer, is the least common and most valuable, being beautifully transparent. The Damar daging, or flesh-like dammer, takes its name from its veined appearance, which causes it to resemble some kinds of agate. In Sumatra some of the trees producing dammer, yield valuable timber. The Damar laut tree, not mentioned by Rumphius, is employed at Penang for the frame timbers of ships, beams, and knees. Dammer is also the name of a gummy substance found floating on the sea off the E. African coast, which the people believe to be excreta of whales. Captain Burton supposes it to be unripe gum washed seaward during the rains.—*Powell; Beddome, Fl. Sylv.* p. 84; *Burton; Hawkes; Mad. Ex. J. Rep.; Dr. Wallich.*

DAMNI, also Daoni, HIND. An article of dress of Mahomedan women.

DAMODAR, a river of Bengal, which rises in the Chutia Nagpur watershed, and, after a S.E. course of about 350 miles, falls into the Hoogly just above the James and Mary Sands' shoal, which it has helped to deposit at the junction. Together with its tributaries, it forms the great line of drainage of the country stretching north-west from Calcutta to the fringe of the plateau of Central India. The Damodar river, tributary to the Hoogly, rises in lat. 23° 55′ N., and long. 84° 53′ E., and runs S.E. to Bardwan, S. to Diamond harbour. Its length is 350 miles. It runs through a rich country, which suffered in the middle of the 19th century with a terrible fever epidemic, that spread in 1868 into Birbhum. The Damoodah valley is rich in coal, which is very largely extracted. Damoodah is subject to sudden rises during the periodic rains, and has often burst its banks and devastated all around. One of the most severe inundations was in 1823, when this river overflowed the country for many miles, and many people perished. In that inundation a good-sized pinnace sailed through the Sooksagur bazar, and Chinsura and Chandernuggur were laid under water. The Santal race venerate the Damoodah.

DAMOH, a district lying between lat. 22° 10′ and 23° 30′ N., and long. 79° 5′ and 80° E. It is on the table-land of the Vindhyan mountains, and in its extreme length measures about 90 miles north to south, breadth 50 miles. The population is about 269,642,—aboriginal tribes, 32,528; Hindus, 237,204; Mahomedans, 8064; Buddhists and Jains, 5418; Gonds, 30,209 in 1872, the remainder consisting chiefly of Kurku; Brahmans, 21,378; the mass of the Hindu population consisting of Lodhi (33,342), Kurmi (20,664), and other inferior castes. The first known government was that of the Chandel Rajputs, whose seat of government was at Mahobar, in Bundelkhand. After the decadence of the Chandel, the country seems to have fallen into various hands at different times; but the most definite of the local traditions point to a period of Gond supremacy exercised from Khatola in Bundelkhand, the seat of a long since extinct Gond principality, and subsequently, as regards the southern portions of the district, from Chauragarh in Nerbadda valley, one of the capitals of the Mandla dynasty.

DAMOLA. HIND. A tola (180 grs.) of gold dust, a kanch.

DAMON and PYTHIAS, the two followers of Anaxagoras, are supposed by Major Cunningham to be the Sanskrit Dharmma, virtue or practical morality, and Buddha, wisdom. Even the word Pythagoras seems derived from πυθάς, or Buddha, and ἀγορεύω, to expound or announce. He is said to have married Theano (Sanskrit Dhyana, devout contemplation), and by her had a daughter, whom he named Damo (Sanskrit Dharmma, virtue or practical morality), and who became a most learned Pythagorean.

DAMONU. URIYA. Grewia tiliæfolia, used for fishing-rods; abundant at Palicondah.

DAMPIER STRAIT, called Gamen or Gemi by the Dutch, is formed by Battanta island on the south and that of Waygiou on the north side, and is about 72 miles long from Cape Mabo to Point Pigot. It affords a good channel for vessels passing from the Moluccas to the Pacific, and is very generally selected.—*Horsburgh; Journal of the Ind. Arch.* June 1852, p. 308.

DAMRI, a small copper coin, formerly current in the Karnatic; all copper coin; any small money. In N. India, a nominal coin equal to 3⅛ or 3¼ dam, or between 2 and 3 ganda, so that a damri varies between 8 to 12 kauri.

DAMRI MASJID, a pretty little mosque, near the fort of Ahmadnaggur.

DAM-ul-AKHWAIN. ARAB. Dragon's blood, gum from Calamus draco.

DAMWAST. HIND. An inferior tribe of Rajputs in the Benares district.—*Wilson.*

DAN. HIND. An-Dan-Khan comprehend the sum of sovereign rights in Rajasthan, being allegiance, commercial duties, mines, etc.

DAN, two Persian words, one from Dāshtan, to hold or have, the other from Dānistan, to know. These two derivatives form several compound words, as Attar-dan, a scent-bottle, a perfume-holder; Kalm-dan, pen-holder; and, from Danistan, Na-dan, ignorant. Dan, SANSK., a gift; Dan-pan, charity, from Da, to give.

DANA. HIND. Wise. Danai, wisdom. Dowlat-i-Hind, o danai Faring, is a Persian phrase, meaning, Give me India for wealth, but Europe for knowledge.

DANA. HIND. Any grain or seed; a grain weight. Bihi-dana, Cydonia vulgaris; Hazar-dana, Euphorbia hypericifolia, E. thymifolia; Kala-dana, Pharbitis nil; Ram-dana, Amaranthus mangostanus; Shakar-dana, Colebrookia oppositifolia.

DANAGA. KARN. A cowherd, a shepherd.

DANAIS TYTIA, a butterfly with semi-transparent bluish wings, and a border of rich reddish-brown. This is exactly reproduced in Papilio agestor and in Diadema nama; and all three insects not unfrequently come together in collections made at Darjiling.

DANAKIL tribes occupy the low-lying waterless region between Abyssinia and the sea, trackless and uncultivated.

DANAVA, an inhabitant of the Hindu mythological Mount Meru, described by the Aryan immigrants as enemies of the gods; probably the early inhabitants of the countries with whom the advancing Aryans came in contact. See Avatar; Meru. Danava is also described as a tribe on the Çali, or children of Danu-Beli; their leader was named Danavendra; their origin unknown.

DANCALI, a country in the north-east part of Abyssinia, extending 300 miles along the coast of the Red Sea. The soil is unproductive; and its chief riches consist in fossil, salt, and honey.

DANCING has been practised from the most ancient times by many races. David, king of Jerusalem, danced naked in a religious rite. Later than this Socrates regarded the dance as a part of religion. Most of the uncivilised non-Aryan races of British India have dances, as the Bhil, the Juanga, the Khand, the Kol. In Southern India, also, the Jakkulwar and Jattiwartalawar are dancers. Of the races in S.W. Bengal, the Jadur, Jumbir, Terriah, Khariah, Karni Rasa, Dawa, and Bahni have war dances. The Kol of Nagpur have several dances, which are all more or less connected with some religious ceremony. Among the Santal, also, the dance is known, and the whole of their religious observances are generally performed and attended to by the votaries whilst in a state of intoxication,—a custom which reminds us of the worship of Bacchus among the Greeks and Romans.

Dancing is not practised in India by any Aryan race of Hindus nor by Mahomedans; but Persians, Afghans, Mahomedans of India, and Hindus of all sects, gladly witness the performances of professional dancing women. Many of the non-Aryan or aboriginal races of India, however, particularly those who have not greatly advanced in civilisation, have their national dances; and the Uraon and Ho of Central India are passionately fond of it. The Kodaga race of Coorg have a national dance. The Mahomedan dancers are all women, in bands called taifa, and are all public. The Hindu dancers are also all women, but do not associate with others than Hindus, most of them being attached to the temples.

Many of the dances of wilder races are solemn attitudinizing, moving in a ring, and locking up close to each other, often holding sticks.

The natives of Australia in their corrobery run in Indian file or sideways, and as they stamp the ground they grunt.

DANCING DARVESH, a name given to the Mevleviyeh, also to the Rafai order of the darvesh of Turkey and Egypt. See Darvesh; Eesawiya.

DANCING GIRLS.

Hierodulæ . of BABYLON.	Deva-dasa, . . . SANSK.
Bayadere, ... FR.	Basava, ... TEL.
Kasbin; Kanchni, HIND.	Jogin, ... ,,
Murali, ... MAR.	Bogum wanlu, . . ,,
Balladuras, . . . PORT.	

Amongst the British in India, dancing girls is a term in general use to indicate the Hindu women devoted to the service of the Hindu idols in the temples, as also the bands of Hindu and Mahomedan women who practise singing and dancing for hire. For Hindu dancing girls see Deva-Dasa; for Mahomedan dancing girls, see Taifa. In the performance of the Hindu dancing girls in the two dances termed avancum and kancheene naeteum, their movements are combined with great agility, ease, and gracefulness, and with their nimble steps, the turning and twisting of their hands, eyes, face, features, and body agree, whilst they beat time with their feet. The feet generally placed flat, as they seldom dance on

their toes, the movements and position combine something of the waltz and Spanish cachucha,—they advance, retire, whirl around, drop down and rise again with ease and rapidity, whilst the several movements are kept in order with the twirling and twisting of their hands, features, body, etc. Some portions of the step resemble the hornpipe and jig, whilst they hop and skip from one leg to another, keeping time, now turning, now whirling, now capering, and now drooping, performing a coquettish pantomime with their antics, then affecting coyness, and dancing away from the assembly, by suddenly turning away as if careless of their allurements, but returning to the attack with greater vigour and increased blandishments. It is indeed surprising to witness their feats of strength and bodily powers of endurance, for, notwithstanding their frail make and delicate appearance, the amount of fatigue they endure, dancing as they do from nightfall to early hours of the morning, is astonishing. Their dancing is perfection; and the bodily fatigue they must undergo, from the attitudes and positions they combine in their dances, must be great. In what is called the sterria cothoo, athletic feats are performed,—resting their hands on the ground, and flinging their feet in the air with great rapidity, and thus twirling round and round, successively, performing various somersaults; lying full length on the ground with their hands and feet resting, contorting, twirling, and twisting their bodies in various ways; or, whilst resting on the hands and legs, with their backs to the ground and their chest and abdomen turned upwards, drawing the hands and feet as close together as possible; whilst their bodies are thus arched they, with their mouths, will pick up rupees from the ground. In this arched position, beating time with their hands and feet, they work round and round in a circle. During their performance they join their attendants in the songs that are sung, and regulate the various movements of their bodies to the expression given vent to in the song.

Modiye dūcūrūthū.—In this dance the word 'mod' is a term used to designate a craft or enchantment practised by a conjuror, who places or hides money or other valuables in a certain place, and often in the presence of his opponent, with the view of testing his ability, and challenges him to remove it, which the opponent endeavours to do by playing on a pipe termed 'maked;' and if he be not equally skilled, he is struck to the ground in a mysterious manner, sick and ill, frequently bleeding from the nose and mouth profusely. The dance is in imitation of this, by the girl playing on a 'maked,' dancing at the same time, and throwing herself on the ground; the right leg is stretched out at full length, forming a perfect angle with her body out on one side; on the other, the left leg, doubled under the knee, is stretched out in like manner on the opposite side, producing a most singular appearance, and as if there were no joint in the hips.

Colu auteum, or the stick dance, is formed by a number of girls of the same age, size, and dress, numbering from twelve to twenty-four or more, each having two sticks, one in each hand, about eighteen inches long, well turned, and painted with circular stripes of yellow, green, and red. Either to the roof, or across a piece of wood raised in support for the purpose, a stout skein of thread in different colours is suspended, and having as many strands as there are girls; the free ends of the strands are tied to the ends of the painted sticks each holds; the dance begins with the usual song and accompaniment of music, when each girl, striking her sticks, dances a kind of jig and hops from place to place, exchanging places with each other. This is done with such order and regularity, that the several strands are plaited with the utmost evenness into a stout cord or tape of many colours, according to the design. At a sign from the conductor, the same is undone with equal order and regularity, the girls dancing and exchanging places with each other without a single mistake or false step, either in the plaiting or unplaiting of the strands of thread. The readiness, grace, and ease with which the several movements are effected, are worthy of admiration. At some places, on festive occasions, during the peregrinations of the Hindu idol around the town in procession, these girls perform the stick dance on a platform, which is carried and precedes the idol. More frequently these and other dances are performed on foot in front, and at some distance from the procession, which stands still at a certain distance to allow of its being properly carried out.

Mahomedan dancing women attitudinize with their feet and hands, and move their eyes and change the expression of their face to indicate various emotions.

DAND. PUKH. A tank.

DAND. HIND. A fine, a mulct.

DAND. HIND. The support of the canopy on an ekka, etc.; a rod, an oar, a staff or wand. Hence Dandi, an oarsman.

DANDA. SANSK. Originally imports a staff, and amongst Hindu ascetics it figuratively signifies moral restraint, exercised especially in three ways, in the control of speech, body, and mind, or in word, deed, and thought. A joint reference to the literal and figurative sense of the term has given rise to the religious distinction termed Danda Grahanum, the taking up of the staff, or adopting the exercise of the moral restraints above mentioned, and carrying, as emblematic of such a purpose, either one, or, as in the Tridandi, three small wands or staves. Tridandi designates both these characteristics of the order.—*Wilson.*

DANDAKARANYA, or the forest of Dandaka, is celebrated in Indian story. Varaha Mihira, the great astronomer, mentions Dandaka along with other places in the south of India as follows:—Kerala, Karnata, Kanchipura, Konkana, Chinnapattana (now Madras), etc. In this list Dandaka is distinct from Konkana, or the Upper Kistna, and may, General Cunningham suggests, therefore perhaps be identified with the lower valley of the Kistna, of which Dhandakakata was the capital. Gen. Cunningham (Anc. Geog. of India, p. 544) seems to have been led to this surmise from M. Vivien de Saint-Martin having stated his suspicion that the name of Dandaka is connected with Dhandakakata. But there were in ancient times great forest tracts stretching across the Peninsula of India from east to west, portions of which still remain, and several parts of them seem to have been so designated. That described in the Ramayana was a forest near the Godavery river, in which Rama was residing when Ravana carried off Sita.

It has also with much probability been supposed to have been a forest anciently covering the south of the Peninsula, now the territory of the Marava and Kollari, whose features are often like those of the baboon, hence the origin of Valmiki's monkey army. The forest tract in the Syhadri mountains, in the Dekhan, and the plateau of Chutia Nagpur, have also been pointed to as parts of Dandakaranya.—*Cunningham's Anc. Geog.*

DANDA KASANWALA. HIND. Sticks used for wringing out skeins of silk from the dye vat.

DANDASA. HIND. Astringent barks of Juglans regia and other trees.

DANDASULU. TEL. Village watchers.

DANDAWAT, Dandam. SANSK. From Danda, a walking-stick. A Hindu form of salutation, bow, obeisance, prostration, performed amongst Hindus to each other, and is daily seen from a Hindu of inferior caste to a Brahman or higher caste. It consists in joining the hands with the tips of the fingers pointed upwards, and raising the hands so joined to the forehead. It seems the same as the Anjali (SANSK.), Hindu form of respectful obeisance. The head is slightly bowed, the palms of the hands are brought together, and raised laterally to the middle of the forehead, so that the tips of the thumbs only are in contact with it.—*Hind. Theat.* ii. p. 108. See Ashtanga danda.

DANDA-ZANI, HIND., literally stick-beating, a mode of torture said to have been practised by the subordinate officers in the private domains of the raja of Benares.

DANDELION. Pu-kung-ying, CHIN. The Chinese plant is said to be Leontodon taraxacum, also L. Chinense. It grows to the north of the Meikong hills.

DANDH, or 'Kolab,' in Sind, a tract of low land flooded by the inundation, partially or totally dry during the cold season, and at all times a hotbed of miasma.—*Burton, Scinde*, p. 377.

DANDHU PUNT. In the north of India, Baji Rao, the ex-Peshwa, who had been dethroned in 1818, lived on till 1853 in the enjoyment of his annual pension of £80,000. His adopted son, Dandhu Punt, styled the Nana Sahib, inherited his accumulated savings, but could obtain no further recognition. When the Bengal native soldiery mutinied and the people rebelled, his cruelties at Cawnpur to helpless women and children has made him execrated. He fled, and is supposed to have died in the Terai.—*Imp. Gaz.* iv. See Nana Rao.

DANDI. HIND. A Hindu sect who worship Siva, and represent the fourth, Asrama or mendicant, life, into which the Hindu is to enter, after passing through the previous stages of student, householder, and hermit. He shaves his hair and beard, wears only a cloth round his loins, and subsists on food obtained ready dressed from the houses of Brahmans, once a day only. Any Hindu of the first three classes, of student, householder, and hermit, may become a Sanyasi or Dandi. Indeed, in these days, a Hindu of any caste may adopt the life and emblems of this order. These constitute the Dandi, simply so termed, and are regarded as distinct from the primitive members of the order, to whom the appellation of Das-nami is also applied, and who admit none but Brahmans into their fraternity. But the Brahman can pass from any one of the first orders to the last at once. He becomes a Sanyasi, abandoning all sensual affection. The Dandi is distinguished by carrying a small dand or wand with several knots on it, and a piece of cloth dyed with red ochre, in which the Brahmanical cord is supposed to be enshrined and attached to it. The Dandi are followers of Sankaracharya, and are a numerous order of religious mendicants, many of whom have been eminent as writers on various subjects, especially on the Vedanta philosophy. They are divided into ten classes, hence their other name Das-nami, each of which is distinguished by a peculiar name, as Tirtha, Asrama, Vana, Aranya, Saraswati, Puri, Bharati, Gir or Giri, Parvata, and Sagara, which is added to the proper name of the individual, as Purushottama Gir, or Bodhendra Saraswati, etc. They are hence known collectively as the Dasmani, or ten-name Gosains. Of these, only three and a half tribes, the Tirtha, Asrama, Saraswati, and part of Bharati are now considered pure Dandi of Sankaracharya; the other six and a half members of the Das-nami are called Atit. They have abandoned the staff, the use of clothes, money, and ornaments, prepare their own food, and admit members from any order of Hindus. They are often collected in maths as well as the Dandi; but they mix freely in the business of the world, carry on trade, and often accumulate property, and they frequently officiate as priests at the shrines of some of the deities. Some of them even marry, and are then styled Sam-yogi. The Dandi are to the Saiva sect what the followers of Ramanuja are to those of the Vaishnava faith. Sankara's Dandi are sufficiently numerous in and about Benares.—*Wilson.* See Danda; Hindu.

DANDI, author of the Dasa-Kamara-Charita, or the Adventures of the Ten Princes, is supposed to have lived about the end of the 11th century. The scene is laid in Pashpapuri, a city of Magadha, then ruled by Raja Hansa, whose queen's name was Vasumati. It is a pleasing story in harmonious verse, arranged into two parts. The first, containing five chapters, ends with the marriage of the principal hero; the other has eight, and contains the adventures of the same prince and his companions. Unscrupulous deception, ready invention, extreme credulity and superstition, and disregard of human life, are strongly illustrated.

DANDI. HIND. In the Simla Himalaya, a hammock-shaped conveyance for travellers, slung on a pole, with straps for the feet and back, and carried by two bearers. It is a light litter suited for hill travelling.

DANDI BUTI. HIND. of Beas. Cleome ruta.

DA-NEE. BURM. Nipa fruticans.

DANG, a hill or precipice, the summit of a mountain, as Lal-dang. In Dehli, and generally in Upper India, the word is used to signify the high bank of a river. It is provincially corrupted into Dhang and Dhayung; the forest or jungle tracts in the Syhadri range are so called. A wild, a thicket, a place overrun with bushes, a tract of country, along, near to, or below the Ghats, not mountainous, but interspersed with hills so as to leave no extent of level ground. Dangi, HIND., a forester. Dangs is the designation of the tract of country situated within the limits of the Political Agency of Kandesh, bounded N.W. by the petty state of Warsavi in the Rewa Kanta Agency.—*Elliot; Imp. Gaz.*

DANGA-GURGUR. BENG. Coix gigantea.

DANGAH. In Persia, a custom exists of dividing fields, villages, whole districts, and even the water for irrigating the fields, into six parts, which are further subdivided into two unequal parts, the one containing four parts, Char-dangheh, and the other two parts, Do-dangheh.

DANGAH. HIND. Rebellion, riot, uprising.

DANGAR, in the Bombay Presidency, rice grown in the kharif or monsoon months. It is sown in small beds, and transplanted in July and August into beds which have been highly manured, flooded, and repeatedly ploughed. The crop ripens in October, yielding 20 to 40 seers the bigha.—*Gloss.*

DANGAREE, a coarse cotton cloth in use in India for common towels.

DANGAST. HIND. A class of Rajputs in Ghazipur.

DANGI. MAHR. A forester; an inhabitant of a low, hilly, and jungle tract. Also a tribe of Rajputs inhabiting the woody districts of Eastern Malwa; also a name given to the Bundelas.

DANIEL. Mr. Layard says his tomb was preserved amongst the ruins of Susa, or in a valley of the Bakhtiyari mountains. Daniel-i-Akbar, a name of Susan or Sushan on the Karan river. See Luristan. The Arabs made no opposition to Baron de Bode entering the chapel in which the coffin of Daniel is said to be deposited, on learning that Christians as well as Mahomedans acknowledge him to have been a prophet.—*De Bode's Travels*, ii. p. 190; *Layard, Nineveh*, i. p. 252. See Susa.

DANK. HIND. Jewellers' foil.

DANT. HIND. A tooth. Dant-tinka, an ancient form of deprecating anger, alluded to in the inscription on the lat of Firoz Shah at Dehli. The supplicant takes a straw or bit of grass in the mouth and stands on one leg. It is meant to imply that the supplicant is as the offended person's cow.—*H. Elliot.*

DANTA PURA, the modern Puri. A tooth (dant) of Buddha was sent there after his death and cremation. After lying there 800 years, it was, A.D. 311, sent to Ceylon, where, as is said, it still remains.

DANTI. HIND. A sickle, perhaps a corruption of Durantee.—*Elliot.*

DANTIWARA, a village in the Bastar state. It derives its importance from a celebrated temple to Danteswari or Kali, the household goddess of the rajas of Bastar for many generations. It is said that Meriah sacrifice used to be practised here in former years; and in front of the shrine is the stone pillar or block to which the animals now substituted are tied up before being killed.

DANU or D'hanu or D'hanao, a rude Burmese tribe near M'we-yen.

DANUK, a low tribe in Behar and the Upper Provinces of India, fowlers, hunters, also predial slaves.—*Wils.*

DANUSHA, the unerring bow, the 11th article produced by churning the ocean. See Karma.

DANYA. MALEAL. Coriander seed.

DAOUDI, believers in the divinity of king David among the Bakhtyari in Persia. The Georgians in Bokhara, though for centuries resident there, inwardly are Christians, outwardly Mahomedans.—*Wolff's Bokhara*, i. p. 54.

DAOUDPUTRA, a Mahomedan tribe who claim descent from the khalif Abbas, but supposed to be from Daoud, the first of the family who acquired a name. They are said to be Baluch changed by a long residence in Sind. They moved from Bahawulpur and seized land on the Sutlej, reducing the remains of the ancient Lungga and Johia, and introducing the Sind system of canals of irrigation; and both banks of the river below Pakpatan bear witness to their original industry and love of agriculture. Daoudputra is applied both to the country and to its possessors, the children of David. Daoud Khan is said to have been a native of Shikarpur, west of the Indus, who drew upon himself the arms of Kandahar. Unable to cope with his opponent, he abandoned his native place, passed his family and effects across the Indus, and followed them into the desert. The royal forces pursued, and, coming up with him at Sootialloh, Daoud destroyed his families, who impeded his flight, and faced his foes. They, appalled at this desperate act, deemed it unwise to attack him, and retreated. Daoud Khan, with his adherents, then settled in the Kutchi, or flats of Sind, and gradually extended his authority into the thul. He was succeeded by Mubarik Khan, who deprived the Bhatti of the district called Khadal, and settled in their chief town, Derrawal, founded by Rawul Deoraj in the eighth century. Derrawal was at that time inhabited by a branch of the Bhatti, broken off at a very early period, its chief holding the title of Rawul, and whose family since their expulsion have resided at Gurialah, belonging to Bikanir. The Daoudputra are to be met with in various parts of Sind.—*Tod's Rajasthan*, ii. p. 321. See Bahawulpur; Jut.

DAPHLA, Dophla, or Duffla, a tribe in a tract of country on the N.E. frontier of India. It lies north of Durang and Lakhimpur districts, in the province of Assam. They call themselves Bangni, a word signifying 'man' in their own language. In the cold season of 1874–75, an armed expedition was marched into the hills to recover captives.

DAPHNE, a genus of plants of which several species grow in India. They are of the natural order Thymalaceæ. A daphne grows in the Kashmirian mountains allied to D. gnidium and D. oleoides. It is essentially different from D. cannabina, from which, in Nepal, a paper is manufactured according to the Chinese manner. Acrid and dangerous properties appear to be common to them all; some species are remarkable for the toughness of their fibre, and for the economical purposes to which they are applied. From D. cannabina is prepared the best kind of writing paper in China, according to Loureiro; but in Nepal daphne paper is very brittle and bad. At the Great Exhibition of 1851, a huge sheet of Nepal paper was exhibited by Colonel Sykes. The lace-bark tree, D. lagetta, now Lagetta lintearia, of the West Indies, is remarkable for the beautiful net-like appearance of its several easily separable layers of bark, whence it has received its English name. A plant common in English gardens, and used in medicine on account of its acridity, is the D. mezereum of botanists.—*Bengal Disp.* p. 531; *Honigberger*, p. 268; *Eng. Cyc.*

DAPHNE CANNABINA. *Wall.* Paper shrub.

D. bholua, *Wall.* | D. papyracea, *Wall.*
D. odora, *Thunb.*

Niggi, Jeku, . . HIND. | Mahadeo ka phul, HIND.

A small evergreen perennial shrub, somewhat like a laurel, which bears poisonous berries. It

grows in Nepal, Sikkim, in Kamaon at 5000 to 9000 feet, the N.W. Himalaya generally at from 3500 to 8000 feet. It is with this shrub that the Nepal paper is made; and in Kamaon, etc., large quantities are manufactured from the purple-flowered variety. The bark is boiled in a metallic pot with oak ashes, which are highly alkaline. The softened bark is then pounded with a mallet in a stone mortar, till reduced to a pulp like dough. This pulp is churned with water into a very thin paste, until it lose all trace of fibre, and will diffuse and settle smoothly. In this state it is poured into a coarse sieve placed over a frame, with a cloth bottom floating on water. The sieve stops the coarse pieces, allows the fine emulsion to pass through, and then by agitation this is smoothly deposited over the cloth. Removing the frame, the water filters away, and the pulp dries rapidly by placing the frame before a fire.

The paper is subsequently polished by friction with a shell or piece of hard wood. Sheets have been made many yards square. It may be purchased at Khatmandu at 17 annas sicca for 3 seers. Bricks of the pulp are sold from 8 to 10 annas for 3 seers. The greater part of the paper is made by cis-Himalayan Bhutiah, east of the Kali river. The manufacture seems to have been introduced from China about the 14th century. This unsightly paper is much overrated. But it is tough when kept dry; can be used like cloth for wrapping up dry substances; and it can be used after having been saturated with water, provided it be carefully dried within a reasonable time after it has been wetted. The dried bark may be substituted for D. mezereum. The bazar mezereon is almost always inert from age. In Chumba, the flowers appear to be hung up as offerings in temples. — *J. L. Stewart; O'Sh.* p. 531; *Beng. Phar.* p. 279; *Cleghorn, P. R.*

DAPHNE MEZEREUM. *Linn.* Spurge-olive.

Mazrium, Adada, . ARAB.	Kameela, ... GR.
Iskhes, ... ,,	Mazriun, . . . PERS.

The berries are brisk but unsafe cathartics. Fresh bark is counter-irritant and external stimulant; the dried bark is a stimulant alterative in syphilitic, rheumatic, and scrofulous maladies. It is frequently combined with sarsaparilla, as in the Lisbon diet drink.—*O'Sh.* p. 530.

DAPHNE OLEOIDES. *Schreb.*

D. mucronata, *Royle.*	Kutti lal, Kanthan, JHEL.
Kutal of . . . HAZARA.	Gandlena, Gundalun, RAV.

This paper shrub grows in Kunawar and in the Panjab, and is used medicinally, and said to be used in papermaking. It is in great abundance from a little above Kawai to Kaghan. The pretty red berries are not unfrequently eaten, but are said to be apt to cause sickness.—*J. L. Stewart; Cleghorn.*

DAPHNIDIUM CUBEBA. *Smith.*

Laurus cubeba.	Pih-ching-kia, . . CHIN.

A plant of Cochin-China and the S. of China. The bark and berries are said to be used to cure fish. D. elongatum, *Nees*, and D. pulcherrimum, *Nees*, are trees of Darjiling hills.—*Kurz; Smith.*

DAPHNIPHYLLOPSIS CAPITATA. *Kurz.* A timber tree of the Darjiling hills.—*Kurz.*

DAPHNIPHYLLUM ROXBURGHII. *Baillon.*

Goughia Neilgherrense, *Wight, Icones.*
Nir chappay of the . . . BADAGA.

A good-sized glabrous tree, very common on the mountains on the west side of the Madras Presidency, and in Ceylon at elevations from 4000 feet upwards; also indigenous in Hong-Kong, Loo-Choo, Corea, and in Japan. The wood makes excellent fuel. Its foliage makes it highly ornamental for shrubberies, etc.—*Beddome, Fl. Sylv.*

DAPHNIS MYRRHÆ. *Smith.* Wu-yoh, CHIN. A shrub of several Chinese provinces, resembling the tea shrub. Root used medicinally.—*Smith.*

DAR. PERS., HIND. In the Persian, from Dashtan, to hold, a possessor, a place of abode; also from the Chaldee and Hebrew, meaning to encircle, to dwell. Used as a prefix and postfix to many compound nouns,—as Dār-ul-fana, the perishable abode, *i.e.* the world; Dar-ul-baka, the permanent abode, *i.e.* eternity; Amil-dar, a tax-gatherer; Ab-dar, watery, a water-cooler; Zamin-dar, a land-holder; Na-dar, a pauper (holder of nothing); Killa-dar, Chob-dar, Jawab-dar, etc.; Dar-us-shafa, a hospital; Dar-ul-khilafat, the khalif's residence; Dar-us-sultanat, the residence of a king, a capital; Dar-ul-harb, a country under a non-Mahomedan government, the seat of constant hostility or war, non-Mahomedans at all times being legitimate objects of attack.

Dar-ul-karar, a rhythmical addition to Kandahar. The words mean the abode of quiet, or city of stability. Throughout the East, Mahomedans often employ this kind of alliteration. After Choki, a chair, they will add choki-oki; to Bachah, a child, is added bach-kach; Hyderabad is farkhundah baniad, of happy foundation.

Dar-ul-karar, or city of permanence, is allegorically applied to the future world, as opposed to this, the Dunya-i-fani, the transitory world.

Dar-ul-khilafat, at Baghdad, the palace built by Al Mansur, the second khalif of the Abbas dynasty, and which his successors enlarged and furnished in the most costly manner. A piece of the Hajar-us-siah, or black stone of Mecca, was let into the threshold of the principal gateway, and a large curtain, made of the hangings of the temple, was suspended from a window of the gateway, to about the height of a man from the ground. Every person entering had to rub his eyes with the curtain, and to crawl over the black stone to avoid touching it with his feet.

DAR. PERS. A door, a gate; hence Dār-wān, a door-keeper, Dar-waza, a door, a gateway. Most cities in India have their gates named from the chief town to which they lead. Thus the Dehli gate, the Mecca gate.

DAR. HIND. A weight used in the tinsel-maker's apparatus.

DAR, a town near the valley of Kābul, with many sepulchral topes.

DARA. PUKHTU. A glen, a defile.

DARA or Durrah. MAHR. A body of the Pindari.

DARA, a king of Persia, son of king Darab, overcome by Alexander the Great.

DARAB, king of Persia, son of Kai Bahman or Ardeshir Daraz-Dast, Artaxerxes Longimanus.

DARABGIRD, one of the five ancient divisions, circles, or departments of ancient Fars. Darabgird was built by Darius I. It is 150 miles S.E. of Shiraz; is finely situated, and surrounded with orange and lemon and date groves; tobacco and other products are largely cultivated. The people have numerous flocks and herds. — *MacGregor*, p. 116.

DARAKHT. PERS. A tree.

Darakht-i-Azad, Melia sempervirens; Azadarachta Indica.
Darakht-i-Muql, Commiphora Madagascarensis.
Darakht-tamr-i-Hindi, Tamarindus Indicus.

DARANA. HIND. A scarecrow; from Darna.

DARARI-DANDA. HIND. A rolling-pin and concave receptacle used by native needle-makers for flattening wire.

DARBAND, a town of Daghistan, since 1813 in Russian territory. It has the citadel Naraini Kala, supposed to have been built by Alexander. The Caucasian wall extended from Darband. It was 21 feet high and 7 feet wide, and was intended as a defence against the Scythians from the north. It was first captured in 1722 by Peter the Great. Near it is the Kogre-Kafe mountain; at its foot the village of Dashkessine and the cave of the Dives, the dwelling-place of the giants of the Scripture. —*MacGregor; Porter's Travels*, i. p. 72; *Malcolm's Persia*, ii. p. 5.

DARBAR. HIND., PERS. A general reception by a ruler in British India, or by any officer of rank; a court, a royal court, a levee. Also the Sikh temple at Amritsar.

DARBHA. HIND. Poa cynosuroides, *Retz.*

DAR-CHINI. HIND. Barks of Cassia lignea, Cinnamomum iners, *Rein.*, Laurus cinnamomum, and C. albiflorum.

DARD, an Urdu poet of Dehli, whose name was Khaja Mir. He lived in the 18th century; his poems were of a plaintive and pathetic character, as the Nala-i-Dard, Ah-i-Sard, Soz-i-Dil, Shama-i-Mahfil.

DARD, a race lying along the Indus, to the westward of Ladakh, and to the N. and N.E. of the Snowy Range, who speak three distinct dialects. They use the Persian character in writing Dardu, the three dialects of which are called Shina, Khajuna, and Arniya. The Shina dialect is spoken by the people of Astor, Gilghit, and lower down in Chelas, Darel, Rohli, and Palas, on both banks of the Indus. The Khajuna, by the people of Hunza and Nagyr; and the Arniya in Yasan and Chitral. The Dard group of languages includes the Arniya, Astori, Gilghiti, Kalashamander, and Khajuna. The Kashmir people have their own peculiar language. In Gilghit, Astor, and Baltistan, the castes are Ronū, Shin, Yaskun, Kremin, and Dum or Dom. The Kremin is a mixed race. The Shin or Shina and Yaskun were the dominant race. In the N.W. Himalaya, the lowest castes are the Dogra and Dom. Astor has an area of 1600 square miles, on the left bank of the Indus. Gilghit, in Tibetan Gyilgyid, has an area of 2500 square miles, on the right bank of the Indus. The Dard or Durd, the people who now occupy the country called Dardu, are supposed by Vigne to be the Dadicæ (Δαδίκαι) of Herodotus. Darada, a country in the Hindu Kush, bordering on Kashmir, is mentioned by Pliny. The people are the Dard, and are mentioned in the Vishnu Purana. The Kashmiri has decided affinities with the Dard tongue. The Balti people of Little Tibet say that Ladakh, Iskardo, Khopalu, Purik, Nagyr, Gilghit, and Astor are distinct Tibets. Papps is a drug from Ladakh, seemingly composed of dough, which the Dards add to an infusion of corn to make the beer called mo. Wine is largely made by the Dards. Men and women amongst the Dards eat together. When men drink plain milk together, it is as an oath of eternal friendship. At the conclusion of the mullah's reading the marriage service, the bride and bridegroom partake of a spoonful of boiled milk. Dards are fond of chaughan bazi, or hockey on horseback, also called polo. The game is called tope in Astor; at Gilghit it is called bulla. The Dard legends and beast tales have been described by Dr. Leitner.—*Dowson; Latham; Vigne.*

DARDANELLES, two castles of Turkey. One, called Sestos, is in Roumania; the other, Abydos, in Natolia. Long. 26° 26′ E., lat. 40° 10′ N.

DAREGA, a round shield used by the fair red-haired Touareng race in Northern Africa.

DARENGRI. HIND. An astringent leaf used in Kashmir in dyeing.

DARFUR or Darfoor, a kingdom of Africa, on the borders of Nubia and Nigritia. The people are barbarous, and consist of native tribes, of a deep black complexion, with woolly hair.

DARGAH. HIND., PERS. A tomb or shrine, of which there are in India several of fame. Near Mangalore, at the village of Cuddry (two miles off), is Shaikh Furreed ka Dargah. It consists of a hole in the centre of the side of a perpendicular laterite rock, which is fabulously said to lead all the way to Hyderabad, 450 miles. The opening is square, about six feet above the ground, ascended by a flight of stone steps rudely constructed, and just large enough to allow of a person to crawl in. The cavern is very dark, and no one knows the exact size of it. Adjoining is a chasm with an opening left for people to creep in by. Tradition states that about A.D. 1738, there was a pir named Shaikh Furreed, who made chilla (*i.e.* neither speaking, eating, or drinking for forty days, but worshipping God and living retired from the world). He resided at Cuddry for twelve years, during which time he used to observe chillas, remaining for forty days together in the cavern, seeing and speaking to nobody, eating and drinking nothing; after the forty days were over, he was wont to come out for four or five days, but partake of no other food but the leaves of a plant (since named after him), Furreed-bootee, which grows wild in the surrounding jungles, and has a sweetish taste; he drank water, spoke during these days, said prayers in an adjoining stone building, and then retired again to this cavern to perform another forty days' chilla, and so on. At the end of twelve years he disappeared, and this being the road to Mecca, it is said that he set out for that town by the subterraneous route, and has never been heard of since. Mahomedans resort hither occasionally, and on Fridays cook victuals, and, having offered fatiha over them while burning incense, in his name distribute them among the fakirs resident there, as well as those who have accompanied them. If a dargah be situated in a place where no food can be dressed (from want of materials or otherwise), they take sweetmeats with them, which they substitute in its stead. This dargah is in the charge of a fakir, who receives the offerings that are made by visitors, and which are placed at the entrance of the cave; when he dies, the four principal makkan-walay (pirs), residing at the four principal makkans (or houses of pirs), spiritual guides (so called) at Mangalore, and six or ten of their murid (or disciples), select a successor; on such occasions numerous fakirs are likewise present. In Tipu Sultan's time, the individual in charge of this dargah received rupees

corresponding to the number of masts of the vessels that entered the roads,—for every ship, three rupees; patamars, etc., two rupees; manji, etc., one rupee. This was abolished when the place fell into the hands of the British.

A famed dargah is on the banks of the river at Mangalore, and consists of a large, long tomb, with minarets at each extremity. Lao Langar Shāh, a fakir, whose name it bears, is buried here. Lamps are lit here every night; and it is chiefly visited by the Tamil, a Hindu race, but also other Hindus and Mahomedans. Most Hindus, however, frequent Shaikh Furreed's dargah. Dargahs are resorted to when people are desirous of being freed from any distemper, misfortune, etc. If the individual who is enshrined in the dargah has been wealthy, large dinners are provided, fatiha offered, and the food distributed to any who choose to partake of it; there being sometimes kanchni ka taifa (band of dancing girls) to entertain the guests. Among the great, this takes place on every night of the year (and is never observed in the day-time); but among the poorer classes of people, every Monday and Thursday, or once a week or month.—*Herklots.*

DARHA, the tutelary deity of the Kol and Oraon.

DAR-HALD. HIND. Berberis lycium, B. Asiatica, B. aristata. The word means yellow wood, and is also applied to turmeric.

DARI, an ancient dialect of the Persians, supposed to have been spoken about Balkh.

DARI, Daree, or Durree. HIND. The cotton-striped or patterned carpeting of India; also a stout twill cloth, woven like a dari (carpet), only finer.

DARIA. PERS. A sea, a lake. Daria-Dara, a lake of Afghanistan, in lat. 33° 35′ N., and long. 64° 53′ E., 40 miles S. of Siah-Koh.

Daria-i-Neyriz, a lake in the province of Fars, about 10 miles E. of Shiraz. It is 60 miles long, and 3 to 5 miles broad, and is filled by the river Kur. Its surface is often covered by innumerable water birds.

Daria-i-Raza, the Aryan Palus of the ancients, a lake formed by the accumulation of the waters of the Helmand at the southern extremity of its course, and called the lake of Zarrah by Europeans. This is a contraction of Zarrenj, the ancient capital; and this again represents the Zarangi or Drangi of the Greeks. In old Persian books it is called Daria-Raza, or Little Sea. The present inhabitants of Seistan call it Meshila-i-Rustum, also Meshila-i-Seistan. Meshila merely means in Arabic, a muddy swamp. The ordinary name of the lake is Hamun, or the expanse.—*Ed. Ferrier's Journ.; MacGregor.* See Helmand.

DARIDR. HIND. Poverty. Daridr khedna, to drive out poverty, is a custom, on the morning of the Dewali, of taking a sieve or winnowing basket and beating it in every corner of the house, etc., for the purpose of averting poverty. The night preceding the ceremony is passed as a vigil, called Koja gara, as Lakshmi descended on this night, and promised wealth to all who were awake. At night, parties of merchants play cards at high stakes.—*H. Elliot.*

DARI-KHANA, a hall of audience, appropriated for ceremonies; carpets are spread.

DARIUS, Persian kings of the Kyanian dynasty, known as Dara. The first seems to have been Darius Hystaspes, whose name has been said to be derived from Hysna, to neigh, and Aspa, a horse. His Persian name was Gushtasp. His admiral, Scylax, reported so favourably of the wealth of India, that Darius invaded India, and annexed the provinces bordering on the Indus. His Indian possessions were the most valuable of his twenty satrapies, and are supposed to have included the Panjab; but there is no testimony to this beyond the authority of Herodotus (lib. iii. p. 100), and the doubtful voyage of Scylax down the Indus. Bunsen gives the following dates of the reigns of the kings Darius:—Darius, son of Hystaspes, B.C. 521 to 486; Darius Nothus, B.C. 423 to 405; Darius III., surnamed Codomanus, B.C. 335 to 332. The edicts of Darius Hystaspes are preserved in the Achæmenian inscriptions at Behistun, first translated by Sir Henry Rawlinson. Bactria is enumerated as one of his provinces in the inscription which he caused to be carved on the rock of Behistun.—*Hist. of Panjab*, p. 45.

DARIYAI. HIND. A plain silk fabric. Dariyai-baf, the silk-weaver. Dariyai dhup-chan (lit. sun ray), shot silk.

DARJILING, in lat. 27° 2′ 48″ N., and long. 88° 18′ 36″ E., in Sikkim, is a large station and sanatorium, 412 miles from Calcutta. The top of the Observatory hill is 7168 feet above the sea. Darjiling ridge, however, varies in height from 6500 to 7500 feet above the level of the sea. The mean rainfall is 130 inches, and mean temperature, 50°. To the N.W. towards Nepal, the snowy peaks of Kubra and Junnoo (respectively 24,005 feet and 25,312 feet) rise over the shoulder of Singalelah; whilst eastward the snowy mountains appear to form an unbroken range, trending north-east to the great mass of Donkia (23,176 feet), and thence south-east by the fingered peaks of Tunkola and the silver cone of Chola (17,320 feet), gradually sinking into the Bhutan mountains at Gipmoochi, 14,509 feet above sea-level. Darjiling was acquired by the British in 1835 as a sanatorium, a tract of country 138 square miles in extent being ceded by the raja of Sikkim, in return for an allowance of £300 per annum, afterwards raised to £600. Its population has increased from a few scattered tribes to upwards of 100,000, chiefly Murmi and Nepalese (32,338), Rajbansi Koch (23,124), the original Lepcha (3952), Dhimal and Mech (1766), along with Sharpa Bhutia, Limbu, Sanwar, and Chepang, and Brahmans, Rajputs, and Oraon. The Bhutia, Lepcha, and Murmi are Buddhists, and speak the Tibetan language. They are strong and active, and incline strongly to the Mongolian race. The Limbu, Sanwar, and Chepang are of a small Mongolian type, strongest in the Limbu, and their language is referable to either the Tibetan or Indian standard. The Mechi, Dhimal, and Garo are lowland tribes, with a Mongolian physiognomy, but are neither Hindus, Buddhists, nor Mahomedans. The Tharoo and Dhunwar are Buddhists or Mahomedans, with fair and barely Mongolian features. The Bahir, Kebant, Amatti, Maralia, Dhanook, and Dom are not Mongolian, but a dark race speaking Hindi or Bengali. The Koch or Rajbansi inhabit the Terai of Nepal and Sikkim, and have spread into British territory.

The mountainous country, at from 1500 to 4000 feet above the sea, is inhabited by the *Limbu*, a martial, beardless Mongolian race. From 4000 to

6000 feet, the hills are occupied by the *Lepcha*, the *Bhutia*, and *Murmi*. During the summer months, the summit of the great Singaloda spur separating Darjiling fram Nepal is occupied by the *Garong*, a pastoral race from Nepal, who graze their flocks at heights from 9000 to 14,500 feet, their great flocks being guarded by huge savage black dogs. The *Lepcha* Buddhists are aborigines; they are a fair, beardless, Mongolian race, omnivorous, amiable, and cheerful. They have a written language in a character of their own.

The *Limbu* are Hindu, Buddhist, and polytheist by turns, as circumstances or convenience require.

The *Bhutia* are from Bhutan, east of the Tista river. Many of them have beards and moustaches. They have a written language in the Tibetan character. They are Buddhist Mongolians. They are agricultural and pastoral.

The mountain slopes are so steep, that the spurs or little shelves are the only sites for habitation between the very rare flats on the river banks and the mountain ridges, above 6000 feet, beyond which elevation cultivation is rarely if ever carried by the natives of Sikkim. The varieties of grain are different, but as many as eight or ten kinds are grown without irrigation by the Lepcha, and the produce is described as very good, 80-fold. Much of this success is due to the great dampness of the climate; were it not for this, the culture of the grain would probably be abandoned by the Lepcha, who never remain for more than three seasons in one spot. The geological structure of the mountains of Sikkim is very uniform, the rocks being principally varieties of micaceous shale and gneiss. The soil is generally formed by the disintegration of these rocks, and is covered in some places with vegetable mould. At Darjiling the Minchu spring water is a carbonated and sulphuretted chalybeate, containing its iron in the peculiar state in which it is found in the Bath waters.—*B. H. Hodgson, Esq., C.S.; Indi. Anna. Medi. Science*, p. 264; *Hooker, Him. Journ.; Dr. Thomson in Eth. Soc. Journ.*

DARMA, a pass leading into Garhwal. Its occupants are said to be the descendants of a body of Mongols, whom Timur left behind him in Kamaon. They practise divination, taking their omens from the warm liver of a sacrificed sheep. They eat the yak and the cow. They inter their dead for a time, and then, in the month Kartik, they exhume and burn them.—*Cunningham's Ladakh; Latham's Ethnology.*

DARMA. Beng. Amphidonax karka, *Lind.* The darma grass matting is much used in Bengal to make walls of native huts and fences.

DARNING, or Rafu-gari, is a branch of the sewing art, which, though in Europe applied to the most homely purposes, requires the greatest skill in the East, where a defect in a costly shawl is to be made good, or a coarse thread is to be picked out of a piece of a muslin into which it has been accidentally introduced. So skilful are some of the rafu-gar, that they can extract a thread twenty yards long from a piece of the finest muslin, and replace it with one of the finest quality. They are principally employed in repairing the muslins and calicoes that are injured during bleaching; in removing knots, and joining broken threads; also in forming the gold and silver headings on cloths. — *Taylor; Royle, Arts of India.*

DAROGHA. Hind. A superintendent.

DAROO or Daru. Hind. A general term for ardent spirits, and equivalent to the Araq of the Arab and Persian. Daroo distilled from the mahwa flower is produced in great quantities in all the jungles of the Upper Godavery, and in several parts of the Bombay Presidency; but in the S.E. of Asia, rice, gur, or unclarified sugar, the fermented palm wines, are the substances commonly utilized. Daroo also means gunpowder; likewise also medicines.

DAROOD, properly Darud. Pers. Blessing or benediction. Darudi, a person who reads prayers or the Koran at tombs.

DARORAH. Hind. Gang robbery with violence.

DARRAH. Hind. A valley, a glen, a defile.

DARRANG, a district in Upper Assam, in a narrow strip of land, 126 miles long, between the lower ranges of the Himalaya and the Brahmaputra, which is navigable for steamers all the year round. The Aham are a wild tribe of Shan origin from the Burmese hills, who first entered the valley about the 13th century. They organized their conquered territory with minute precision, and held their own until the advent of the British. In Darrang they number only 3490. The Towang Bhutia are entirely independent of the state of Bhutan. They trade with Tibet, and are quiet and friendly. The Aka or Hrusso are a small tribe who used formerly to commit frequent raids on British territory. They now receive pasa or black-mail to the amount of £67 a year. Farther east are the Daphla, whose native mountains extend along the neighbouring district of Lakhimpur. In the year 1872, the village of Amtola, occupied by Daphla settlers, was attacked by a strong party of hill Daphla, and 44 persons were carried off to the mountains.

In Darrang, as in the rest of the upper valley of the Brahmaputra, the great majority of the population are of aboriginal descent. The aborigines of the census report are mainly composed of Lachari, who number 62,214 out of the total of 76,094; Rabha, 10,302; Daphla within the district boundaries are 134 in number; Koch, 46,788; Dom, 8023; and the Aham, 3490. Of Hindus proper, by far the most numerous caste is the Kolita (16,998), the ancient priesthood of Assam, who are now admitted to Hinduism as pure Sudras. The weaving castes are also strongly represented, with an aggregate of 18,550 members.—*Imp. Gaz.*

DARSANA. Sansk. Demonstration; a system of doctrine or philosophy, of which six schools are recognised by the Hindus:—

1. The *Sankhya* philosophy of Kapila was dualistic, teaching the distinction of soul and matter.

2. The *Yoga* or Patanjala system taught the practice of abstraction, or Yoga.

Logic or dialecties has two parts, viz.:

3. The *Nyaya*, as taught by Gautama or Akshapada; and

4. *Vaiseshika*, founded by Kanada or Kanabhaksha.

5. The *Purva Mimansa* philosophy, by Jaimini, treating of the purport of the ceremonies of the Vedas. It is commonly called the Mimansa.

6. The *Uttara Mimansa* or Vedanta, by Veda

Vyasa or Badarayana, inculcating the unity of spirit and matter.

The principal doctrines of the Uttara Mimansa are that God is the omniscient and omnipotent cause of the existence, continuance, and dissolution of the universe. It is supposed to have been founded three or four centuries before Christ. The Nyaya and Vaiseshika recognise a supreme being. The Yoga is theistical, and Sankhya atheistical. All have the same final object, the emancipation of the soul from future birth and existence, and its absorption into the supreme soul of the universe.

The Sankhya system was taught by Kapila. Its principal doctrine is that rest from transmigration is to be obtained by true knowledge, and that true knowledge consists in regarding man and the world as altogether worthless and perishable. Kapila added little or nothing about the eternal reality behind these transitory things, and this important portion of the scheme was completed by Patanjali, forming the second or Yoga system of philosophy. Patanjali's four chapters are appended in the best manuscripts to the Sutras (or leaves) of Kapila, and form together the work called Sankhyapravāchana.

The third philosophic system is the Nyaya of Gautama, which again was supplemented by the Vaiseshika, or fourth system of Kanada. These two darsanas both occupy themselves with elaborate investigations into the mental constitution of man and the laws of logic, as means for the attainment of true knowledge. Lastly, the fifth and sixth systems are called the Purva Mimansa and the Uttara Mimansa. The first originated by Jaimini, and the second by the eminent sage Vyasa. It is this last system, the Uttara Mimansa of Vyasa, to which the title of Vedanta is applied; the word meaning, 'the ultimate aim of the Vedas.' All the other systems of philosophy recognise the Vedas as sacred; but the two Mimansas treat them as absolute revelation, and are in fact commentaries and interpretations of their earlier and later portions.

The Vedanta simply teaches that the universe emanates in successive developments from Brahma or Paramatma, the supreme soul; that man's soul is identical in origin with the supreme soul; and that liberation from transmigration will be obtained so soon as man knows his soul to be one with the supreme soul. The Vedanta system represents the religion of Hindu philosophy, or rather the religion of philosophers. To suppose that men who accepted the Sankhya or Nyaya systems would therefore take no interest in the Vedanta, would be somewhat like supposing that if a man studied Aristotle he would necessarily despise the Psalms. The great Hindu theologian, Sankaracharya, author of the poem Atma-Bodha, was an enthusiastic Vedantist.

☞ Darsana with lay Hindus generally means performance of religious duties, visiting temples, seeing or reverencing idols.

DARUDI, from Darud, PERS., benediction, one who repeats benedictions at a tomb or public building.

DARUKA, in Hindu mythology, a female Asura, who, according to Colonel Vans Kennedy, was the leader of a host of Amazonian Asura, with whom the gods were afraid to engage in battle, from the dread of incurring the sin of feminicide. They in consequence applied to Siva, on whose solicitation Parvati produced from herself the form of Kali, having in her hands a trident and a skull. On beholding her, the affrighted gods ran away. Kali alone attacked Daruka and her hosts, and destroyed them.—*Cole. Myth. Hind.* p. 378.

DARUN-AJ-AKARBI. ARAB. Doronicum scorpoides, a kind of fern, the root and leaves of which reached Ajmir from Arabia *via* Bombay. Considered as a tonic. Four to six massa are a dose. One tola costs two rupees. — *Gen. Med. Top.*

DARVESH, from Dar, a door, and Vihtan, to beg, is the Persian term synonymous with the Arabic and Indian fakir, a Mahomedan religious mendicant. Originally there were twelve orders, viz. Rafai, Sadi, Sahravardi, Shibani, Mulavi, Kadiri, Nakshbandi, Vaisi, Jalwati, Khalwati, Bedawi, Dassuki. There have been many branches added, amongst whom may be mentioned the Banawa, Chishti, Kalandar, Madaria, Rasul-Shahi. The system of religious devotees originated amongst Mahomedans,—according to one tradition, with Owais bin Aamir. He had never seen Mahomed, but he so loved and revered him, that he caused two of his front teeth to be extracted, because Mahomed had lost two of his front teeth in the disastrous battle of Ohod, and the example given by Owais was followed by the khalifs Abubakr and Ali, and the associations of recluses created by them. But most of the existing orders of darvesh which are scattered over Mahomedan countries, trace back their origin to Jalal-ud-Din, Rumi, the author of the Masnavi-i-Sharif, who founded the Mulavi order. In European Turkey, the darvesh have formed somewhat prominent communities, and about sixty different orders, each named after its founder, are supposed to exist there. The Batashi or Bektashi of Constantinople are said to be quite atheistic, not attached to the principles of the Koran, nor firm believers in Mahomed as a prophet. They are generally of the sect of Ali, therefore Sufi or Mahomedan spiritualists. They have a takiah on the bank of the Tigris at Baghdad, on the west side of the town. The Rafai darvesh, so common in Turkey, inflict on themselves great self-torture. They are also known as the Eesawiya, *q.v.* Some of the wandering Indian fakirs travel so far west as Hungary, to visit the shrine of a santon, Gul-baba, and travel east to Tenasserim and Burma. One whom the editor met near Hingolee, in the Dekhan, was a native of the Panjab, but had been to Ceylon, Mergui, Tavoy, Rangoon, and Moulmein. In British India many fakirs are low, profligate men, held in great disesteem by all classes of the community, and some of them are utterly degraded in habits and mode of life. The bulk of them are Be-Sharra, literally without law, *i.e.* do not act up to the precepts of Mahomed, but are latitudinarians; a few are Ba-Sharra, or with law, following Mahomedanism. The latter are styled Salik; the Be-Sharra are the Majzub. Azad, Rasul-Shahi, Imam Shahi, Kalandar, are of both sects.

No character in the Moslem world is so proper for disguise as that of the darvesh. It is assumed by all ranks, ages, and creeds,—by the nobleman who has been disgraced at court, and by the peasant who is too idle to till the ground; by

Dives who is weary of life, and by Lazarus who begs bread from door to door.

The Madaria order are named after Badi-ud-Din, Shah Madar, called also Zandah Shah Madar, who is buried at Makanpur (ob. 1433 A.D.).

The Nakshbandi darvesh illustrate their theology with pictures.

Mevleviyeh, dancing darvesh, are a solemn and, for the most part, learned body of men, revolve like teetotums till they have addled their brain.

Gulshaniyeh, the Howlers of the guide-books, toss their heads backwards and forwards, and howl the name of Allah till they fall back foaming at the mouth in an epileptic fit.

The Rafaiyeh cut themselves with knives, eat live coals, chew glass, and perform other mad freaks for the same purpose, namely, to lose the idea of self and attain a fancied reabsorption in the Deity. How far the same motives may have actuated the prophets of Samuel's time, when Saul (as casual spectators at a darvesh celebration often do now) stripped himself naked and joined the wild prophetic dance (1 Samuel xix. 24), must be left to biblical scholars to decide.—*Burton's Meeca*, i. p. 21; *Osborn's Islam*, p. 92; *Herklots, Qanoon-i-Islam*; *H. Elliot*.

DARWAZ, a chieftaincy in the valley of the Oxus. It is north of Badakhshan, and is ruled by an independent Tajak chief. He claims a Grecian descent, like the mir of Badakhshan, and the chiefs of Chitral, Gilghit, Iskardo, and others. The Oxus sands here are washed for gold.—*MacGregor*, p. 224.

DARWAZAH. HIND. Door; the gate of a town or fortress. All great Mahomedan cities name their gateways generally as leading to other cities, such as Mecca-darwazah, Dehli-darwaza. Darwazah-i-Irak, the western gateway of the town of Herat. See Dar.

DARWAZYE, one of the Hazara states, the chief of which is of the Tournoulee.

DARYAN or Dryon, a strait above 120 miles long, from Pulo-Varela to the Carimons, and is bounded on the west side by the coast of Sumatra, False Durian, Sabon, and the contiguous islands; on the east side by the islands off the south and west sides of Lingin, Great and Little Durian, and the adjacent islands. Throughout these straits the tides are very irregular.—*Horsburgh*.

DAS. HIND. Ten. Dasaha, MAHR., the period of the ten days' impurity on the death of a relative. Dasoond, the tenth part. Dasa-Marma, the ten commandments of Valabhacharya. Dasagriva, or the 'Ten-necked,' a name of Ravana. Dasahara, or 'Ten-removing,' a name of Ganga.

DAS, Dāsa, Doss, forms part of the names of many Hindus of N. India and Bengal, and is of frequent occurrence amongst the Kayasth tribes. Dasa means servant, slave, the servant or slave of a deity, and corresponds to the Abd and Ghulam of the Mahomedans. The Arab Abdallah and the Hindu Iswara Das alike mean the servant of the Lord. Narayan Doss, Bhagavan Das, Krishen Doss, for instance, signify the slave of Narayan, Bhagavan, or Krishna. Ramdas is, in like manner, the slave of Rama. Deva Dasa are Hindu temple women, slaves of the temple deity. In the days of Akbar it was borne by Rajputs, as Raja Bhagwan Das, of the Kachwaha tribe. It is now seldom used by Rajputs except for illegitimate offspring.

DASA, an order of Vaishnava devotees.

DASAHARA or Dashara. SANSK. The tenth of Jeth Shukhl Paksh, which is the birthday of Ganga. Also is the tenth of Asin Shukl Paksh, Asoj or Ashwin shud, on which, after the worship and religious ceremonies performed during nine nights, the Hindus throw the images of Devi into the river. The day is celebrated with great pomp by the Mahrattas and Hindus of Mysore and of all Maharashtra. The festival occurs about the first days of October. It is supposed to relate to the autumnal equinox or the breaking up of the S.W. monsoon, when the weather becomes suitable for military operations. In Bengal it is a popular festival in honour of Durga, celebrated in the month Aswin (September—October), for nine days. The tenth day of Asoj is commemorative of the date on which the deified Rama commenced his expedition to Lanka for the recovery of Sita from Ravana. The nine days preceding the Dashara are the Naoratri, or 'nine-nights,' during which a Brahman is engaged to read the praises of Durga, and on the tenth perform the homa or fire-sacrifice, in which rice and ghi are poured into the fire. Bania women keep up a dance called garbha. As Arjuna and his brothers worshipped the shumee tree, the Acacia suma, and hung up their arms upon it, so the Hindus go forth to worship that tree on the festival of the Dashara. They address the tree under the name of Aparajita, the invincible goddess, sprinkle it with five ambrosial liquids, the panchamrit, a mixture of milk, curds, sugar, clarified butter, and honey, wash it with water, and hang garments upon it. They light lamps and burn incense before the symbol of Aparajita, make chandlos upon the tree, sprinkle it with rose-coloured water, and set offerings of food before it.

In this festival Hindu soldiers have converted the animals and instruments of modern warfare into emblems of their Bellona. Thus the horse is invoked to carry his master, first to victory, and then to repose. The flagstaff is the ensign of Indra; the sword is celebrated under several names; the bow and arrows are also praised; and even fire-arms have their proper pre-eminence of adoration. The Hindu artilleryman at all times regards the gun to which he is attached as an object of superstitious reverence, and usually bestows on it the name of some deity. During the Durga festival, the cannon belonging to the army were planted, praised, invoked, and propitiated by several species of offerings. On the morning of the tenth day, the Peshwa, with all his chiefs and soldiers, used to move out to the camp in the vicinity of the city, each being ranged under his particular banner, mounted on his best horse, dressed in his finest clothes, and with his arms highly polished. Horses, elephants, and camels were all arranged in their gayest trappings, and every corps spread its gaudiest flags and banners. The whole population of the capital, either as actors or spectators, joined in this grand procession, which moved towards the sacred tree, the object of adoration. After the offerings and prayers, the Peshwa plucked some leaves of the tree, on which all the cannon and musketry commenced firing. The Peshwa then plucked from a field, purchased for the occasion, a stalk of jawari or bajri, on which the whole

crowd fired off their arms or shot arrows, and rushed in an instant and tore up the whole. Each endeavoured to procure a share of the spoil. Some succeeded in carrying off a handful, whilst others contented themselves with a few stalks; all, however, returned home with shouts of joy, and the remainder of the day and night was devoted to festivity and mirth. Many other usages prevail at this festival, which are peculiar to the Mahrattas; among others, that of sacrificing sheep and buffaloes, sprinkling the blood on the horses with great ceremony, and distributing the flesh of the former to all ranks, Brahmans excepted. The chiefs often gave money to enable their soldiers to buy sheep to perform sacrifices, which, from furnishing them with a good dinner, were by many considered as the most essential ceremonies of the Dasahara.—*Forbes, Rasamala, Hindu Annals*, ii. p. 335.

DASA-KAMARA-CHARITA, Tales of the Ten Princes, a Sanskrit book by Sri Dandi.—*Dowson.* See Dandi.

DASANAKHI. HIND. An ancient missile weapon of India.

DASARATHA, king of Ayodhya, of the Solar race, a potent sovereign in ancient India, and father of Rama. His kingdom consisted of the eastern countries, Sindhu, Saurastra, Savira; southern countries, Anga, Banga, Magadha, Kosala, and Kasi. He was a descendant of Ikshwaku. Buchanan supposes him to have lived in the 15th century before the Christian era. According to Wilson, the sons of Dasaratha were Rama, Lakshmana, Bharata, and Satrughna. His chief queen, Kausalya, bore Rama; Kaikeyi gave birth to Bharata, and Su-mitra bore Lakshmana and Satrughna. At the time that Sita was married to Rama, Urmila, the other daughter of Janaka, was given to Lakshmana, and the two other brothers were married to Mandavi and Srutakirtti, the daughters of Kusadhwaja, the sovereign of Sankasya, or, according to the Agni Purana, of Kasi or Benares, and brother of Janaka. Dasaratha Jataka is the Buddhist story of king Rama.—*Hindu Theatre*, i. pp. 288-289.

DASARI. TEL., KAR. A mendicant of a class in the south of India, a worshipper of Vishnu.

DASATIR, sacred writings of the ancient Persian prophets, published by Mullah Firoz-bin-Kaus at Bombay in 1818, in 2 vols. 8vo.—*Buist's Cat.*

DASHA-BHOOJA. SANSK. From Dashan, ten, and Bhooja, an arm. Dashahara, SANSK., from Dashan, ten, and Hree, to take away. Dasha-koomara, SANSK., from Dashan, ten, and Koomara, a son. Dasha-dik-pala, SANSK. Pala signifies the cherishing of a person. Dasha-rat'ha, SANSK., from Dashan, ten, and Rat'ha, a chariot. Dashama-padshahé-grant'ha, SANSK., from Dashama, the tenth, padshah, king, and Grant'ha, a book.

DASHI. KASHMIR. The edging at the ends of a long shawl.

DASHMANTA or Dushyanta, a king of the Lunar race, husband of Sakuntala.

DASHT. PERS. A desert; also an open tract of country, a plain.

Dasht-i-Badu, the northern part of Dasht-i-Goran.

Dasht-i-be-Daulat, in Baluchistan, is an elevated valley or plain, situated to the N.E. of Mustung, at the head of the Bolan Pass. Its area is from 15 to 20 square miles, and some of its boundaries approach the Bolan pass. It has no towns or villages, but is occasionally dotted with the tomans of the Kurd tribe. Some portions of it are cultivated in the spring and summer months, but during the winter it is a bleak, howling wilderness, destitute of trees or any shelter; the snow lies deep on it, and cold winds whistle over its frozen surface. It is subject to the depredations of the Kaka tribe of Afghans, and caravans are frequently plundered by them. In the summer it is frequently clothed with the fragrant terk plant, and its surface diversified by fields of waving grain. It has no streams, but one or two wells have been dug, and water obtained with some difficulty. The cultivators are dependent on rain and heavy dews for the success of their labours. On the N. it communicates with the valley of Shal, on the E. it has the Kharlaki ridge, in which is the head of the Bolan pass, and on the W. and S. Chahaltan. It is pretty in spring, and parts are cultivated.

Dasht-i-Drugi, a small plain in Jalawan.

Dasht-i-Goran, or plain of the wild asses, is S. of Chappar, in the Kalat district, occupied by the Sunari section of the Zahri Brahui of Jalawan. It was once occupied by the Zigger Minghal, but their increasing numbers compelled them to migrate.

Dasht-i-Kapchak. Kapchak is a Turkish word, and Dasht means a wide uncultivated plain.

Dasht-i-Mat, a valley in Jalawan.

Dasht-i-Tik, part of Dasht Goran.

Dasht-Khor, in Kej, is fertilized by the river Khor, which disembogues near Juni, W. of Ras Pishkan. The occupants are Kaodai (Khudai?), Rind, Hot, Birdi, Bar, and Shahzada.—*Robertson; Pottinger; Hough; Mason; Cook; Markham, Embassy*, p. 34; *Ross.*

DASHTISTAN means a level country, from Dasht, a plain; but it is particularly applied to the low country extending along part of the shores of the Persian Gulf.—*Fraser's Khorasan.*

DASHYANTA was eldest son of Aulla, and father of the emperor Bharata by Sakuntala.

DASI. HIND. A female servant.

DAS-NAMAH, a Hindu sect, worshippers of Siva, also called Dandi. Sankaracharya was their founder. They take this name from the words Das, ten, and Namah, a class, because there were ten orders amongst them. See Dandi.

DASOOND, or tenth, in Mewar, as in Europe, was the stated sum to be levied in periods of emergency or danger.

DAS PADSHAH-KI-GRANTH. This and the Adi-Granth form the religious writings of the Sikh sect. See Sikhs.

DASRAT RAMA, a name of Rama Chandra.

DAST. PERS., HIND. The hand. Dastawez, a signature, a voucher. Dast Bosee, lit. hand-kissing. Dastah, a kalliyon, a small hand hookah. Dastana, a glove, also a flat brush for spreading newly-made paper. Dast Panna, a pair of tongs carried by fakirs.

DASTAGIR-WALAY, an appellation given by the Gyr-Mahdi Mahomedans to all other sects.

DASTAR or Pagri, the name given in India to the turband, worn on the head by Mahomedans of Turkey and India, and by Hindus. The word turband is unknown to Mahomedans of India. It is from Sarband, head-dress.

DASTAR-KHAN, a table-cloth, or rather a floor-cloth, being spread on the ground; but it is also used to denote the custom, whenever a guest enters a house, of laying a table, from which, under all circumstances, he must eat something. The man who attends to the duty is called Dastar-khan-ji. In Central Asia leather table-cloths have, in modern times, been replaced by bright-coloured Russian calico, or, amongst the richer classes, by silk with long fringes. — *Vambery, Bokhara*, pp. 201, 382.

DASTUR, a high priest of the Zoroastrians.

DASTUR. HIND. Custom, hence Dasturi, a customary fee, perquisites formerly paid by a dealer to servants when their master makes purchases.

DASTUR-ul-AMAL, a revenue work prepared in the time of Akbar. A body of instructions and tables for the use of revenue officers under the native Government of India.—*Wils.*

DASYA, in the Sanskrit writings, a race or races who, along with the M'hlecha, opposed the advancing Aryan race. It is probable that they were the prior occupants of the new countries, and were all reduced to subjection or slavery, the word being either from Des, a country, or from Dasa, a slave. The Aitareya Brahmana says most of the Dasya are sprung from Visvamitra, and Sanskrit writers applied the term Dasya to all the aborigines from the Naga of North-Eastern Bengal, throughout all India, to the indigenous races of Ceylon. They are usually supposed to have comprised the Bhil, Kol, Santal, Naga, and other races, who, when the Aryans entered India, were occupying the entire country between the Himalaya and Vindhya. They seem to have been worshippers of trees and serpents, and to have been the first to have adopted Buddhism. Fergusson (p. 13) supposes them to have been of Tibetan origin. They were overcome and ruled over by the Aryans. They built square tower-like temples, with a perpendicular base, but a curvilinear outline above.

DASYAULUS. *Thwaites.* Several species of this genus of middle-sized trees occur in Ceylon, viz. D. fulvus, at Hewessee in the Pasdoon Corle; D. microphyllus, in the south, but rare; D. Moonii, at Caltura near Ratnapura; and D. neriifolia, Gang mee, SINGH., common on the banks of rivers and streams in the warmer parts of the island. The last is the Bassia neriifolia of Moon's Cat. It is grown for shade in the cinnamon gardens, and its timber is used for common purposes.—*Thw.*

DATA, a mode of address among fakirs.

DATE PALMS are met with in almost every part of the south of Asia. In the Peninsula of India the wild date, Phœnix sylvestris, shoots up in every dip of ground, and it is common in portions of the Dacca, Mimensing, and Sunderbun districts. When not stunted in its growth by the extraction of its sap, it is a very handsome tree, rising to 30 or 40 feet in height, with a dense crown of leaves spreading in a hemispherical form on its summit. The leaves are from 10 to 15 feet long, and composed of numerous leaflets or pinules about 18 inches long; the fruit is only about one-fourth the size of the Arabian variety. The cultivators of the true date tree, Phœnix dactylifera, in Arabia, fertilize the clusters of blossoms in the female trees, by taking the stamina of the flowers of the male plant and placing them in the centre of each cluster of blossoms. In some parts of Arabia, however, the male trees are planted to windward, and the pollen, wafted by the wind, fertilizes the blossoms in all the trees in the gardens. The culture of the date is of great antiquity. It was emblematic of the Jewish nation. Jericho was the city of palm trees. The date palm was familiar to the Egyptians B.C. 2378. It is first seen in Babylonian monuments B.C. 1500, and first appears on the Assyrian monuments B.C. 858. A recent writer has supposed the date to be the conical figure on the top of the thyrsus of Bacchus. This fruit, according to Pliny, was consecrated to the worship of almost every heathen divinity; and the date palm is the sculptural emblem of all that is dignified, beautiful, and good, and entered largely into the ornamentation of temples. In India, the Phœnix sylvestris is used solely for the palm juice extracted from it. The process of tapping and extracting the juice goes on all the year round, but in Bengal it is continuous from the 1st November to the 15th of February. Some days previously, the lower leaves of the crown are stripped off all round, and a few extra leaves from the side of the tree intended to be tapped. On the part thus denuded a triangular incision is made with a knife, about an inch deep, so as to penetrate through the cortex and divide the sap vessels, one point of the triangle downwards, into which is inserted a piece of grooved bamboo, in order to direct the sap into an earthen pot suspended underneath it by a string. The pots are suspended in the evening, and, when sugar has to be made, are removed very early the following morning, ere the sun has sufficient heat to warm the juice, which would cause it immediately to ferment, and destroy its quality of crystallizing into sugar. The cutting being made in the afternoon in Bengal, next morning the pot is found to contain, from a full-grown tree, 10 seers of juice, the second morning 4 seers, and the third morning 2 seers of juice; the quantity exuding afterwards is so small, that no pot is suspended for the next four days. The boiling apparatus consists of a hole of about 3 feet in diameter, sunk about 2 feet in the ground, over which are supported by mud arches four thin earthen pans of a semi-globular shape, and 4 inches in diameter; the hole itself is the furnace, and has two apertures on opposite sides for feeding in the fuel and for the escape of the smoke. The fire is lit so soon as the juice is collected and poured into the four pans, which are kept constantly supplied with fresh juice as the water evaporates, until the whole produce of the morning is boiled down to the required density. As the contents of each pan become sufficiently boiled, they are ladled out into other earthen pots or jars of various sizes, from 5 to 20 seers of contents, according to the local custom, and in these the boiled extract cools, crystallizes into a hard compound of granulated sugar and molasses, and is brought to market for sale as goor. By subsequent processes the goor is deprived more or less of its molasses and impurities. A Persian poem celebrates the Arabian date palm, Phœnix dactylifera, and its 360 uses.

DATE PLUM, Yuen-ts-au, CHIN. Fruit of Diospyros kaki.

DATES of Phœnix dactylifera.

Wu-lau-tsze, . . .	CHIN.	Datteln, ...	GER.
Fan-tsau, ...	„	Khurma, Khajur,	HIND.
Dattes, ...	FR.	Dateri, ...	IT.

The best dates are the fruit of the Phœnix dactylifera, dried in the sun. They have a shrivelled appearance, and a pleasant subacid taste. The date trees on the coast of Oman form a continuous grove to Khorfakan, a distance of 150 miles, and the Arabs have a saying that a traveller may proceed the whole distance without ever losing their shade. Dates form the principal export from Oman, large quantities being taken to India. The Mahomedan and Hindu population are very partial to them. The best are brought from Basrah and Bahrein, those from Oman being classed next in excellence. Some are simply dried, and then strung on lines; others, which is the usual plan, are packed in baskets. The Phœnix dactylifera is invaluable to the desert tribes of Northern Africa and the Sahara, whose most important wants it supplies. The fruit is the common food of themselves and their cattle, while their huts and houses are chiefly constructed of date-wood. Makran dates are famed, and are largely exported. Multan, Dehra Ghazi Khan, and Muzaffargarh produce dates in large quantities from the Phœnix sylvestris, but of an inferior kind to those of Arabia; they are, however, preserved, either by being dried, or else by being boiled in oil and water, and then dried; when about to ripen, a piece of matting is put over the cluster to prevent the ravages of birds, etc.—*Wellsted's Travels*, i. 188; *Fraser's Journey*, 74; *Burton's Mecca; Powell's Panjab.*

DATIA, chief town of Datia state, Bundelkhand, lying on the road. from Agra to Sagal (Saugor), 125 miles south-east of the former, and 148 miles north-east of the latter, lat. 25° 40′ N., long. 78° 30′ E.; estimated population, 40,000, almost exclusively Hindus.

DATISCA CANNABINA. *Linn.* Ik'lbir, HIND. Grows in Kashmir, Kanawar, Nepal, and the Himalaya; its bark and the woody portions of the root are much esteemed in the Panjab for dyeing silk of a yellow colour. It is also an ingredient in producing a pleasing pale 'pista' green. It is exclusively a hill product. It is used as an expectorant in catarrh. The bark also contains a bitter principle like quassia. Root exported to Amritsar as a dyestuff.—*Stewart; Cleghorn; Cal. Cat. Ex.* 1862. See Dyes.

DATTA. SANSK. From Da, to give; abbreviated into Dat or Dut, a gift, a donation, a son given in adoption, a girl betrothed. Datta or Dutt is a subdivision of the writer caste of Bengal, and borne as a name, as Jai Krishn Dutt. The Datta came to Bengal along with the Kulin race.

DATTA JAYANTI, a Hindu festival held in honour of a deity named Datta.

DATU. MALAY. A governor under a sultan.

DATUNI, the root of the Croton tiglium; it is a very powerful purge, much used in prescriptions.

DATURA ALBA. *Rumph.*

D. metel, *Roxb.*, *Rheede.*

Jouz-mazil,	ARAB.	Safed dhatura,	HIND.
Pa-daing-phoo,	BURM.	Humata, Humatu,	MALE.
Nau-yang-hwa,	CHIN.	Velle umate,	TAM.
Man-to-lo-hwa,	,,	Tella umati,	TEL.
Sada dhatura,	HIND.		

The Datura genus of plants is common in India, both wild and cultivated; the colours of the flowers are white, yellow, purple, and blue. D. pontica is reputed to have contributed to the poisonous quality of the honey that was eaten by Xenophon's soldiers. Bishop Heber notices Datura alba in his Walk in Bengal:

> 'While to the cooler air confest
> The broad datura bares her breast
> Of fragrant scent and virgin white,
> A pearl around the locks of night.'

Its beautiful long white flowers in Rohtak are used as an offering to the shrines of certain deities. Its value as a curative in asthma is known both to Europeans and natives, who smoke the seed in their hookahs when so afflicted. The white and purple species are alike used by thieves to stupefy victims, but the white is considered the most efficient. The victims are usually discovered in a state of insensibility, and breathing hard and heavily; if removed, care should be taken not to expose them to the heat of the sun, which is fatal. The action of the poison is quicker in the hot weather than in the cold; much, of course, depends on the individual constitution of the victim. But usually in hot weather it begins to act in five minutes, and coma supervenes within the hour; in cold weather it begins to act in a quarter of an hour or twenty minutes. The seeds are given with sweetmeats, and the effects have been known to continue for two days, and still recovery take place; cold effusion and strong stimulant emetics constitute the most effectual treatment. The vision often continues obscured long after the general recovery takes place. This state is best remedied by blisters to the temples or nape of the neck, and by cold effusion. If given while the stomach is empty, a much smaller dose may induce all the preceding symptoms and prove fatal. This is well known to the Indian poisoners, who suit the time of administration according to the purpose they mean to serve.—*Powell; Stewart.*

DATURA FASTUOSA. *Roxb.*

Kala dhatura,	BENG.	Kachu-bong,	MALAY.
Purple thorn apple,	ENG.	Nella umata,	MALEAL.

Rotikubung,	MALAY.	Nalla ummetta,	TEL.

This is very common over both of the Peninsulas of India. It is used in asthma. Both the single and double flowered varieties of this species may be often seen near Burman houses, and children not knowing its poisonous character sometimes eat the fruit, with very serious effects. Its large tulip-shaped white flower is sacred to Mahadeva.—*O'Sh.; Roxb.; Gen. Med. Top.* p. 133; *Cat. Exh.* 1862; *Mason; J. L. Stewart.*

DATURA STRAMONIUM. *Linn.*

Fuh-kia-rh, Fung-kia-rh, CHIN.; Thorn apple, ENG.

A native of waste places all over Europe. Its narcotic properties have been proved by Lindberger and others to correspond exactly with those of the belladonna and hyoscyamus. The alcholic extract of the seeds is a perfect substitute for belladonna for many of the purposes described under that head.—*O'Sh.* p. 469.

DATYA, in Hindu mythology, were Brahmans slain by the gods, but were resuscitated by Sukra, their guru, and attacked the gods in Swerga, from which the gods fled in various disguises,—Indra as a peacock, Yamuna as a crow, Kuvera a lizard, Agni a pigeon, Nairat a parrot, Varuna a partridge, Vayu a dove, etc. Indra thus lost his heaven; but he afterwards slew Vitra, the

Datya, and committed the crime of Brahmanicide, for which he had again to leave heaven and do penance. This myth seems to be an account of one of the ancient wars between the Aryan Brahmans and a race with whom they came in contact, or a relation of the suppression of the Vedic naturalism.—*Cole. Myth. Hind.* p. 376.

DAUCUS CAROTA. *Linn.* Carrot.

Gajra, Gajur, Jugur, HIND.	Gajjara, . . TAM., TEL.

Cultivated all over India as a vegetable. Fruit carminative and diuretic. The root is officinal on account of its succulent nature, being favourable for making poultices, which are moderately stimulant. Two kinds in general use all over the Dekhan, are the red and yellow. To preserve carrots until the commencement of the rains in the months of March and April, cut off the green tops, and let the roots remain in the ground; this checks their growth, and by this means good carrots can be had until the middle of July. Yellow Cape answer the best for preserving.

DAUDZAI is a division of the Peshawur district, situated between the Khalil and Khalsa division and the Kābul river. The population in 1868 was 37,671, almost all Mahomedans, Syud, Moghul, Daudzai, Gujar, Khoja, Kashmiri, Khatri, and Arora. The Daudzai tribe in the Peshawur valley, with the Khalil and Mohmand, form the Ghoria Khel, which came from the banks of the Tarnak river in Afghanistan, and settled in Peshawur. They have three sections, the Mandaki, Mamur, and Yusuf. They number 10,000 families.—*MacGr. N. W. F. I.* i. p. 397.

DAUGHTER, from Duhitri, SANSK., milking.

DAUL or Dola. HIND. The boundary of a field, or boundary mark, or mound of earth for that purpose; Scotticé, Dool.

DAULA. HIND. White sugar-cane, the best kind.

DAULAT. ARAB. Fortune, empire, any monarchy. Daulat-ul-Aliyah-al-Usmaniyah, the Ottoman Government.

DAULATABAD, a town and fortress in the Hyderabad dominions, in lat. 19° 57′ N., and long. 75° 18′ E., 10 miles N.W. from Aurangabad. The fortress, also known by the name of Deogiri, has from remote antiquity been a stronghold of the rulers of the Dekhan. At the time of the Mahomedan invasion of the Dekhan in 1294, Deogiri had been in the hands of the Jadhao dynasty since the beginning of the 12th century, and was then the capital of Maharashtra. Ala-ud-Din suddenly galloped into the town, and announced himself as the advanced guard of the imperial army; the city surrendered, but the Jadhao dynasty was not finally extinguished till A.D. 1312. It received the name of Daulatabad from the emperor Muhammad, son of Taghalaq Shah, who tried to make it the capital of the empire in place of Dehli. See Deogiri.

DAULI, in Cuttack, has two separate local edicts, the remaining edicts corresponding with those at Girnar, in Gujerat. They are in the old Lat character, in Old Pali of the 3d or 4th century B.C., probably B.C. 306? Devanampiya, the young prince of Ujjain, is named 'the beloved of the gods.' The king is probably the father of Asoka, who was regent at Ujjain. Both edicts appoint two tupha or colleges for meditation and the propitiation of Heaven. These edicts repeatedly speak of this world and the world hereafter; and the people are expressly commanded to propitiate Heaven, and to confess and believe in God, who is the worthy object of obedience, or more literally, Him, the Eternal, ye shall propitiate by prayer.

DAUP-YAT, in Amherst, a timber employed for rafters. It is a beautiful, yellowish-white, compact wood, but has a tendency to split. The leaves are used as a dye.—*Captain Dance.*

DAUR. HIND. A large earthen vessel used by grain-parchers.

DAUR, amongst the Balute or village officers of the Dekhan, one of the inferior alute.

DAURANI, a tribe, or nation, inhabiting the tract of country, about 400 miles long, through which runs the road between Herat and Kandahar. Its breadth in the N.W. is about 80 miles, and in the S.E. 150 miles. Their country is bounded on the north by the Paropamisan mountains, inhabited by the Aimak and Hazara; on the west and S.W. is Seistan and desert of sand, the desert separating it from Baluchistan; on the south are Shorawak and the hills of Khajah Amran, which separate it from the Tarin and the Kakars, and on the east they join the Ghilzai. The chain of Khajah Amran, though not a mountain of the first rank, is high enough to bear snow for three months, and to be cold all the year. It is chiefly inhabited by shepherds, who belong to the Achakzai clan of the Daurani. They were formerly called the Abdali, till Ahmad Shah, in consequence of a dream of the famous saint at Chumkani, changed it to Daurani, and took himself the title of Shah Dur-i-Dauran. Some accounts describe the mountains of Toba as their most ancient abode. More numerous traditions represent them as having descended into the plains of Khorasan from the mountains of Ghor, which belong to the Paropamisan group, but leave it uncertain whether that tract was their original seat, and by what causes their emigration was occasioned. This tribe is divided into two great branches, Zeeruk and Panjpa; but these divisions are now only of use to distinguish the descent of the different clans. That of Zeeruk is reckoned by far the most honourable. From those branches spring nine clans, of which four belong to Zeeruk, and five to Panjpa:—*Zeeruk*—Popalzai, Alikuzai, Barakzai, Atchakzai. *Panjpa*—Nurzai, Alizai, Ishakzai, Khugiani.

The whole population of the country number about 600,000, of whom the Daurani are about one-half. They are largely pastoral. The better sort have their lands cultivated by hired labourers, Buzgar, or slaves, but often put their hand to necessary work. The poorer Daurani are often Buzur, but seldom labourers, these being chiefly Tajak and Afghan Hamsaya. The pastoral tribes dwell in kishdi or black tents, 20 to 25 feet long, and 10 or 12 broad, price about £4.

DAURI-GOSAVI. MAHR. A Gosain sect who beat the dauru, a small drum.

DAVALLIA, an elegant fern of Moulmein; fructifications in roundish separate spots near the margin. D. parallela and D. pilosa are of Bengal.

DAVARAJPATNAM, a table-land bounding the Neilgherries to the north.

DAVERSOLABETTA, a peak in lat. 11° 27′ N., long. 76° 43′ E., in the Neilgherries, two miles north of Ootacamund; 8380 feet above the sea.

DAVID. Fort St. David, a ruined fort, in lat. 11° 44′ 20″ N., and long. 79° 49′ 30″ E., 1½ miles north of Cuddalore, of which it may be called a suburb. Clive was appointed governor of it in 1756. In 1758 the French dismantled the fort, but sufficiently restored it in 1783 to withstand an attack by General Stuart.—*Imp. Gaz.*

DAVIS, Captain JOHN, in 1585 made the first of his three voyages to the north-west, and discovered the Strait which bears his name. On the eastern side of this wide sea, improperly termed a strait, he discovered and named what has retained his appellative, Cape Desolation; and on the western shore, Mount Raleigh, Cape Walsingham, Exeter Sound, and some other places still bear the names he gave them. In his second voyage, in 1586, he examined the coast on the west side of the strait between Cumberland Island and lat. 66½° N. In 1587, not discouraged by his want of success, he made a third voyage, and affirmed that he reached lat. 73° N. He examined the coast which he had seen before, gave names to some other places, but made no advance to solve the problem of the north-west passage. The discoveries which he made in his three voyages proved of great commercial importance, since to him more than any preceding or subsequent navigator has the whale fishery been indebted.

He was chief pilot in a Dutch mercantile voyage to the Malay principality of Acheen, the north part of Sumatra, and he wrote the story of this adventure. The two brothers Houtman were chief commanding officers of the Lion and Lioness; but one of them was slain, with a large number of his men, by a sudden and insidious attack from the Malays while feasting on board ship, and the other was taken captive. Both ships were then safely brought back to Holland by Davis, who survived to encounter a similar tragic fate in 1605. He was fifty-five years of age when he thus met with his death, and was on his third voyage to the Straits of Malacca. His second, from February 1601 to September 1603, was in the capacity of pilot-major to the Red Dragon, one of the English East India Company's first squadron of vessels, under Captain Sir James Lancaster. The last voyage, which proved fatal to Davis, was made by him as pilot of the Tiger, a vessel fitted out by Sir Edward Michelborne, who personally commanded, as it appears, without regard to the East India Company's exclusive privileges. Michelborne wrote the report given by Purchas. A gang of Japanese pirates, whose vessel lay alongside the Tiger in a harbour off Patana, not far from Singapore, were imprudently permitted to come aboard for hospitality. Michelborne says that Davis neglected to keep proper guard, or to remove their weapons; however that may have been, they attempted to seize the English ship, and in the fighting Davis and other men were killed.—*Sir John Ross, N. W. Passage.*

DAVIS, Sir JOHN FRANCIS, author of a General Description of the Empire of China and its Inhabitants; Sketches of China.

DAWA. Arab., Hind., Pers. A claim. Ladawa, no demands. Madda'a, a claimant. Madda-alei, a defendant.

DAWA. Hind. Medicine. Dawa-i-Atishak, gentian root. Dawa-i-Mubarak, Clerodendron siphonanthus. Dawa-i-Pechish, Ophelia elegans.

DAWAN. Hind. Threshing the corn by bullocks, attaching six or eight in a row, and driving them round a central pivot over the corn strewed on the floor.

DAWAR, known in old times as the Bilad-ud-dawar, and by the modern inhabitants as Zamin-i-dawar. A large province, contiguous to Rukhkhaj, Bast, and Ghor, and the opening of the latter to Sejistan. Elphinstone says, on the right bank of the river Helmand lies the rich country of Zamindawar, which has the Paropamisan mountains on the north, and some hills connected with that range are found within its limits. This fine country extends for forty or fifty miles to the west of the Helmand.—*Elph. Caubul*, p. 122; *Reinaud, Mem. sur l'Inde*, p. 173.

DAWAT, invitation, also exorcism, practised by Mahomedans in India to command the presence of genii and demons; for the protection from evil, casting out of devils, to create enmities, friendships, or love between people, to destroy or injure enemies, detect crimes. These are effected by philters, faleetahs or lamp-charms, smoke-charms, amulets.—*Herkl.*

DAWN.

Bhor, ...	Hind.	Sub'h-i-Sadiq, . .	Pers.
Jhajarkha, ...	,,	Sub'h-i-Kazib, . .	,,

The first grey luminosity is known as the Sub'h-i-Kazib, or false dawn, the true dawn being Sub'h-i-Sadiq. Where false dawns are visible, about two hours before dawn of day, the horizon becomes quite light, and is succeeded by impenetrable darkness. It is chiefly visible about August. An African traveller on the skirts of the Sahara, says he has seen it equally bright, though not equally beautiful, with the Sub'h-i-Kazib of Persia. It is, in fact, nothing but the zodiacal light, respecting the nature and cause of which crude conjectures only have hitherto been put forward.

> 'Tis dawn!—at least that earliest dawn
> Whose glimpses are again withdrawn,
> As if the morn had waked, and then
> Shut close her lids of light again.'

The dawn of the Rig Veda is personified as a lovely maiden, under the names,—Arjuni, for whom the Greeks have Argyronis; Brisaya, Briseis; Dahana, Daphne; Ushas, Eos; Sarama, Helen; Saranya, Erinys.

Panis, a wicked monster, is said to have tempted Sarama to be unfaithful to Indra, and among the Greeks Paris tempted Helen.

DAY, Mr., a servant of the English East India Company, who founded Madras in 1639.

DAY. Deputy Surgeon-General Francis Day, a Madras medical officer, who wrote on the fishes of India, Malabar, Cochin, and the British Islands. As Inspector-General of Fishes in India, he examined the rivers and seas from Persian Makran in the west, along two thousand miles of coast eastwards to Singapore; and from 1865 to the present time (1883), in reports to Government, which have all been printed, and in numerous articles to scientific journals, he has contributed to his favourite science an amount of information which no man of science working single-handed has, perhaps, ever before accom-

plished. The more prominent results of his great labours are given in the following volumes :—

In 1865, he published his Fishes of Malabar.
,, 1873, Reports on the Sea and the Fresh-water Fish and Fisheries of India and Burma.
,, 1875–1879, Fishes of India.
,, 1876, Fishes of Neilgherry Hills; Some Wynad Fishes.
,, 1867, Some Fishes of Madras and some of India.
In 1868, Fishes of India; 1869, do. of Orissa, Calcutta, and Burma.
,, 1870, Do. of Andaman, Nicobar, W. India, etc.
,, 1880–1883, Fishes of Great Britain and Ireland.

From the remotest times, amongst the Chaldæans, Egyptians, Arabians, Hindus, Greeks, and the nations of northern Europe, there has been a hebdomadary division of the month. In general, the days are commenced by the day of the sun, followed by the moon, and the five planets, Mars, Mercury, Jupiter, Venus, and Saturn.

The following origin of the ancient names has been suggested in connection with astronomical science. The planetary arrangement of Ptolemy was thus :—1. Saturn; 2. Jupiter; 3. Mars; 4. the Sun; 5. Venus; 6. Mercury; 7. the Moon. Each of these planets was supposed to preside successively over each hour of the 24 of each day, in the order above given. In this way Saturn would preside over the first hour of the first day, Jupiter over the second hour, Mars over the third, the Sun over the fourth, and so on. Thus the Sun, presiding over the fourth, eleventh, and eighteenth hours of the first day, would preside over the first hour of the second day; and, carrying on the series, the Moon would preside over the first hour of the third day, Mars over the first hour of the fourth day, Mercury over the first hour of the fifth day, Jupiter over the first hour of the sixth day, and Venus over the first hour of the seventh day. Hence the names of the days yet used in the learned professions throughout Europe.

Four of the present English names of the days of the week are derived from the Saxon. Tiw, Woden, Thor, and Friya were deities of the pagan Saxons. Thor was the god of thunder, as well as the ancient Jove, and Friya was a goddess, the wife of Woden.

The Hindus, however, reckon by the light and dark halves of the moon, which they designate kista (or Krishna), paksham, and sakla paksham, though they, too, have a weekly arrangement. In the Rajput names of the day, Sooraj-war, or Adit-war, is Sunday, and the days of the week are from the other planets. Mangala is one of the oldest names of the Hindu Mars, Kumara, to whom the Woden's-day of the North-men, the Mardi of the French, and the Dies Martis of the Romans, are alike sacred. Mangala also means happy, the reverse of the origin of Mongol, said to mean sad. Vris'hut-pati is he who rides on the bull, the steed or vahan of the Rajput god of war; and Sucra is a cyclop, regent of the planet Venus.

The manner of reckoning the days by the ancient Jews, and which subsists amongst that people at the present time, is to commence the day at a certain hour of the evening, and to finish it on the next evening at the same hour. Thus their Sabbath begins on the afternoon of Friday, and is completed on the afternoon of Saturday. The Roman Catholic Church also commences its festivals in the evening; and this custom is retained in Britain in some of the popular observances, such as the eve of St. John and Christmas eve.

The civil day of Great Britain now commences at 12 o'clock midnight, and lasts till the same hour of the following night. The astronomical day begins at noon, and is counted up to 24 hours, terminating at the succeeding noon. This mode of reckoning the day is that used in the Nautical Almanac, and it sometimes leads to mistakes with persons not familiar with this manner of computation; a little consideration will obviate the difficulty. Thus January 10, fifteen hours, in astronomical time, is January 11, 3 in the morning, civil time. In France and most of the states of Europe, as with the British, the hours are counted up to 12 from midnight till noon, and from noon till midnight. In parts of Italy and of Germany, the day is held to commence about sunset, and the hours are counted on till the next sunset. This mode is very inconvenient to travellers, as the noon of the 'Italian hours' at the summer solstice is 16 o'clock, and 19 o'clock at the winter solstice.

The division of the day among Mahomedans is chiefly subservient to the stated time of performing their devotions, and is not generally very accurate. They begin their account at sunset, reckoning twelve hours from thence to sunrise, whether the night be long or short; from sunrise to sunset they also reckon twelve hours, and consequently a night hour is longer in the winter

than an hour of the day, and in summer the hours of the day are longer than those of the night. At the equinoxes alone, all the hours are of equal length, and then they coincide with those adopted by the British, French, and Germans, in commencement and duration, differing of course six hours in enumeration, so that six o'clock of Britain is their twelve, seven is their one, etc. At other periods of the year, also, their six o'clock coincides with British twelve, but every other hour differs more or less from those of Britain. The time of sunrise, and consequently the length of the day, being known, the length of each hour will be easily found by division, and the period of any given hour determined. Thus, if the sun rise at 7 o'clock, the length of the day will be ten hours (of 60 minutes each), and that of each hour 50 minutes. One o'clock, Mahomedan reckoning, will then be at 50 minutes after 7; 2 o'clock, 40 minutes after 8; and 3 o'clock will be half-past 9; and so on of the others. When the sun rises at 5 o'clock, the first three hours of the day will be completed severally at ten minutes after 6, twenty minutes after 7, and half-past 8. In every case 6 o'clock arrives exactly at midday, which in India is called Do pahar, or the second watch. Mahomedans in India also reckon part of a day for the whole; thus, what they mean by three days, is the day on which an event happens and the two following. The Mahomedans reckon the sidereal day in their time, from sunset to sunset, differing thus from the European civil day, midnight to midnight, or solar day, midday to midday.

Though the Gothic and Scandinavian nations have, in the cases of Tuesday, Wednesday, Thursday, and Friday, given the names of Scandinavian deities, Tuisco, Woden, Thor, Friya, to four days of the week, most of the northern nations have preserved the Latin names, as in French—Mardi, Mercredi, Jeudi, Vendredi; Spanish—Martes, Miercoles, Juenes, Viernes; Italian—Martedi, Mercoledi, Giovedi, Venerdi, while for Saturday they have taken the sabbatical word.—*Tod's Rajasthan*, i. pp. 232, 595; *Bowring's Siam*.

DAYA. SANSK. Gift, donation, inheritance.

DAYA BHAGA, a treatise by Jimuta Vahana on the law of inheritance current in Bengal. The Daya-Krama-Sangraha is by Sri Krishna Tarkalankara, and that by Raghunandana Bhatta Charya is called Daya-Tatwa.—*Dowson*.

DAYAK is the name given to all the wild tribes of Sumatra and Celebes, but is particularly applied to those of Borneo, where they are most numerous; some are wild savages, but others have fixed habitations, large barrack-like huts containing many families. They are ignorant of any written character. In their wars they clothe in prepared skins, their arms are the sword and spear and blow-pipe. The Kayan Dayak are idol-worshippers, keep their dead for some days, and inter in a coffin made of the hollow trunk of a tree. See Dyak.

DAYAL BIRD. Copsychus saularis. See Robin.

DAYAMUR, a magnificent peak in the Bara Lacha or Western Himalaya, visible from Ramnagur in the Panjab.

DEAD. The remains of the several races in South-Eastern Asia are variously disposed of. One of the most ancient of the races, the Parsee or Guebre, the followers of Zertusht or Zoroaster, expose their dead on a platform in a circular tower. The Buddhist Tibetans allow the dead to be dragged in an unseemly manner to a distance, and then exposed. The dead of the Buddhist Burmese of rank, particularly of the religious Phoungye monk, is laid in honey for a year, and then conveyed with much seeming rejoicing to the burning place, and burned amidst fireworks. The Chinese revere the dead, and make pilgrimages to their ancestors' graves. Their dead are placed in coffins made of great logs of wood, and lodged in chambers above ground in the manner of the ancient Jews. Some of these log coffins are costly, and it is usual for the rich Chinese to keep their coffins ready for their own use. The Saiva Hindu, the Jangam or Lingadari, the Pariah and non-Aryan races, and the five artisan classes of India, all inter their dead with their faces to the north. The Lingadari artisan dead are seated in the grave facing the north, and in some places are carried to the grave seated on a chair. The Vaishnava Hindu who die of ordinary diseases are burned on a funeral pyre; and it was not unusual amongst the burning classes of the Rajputs and Hindus of the Mahratta country and Northern India, for their widows to immolate themselves alongside the bodies of their deceased husbands. Amongst the Balinese, the widow and slaves of the deceased great are burned along with the deceased. But with the Vaishnava Hindu, unmarried persons, or such as have died of smallpox or cholera, are buried. The Mahomedan dead are all buried, and visits are paid to their graves. Dr. Livingstone describes the practice of the Balonda of S. Africa to be, to abandon the spot where a favourite wife has died.—*Livingstone, Travels*. See Burial Ceremonies.

DEADLY NIGHTSHADE, Atropa belladonna, *L.*, a powerful narcotic poison employed in medicine. It is a herbaceous plant of Europe, with solitary lurid flowers, and violet-black berries on short stalks, springing from the bases of the rather large ovate leaves.

DEAD SEA, called now Bahr-ul-Lut, or the Sea of Lot, into which the river Jordan disembogues. It is the largest lake in Palestine, being 40 miles long, with an average breadth of 9 miles. It occupies the valley of Siddim, in which were the cities of Sodom, Gomorrah, Admar, Zeboim, and Zoar, which sank by some convulsion of nature. It is called the Sea of the Plain, Deut. iii. 17, the Salt Sea in Deut. iii. 17, Josh. xv. 5, from the extremely salt and bitter taste of its waters, which hold 2 lbs. of salt in a gallon; and the East Sea in Ezek. xlvii. 18, Joel ii. 20, from its position with respect to the Judæan mountains. Josephus and the Roman writers call it the Lake Asphaltites, from the abundance of bitumen found in it. The more familiar name, the Dead Sea, is in allusion to the ancient tradition, erroneously but generally received, that no animal could exist in its salt and hydrosulphuric waters. Its surface is 1312 feet below that of the Mediterranean, and in places the water is 1320 feet deep. Hot springs abound near the mouth of the river Jordan. It is 4000 feet below Jerusalem; but the general slope of the intervening district is so regular, that from the spires of the city and the Mount of Olives one can look down directly upon its waters. — *Taylor, Saracen*, p. 63; *Maury's Phys. Geog.* p. 186; *Robertson's Tr.* p. 68.

DEAD SEA APPLES. See Hymenoptera.

DEATH'S HEAD MOTH, Acherontia satanas.

DEB. BENG., URIYA. A cognomen appropriate to Brahmans, as Chandradeb.

DEBAL or Dewal. SIND. An ancient city, celebrated as the emporium of the Indus during the middle ages. It has been supposed to have been the city of Brahmana, but site now unknown; supposed by Burnes and Burton to be the modern Tatta, which is styled Debal or Dewal (temple) by the Arabs and Persians. Mr. Elphinstone and M. Reinaud point to Kurachee, and Dr. Burnes and Mr. Crow indicate a site between Kurachee and Tatta. Mr. Thomas also gives Kurachee as the ancient Debal. The temple was probably on the promontory now occupied by Fort Manora, and was occupied by a pirate tribe called Tangamura. —*Elliot's Hist. of India.*

DEBAR, a celebrated artificial lake in Mewar, 20 miles S.E. of Udaipur (Oodeypore) town, Mewar, 10 or 12 miles N.W. from Chaond, where Pratap destroyed the army which Akbar had sent under the command of Farid Khan. Debar was formed by Jye Singh in A.D. 1681, raising a dam across the streams escaping from the Debar pool, and he named it Jye-Samudra, the Sea of Victory. It is 8 or 10 miles long, about a mile broad, and 960 feet above the sea. Its northern shore is dotted with picturesque fishing hamlets, and its surface with small wooded islands, adding greatly to the beauty of perhaps one of the largest artificial sheets of water in the world.

DE BARROS, JOAO, and Diego De Conto, two Portuguese writers, who, in concert, gave a history of the Portuguese in Asia. Jaoa de Barros held at Lisbon the office of Custodian of the Records of India. He was a contemporary of Albuquerque. He published three decades, his fourth being posthumous, but in these he celebrated the achievements of Albuquerque, to whom he stood in the same relation as Orme, the British historian, does to the British conqueror Clive. His companion writer was Diego de Conto, and their book was entitled Da Asia dos Feitos que as Portuguezes fozeram no descubrimento e conquista das terras e mares do Oriente, Lisbon, 1778. De Barros was born in A.D. 1496, and died in 1570. The first decade of his work was published in 1552, the second in 1553, the third in 1563, and the fourth after his death, in 1777-8.—*Tennant; Bikmore.*

DEBAR RUMI, thin crimson silk.

DEBI PATAN, a village in Gonda district, Oudh, with temples. Lat. 27° 32′ 8″ N., long. 82° 26′ 30″ E. Stated to be probably one of the oldest seats of the Saiva form of Hinduism in Northern India. A large religious trading fair, lasting for about ten days, and attended by about 100,000 persons, is held here each year.—*Imp. Gaz.*

DEBKI, BENG., a dance of the Arabs resembling in some respects that of the Albanians, and those who perform in it are scarcely less vehement in their gestures, or less extravagant in their excitement, than those wild mountaineers. They form a circle, holding one another by the hand, and, moving slowly round at first, go through a shuffling step with their feet, twisting their bodies into various attitudes. As the music quickens, their movements are more active; they stamp with their feet, shout their war-cry, and jump as they hurry round the musicians. The motions of the women are not without grace; but, as they wrap themselves in their coarse cloaks before they join in the dance, their forms, which the simple Arab shirt so well displays, are entirely concealed.—*Layard, Nineveh*, p. 119; *Baron de Bode's Travels.*

DE BODE. Baron C. A. de Bode, a traveller in the lands of Southern Persia, Luristan, and Arabistan.

DE BOIGNE. Benoit de Boigne, born 8th March 1751, at Chambery. He was the son of a furrier, and he joined the Irish Brigade in 1768 as an ensign. After a short service, he entered the Russian army, but, quitting that, after several misfortunes, he landed at Madras in 1777. He entered the 6th M.N.I. as an ensign, which he soon after quitted. In 1784? he took service with Madhaji Sindia, and shared in the battles of 1787, 1788. He then left, but again entered Sindia's service.

DEB-RAJA, the temporal ruler of the Bhot, from Deo, the deity.

DEBRA TABOR, a town in Amhara in Abyssinia, formerly a small village. It was afterwards a place of considerable size, and the residence of the emperor Theodore.

DEBREGEASIA EDULIS. *Weddell.* The Janatsi-itsigo or Teon-itsigo of Japan, is a bush with edible berries, and a fibre valuable for textile fabrics. D. dichotoma occurs in Java, and D. hypoleuca, D. velutina, and D. Wallichiana ascend the Himalayas for several thousand feet.—*F. von Mueller.*

DE BRITO. Philip de Brito y Nicote, surnamed Chango, *i.e.* Good Man, a Portuguese adventurer, who, about A.D. 1600, aided Shimili Shah, king of Arakan. He got possession of Syriam, and became virtually sovereign of Pegu, and conquered the neighbouring kingdom of Tounghoo, reducing its king to vassalage. At last, meeting with reverses, he was betrayed to the king of Ava, A.D. 1613, who impaled him on a hill overlooking Syriam fort, dying after two days of great agony. His wife, a Goanese lady, Donna Louise de Salhanha, with other captives, was carried to Ava, and their descendants are still distinguishable.

DEBROOGHUR, the chief station of Lakhimpur in Assam. From Debrooghur as far as Gowhatee in Lower Assam, there are immense tracts of land on both sides of the Berhampooter, suitable for tea cultivation.

DEBURAH. HEB. In the Hebrew Scriptures are several Hebrew words which in the English version have been translated Fly, viz. Oreb, Zebub, Deburrah, Tsira, Sarabim, Bak, Cinnim. The Orov or Orob, HEB., a swarm or assemblage, is translated in Psalm cv. 31, swarms of flies; but Exodus viii. 31, also Psalm lxxviii. 45, is supposed to allude to the mosquito. The Hebrew Zenon of Ecclesiastes x. 1 and Isaiah viii. 18 is not known. Flies are undoubtedly very troublesome at some seasons in tropical Asia, but an infusion of quassia sweetened with sugar, on a plate, destroys them. See Fly.

DECAISNEA, *sp.*, a very remarkable plant, which Dr. Hooker saw in flower in the Lachen valley, and called Loodooma by the Bhutia, and Nomorchi by the Lepcha. It grew on the ridge near Tumloong and the Ryot valley at 7000 feet; it bears a yellow fruit like short cucumbers, full

of a soft, sweet, milky pulp, and large black seeds. It belongs to the new genus, Stauntonia, of which two Himalayan kinds produce similar but less agreeable edible fruits, the Kole-pot of the Lepcha. Messrs. Cambessedes and Decaisne issued a volume on some of the plants of Jacquemont's voyage.—*Hook. Him. Jour.* ii. p. 198.

DECCAN. See Dekhan.

DECIUS. Ephesus, the chief town of Ionia, in Asia Minor, 45 miles south of Smyrna, was famous for its temple of Diana; and amongst the Mahomedans of the East, its story of the seven sleepers is continued, through the Koran. The legend is that when the emperor Decius persecuted the Christians, seven noble youths concealed themselves in a cavern, which was then blocked up with stones. They immediately fell into a deep slumber, which lasted for 187 years. At last the slaves of Adolius removed some of the stones for building materials, on which the seven sleepers were aroused, and despatched Jamblichus, one of their number, to the city, to procure food, on which the altered appearance of Ephesus, the age of the coin he presented to the baker, and his long beard, led to a discovery of the marvellous occurrence. The bishop of Ephesus, the clergy and magistrates, visited the cavern, and, after conversing with the somnambulists, they quietly expired. James, a Syrian bishop of the fifth century, devotes a homily to its praise; and the story of the seven sleepers is found in the Roman, Abyssinian, and Russian calendars. Mahomed introduced the tale in his Koran, as the Companions of the Cave, and says God caused them to turn over occasionally from right to left to preserve their health.—*Milner's Seven Churches*, p. 171; *Sale's Koran*, p. 219.

DECOITS are gangs associated for the purpose of plunder, who assemble by night, fall on an unsuspecting village, and kill those who offer resistance.—*Elph. India*, p. 377. See Daka.

DE CONTO. Diego de Conto, an officer of the Portuguese, who served in India, and died at Goa, 1600. He brought down from 1539, to his own time, the history of the Portuguese in India, commenced by De Barros. The joint history consists of 24 vols. 8vo. See De Barros.

DEDH, a race in Cutch, who are tanners, and who speak a dialect of the Cutchi. The word seems a modification of Dher.

DEEARA or Dewara. HIND. Alluvial soil, or an island formed in the bed of a river.—*Elliot.*

DEEG, a town and fortress in Bhartpur (Bhurtpur) state, Central India, lat. 27° 28′ N., and long. 77° 22′ E., lies in a lonely marshy tract amid numerous jhils or shallow lakes, fed by the stream of the Manas Nai. Here, on the 13th November 1804, a British force under General Fraser defeated the army of Holkar, and the Jat of Deeg having fired upon the conquerors, siege was laid to the town in December, and it was carried by storm on the 23d. It was dismantled after the capture of Bhartpur by Lord Combermere.—*Imp. Gaz.*

DEER.

Daim, ...	FR.	Cervi, ...	IT.
Hirsch, ...	GER.	Ciervo, ...	SP.
Ail, ...	HEB.	Man, ...	TAM.
Hirn, ...	HIND.	Karaja, ...	TURK.

A general term used by the British in India to designate several bovine animals, distinguishing them as the barking-deer, hog-deer, rib-faced-deer, sambur, and spotted deer. There are, however, frequent minglings of names, as there are a variety of scientific and vernacular synonyms. These animals are all eagerly pursued as game.

Giana of Tibet, Nepal, and sal forests, is the Cervus Wallichii of Cuvier.

Bara Singha or Buraya of Bengal, eastern and northern skirts of India, is the Rucervus duvaucelli of Cuvier.

Sangnai or Sangrai, of Munipore and Malay Peninsula, is the Panolia acuticornis and P. Eldii of Gray; the Cervus or Rusa frontalis of M'Clelland, and the Cervus Eldii of the Cal. Jour. Nat. Hist.

Sambur of the Mahrattas, Sambara, SANSK., an inhabitant of the Dekhan, Southern Mahratta country, of Sumatra, Borneo, and Banka, is the Rusa equina of Cuvier and Gray, the Cervus equinus of Cuvier, the Cervus or Rusa hippelaphus of Elliot, Rusa etam or Rusa kumbang of the inhabitants of Sumatra.

Sambur of Hodgson, a dweller in the forests of Northern India, is the Rusa hippelaphus of Cuvier and Gray, the Cervus hippelaphus of Gray.

Jarai or Jerrow of the great forests of India and of Ceylon, is the Rusa Aristotelis of Cuvier and Gray, the Cervus Aristotelis of Cuvier.

The Spotted deer, Chitra, SANSK., and Chital, HIND., of continental India and Southern Mahratta country and of the Malayan Peninsula, is the Axis maculata of Gray, the Cervus axis of Erxleben and Elliot.

The Hog deer of continental India and Assam, which is called by the vernacular names Para, Khar, Laghuna, and Sugoria, is the Hyelaphus porcinus of Sundeval, the Cervus porcinus of Zimmerman, and the Axis (Cervus) niger of Dr. Buchanan.

The Muntjak of the Sundanese, Kidang of the Javanese, the Kijang of the Malays of Sumatra, found in Banka, Borneo, Java, and Sumatra, is the Cervulus vaginalis of Bodd. and Gray, Cervus muntjac. of Zimmerman.

The Barking deer of Europeans, the Rib-faced deer of Pennant, dwells in the plains of India. It is the Baiker or Bekra of the Mahrattas according to Sykes and Elliot, the Ratwa and Kaher of the Indian continent of Hodgson, Cervus muntjac. of Sykes, Stylocerus ratwa of Hodgson.

Paddy-field deer of Ceylon is Axis oryzus of Kelaart.

Ravine deer or Bennet's deer, better known to Indian sportsmen as the Chinckara (Antilope Bennettii), is somewhat common on the Salt Range and most parts of the Panjab, but does not affect the Himalayas.

Deer-skins are exported from New York, New Orleans, Canada, and India. Antelope skins from the Cape of Good Hope are of good quality. Deer-skins are all shamoyed, or dressed in oil, chiefly for riding-breeches, and shamoyed leather of sheep, goat, and deer skins was formerly a lucrative branch of the leather trade of Great Britain. This kind of leather is employed for breeches, white or dyed, worn by persons who ride much on horseback. In wet weather leathern garments fit close to the skin, and are long in drying, so that the wearers are liable to colds, rheumatism, and other complaints. —*Jerdon; Adams.* See Antelope; Bovidæ; Cervidæ.

DEESA, a town and military station in Gujerat, on the bank of the Banās, lat. 24° 14′ 30″ N., about 350 feet above the sea; its rainfall is 12 and 14 inches, and the thermometer ranges from 50° to 110°. It is surrounded by a desert of sand. It is one of the hottest and most unhealthy stations in India, the thermometer (Fahrenheit) frequently ranging, during the months of March, April, May, and June, as high as 110 degrees. Deesa town is surrounded by a curtain with bastions.

DEG. HIND. Steel filings, used in firework-

making. A large copper caldron or globular vessel, a cooking pot. Deg-cha, a small pot.

DEGEI, pronounced Ndengei. The supreme god in Fiji, and known in the other groups as Tanga-roa or Taa-roa, Tanga being his proper name, Roa an adjective signifying the far-renowned, perhaps also the most high. To him is attributed the creation and government of the world; and there are no images of him, nor of any of the minor gods, collectively termed Kalou. His sway was everywhere acknowledged by the natives, and no attempts were ever made to elevate any local gods above him. Bure-Kalon is the temple.—*Galton's Vacation Tourists*, p. 269.

DEGHA CHUR. BENG. Islands formed by deposit of the alluvial soil brought down by the Ganges, Brahmaputra, and Megna rivers. So soon as they emerge from the water and cease to be overflowed by the tide, contracts are made for the land at a nominal rent. When bushes and grass appear, wild men, speaking a barbarous patois, come down to pasture large herds of cattle on the young herbage, putting up sheds for the beasts, but themselves bivouacking in the open. They pay grazing rent to the contractor of the island, and rent for cutting fuel. As the land becomes settled, contractors are ready to cultivate, and at length settle on it. They dig large tanks for fresh water, and raise high mounds for the foundations of their homesteads in the low country, which is intersected by numerous water-courses, and plant them round with betel, cocoanut, and date palms, plantains, and other plants.—*Geog. Mag.* June 1877.

DEH. PERS. A village; hence Dehgan, a villager, a cultivator. Dehi, pertaining to a village. Dehat, villages. Dehkani, a villager or cultivator.—*Wils.*

DE HAVILLAND. Colonel Thomas Fiott de Havilland, eldest son of Sir Peter de Havilland of Guernsey, born 1776. He received a cadetship for the Madras Infantry at the age of sixteen, but on the formation of the corps of Engineers he obtained a lieutenant's commission. He was present at the taking of Seringapatam as field engineer, was taken prisoner by the French at sea, but was soon released, and remained with his corps till 1812; then returned to Guernsey, and built Jerbourg barracks. Having returned to Madras, he planned and constructed the Mount road, built St. George's Church, now the Cathedral; also St. Andrew's Church, or the Scotch Kirk, which was long considered the perfection of architecture in Madras, and of which the steeple is still the tallest piece of masonry and its dome the finest in that city. He constructed the North Beach road as a bulwark against the encroachments of the sea, which then threatened to submerge the whole of Black Town.

DEHGAN or Deggan, a supposed Aryan tribe, once spread over Afghanistan, but latterly in the Kunair valley. Elphinstone says they are distinct from the Hindki, and must not be confounded with the Tajak, whom the Afghans sometimes call Dehgan, by corruption from Dehkan, a husbandman. The Deggans speak the language which is mentioned under the name of Lughmaunee in the Commentaries of Baber, the Ain-i-Akbari, and other books. The language seems to be composed of Sanskrit and modern Persian, with some words of Pushtu, and a very large mixture of some unknown root. The greater part of the words, however, are Sanskrit.

DEHLI, a city of Hindustan, built on the right bank of the Jumna, in lat. 28° 39′ N., and long. 77° 18′ E., and 800 feet above the sea. It gives its name to a revenue district under the Lieutenant-Governor of the Panjab. The whole country, for some 10 or 12 miles around the modern Dehli, is covered with the debris of ruined cities, which extend over an estimated area of 45 sq. miles. About fifteen centuries before the Christian era, the town of Indraprestha was in existence on the Jumna, in the vicinity of the site occupied by the modern Dehli. It was one of the five 'pat' or 'prastha,' viz. Panipat, Sonpat, Indrapat, Tilpat, and Baghpat, which Dhritorashtra gave to the Pandu. Now, however, Purana Killa and the Negumbod ghat on the Jumna are the only places which can be pointed to as probably connected with the ancient Indraprestha, and the ghat seems to have been a sacred place of pilgrimage even before the Pandu family settled there. The people still call Purana Killa, Indrapat, though Humayun new-named it Din-Panah, and Sher Shah styled it Sherghar. Thirty princes of the line of Yudishtra succeeded him on the throne, but only their names are known; and the last of them was Kashemaka, who was murdered by his minister Viserwa, whose line of fourteen princes held sway for five hundred years. The last of the Maurya was slain by the raja Kemayoun, styled Sakaditya, or chief of the Saka, who subsequently fell before Vikramaditya, and Avanti or Ujjain became the capital. Dehli was then in existence, because Vikramaditya was described as possessing it,—Dilli-pat-kahayo became king of Dehli. Ancient Dehli was 5 miles distant from Indraprestha, on a rocky hill to the S.W., and 11 miles from the modern Dehli. It is surmised that on the removal of the capital to Ujjain, the cities in that locality lay waste and desolate for eight centuries. Fa Hian, A.D. 400, and after him Hiwen Thsang, who travelled in the 8th century (A.D. 750), make no mention of Dehli, nor is it mentioned in the time of Mahmud, who sacked and plundered both Muttra and Thanésar. In A.D. 1052, however, Anangpal rebuilt it.

In A.D. 1191, Prithi-raj utterly routed Mahomed Gori at Tiruri, 14 miles from Thanésar, and compelled him to recross the Indus. But in 1193 Muhammad re-entered Hindustan with a mixed Turk, Tartar, and Afghan army, defeated the Hindu princes, murdered the king of Dehli, took Ajmir, and returned to Ghazni. From that time until the early years of the 19th century, ending in the mutiny of the Bengal army and the rebellion of the northern people in 1857, Dehli continued in the possession of successive rulers of different races,—Turk, Moghul, Persian, Afghan,—but all following Mahomedanism.

For nearly a hundred years, however, the nominal ruler had been merely titular. The emperor Shah Alam entered Dehli a prisoner with the Mahrattas on 22d December 1771. He continued a mere state prisoner in their hands till 1803, when he was released by Lord Lake. All the territories and resources assigned for his support by the Mahrattas were continued to him, and a pecuniary provision was granted in addition, fixed at Rs. 60,000, but afterwards increased to Rs. 1,00,000 a month. Shah Alam died on

the 19th November 1806, and was succeeded by Akbar Shah, who was succeeded in 1837 by his eldest son, Bahadur Shah. He was restricted to the neighbourhood of Dehli, he was not allowed to confer titles or to issue a currency, but he had the control of civil and criminal justice within the palace. When the mutiny of 1857 broke out, the mutineers in Dehli took possession of the town, fort, and stores, and applied to the king. Bahadur Shah's conduct was vacillating, but he subsequently identified himself with the rebel cause. After the fall of Dehli on the 20th September 1857, he was captured, and tried on the charges of—1st. Aiding and abetting the mutiny of British troops; 2d. Encouraging and assisting divers persons in waging war against the British Government; 3d. Assuming the sovereignty of India; 4th. Causing and being accessory to the murder of Christians. He was convicted on each charge on the 9th December 1858, and sent to Rangoon, where he died in 1862; and thus, after nearly five centuries of sovereign power, the Timurides ceased to reign. The prospect of sovereignty was short-lived. The Dehli massacre of Europeans occurred on the 11th May 1857. Dehli was assaulted on the 14th September 1857. From the 14th to the 17th of September, the Church, the Cutcherry, the College, the Kotwalli, the Magazine, and the Dehli Bank House were one after the other carried and recovered. On the 18th, the line of communication between the Magazine and the Kābul gate was completed. On the 19th, the Burn bastion, near the Lahore gate, was taken possession of by a surprise. This bastion is so called from Colonel Burn, who with a handful of men made a most memorable defence of Dehli in 1804, against an overwhelming army of Holkar, and the cannonade of 130 guns. Sir D. Ouchterlony, then Resident, wrote of this defence, that it cannot but reflect the greatest honour on the discipline, courage, and fortitude of British troops in the eyes of all Hindustan, to observe that with a small force they sustained a siege of nine days, repelled an assault, and defended a city 10 miles in circumference, which had ever before been given up at the first appearance of an enemy at its gates. The 20th of September was the day of the final recapture of Dehli. On that day the imperial palace was entered and found deserted. The main picket of the British forces was at the house of Hindu Rao, on the top of the ridge that is to the north-west of the city. The chief efforts of the rebels were directed against this post of the besiegers. From the 8th of June 1857, until the fall of Dehli, it had to sustain twenty-six attacks. On the 14th of September, the attacking force for the storming of the city was divided into four columns, with a reserve. The party fixed upon to blow open the Kashmir gate consisted of Lieutenants Salkeld and Home, Sergeants Carmichael, Burgess, and Smith, bugler Hawthorne, who accompanied the party to sound the advance when the gate was blown in, and eight native sappers under Havildar Madhu, to carry the bags of powder.

Muhammad of Ghor found Dehli occupied by the Tomara clan, Ajmir by the Chauhans, and Kanauj by the Rahtors. These Rajput states formed the natural breakwaters against invaders from the north-west. But their feuds are said to have left to the king of Dehli and Ajmir, then united under one Chauhan overlord, only 64 of his 108 warrior chiefs; and when, in 1193, the Afghans again swept down on the Panjab, Prithi-raj, of Dehli and Ajmir, was defeated and slain. His heroic princess burned herself on his funeral pile. Muhammad of Ghor having occupied Dehli, pressed on to Ajmir, and in 1194 overthrew the rival Hindu monarch of Kanauj, whose body was identified on the field of battle by his false teeth. The brave Rahtor Rajputs of Kanauj, with other of the Rajput clans in Northern India, quitted their homes in large bodies rather than submit to the stranger. They migrated to the regions bordering on the eastern desert of the Indus, and there founded the military kingdoms which bear their name, Rajputana, to this day. Since then Dehli was burned by Timur, 1398; occupied by Baber, 1526; sacked by Nadir, 1739; taken by Mahrattas, 1758; taken by British, 12th September 1803; and again recovered by British, 20th September 1857.

Dehli town in 1868 had a population of 154,417. Dehli district population, in an area of 1277 square miles, comprised Hindus, 438,886; Mahomedans, 130,645; Sikhs, 580; and others, 38,739, the total population being 608,850. Jats number 107,856, of remarkably industrious habits, agricultural skill, and promptitude in the payment of revenue. North of Dehli the greater part of the land is in their possession, though they often share their villages with Brahman coparceners. Gujars (22,164) are pastoral and semi-nomade, in the hilly plateau of the south. They are addicted to cattle-lifting and thieving. The other tribes comprise 14,109 Ahirs, 10,677 Rajputs, 15,776 Pathans, and 8392 Sayyids.

Akbar and Jahangir usually resided at Agra, Lahore, or Ajmir; and Dehli again languished in disfavour, till the reign of Shah Jahan. This emperor rebuilt the city in its present form, surrounding it with the existing fortifications, and adding the title of Shah-jahanabad, from his own name. He also built the Jamma Masjid, and reopened the Western Jumna Canal. Dehli is still enclosed on three sides by the lofty wall of solid stone, constructed by the emperor Shah Jahan, and subsequently strengthened by the British, at the beginning of the 19th century, with a ditch and glacis. The eastern side, where the city extends to the river bank, has no wall, but the high bank is faced with masonry. There are many architectural remains. In Purana Killa is the Keelar Kona mosque, which was commenced by Humayun, and finished by Sher Shah. It has five horseshoe arches, decorated with blue tiles and marble, and some of them have been noticed under architecture.

The *Palace of Shah Jahan*—now the fort—measures 1600 feet east and west by 3200 north and south, exclusive of the gateways.

Diwan-i-Khas, or Private Audience Hall (the most ornamented of all Shah Jahan's buildings), overhangs the river; nothing can exceed the delicacy of its inlaid work or the poetry of its design.

A little to the south of the Chandni Chauk is the *Jamma Masjid*, standing out boldly from a small rocky rising ground. It was built by Shah Jahan between the fourth and tenth years of his reign, and is one of the finest buildings of its kind in India.

The Kala Masjid, supposed to have been built by one of the early Afghan sovereigns, and the mosque of Roshan-ud-Daula, merit notice.

To the west, beyond the walls, is a little chapel in honour of a Musalman saint, Nizam-ud-Din, near whose shrine members of the late imperial family, up to the time of the mutiny, were buried, each in his own little enclosure, surrounded by very elegant lattice-work of white marble.

Iron Pillar.—The earliest authentic information regarding the city is derived from the iron pillar of Raja Dhava, set up in the 3d or 4th century B.C. (319). It consists of a solid shaft of metal, 16 inches in diameter, and about 50 feet in length, but less than half its height appears above the ground. A Sanskrit inscription, deeply cut on its western face, records the story of its origin. Mr. James Prinsep, the first decipherer of the legend, found that it commemorated the prowess of Raja Dhava, who obtained with his own arm an undivided sovereignty on the earth for a long period; while the letters appear to be 'the typical cuts inflicted on his enemies by his sword, writing his immortal fame.' It is the arm of fame (Kirti Bhuja) of Raja Dhava. There is another inscription on it, which has given rise to a tradition that attributes the erection of the pillar to Anang Pal, founder of the Tuar dynasty in the 8th century A.D. Anang Pal II. made Dehli the Tuar metropolis, surrounding it with a massive line of fortifications, whose ruins are still believed to exist in the great circle of masonry lying around the Kutub Minar. The date of this restoration has been preserved by a second inscription cut into the more ancient pillar of Raja Dhava: 'In Sambat 1109' (1052 A.D.), 'Anang Pal peopled Dilli.' Just a century later, under the reign of a third Anang Pal, last of the Tuar line, Dehli fell before Visaldeva or Bisaldeo, Chauhan ruler of Ajmir. The conqueror permitted the vanquished raja to retain possession as a vassal; and from a marriage between the two houses sprang the celebrated Prithi-raj, the last champion of Hindu independence in Upper India, who thus succeeded to the joint realms of the Tuars and the Chauhans. Prithi-raj further strengthened the defences of the city by an exterior wall, which ran round the fortifications of Anang Pal, and of which remains may still be traced for a considerable distance. In 1191, Shahab-ud-Din made his first invasion of Upper India. As above mentioned, the Rajput ruler Prithi-raj successfully defended his kingdom for the time; but two years later the Mahomedan invader returned, utterly overthrew the Hindus in a great battle, and put their prince to death in cold blood. Kutub-ud-Din, the Sultan's viceroy, attacked and took Dehli, which became thenceforth the Mahomedan capital. On the death of Shahab-ud-Din in 1206, the viceroy became an independent sovereign, and founder of the Slave dynasty, to whom old Dehli owes most of its grandest ruins.

Kutub-ud-Din's Mosque, according to the inscription on its entrance archway, was commenced immediately after the capture of the city in 1193. It was completed in three years, and enlarged during the reign of Altamsh, son-in-law of the founder. Eleven magnificent arches close its western façade, Mahomedan in outline and design, but carried out in detail by Hindu workmen, as the intricate lacework which covers every portion of the arcade sufficiently bears witness. Ibn Batuta, who saw the mosque about 150 years after its erection, describes it as unequalled either for beauty or extent.

The *Kutub Minar*, another celebrated monument of the great Slave king, stands in the S.E. corner of the outer courtyard. It rises to a height of 238 feet 1 inch, tapering gracefully from a diameter of 47 feet at the base to nearly 9 feet at the summit. The shaft consists of five storeys, enclosing a spiral staircase, and is crowned by a now broken cupola, which fell during an earthquake in 1803. The original purpose of the minaret was doubtless as a muazzan's tower, whence the āsan summons to prayer might be heard throughout the whole city. The site chosen for the mosque was that already occupied by Raja Dhava's pillar, which forms the centre ornament of the inner courtyard. Around, in every direction, spreads a heap of splendid ruins, the most striking of which is the unfinished minaret of Ala-ud-Din, commenced in 1311. The Slave dynasty retained the sovereignty till 1288, when Jalal-ud-Din founded a new line.

Firoz Shah Taghalaq removed the site of Dehli to a new town, Firozabad, which appears to have occupied the ground between the tomb of Humayun and the ridge. Amid the ruins of this prince's palace, just outside the modern south gate, stands one of Asoka's pillars, erected in the 3d century B.C. This monolith, 42 feet in height, known as Firoz Shah's lathi or club, contains a Pali inscription, which was deciphered by Mr. James Prinsep. It is supposed to have been brought from Shrughna, in A.D. 1356, by Firoz Shah on a truck to Khizrabad, and thence by water to Dehli, then called Firozabad, and set up in the courtyard of the palace of Firoz. Its head is now bare; but so late as A.D. 1611, when William Finch was there, it had a golden pinnacle, which gave it the name of Minar-i-Zarin, or golden minaret. It is a single shaft of pale-pink sandstone, and, like all Asoka's pillars, is 42 feet 7 inches high, of which the upper 35 feet are very highly polished.

In 1526, Baber, the sixth in descent from Timur, was the founder of the dynasty which lasted till 1857. He marched into India with a small force, overthrew Ibrahim Lodi, the last Afghan ruler, at Panipat, and entered Dehli in May of the same year. His son for a time was driven from India, but in 1555 Humayun regained his throne. He died within six months of his restoration. His tomb forms one of the most striking architectural monuments in the neighbourhood. Its white marble dome is a conspicuous object for miles around. It cost fifteen lakhs of rupees, and was erected by his widow, Hamida Banu, who is also interred near.

Bhoot Khana.—In Prithi-raj's capital were twenty-seven Hindu temples, of which several hundreds of richly-carved pillars still remain, to attest both the taste and the wealth of the last Hindu rulers of Dehli. The Bhoot Khana is a colonnaded courtyard, the materials of which were obtained from the demolition of the Hindu temples.

The *Alia Durwaza*, built by Ala-ud-Din, A.H. 710, A.D. 1310, is a beautiful specimen of Pathan architecture.

Roushan Charagh, built by Firoz Shah as a shrine to the memory of a famous saint, is at the S.W. corner of Siri or Shahpur.

The fortifications of *Taghalaqabad* form a stupendous structure.

The *Shalimar* gardens were made by the emperor Shah Jahan at a cost of a kror of rupees.

The *Zinat Masjid*, called also the Kumari Masjid, was built by Zinat-un-Nissa, the spinster daughter of Aurangzeb.—*Imp. Gaz.* See Architecture.

DEHRA, a small town in the N.W. Provinces of British India, in lat. 30° 19′ 59″ N., long. 78° 5′ 57″ E., 2300 feet above the sea, with 7316 inhabitants. It is the principal station of the Dehra Doon revenue district, of 1021 sq. miles, with 116,945 inhabitants. The district consists of the double valley of Dehra proper, and the outlying mountain tract of Jaunsār Bāwar. To the S. are the Siwalik Hills, a mass of Himalayan debris. It is cut off from the Doab of the Ganges and Jumna by the Siwalik Hills. It has been largely occupied with tea plantations, and many Europeans reside in the town of Dehra. Dehra seems a corruption of Darrah or Tarai, a valley, or, amongst the Mahrattas, Therri, as Bhima therri, Seena therri. The Ganges, passing between this district and Garhwal, pours rapidly over beds of boulder, through several channels, encircling jungle-clad islets, and debouches at length upon the plains at Hardwar. The Jumna sweeps round the whole south-western boundary, and reaches the level uplands near Badshah Mahal, in Saharanpur district, an ancient hunting seat of the Dehli emperors. The Brahmans (10,279) and Rajputs (33,125) are each divided into the mountain and the lowland clans. The highland Brahmans will eat any kind of meat except beef.

The Mehra race inhabit the remoter portions of the eastern Doon, inferior both in physique and intelligence, and timidly averse to intercourse with strangers. The Dom or Dhūm have dingy black skins and woolly hair; they form the servile class, only just emancipated from actual slavery under British rule.

DEHRA GHAZI KHAN, a town and a district in the Dehrajat division of the Panjab. The town is in a low alluvial tract, 4 miles from the right or west bank of the Indus, in lat. 30° 3′ 47″ N., and long. 70° 49′ 8″ E. It commands important routes and the navigation of the Indus. It leads to the commercial towns of Multan and Bahawulpur, which adjoin it, and is about equidistant from Amritsar and the opulent town of Shikarpur in Sind. The district has an area of 4740 square miles, and in 1868 had 308,840 inhabitants, viz. 38,467 Hindus, 264,527 Mahomedans, and 1124 Sikhs. The plain tribes are the Nootkani, Lund, and Dreshuk, all of them well conducted. Their lands are classed as Pachad, or lands irrigated by hill streams, and Sind, or lands within the influence of the river. The latter class has enormously increased. The soil is a tenacious clay, fertile if well irrigated, but almost entirely sterile if without water. The canals have been greatly extended, partly by the chiefs of the Baluch clans, and partly by the Government. The geographical boundary between the Pathan and Baluch races in the hills nearly corresponds with the northern limit of the district, and it naturally follows that the Baluchis are more numerous in Dehra Ghazi Khan than in any other portion of the Panjab. Each clan owes allegiance to a feudatory chieftain or tumandar.

DEHRA ISMAIL KHAN, a town and a revenue district in the Dehrajat division of the Panjab, the town being built on the right or west bank of the Indus, in lat. 31° 50′ N., and long. 70° 55′ 44″ E. In 1868 the town had 24,906 inhabitants, a third part Hindus. The population of the district in 1868 was 394,864 souls,—338,387 Musalmans, 48,756 Hindus, 1587 Sikhs, and 6134 others. Amongst the Hindus, the Arora numbered 42,087; they comprise the principal trading classes, a few wealthy families being found in the larger towns, the majority being petty dealers in corn or money throughout the country villages. Dehra Ismail Khan is the market town of the Lohani merchants. It is subject to alteration from the inundations of the river, which on one occasion swept away the entire town. It is nearer to the great commercial city of Amritsar than any of the other places on the Indus, and lies on the road between it and Kābul. It is one of the eligible commercial sites on the Indus. It yields iron, coal, and sulphur. —*Bengal As. Trans.* viii. p. 250; *Papers, East India (Cabul and Afghanistan)*; *Imp. Gaz.*

DEHRAJAT, a revenue division of the Panjab, lying between lat. 28° 27′ and 33° 15′ N., and long. 69° 35′ and 72° 2′ E.; area, 15,007 square miles, and population 991,251 in 1868. It comprises the districts of Dehra Ghazi Khan, Dehra Ismail Khan, and Bunnu. It is on the right bank of the Indus, below the Salt Range, and to the point where that river is joined by the waters of the Panjab. It comprises about two-thirds of the narrow strip of land which lies between the Indus and the Suliman mountains, and extends from the hills and valleys of the Kohat district to the Sind frontier. The lower part bears the local name of Sind from bordering on the Indus, and the upper that of Daman, or skirt, from its bordering on the Suliman mountains. The country is flat and in many places fertile, but to the westward of the river there are no wells. A fringe of cultivation and jungle extends along the bank of the great river, and terminates, as you advance into the interior, in a flat desert country, where a precarious supply of water from the hills affords a poor cultivation in the vicinity of the thinly scattered villages. The Tank chief is a Pathan of good family. The nawab of Dehra Ismail Khan belongs to the princely Saddozai race. South of Dehra Ismail Khan lies the large tract of Dehra Ghazi Khan, which extends as far west as the mountains and along the Indus to Sind. Its principal chiefs usually behaved well, even at times when their brethren of the hills were in a state of hostility against British subjects. The plain tribes are the Nutkani, Lund, and Dreshuk, all of them well conducted; they had a certain number of fighting men, but they were long victimized by the Bozdar and Gurchani.

The Dehra Ghazi Khan district has the Dreshuk and Mazari.

Adjoining the frontier of Dehra Ghazi Khan district are the Khutran, Kosa, Laghari, Gurchani, Murri, and Bugti.

Dehra Ismail Khan district, Bunnuchi, Murwati, Butani chiefs of Tank, chiefs of Kolache, chiefs of Dehra Ismail Khan, Nutkani, Lund.

Adjoining frontier of Dehra Ismail Khan district are Sheorani, Oosterani, Kusrani, Bozdar.

Adjoining frontier of Kohat district, Buzoti, Sipah, Orakzai, Zymoosht Afghans, Turi.

Adjoining frontier of Kohat and Dehra Ismail Khan district, Waziri.

The tribes, from north to south, of the Dehrajat frontier come in the following order :—

Pathan tribes—	*Baluchi*—Kusrani.
Ahmadzai, Waziri.	*Pathan*—Khetrani.
Utmanzai, ,,	*Baluch tribes*—
Mahsud, ,,	Bozdar. | Laghari.
Butani.	Lund. | Gurchani.
Sheorani.	Kosa. | Mazari.
Usteranah.	

—*Papers, East India* (*Cabul and Afghanistan*), 1859; *Elphinstone's Caubul; The Derajat, or Hist. of the Panjab; Aitcheson's Treaties.*

DEHWAL, in Central Oudh, a village official who performs some duties for the cultivators. He also sets up the holi, a stem of the castor-oil plant, and five pieces of cow-dung fuel, on the Basant Panchami.

DEHWAR. PERS. A villager, a farmer. The Tajak race on the northern borders of Afghanistan are called Dehgan. The Dehwar residing with the Babi, at Kalat, are supposed to be descendants of Tajak from Balkh. They are an agricultural, hard-working, poor people, who dwell in villages, and do not migrate. Their language is nearly pure Persian.—*Dr. Cooke in Bo. Med. Trans.* 1860.

DEHWAR, also written Dewar and Deehwar, in Northern India, the village deity, the deity under whose care the village is placed; the *genius loci*, to whom, at each harvest, a portion of grain is set apart. The corresponding term in the north-west is Thanapati, the lord of the place; in Bundelkhand, Gram deota or Gramma-deva. In Saugor the deity is styled Miroyea, from the fact of his being the guardian of boundaries. The Dehwar is also very commonly, and even where these local names prevail, styled Bhoomia, from Bhoom, land. The occupation of the Dehwar is very much like that of the Roman Lares rurales,

'qui compita servant,
Et vigilant nostra semper in urbe Lares.'

The Dehwar deities have various local names, such as Kutesuree, Burnaichu, Hunwut, Bhoom Sen, Chanwur, Casheenath, Munsa Ram, Hurdour, Rutnoo, Huree Ram, Jharkhund Eesoor, Kall Sen, Bisharee; ofttimes they are the spirits of good men, of Brahmans or village heroes, but who, when they become objects of worship, come to be generally considered very malicious devils; and ofttimes they are nothing but mere epithets of the Dii majores. In some places their images are of male, in others of female, figures. In many places the villagers, for fear of misrepresenting their Gramma deota, erect a stone without form or feature, like the si Deo si Deæ of the Romans, which ambiguous expression was addressed to their tutelary gods, to obviate all chance of mistake. The worship of these village gods is fixed to no stated day. In some places it occurs on the 14th of every month; in others, on the full moon of Cheyt; at others, on the full moon of Katik, and so on. The unshapen stone or log of wood is a common form of the village deity of the Peninsula; but Hanuman is a frequent form between the Nerbadda and the Kistna rivers; and to the south is the Ai, the Amman or Amma, or some deified hero, or a shapeless stone from the bed of a river. These Dehwar or Gramma deota are ante-Brahmanical; and with respect to the gods of the south of India there are many circumstances of their worship which are not of Hindu origin.—*Elliot, quoting Bombay Literary Transactions; Journal R. A. S.*, Nos. ix. and x.; *Buchanan's East Ind.* ii. pp. 138, 352, 478; *Wilson's Hindu Theatre*, i. p. 21, ii. p. 64.

DEIFIED WARRIORS are largely worshipped in the Peninsula of India. Rama, one of these, was the leader of an invasion of the southern part of the Peninsula of India and of Ceylon. He advanced into the forests of Dandakaranya, scattering the prior inhabitants as he advanced, whom he described as Rakshasa and demons, driving some of them into the forests and mountain retreats, where they still reside in a barbarous freedom, and reducing others to the state of predial slavery, in which the Pariah, the Pallar, Cherumar, and other humbled races are now dwelling in the plains. To such invasions is owing the circumstance that each province in India has its own peculiar helot race; and each range of mountains and each forest tract its own tribes of wild savages, either wholly independent, or partially subject to their more civilised neighbours in the open country. We may instance the Pahari of the Rajmahal hills on the banks of the Ganges, and from their locality westwards through all the races in the Vindhya hills, the Meena, the Mhair, the Bhil, the Koli, southwards through the Gond races in Bustar and Gondwana. Amongst the Santal, the Gond, the Kond, Chenchwar, Souriah, the Yanady, the Irular, the Kurumbar, the Beder, Kallar, to the Maleali or mountaineers in the south, an infinite succession of races and tribes, with customs and speaking languages differing greatly from the inhabitants in the plains, besides whom are numerous homeless races, as the Korava, Wadawar, Yerkalwar, and Pardi. The ancient Sanskrit writers give other names of ancient races with whom the Aryans came in contact in their advance to the Ganges, some of which cannot now be traced.

DEIOPEIA PULCHELLA, an insect common in British India. It feeds on the kernel of the seed of Phyrostigma venenosum, which contains a poisonous principle, and the excrement of its larvæ contains the poisonous principle of the bean unaltered.

DEITY. See Allah; Bhagwan; Deo; Deva; Eswara; Khuda.

DEKA-CHANG, in Cachar and amongst the Assamese, is a club-house for the grown-up young unmarried men of the tribes of the eastern frontier, who reside there from adolescence. The Garo and tribes of Central India and Archipelago also follow this custom. It is a town-house or bachelor hall, like the choultry of the south of India.

DEKHAN. India south of the Vindhya range and of the Nerbadda and Satpura, is termed the Peninsula by the British, but northern Hindus and Mahomedans call it the Dakshana or Dekhan, meaning south. At its broadest part, in lat. 22° N., it is 1200 miles across, but it tapers away towards the south, and in lat. 7° 40′ N. ends in Cape Comorin, the Indian Ocean washing its western, and the Bay of Bengal its eastern shores. A range of mountains runs along each side of this peninsula, parallel with the coast, leaving between them and the sea, in their whole length from north to south, a belt of low level land from 20 to 50 miles in breadth. These two ranges are termed the Eastern Ghats, and the Syhadri mountains or Western Ghats, and have elevations of 1200 to 3000 feet respectively; but solitary mountains and

spurs from the western range attain to 6000 and 8000 feet above the level of the sea. The Western Ghats, on the side next the sea, at places sink precipitously to the level belt below. The Eastern Ghats do not fall so abruptly; but both ranges are covered with thick forests, through which a few passes lead from the coasts into the interior of the country, which is upraised by the mountains into table-lands from 1200 to 3000 feet above the sea, the general declivity of the land being from west to east. The Bombay and Madras armies are distributed over the Dekhan, and branch out into adjoining provinces. Thus the Bombay Presidency has its troops in Gujerat, Cutch, and Sind on the north-west of the Peninsula; and the Madras troops hold British Burma, Mysore, Travancore, and Cochin. Though Dekhan signifies the south, as Poorub does the east, when applied to Bengal and its dependencies, at the present day the term is generally restricted to the Hyderabad and Dowlatabad provinces lying between Berar and the Kistna, and from the Syhadri or Western Ghats eastwards to Telingana. The Hindus and British in Northern India, however, make the Dekhan more extensive, and regard it as including all the southern table-land, supported as it were by a triangle formed by the Satpura or sub-Vindhya on the N., the Syhadri or Western Ghats on the west, and the Eastern Ghats on the east, the Satpura range constituting the base of the triangle. The length from the Satpura range to Salem, and breadth from Mahabaleshwar to Sirguja, are about 700 miles. But if Chutia Nagpur be considered as part of this great table-land, it may be said to extend nearly 250 miles further in a N.E. direction, or about 950 miles in all. Its highest parts are those nearest the Western Ghats, and in the centre of Mysore. Mahabaleshwar, in lat. 18° N., and long. 73° 45′ E., is 4700 feet; the source of Kistna, 4500 feet; source of Godavery, 3000 feet; Poona, 1823 feet; source of Manjera, 3019 feet; and the rivers rising in ravines between spurs of the Western Ghats, wind their way through Eastern Ghats across the Dekhan, the slope being in that direction. The plains of Nagpur, 1000 feet, slope to S.E., drained by Wain-Ganga, which falls into the Godavery. Hyderabad is 1800 feet; Secunderabad, in lat. 17° 26′ N., lat. 78° 33′ E., is 1837 feet. Beder, in lat. 17° 53′ N., long. 77° 36′ E., is 2359 feet. From the Wain-Ganga the surface rises towards N.E., where Rypur, lat 21° 12′ N., long. 81° 40′ E., is 1747 feet; source of Mahanadi, 2111 feet. Nundidrug, highest in Mysore, 4856 feet, slope from hence on all sides, S. to Bangalore, 3000 feet; E. to plains of Carnatic-Chitoor, 1100 feet; N. to plains of Gooty, 1182 feet; and those of Bellary plains, 1600 feet; Gooty plains, 1182 feet; Cuddapah town, 507 feet; and E. part of Cuddapah district, 450 feet.

A great outburst of greenstone or trap rock covers all Berar from the Nerbadda to Bombay, and southwards through Nirmul to Naldrug; between Naldrug and Beder, and for 100 miles north and south of Beder, are great hills of laterite. The area covered by trap in the Peninsula of India can be little less than 200,000 square miles. Except the hollow of the Loonar lake, there is no trace of any crater in this volcanic region: 20 miles to the east of Nirmul, and a few miles south of the mountains, hornblende slate occurs, resting on granite and quartz rock. The countries through which the Gatparba and the Malparba run, and the lower course of the Kistna, Bhima, and Tumbudra, and all about Kalladgi, Kurnool, and Cuddapah, are formed of strata of limestone and clay-slate. The granitic platform of the Dekhan, which intervenes between the Kistna and the Godavery, is intersected by numerous greenstone dykes, sometimes porphyritic, having for the greater part a direction from E. to W. The inhabitants of this great table-land region are nations speaking Gondi, Mahrati, Telugu, and Canarese; and for 120 miles north-west from the town of Sadashipet, running on through Beder and Dangapura, the three last languages join, and the villages are styled Si-bhasha-basti, three-tongue towns. This mingling line is in the Hyderabad Dominions, a State in subsidiary alliance formed from out of the lands of the Gond, Teling, Mahratta, and Canarese races, Persian and Urdu or Hindustani being the court languages.

Away on the N.W. of the Dekhan are the races speaking Konkani and Gujerati, to the N.E. are the Gond and the Uriya races, and the Kandh or Kondh. To the extreme south are races speaking Canarese, Tamil, and Maleala, none of all of whom, however, are reckoned as populations of Dekhan proper. Besides, there are several uncivilised savage or semi-savage races, as the Bhil and the Koli of the N.W., the Khand, the Juanga, the Sowra of the N.E., the Ramusi of the Daulatabad and Hyderabad provinces, the Dher, Mang, Mhar, Pariah, Holar, Eskar, who are mostly predial slaves, the Berud near the Kolhapur state, the Beder population in the Raichore Doab, the homeless wandering Wadara, Upara, Kathadi, Dumar, Korawa, Yerkala, Banjara, the cowherd and shepherd Dhangar and Kurubar, the hill and forest Badaga, Erular, Male Arasar.

It was not till A.D. 1471 that the Mahomedans of the Dekhan extended their arms to the Northern Circars. At this time the Uriya raja of what is now the Ganjam country, died without issue, and his adopted son, Mungul Rai, and his cousin Humner (?) became competitors for the succession. During Mahmud's time (in 1512), the Bahmani dominion was dismembered, and five Dekhani kingdoms set up. The country now known as the Northern Circars fell under the dominion of the Kutub Shahi state, whose capital was Golconda, near Hyderabad. That portion south of the Godavery became tributary without difficulty; but Wistna Doe, or Gajapati, a powerful prince of Orissa, who ruled in Rajamundry and Chicacole, withheld submission, and it was not till A.D. 1571 that his pretensions were lowered. The Northern Circars was occupied by the British in 1766. The British now rule over the Ceded Districts of Bellary, Cuddapah, and Kurnool, over the S. Mahratta country, part of ancient Daulatabad; and they have assigned to them all Berar. The Nizam holds Hyderabad; and a few small chiefs rule in the Central Provinces, in Gondwana, along the line of the Godavery, in Orissa, and near the Kistna river.—*Elliot; Annl. Ind. Adm.* xi. p. 243; *Rennell's Memoir.*

DEKHANI HEMP is prepared from the Hibiscus cannabinus. It is also called Ambaree. Dekhani brown hemp of Bombay is from Crotalaria juncea, *Linn.*

DELADA, in the Malegawa temple at Kandy, is

the most devoutly worshipped relic of their religion which is possessed by the Buddhist nations of the East. Long before the Christian era, it was adored by the Buddhist sovereigns of Orissa, and was originally deposited in the great temple of Jaganath, then a Buddhist foundation. Its first deposition in Ceylon was in the 4th century A.D. The Buddhists of Ceylon have a tradition that whoever can succeed in retaining it must of necessity become the sovereign of the country. The Chinese traveller, Fa Hian, mentions amongst the precious relics worshipped in the 5th century by the Buddhists of Ladakh, a vase in which Buddha had spat, and one of his teeth; another tooth was similarly cherished by the king of Nakia, in Afghanistan, eastward of Ghazni. In an adjoining monastery the monks preserved the cuttings of his hair and nails. Fa Hian also describes a shadow of Buddha, which was shown to him at Nakia, but admits his inability to describe the process of its preservation.—*Tennant's Ceylon*, p. 239. See Buddha.

DELAI LAMA lives in the Bouddha La monastery outside of Lhassa, and is believed to be the living incarnation of the deity. But there are four or five subordinate incarnations in different parts of Tibet and Mongolia, objects of worship in the places where they reside, and by particular sects of Buddhists. In the centre of the Bouddha La is a building of four storeys, crowned by a dome covered entirely with sheets of gold.—*Fergusson*, p. 312.

DE L'HOSTE, CAPTAIN, an officer of the Bombay army, author of Memoirs on Scinde; On the Nerbudda River; Journal of a March from Ahmadabad to Sukkur, Upper Scinde; Notes on the Meteorology of the Phoonda Ghaut.—*Dr. Buist's Cat.; Bom. Geo. Trans.* i. p. 22.

DELIMA HEBECARPA, a creeper of Penang and Java. D. Sarmentosa, *Linn.*, a shrub with small white flowers in panicles; grows in the southern parts of Ceylon up to an elevation of 1000 feet.—*Thw.* p. 21; *Riddell; Voigt.*

DELMI, also called Buya, a family who overthrew the Samani. They were from the district of Mazenderan, in which their founder was a fisherman. They seized the western provinces of Persia, seized on Baghdad and the person of the khalif, and ruled (A.D. 932-1055, A.H. 321-448) for 100 years over an extensive territory in his name. The Amir Azan, Delmi, built the dam called Band-i-Amir, the Bendamir of Europeans. —*Elph.* p. 272. See Bendamir.

DELPHINIDÆ, a family of mammals of the order Cetaceæ, or the whale tribe, which live in the ocean. Amongst them are the whales, the largest of creatures now existing; also the dolphins, the porpoises, and the dugong. They have fin-like anterior extremities, the posterior extremities being absent, or rather their place supplied by a large horizontal caudal fin or tail. They have no hair on their skin, have no outer ear, and the bones of the neck are so compressed as to leave the animal without the appearance of a neck. Some of them eat plants, or are phytophagous; some are zoophagous, or animal-eaters. Seven species of cetaceans have been described from the Bay of Bengal, six of the family Delphinidæ, the seventh belonging to the sperm whales, Physeteridæ, and called Physeter (Euphysetes) simus. The family Delphinidæ, or porpoises, has 5 genera and 14 species, viz. Delphinus, 8 species; Steno, 2 species; Neomeris, 1 species; Platanista, 2 species; and Globiocephalus, 1 species. The family Balænidæ, or whales, has 4 genera and 7 species, viz. Balænoptera, 1 species; Balæna, 4 species; Physeter, 1 species; and Phocæna, 1 species. Sub-order Sirenia, herbivorous Cetacea, has 1 genus, Halicore, and 3 species.

DELPHINÆ.

Neomeris phocenoides, *Gray*, Delphinus melas, *Terns.* A dolphin of the Indian Ocean.

Phocæna communis, Ph. Rondeletii, *Willoughby*, Delphinus phocæna, *Linn.* Common porpoise.

Grampus sakamata, *Schlegel*, Sakam kuzira, JAPAN. Found off the coast of Japan.

G. Sieboldii, Naiso gata, JAPAN. A native of the coasts of Japan.

G. macrorhynchus, black fish of the South Sea whalers, inhabits the South Seas.

Delphinapterus Peronii, right whale porpoise of whalers. Is found on the Brazil bank, off the coasts of New Guinea, and the higher southern latitudes. It lives in large shoals, and its flesh is esteemed a delicacy. It is black, but the beak, the pectoral fins, and under part of the body are white.

Delphinus.—Seafaring people call the species of this genus bottle-nose, bottle-head, flounder-head, grampus, porpoise, sometimes even whale, and give the name of dolphin to the Coryphæna, a scomberoid fish which changes colour when dying. There are several species of Delphinus recognised.

D. delphis. The dolphin attains a length of 9 to 10 feet. Greek legends make it the friend and companion of man.

D. orca, the grampus, measures 25 feet in length, and is 12 or 13 feet round. It is the most voracious of all the dolphin tribe.

D. Heavisidii, hastated dolphin, the South Sea and Cape of Good Hope.

D. obscurus, the dusky dolphin, inhabits the Southern Ocean and Cape of Good Hope.

D. abusalam, Red Sea.

D. eutropia, Pacific Ocean and Chili.

D. Novæ Zealandiæ, the New Zealand dolphin, New Zealand and Cape Gable.

D. Forsteri, Forster's dolphin, Pacific Ocean between N. Caledonia and Norfolk Island.

D. Sao, inhabits Madagascar.

D. longirostris, Cape dolphin, about the Cape of Good Hope and the Southern Ocean.

Steno Malayanus, Dolphinus plumbeus, *Dussumier, Cuvier;* Delphinus Malayanus, *Lesson apud Cuvier;* Parampuan Laut, MALAY; Dolphin ventre roux of Paris Museum. Inhabits the Malabar coast and coasts of Penang. It is numerous, and rather heavy in its movements, but is rarely captured, except by chance in the stake-nets. It eats small fishes, Clupea and Glyphisidon cœlestinus, *Cuvier.*

S. frontanus, inhabits the Indian Ocean and the Pacific.

Platanista Gangetica, *Gray*, Delphinus Shawensis, *Bl.;* D. Gangeticus, *Roxb.;* Platanista of Pliny; Dauphine du Gange, *F. Cuvier;* Sou-sou of India; Susa of Buffon. Inhabits the Indian seas, the Ganges, and Irawadi.

Halicore Dugong, Trichechus dugong, *Gmel.;* Dugungus Indicus, *Ham.*; Indian dugong, ENG.; Le dugong des Indes, FR. Inhabits the shallows of the Indian Ocean and about Ceylon, where the water is not more than two or three fathoms deep. It does not appear to frequent the land or the fresh water. Its flesh is delicate. The dugong was noticed as occurring in Ceylon by the early Arab sailors, by Megasthenes (Fragm. lix.) and Ælian, and subsequently by the Portuguese. It is this creature which has given rise to the tales about mermaids, which have till the present day occupied the world, and doubtless had their origin in the tales of the Arab sailors. They are phytophagous, or plant-eaters.

H. Indicus, *Owen*, the Malay dugong, an inhabitant of the narrow seas of the Eastern Archipelago.

H. tabernaculi, *Ruppell*, the dugong of the Red Sea, has a feeble voice, and feeds on algæ. It is about ten feet long. In February and March, bloody battles occur between the males. Its flesh, teeth, and skins are utilized.

H. australis, manate of Dampier, white-tailed manate of Pennant. It is a native of the west coast of Australia.

H. Indicus, *F. Cuvier;* Trichechus dugong, *Erxleben;* Halicore cetacea, *Illeger;* Halicore dugong, *Cuvier apud Raffles;* Halicore tabernaculum, *Ruppell;* Dugungus Marinus, *Tiedemann apud Schinz.*

Dugong of Buffon. | Parampuan laut, MALAY.
Dugong, . . . MALAY. |

Under these synonyms Dr. Theodore Cantor unites all the above, which he says inhabits the Red Sea, the seas of the Malay Peninsula, Singapore, Sumatra, the Philippine Islands, Moluccas, Sunda Islands, and New Holland.—*Cat. Mam. Mus.; E. I. C. Hartwig; English Cyclopædia*, p. 913; *Mr. Blyth in Beng. As. Soc. Journ.; Tennant's Ceylon; Dr. Theodore Cantor in Beng. As. Soc. Journal* of 11th December 1846.

DELPHINIUM, a genus of plants of the natural order Ranunculaceæ, of which several species, D. ajacis, D. Brunonianum, D. consolida, D. glaciale, and D. Oliverianum, occur in India and the south of Asia.

Delphinium ajacis, *Linn.*

Larkspur, ... ENG. | Na-furman, . . HIND.

Is cultivated in gardens in India during the cold season. The properties of the seeds agree with those of the stavesacre kind.—*O'Sh.*

Delphinium Brunonianum, *Cleg.*

Musk plant, . . . ENG. | Nepari, ... PANJ.

Grows in the Sutlej valley between Rampur and Sungnam, at an elevation of 14,000 feet. Smells powerfully of musk.—*Cleghorn's Panj. Rep.*

Delphinium glaciale, *Hooker*, of E. Nepal, is one of the most alpine plants in the world, growing at an elevation of 17,000 feet. It is abundant in the valley of the Chomiochoo near Tungu, in Tibet, and exhales a rank smell of musk.—*Hook.*

Delphinium pauciflorum, *O'Sh.*

Judwar, HIND. of BOMBAY. | Nirbisi of HIMALAYA.

A tuberous root in Sirmoor, without poisonous properties. The best comes from Lahore.—*O'Sh.*

Delphinium staphisagria, *L.*, the stavesacre or lousewort, a biennial plant, native of the Levant, Teneriffe, and Asia Minor. The powder taken internally acts as a violent cathartic and emetic. It is made into an ointment used for destroying vermin in the hair. The seeds intoxicate fish.—*O'Sh.* p. 168.

DELPHOS, a town in Greece where was an ancient oracle and place of worship, in a cave of the earth called Delphi, the word Delphi being synonymous with Yoni. See Delphi; Yavana.

DELUGE.

Tufan, . ARAB., TURK. | Diluvio, . . . IT., SP.
Ueberschwemmung, GER. |

The deluge of the Old Testament was known to the Chaldæans, the Aryan Hindus, the Parsees, the Hebrews, Christians, and Mahomedans. The last three religionists have their account of it in the 6th to the 9th chapter of Genesis, in which it is related how the Almighty, in consequence of the wickedness of mankind, brought a flood of rain for forty days on the earth, and destroyed all but Noah, his wife, his sons, and their wives, with pairs of all animals.

The Chaldeo-Babylonian narrative of the event is recorded in the great epic poem of the town of Uruk, three copies of which were made for the royal library, in the 8th century B.C., by order of Assur-bani-pal, king of Assyria, from a very ancient copy of it in the sacerdotal library of the town of Uruk, seemingly of the time of Abraham. The narrative follows with great exactness the same course as that of Genesis, which, in chapters vi. vii. viii. and ix., gives two different narratives. The cataclysm there noticed corresponds with the rising and overflow of the Tigris and Euphrates, from the middle of March to the end of May, and 26 days later the Jehovist makes Noah leave the ark.

Berosus, who had access to Babylonian records, says a god appeared to Xisuthros in a dream, prophesied a flood, and bade him bury sacred records in the City of the Sun at Sippara. The flood came, Xisuthros released birds to ascertain the state of the country, the occupants disembarked, and recovered the interred records.

The account which the Hindus have of the deluge is described in the Satapatha Brahmana of the Rig Veda, also with variations in the Mahabharata, in the Bhagavata Purana, in the Agni Purana, and in the Matsya Purana. The first of these does not indicate who was the person saved; the Mahabharata indicates Brahma, and the Puranas, Vishnu. The first of the Hindu accounts of this is found in the Satapatha Brahmana. In it the 7th Menu Vaivasata one morning caught a fish, which told him of the coming flood, and, on the advice of the fish, he built a ship, which he attached to the horn of the fish, sailed over the northern mountain, and attached it to a tree till the waters subsided, when he found all living things destroyed.

The essence of the extract from the Agni Purana is this:—'When ocean quitted his bounds and caused universal destruction by Brahma's command, Vaivaswata Menu (Noah), who dwelt near the Himalaya mountains, was giving water to the gods in the Kritmala river, when a small fish fell into his hand. A voice commanded him to preserve it. The fish expanded to an enormous size. Menu, with his sons and their wives, and the sages, with the seed of every living thing, entered into a vessel, which was fastened to a horn on the head of the fish, and thus they were preserved.' In this fable the grand northern chain is given as that to which the abode of the great patriarch of mankind approximated.

In the Puranas it is not Menu Vaivasata, the 7th Menu, whom the divine fish saves from the deluge, but Satyavrata, the king of the Dasya, the man who loves justice and truth. The Bhagavata Purana says, 'In seven days, said Vishnu to Satyavrata, the three worlds shall be submerged.'

The West Iranians, now represented by the Parsees, had a knowledge of a deluge, in which Yima, the father of the human race, was warned by Ahuramazda to hedge in a square garden (vara), and cause the germs of men, beasts, and plants to enter it, in order to escape annihilation.

The Greeks had two legends as to deluges, one connected with Ogyges, king of Bœotia, the other the Thessalian legend of Deucalion, who, by the advice of Prometheus, built a coffer, which floated at the mercy of the waves, and after ten days stranded on Mount Parnassus. The former seems connected with a rise of the lake Cupais; the latter seems to relate to the whole earth.

The great inundation recorded in the historic books of China, as having occurred B.C. 2357, in the reign of the emperor Yao, seems to have been occasioned by a rise of the Hoang-ho, a local event long subsequent to the fully historic periods of Egypt and Babylon. The date of the completion of the works undertaken by the minister Yu, to repair the damage done by this flood, lies between B.C. 2278 and 2062.

DEMAVAND, in lat. 35° 50′ N., long. 52° E., a lofty peak on the Elburz range, between Irak Ajami and Mazandaran. A high road leads from Teheran by the town of Demavand to Ask, the capital of the district of Laurijan. The hot baths of Demavand are situated in this locality, at Garmsair, near Garm-ab. They are two in number: one, the tepid bath, is situated within 100 yards of the town of Ask, on the right bank of the river. It rises in an oval basin, measuring about 30 feet by 20, and about 3 feet in depth, formed by deposit from the spring, which gushes up with great force in the centre of the basin, together with a considerable amount of gas. The water contains sulphur, iron, soda, and magnesia. The other spring, which is situated about two miles further down the valley, and on the mountain of Demavand, is so intensely hot (148°), that the water has to be conducted through canals for some distance before it is collected in an artificial basin, in which the patients bathe. This water contains magnesia, iron, and sulphur in much larger proportions. Near Ask there is also a spring of cold water, strongly impregnated with iron. From Ask a road leads down to the town of Amil, but it is extremely dangerous, lives being lost annually from mules and their riders falling over the precipice, along the face of which it runs. Demavand bears N. 65° E. of Teheran, about 40 miles distant, and its pale lofty summit forms a magnificent pyramid as it shoots up from the high range of Elburz. The cone of Demavand is doubtless of volcanic origin, and consists of a number of ridges, which run from the summit to the base, leaving between them deep ravines filled in general with snow and ice, beneath which lies a mass of debris fallen from the upper part of the mountain. The height of the mountain is 21,520 feet. The cone terminates in a crater about 85 yards in diameter, which is nearly surrounded by jagged rocks.—*Chesney*, p. 15; *MacGregor*.

DEMETRIUS. Grecian kings, successors of Alexander, rulers in Syria; there were three of this name:—Demetrius I., surnamed Soter, B.C. 162; Demetrius II., surnamed Nicator, B.C. 147; Demetrius III., surnamed Eucærus, B.C. 94.

DEMOCRITUS, there is authority for believing, went to Egypt and Babylon, but his more distant travels to India are legendary.

DEMODURA, a variety of the Saligrama.

DEMON.

Esprit, ... Fr. | Demonio, . . . It., Sp.
Geist, ... Ger. |

Demon-worship is observed amongst all the non-Aryan races in India, but is perhaps carried out to its fullest extent, and most openly, amongst the Shanar people in the south of the Peninsula. This worship has little or no similarity to any Hindu cultus, being mostly directed to appease the malignancy of evil spirits, the shades or saya of persons who have recently died. In some parts of India there is a mixing up of demon and spirit worship and hero-worship with that of the Hindu deities. In the Dekhan, the deified sage Vithoba and his early expounders are extensively worshipped as local divinities. Byroba, the local deity of herdsmen, is largely worshipped in the Dekhan, as also is Kandoba, the deified hero of shepherds. Outside almost every Hindu village in the Dekhan, is a circle of large stones, sacred to Vetal, a demon-god of the non-Aryan races. Amongst the evil genii of all India is a being or beings called Rakshasa, of giant bulk, terrible teeth, who feast on dead bodies; and the Rakshasa is recognised by Aryan and non-Aryan. The bhoot, acknowledged all over India, more resembles the ghost of Europe. The Rev. Dr. Caldwell, in his work on the devil-worship of the Shanar, has shown how continuously the people of India are making new deities or demons. On the left bank of the stream, at the village of Assaye, at which Sindia's artillery was posted during that battle, is a tree beneath which is the tomb of an officer who fell during the battle, and his spirit is punctually worshipped by all the people of the neighbourhood. Sir Bartle Frere found an order in existence at Government House, Dapoorie, handed down by each non-commissioned officer, for the native sentry on guard, to present arms if a cat or dog, jackal or goat, entered or left the house or crossed near his beat during certain hours of the night, because it was a ghost of a former governor, who was still remembered as one of the best and kindest of rulers. The raja of Wanparty, one of that Reddi race who have founded small principalities along the banks of the Kistna river, died in 1868 at Hyderabad. He had led a turbulent life, and retained to the last much of the spirit of his youth. At the close of that year an outbreak of cholera occurred in that neighbourhood, which the people attributed to the spirit of Wanparty, and they made a clay image of him, riding on an elephant, and placed near him the clay image of a Brinjari, and worshipped all with the Mahabali sacrifice. In India, the Jan, the Gin of the Arabian Nights, is only known amongst the Mahomedans. In Sind, the Jan resembles the Pwecca, or Puck of Britain; the Jan of the Baluch hills is wayward and often morose, but not necessarily malignant. He is described as dwarfish, with large eyes, and covered with long hairs, and often changes to the form of a camel, goat, or other animal. On meeting a Jan, it is essential not to be alarmed, to use civil language. The Jan can become the servant of man, and work hard.

The deep-rooted belief in devils and in demoniacal possession was proved by the mortuary statistics of the N.W. Provinces of India for the year 1865, from which it appears that in 3463 cases, the relatives of the deceased would assign no other causes of death than witchcraft, evil spirits, and devils.

In Ceylon is a class of demigods, who, under the name of Yakshyo, are supposed to inhabit the waters, and dwell on the sides of Mount Meru, and who are distinguished not only for gentleness and benevolence, but even by a veneration for Buddha, who, in one of his earlier transmigrations, was himself born under the form of a Yakshyo. The Yakka, malignant spirits of Ceylon, are the authors of indefinite evil; and the Singhalese have a demon or Sanne for each form of disease, who is supposed to be its direct agent and inflictor, and who is

accordingly invoked for its removal; and others, who delight in the miseries of mankind, are to be propitiated before the arrival of any event over which their pernicious influence might otherwise prevail. Hence, on every domestic occurrence, as well as in every domestic calamity, the services of the Kattadia or devil-priests are sought, and their ceremonies performed, generally with observances so barbarous as to be the most revolting evidence still extant of the uncivilised habits of the Singhalese. Especially in cases of sickness and danger the assistance of the devil-dancer is implicitly relied on. An altar, decorated with garlands, is erected within sight of the patient, and on this an animal, frequently a cock, is to be sacrificed for his recovery. Another kind of demon-worship in Ceylon is a debased form of Hinduism, where the priest or Kapua is the performer.

Mr. Forbes, in the Ras Mala (p. 378), says the bhoot and pret of Gujerat are believed to reside in the place where funeral piles are erected, in trees which are not used for sacrificial purposes, such as the tamarind and the acacia, in desert places, at the spot where a death has occurred, or at cross-roads,—for which reason people set at these places food for the use of the bhoot. He is most at a loss for water to drink. The pipe of his throat is, it is said, the size of the eye of a needle, and he is continually thirsty enough to drink twelve gallons of water. The watchmen of Wuroon Deo, however, are stationed wherever there is water, to prevent the bhoot from drinking, and the thirst is therefore as continual as it is intense. The bhoot feed upon all kinds of refuse. The goblin of the best class—he, that is to say, whose funeral ceremonies have been duly performed, but who has been debarred from liberation by his own intense affection for earthly objects—is called a 'Poorwuj Deo,' and resides in his own house or in a sacred fig-tree. The Poorwuj Deo, like the Etruscan Lar, or the Grecian hero, is regarded as hovering about his former abode, averting dangers from the inhabitants, and bestowing blessings upon them. He frequently appears in the character of a serpent, and is then treated with great respect by the inmates of the house near which he resides. It is a common belief in Gujerat that serpents are always to be found wherever a hoard is buried, and that these are the bhoot of the deceased owners, who have remained upon earth from affection to their wealth. The Arabian Jin also frequents cross-roads; and the fairies of the Scottish lowlands carry bows made of the ribs of a man buried where three lairds' lands meet, as in A Midsummer Night's Dream (Act iii. sec. 2):

'Damned spirits all,
That in cross-ways and floods have burial.'

'Desert places' in Gujerat correspond exactly with the 'dry places' (*ἀνύδρων τόπων*), assigned to the evil spirits in Matthew xii. 43, Luke xi. 24. The custom of placing food for spirits is very general throughout the world. In the dialogue of Dives and Pauper, printed by Richard Pynson in 1493, among the superstitions then in use at the beginning of the year, the following is mentioned: 'Alle that take hede to dysmal dayes, or use nyce observances in the newe moone, or in the newe yeere, as setting of mete or drynke by nighte on the benche to fede alholde or gobelyn.' The powers which the bhoot and pret exercise are the following: They take possession of a corpse, and speak through its mouth; they exhibit themselves in the form which they possessed when living; they enter into a living man, and cause him to speak as they please; sometimes they afflict him with fever or various other diseases; sometimes they assume the forms of animals, and frighten people by suddenly vanishing in a flash of fire; sometimes, remaining invisible, they speak in whispers. A bhoot has been known to come to fisticuffs with a man, and to carry a man off and set him down in a distant place. It is even said that women are sometimes found with child by bhoots.

The Jain Shastras teach a different doctrine in regard to spirits from that which is taught by the Puranas. They assert that there are eight kinds of Vyuntur Deo, and eight of Wan-Vyuntur Deo, who reside below the earth. Each of these has two Indra, or sovereigns, ruling respectively the northern and southern regions, and who are in colour black, white, or blue. The Vyuntur and Wan-Vyuntur Deo appear upon earth, where they possess the bodies of men, exhibit themselves in various shapes, and perform many strange feats, whence their common name of Kootohulee (or surprising) Deo. Below them reside the Bhuwunputee Deo, who also sometimes appear on earth. Below these, again, are the Narkina or infernal spirits. Above this earth, in the atmosphere, five kinds of 'Deo of splendour' reside, the sun, moon, stars, and others. Above them, in twelve Deo Loka, the Deo who ride in chariots dwell; these, sometimes drawn by their own desire, or compelled by charms, appear in the world, but they do harm to no one. Above them are nine classes of Grivek, and five of Unootur Vimani. They are of great power, and never visit the earth. Men who have lived a life of austerity and righteousness are born again in these classes of upper or lower Deo, but the sinner is not born in them. Of old, a man who had performed the rite of 'Uthum' by fasting for three days, acquired the power of calling the Deo to him; but now, it is said, these Deo never visit the earth at any one's call.

In Gujerat, where people wish to prevent the removal of a jungle tree, they paint a trident upon it with vermilion, or, if that be inconvenient, throw down a number of stones at the root of the tree. Whoever, after this, passes by, is sure to add a stone or two to the heap, believing the place to be the residence of a bhoot. If stones are not easily procurable, a bit of old rag is thrown so as to adhere to the tree, and every one who passes by follows the example once set. They call the spot the 'Rag-uncle's.' In places where trees are scarce, these 'uncles' are very common, and people are much annoyed with the dread of touching them. The name 'uncle' is given to the bhoot by women as a term of respect. Men are less superstitious. Similarly, whenever in any place there is a hillock or mound upon which a few stones have been piled one above the other, every passer-by considers himself bound to add a stone to the heap, considering that the spot is the residence of some Deo, and that if any one raise a little temple there his house will flourish. Such monuments are also set up in places where a person has been slain or wounded. Cairns of

this kind are frequently connected with the dead,—

'On many a cairn's grey pyramid,
Where urns of mighty chiefs lie hid.'

—*Rasamala, Hindu Annals*, ii. pp. 379, 387; *Brand's Hindu Annals*, ii. p. 378. See Amma; Dehwar; Devils; Devil-Worship.

DENAR, a coin of Turkish Arabia. It is the denarius of the Romans. Dirhem is the drachma, and Falus (in the singular) is the follis of the Romans (Ouseley's Travels, ii. p. 490). The denarius was reduced by Augustus Cæsar from 90 to 60 grains, and by Constantine to 40 grains. —*Prinsep; J. B. A. S.*, Sept. 1832.

DENDENG. MALAY. Jerked beef; animal muscular fibre, preserved by drying in the sun, nearly the only mode of curing flesh in the Archipelago. Dendeng is made of the flesh of deer, oxen, and buffaloes, and by the Chinese of that of the wild hog. It is a considerable article of native trade.—*Crawfurd's Dict.* p. 120.

DENDROBIUM, a genus of air-plants of the natural order Orchiaceæ, which occur in south-eastern Asia and Australia.

album.	densiflorum.	macrostachyum.
aggregatum.	denudans.	Paxtonii.
alpestre.	filiforme.	pendulum.
aureum.	formosum.	pierardi.
barbatulum.	flavum.	pulchellum.
bicameratum.	Gibsonii.	pumilum.
Cambridgeanum.	graminifolium.	purpureum.
candidum.	heterocarpum.	ramosissimum.
calceolus.	Heyneanum.	secundum.
cœrulescens.	humilis.	stuposum.
clavatum.	Jenkinsii.	sulcatum.
crumenatum.	Jerdonianum.	teretifolium.
chrysanthum.	longicornu.	

The most interesting of the air-plants on the Tenasserim coast is a dendrobium, the flowers of which are white, with a yellow lip, three or four inches in diameter, and exquisitely fragrant. The plant blossoms in March, but it flowers to the close of October, and may be seen whitening under the emerald foliage of the groves nearly six months of the year. The Burmese call it the silver flower.

Dendrobium Ceraia.

Shih-huh, . . . CHIN. | Hwang-ts'au, . . CHIN.

This Chinese species of dendrobium grows on stones.—*Smith; Mason.*

DENDROCALAMUS GIGANTEUS, *Munro*, of Malacca and adjacent islands; one of the mightiest of all bamboos.—*V. Mueller.*

DENDROCALAMUS HAMILTONII, *Nees*, ascends the Himalayas from 2000 to 6000 feet, and rises 60 feet high. Its young shoots are edible. —*Brandis; Kurz; V. Mueller.*

DENDROCALAMUS STRICTUS. *Nees.*

Bambusa stricta, *Roxb.*	B. pubescens, *Lodd.*
B. verticellata, *Rottler.*	Nastus strictus, *Smith.*
Male bamboo, . . ENG.	Sadhanapu veduru, . TEL.

The male bamboo has nearly solid stems, and is much in use for spear-shafts, building purposes, and many other uses. It is absent from Ceylon, except in a cultivated state. It is very general throughout the Madras Presidency, on the dry slopes of the mountains up to 3000 feet elevation. It is common in Bombay, Bengal, and Burma, and extends to Singapore and Java. It flowers frequently, Colonel Beddome believes every year, and does not die down after flowering.—*Beddome.*

DENDROCALAMUS TULDA. *Nees.*

Bambusa tulda, *Roxb.*	Peka bans, Pia bans, HIND.
Tulda bans, . . . BENG.	Bashine bans, . . ,,

The common bamboo of Bengal. Its tender shoots are used as pickles.

DENDROCITTA RUFA, a pleasingly coloured rufous tree magpie, of all India.

DENDROCYGNA, a genus of water-fowl, known in India to sportsmen as the whistling duck. They are common to the northern and southern hemispheres. See Aves; Birds.

DENDROPHIDÆ, a family of harmless snakes, consisting of the following genera:—

Gonyosoma oxycephalum, *Boie*, Andamans, Assam, Pegu, Mergui.
G. gramineum, *Gunth.*, Khassya.
G. rœnatum, *Gray*, Khassya.
Dendrophis pictus, *Gmel.*, Bengal, Assam, Andamans, Arabia, Pegu, Malacca.
Rhodopleuron, *Schl.*, Amboyna.
Chrysopsoelea ornata, *Shaw*, Shang-hai, Malacca.

The Dendrophis genus is common, known as tree-snakes, the name being from the Greek, Dendron, a tree, and Ophis, a serpent. They are also called whip-snakes.

DENGI is the common passage and ferry boat on the river Ganges. It is a comfortless rickety-looking boat, and dangerous to travel in. Caught by the bore even in the middle of the river, if crowded, the dengis are swamped. The punsui is a light and fast boat, longer, broader, and sharper than the dengi, and more comfortable.

DENGUE, fugitive and erratic epidemic rheumatism. This disease, when it first appeared in the British West India Islands, was called the dandy fever, from the stiffness and constraint which it gave to the limbs and body. The Spaniards of the neighbouring islands mistook the term for their word Dengue, denoting prudery, which might also well express stiffness, and hence the term Dengue became at last the name of the disease.

DENKENACOTTA, the finest forest in the Salem collectorate of the Madras Presidency. It contains sandal-wood and acha-wood.—*Cons. Rep.*

DENMARK, a kingdom in the north of Europe. Tranquebar was the first possession of the Danes in India. It was purchased by them from a raja of Tanjore. They also held Serampore in Bengal, Porto Novo on the Coromandel coast, Eddova and Kolchery on the Malabar coast, and other forts and factories. On the 22d February 1845, for £125,000 sterling, Denmark ceded, by treaty, all its Indian possessions at Balasore, Tranquebar, and Frederick's Nagore, or Serampore.

DENWAR, a name given by Mr. Hodgson to a border tribe between Nepal and the Bhot country. See Chepang; Haiyu.

DEO, Dev, Deva, Dewa. SANSK. A god, a deity; hence Dewalai or Dewal, a house of idols, a temple, a pagoda. It is the Zeus of the Greeks and Deus of the Romans, and is possibly the original of the name of Siva, often called Seo, Sheo, Shev, or Sheb; Devi is a goddess. Deo is also used to designate a demon, an idol, genii, giant, a spirit, shade, or ghost, and a hobgoblin. The village tutelary deity or Dehwar of Hindustan, the Gramadeva of S. Indus, has a portion of grain set apart at each harvest. It is commonly represented by a shapeless stone, but has distinct names, as Bhum-sen, Kateswari, Hanwat, Hari Ram. In his concluding letter on Comparative Philo-

logy, Professor Spiegel illustrates from that source the Indo-Germanic notions of the deity. Deva, Sanskrit, Latin Deus, denotes shining, glittering. It is an appellative, and occurs in the plural as often as in the singular; whence it has justly been inferred that even before their separation the Indo-Germans were polytheists; likewise Bhaga, the distributor, is used also in the plural. Well-attested names of deities are connected with Deva. Dyaus is heaven; Apam napat, aquarum nepos, is the generative power residing in the waters. See Dehwar; Demon; Devil.

DEO, seat of the Deo rajas, one of the most ancient families of Behar, in the Aurangabad subdivision, Gaya district. They trace their descent from the Ranas of Udaipur (Oodeypore). Four generations of unswerving loyalty to the East India Company and the Queen Empress have been rewarded by liberal grants of land and villages; and Sir Jai Prakash Singh, K.C.S.I., received the title of Maharaja Bahadur, with a Knight Commandership of the Star of India, for his services in 1857. It is the seat of a famous temple, at which thousands of people congregate twice a year, to hold the Ch'hat festival in honour of the sun-god.—*Imp. Gaz.*

DEOBAND, from Deo-ban, a sacred grove; a small town in Saharunpur district, N.W. Provinces, of the same name. Half a mile from the town is a small lake, the Devi-kund, whose banks are covered with temples, ghats, and sati monuments, which are much frequented. Deoband is of Hindu origin, with a legendary history of 3000 years. The Pandava are said to have passed their first exile within its precincts. The fortress was one of the earliest to fall before the Musalman saint, Sàlàr-Masaud Ghazi. A religious assembly takes place yearly in a neighbouring wood.—*Imp. Gaz.*

DEODAR. HIND. The Cedrus deodara, *Loudon*, is a valuable timber tree in the forests of the N.W. Himalaya under the Panjab Government, and in the Feudatory States of Jummu and Kashmir, in the Liawa and Uj divisions, on the banks of the Chenab, with the Bhutna, the Marru Wardwan, the Jhelum below Baramula, also the Kishenganga. The cones of the deodar are identical with those of the cedar of Lebanon; the deodar has generally longer and more pale bluish leaves and weeping branches, but these characters seem to be unusually developed in English gardens, for several persons, well acquainted with the deodar at Simla, when asked to point it out in the Kew Gardens, have indicated the cedar of Lebanon; and when shown the deodar, declare that they never saw that plant in the Himalaya. Deodar is also applied to the Chickrassia tabularis and Juniperus excelsa; and in Kulu and on the Beas, deodara is applied to the Cupressus torulosa and the Sethia Indica.—*Hooker's Him. Jour.* ii. p. 41.

DEO-DHANGA, or holy hill, is a peak in lat. 87° E., upwards of 29,000 feet high? Deo-dhanga and Mount Everest, 29,002, are about 100 miles N.E. of Khatmandu; both are midway between Gosainthan and Kangchun.—*Beng. As. Soc. Jour.* 1856.

DEO-GHANTA. HIND. Sacred metal bells.

DEOGHUR, or Byjnath, is a small town in the zilla of Birbhum, famous for its temples, visited every year by thousands of pilgrims from the North-West Provinces of India. It is situated in the great table-land which extends from near Bardwan to Dunwa Ghat, in Behar. Granite, syenite, and gneiss, traversed by greenstone dykes, are the prevailing rocks around. Veins of lead ore, partly pure, partly in the state of galena or sulphuret, traverse the principal copper vein at right angles. Both have been analyzed, and found of remarkable richness. The nearest coal is forty miles off; the nearest point on the river where the ore could be shipped for Calcutta is sixty, the road being tolerable all the way. The copper might in all likelihood be separated from the malachite by stamping and washing.

DEOGIRI, now called Dowlatabad, is about 12 miles from Aurangabad, in the Dekhan; is a scarped rock of considerable height, with a roadway leading up through the rock. Its position is commanding, and from the most ancient times was a stronghold of the rulers in that part of India. The name seems to have been sometimes written Deoghur. Ala-ud-Din, nephew and general of Jalal-ud-Din, in A.D. 1294 swept across the Nerbadda and captured Deogiri, and besides money and jewels, obtained the cession of Ellichpur and its dependencies, and the raja was further to pay tribute annually. Ala-ud-Din, on his return, was met by his uncle, Sultan Jalal-ud-Din Khilji, whom he assassinated, 1295, as he was patted on the cheek, and then ascended the throne. Subsequently he invaded and conquered Gujerat, and took its beautiful rani, Kamala Devi, into his household. About A.D. 1300 he repulsed an invasion of the Moghuls under Katallagh Khan. In A.D. 1303 he captured the fort of Chittore, but was immediately recalled to check an invasion of the Moghuls, whom he repulsed a third and fourth time in 1305 and 1306. In 1306 he sent Malik Kafur, his general, a eunuch, and who had been the slave of a merchant at Cambay, to chastise the raja of Deogiri, which Kafur effected, and also subdued the Mahrattas. In A.D. 1309 Malik Kafur captured Warangal, then the capital of Telingana. In 1310 he reduced Belal-Deo, raja of the Karnatic, with whom the Belal dynasty ended. He overran the whole of the eastern provinces as far as Ramisseram, opposite Ceylon, where he erected a mosque to commemorate his victories; and in A.D. 1311 he returned to Dehli, laden with plunder. In 1312 he despatched Kafur a second time to punish Ram Deva, king of Deogiri, and son of the former Ram Deo, who was put to death, and the kingdom annexed. He next carried his arms over all the Mahratta territory and the Karnatic, and soon after died.—*Briqq's Nizam.* See Dowlatabad.

DEO-KORA, the household god of the Garo race. It is a small bell-metal dish with embossed figures, hung up in the house and worshipped, and sacrifice offered. See Deo-Ghanta.

DEOLEE, in Rajputana, in lat. 25° 54′ N., and long. 74° 59′ E., is the headquarters of the Haraoti and Tonk political agency, comprising the states of Bundi, Kotah, Tonk, Jhallawur, and Shahpura. It is 57 miles S.E. from Nasseerabad.

DEO MUNNI? sacred beads of Assam.

DEOOLA are temples sacred to Jaganath; they rise from the foundation in a gradual slope like a sugar-loaf, with an iron image of Garuda on the pinnacle. These temples, made of brick, are ascended by a flight of steps, and contain only one room. The word is Deo-alaya, the House of God.

DEO-PANI, a stream which falls into the Brahma Kund.

DEO PATTAN, a district in the S.W. of India, in which was the temple of Somanath taken by Mahmud of Ghazni in 1024.

DEOPRAYAG, a village in the Garhwal district of the N.W. Provinces, in lat. 30° 8′ N., and long. 78° 39′ E., at the confluence of the Alaknanda and the Bhagirathi, and 2266 feet above sea-level. The united stream takes the name of the Ganges, and the point of junction forms one of the five sacred halting-places in the pilgrimage which Hindus make to Himachal. The village is perched 100 feet above the water's edge, on the scarped side of a mountain, which rises behind it to a height of 800 feet. The great temple of Rama Chandra, built of massive uncemented masonry, stands upon a terrace in the upper part of the town, and consists of an irregular pyramid, capped by a white cupola with a golden ball and spire. Religious ablutions take place at three basins, excavated in the rock at the point of junction of the holy streams.

DEORA is the tribe of the Sarohi princes, chiefs of Abu and Sarohi. It is a branch of the Chauhan Rajputs, whose cradle is said to be on the summit of Abu, whence they spread over the regions skirting the Aravalli to Ajmir, establishing many minor principalities, as Nadol, Jhalor, and others, long before the Rahtor of Jodhpur had set foot in Maroo, but were yet enjoying all the pomp of royalty in the splendid city of Kanauj. Sarohi, Abu, and Chandravati then appertained to the Pramara race; nor was it until the thirteenth century that the uncle of Kana Deo, prince of Jhalore, treacherously obtained possession of the former with its dependencies, by the slaughter of the Pramara race. The city, now the residence of the Deora princes, is comparatively of modern date, the ancient Sarohi lying behind a second range of mountains. The Rahtor and Deora are the bravest of the Rajput races. Achilgarh, or the immoveable castle, is the name of the fortress of the Deora.—*Tod's Tr.* p. 61; *Rajasthan*, ii. pp. 39, 57; *Annals of Mewar*, p. 334.

DEORHI. HIND. A threshold, a household; the household of a person of rank, generally of a Mahomedan noble, answering to the Bab of the Constantinople palace, or the Porte, also to the foot of the throne.

DEORI, priests of the Aka race. Deoshi, the sacrificial priest of the Kooch. Deota, a deity.

DEOTSA, a small plateau or table-land adjoining that of Balti. It and the Balti table-land form a territory 60 miles long and 36 broad, and are part of the territory of Balti. It is high above the forest line or birch region, and tenanted only by the marmot, with a few dwarf willows and herbaceous species as its plants. It is a thinly-inhabited steppe, 13,000 feet above the sea-level, between Skardo and Kashmir, belonging to Baltistan.—*Vigne.*

DE PAYVA. See Pedro da Covillam.

DERA BULLU, a small territory in the Kouen Lun valley, in Turkestan; the valley of the Yarkand river, near this, is 16,883 feet above the sea, in lat. 35° 49′ N., and long. 77° 31′ E.

DERAH or Diarah, HIND., answers to Chur in Lower Bengal, and signifies the long rich alluvial flats which generally line the banks of such rivers as the Gunduk, the Ganges, and the Kosai, and increase, diminish, or completely melt away, owing to the action of the stream in the rainy season.

DEREAH. HIND. Bhera, MAHR. A wood of the Nagpur forests, of great strength; the average logs are from 6½ to 10½ feet long, and from 2 to 3 feet in girth. It has a winding, and, as it were, netted grain, from which, as well as the extraordinary toughness of its fibres, butchers invariably use it for chopping blocks.—*Captain Sankey.*

DERI, a dialect of the Persian language, which is used by the Zoroastrians in Persia; it is not the Zend. It is also described as an ancient dialect of Persian spoken at Balkh, but also as the modern Persian tongue. It is derived from the Parsee, which displaced the rougher Pehlevi, though Pehlevi is still used in the sacred writings at Sherwan.

DES, Desa. SANSK. In Rohilkhand, the Des is the cleared villages on the borders of the Terai; in the Himalayan regions it means the plains of Hindustan. With the Mahrattas, it means the country between the Syhadri and Balaghat hills, the Karnatic and the Godavery river; it also means any plain, open, or champagne country. In the Dekhan it is used to signify a champagne country. Of the words derived from it and its other applications, Des is a native country; Desmukh and Despande are Mahratta revenue officers; Desai, a superintendent of a district; Desastha, Desath or Deshasth, a Mahratta Brahman; Par-desi, a foreigner.

DESERTS of Asia, biaban of the Persians, and Chul of Turkestan. A chain of deserts extend from the Canary Islands in the Atlantic Ocean to the Yellow Sea, crossing Africa and Arabia, through parts of Central Persia, Seistan, Korasan, Afghanistan, and Baluchistan, onwards to the east of the Indus, into Rajputana; and the link, broken by the Himalaya, is found in the great sand sea of the Gobi. They are mostly uninhabitable, from the absence of water and the intense heat, but have occasional oases of rich vegetation, where water springs occur, or where the Nile, the Tigris, the Euphrates, the Indus, and their affluents enrich the country. To the westward, the seas of sand of the African and Arabian wastes are seldom raised above, often sink below, the level of the ocean. To the eastward of the rich tract in Persia, Kerman, Seistan, Chinese Tartary, and Mongolia, the desert consists of series of plateaux, having from 3000 to nearly 10,000 feet of elevation.

The *Eastern Desert of Egypt*, near Jabl Gyr, has ancient green, red, and purple porphyry quarries at Jabl Dakkan (Mons Porphyritis); and breccia quarries occur at Wadi Keuch, which were worked in the time of the first Osirtasen, supposed to have been the Pharaoh who ruled over Egypt in the time of Joseph.

The *Desert of Arabia* extends from where the borders of Syria touch the Euphrates in the north, to near the coast of Hadramaut in the south. It is continued between Syria and the Euphrates; between Hejaz and Jabal Shammar and the Najd provinces, and between Yemen and Oman, and again on the east, between the provinces of Najd and Al Hasa on the Persian Gulf.

There are oases in this desert, and in the winter and after rains are scattered patches of grass, and the Bedouin find pasture on the borders; but in

the hot season the sun pours down its heat in unopposed fierceness. That part miscalled the Syrian desert by Europeans, was the Arabia Deserta of Ptolemy, and is now known as Al Hammad. That in the neighbourhood of Damascus is called Badiyah us Sham.

The *Desert of Syria* lies between Mesopotamia and the coast region of Syria and its southern part, Palestine. It is a great chalk plateau, about 1800 feet above the sea, bounded on the west side by a great depression.

Desert of Kharazm.—Between the Caspian and the Oxus is a desert tract of firm gravel, broken into undulations, and covered with a rich pasture of aromatic herbs, and water is found in some of the hollows on its surface. It is known as the desert of Khiva or Kharazm, also as the Regan, and from June to September is liable to destructive hot winds, in which man and beast perish, even the hardy camel perishing miserably. The Baluchi call this wind Julo, the flame, also Bad-i-Simoom, or the poison wind. There is great heat of skin, quickly ending in death. The approach of the wind is ushered in by an oppressive calm in the air, and a degree of heat that affects the eyes; the precaution then adopted by travellers is to cover themselves over, and lie prostrate on the earth. Pottinger says (Travels, p. 136) that any cloth, however thin, will obviate the deleterious effects of the Bad-i-Simoom on the human body.

The *Great Salt Desert of Central Persia* is called the Daria-i-Kavir. It stretches north and south across the eastern part of that country from Nishabor in the north, to Kirman on the south, and sinks to its lowest level opposite to the Seistan basin. It may be below the sea-level, and is certainly not far above it. It is the principal of the Kavir or Kafeh salt swamps of Persia. Wherever the alluvial soil of the Persian plateau is exposed to sufficient moisture, either by the overflow of rivers, by surface drainage from the hills, or by the want of sufficient slope to carry off desert rainfall, a saline efflorescence is produced, which, forming a thin whitish crust on the surface, retains the moisture beneath for a considerable time, and thus creates in winter and spring a treacherous and impassable bog. About lat. 34° N. it is 6 miles wide.

The *Great Desert of Khorasan* commences east of Koom, and stretches almost due east to the north of Khoor. From near this it turns to the south, and gradually lessens in width. At its broadest, S. of Damghan, it is about 150 miles broad, but generally where the roads cross it its breadth is from 80 to 100 miles. It is a barrier more difficult than any mountains in N. Persia and Khorasan (MacGregor, Khorasan), a desert plain without one blade of grass, one leaf of any kind, or living thing of any sort. Its dark soil is covered with a thick saline efflorescence, which glitters painfully on the eyes, and is felt crunching under the feet. Here and there are darker moist patches. The Kavir is honeycombed with holes about 9 inches deep, and the size of a man's head.

The *Desert of Kizl-Koom* (red sand) extends over an area of 35,000 square miles.

The desert called *Reg-i-Sistan* or *Reg-i-Baluchistan*, on the S.W. part of Afghanistan, extends from the highlands of Kalat to the boundary or Sarhad mountains south of Seistan. It extends from the Mushti range in the south, to the plain of Kandahar on the north, where it ends in a belt, ten or fifteen miles wide, of high desert cliffs, called Chol or dry land. The nomades pasture their cattle there in winter, as it produces a rich pasture at that season of the year.

The *Great Indian Desert*, on the eastern side of the Indus, lies between Sind and Rajputana. It is a sandy tract, but is covered with shrubs, and in places small trees grow. The population is thin, but villages are found throughout; and immense herds of camels, cattle, sheep, and goats are pastured. It is entirely destitute of streams of water, with but few hills of rock, and a large portion of the surface consists of sandhills of considerable height, called Thar or Thurr, or T'hul. When rain falls, crops of bajra (Penicillaria) are raised; and when they fail, the population live principally on the milk of cattle and on imported grain. Throughout the sandy tracts of this desert the vegetation consists of the Calligonum polygonoides (Phog, HIND.; Tob, SIND.), Ærua javanica (Bhui, HIND.; Bahusa, SIND.), Anabasis multiflora (Lana, HIND.), and Mart, a coarse grass growing in tufts, abounding on the sandhills, and spreading for miles on the plains. Phog and Bhui, also Orthanthera viminea (Kip, HIND.), are peculiar to the sandhills. Between the sandhills, Calotropis procera, Salvadora Persica, Acacia rupestris (or Kejri), Capparis aphylla, Zizyphus jujuba, and a few other plants, are commonly found. After rain, numerous herbs spring up, and a grass called Brut (? Cenchrus biflorus), the spiny seeds of which attach themselves to one's clothes like burrs. Divested of their spiny covering, they are made into a kind of bread. Birds are numerous; hyænas, wolves, jackals, the desert fox, Vulpes leucopus, V. Bengalensis, also Lynx Felis caracal occur; and the desert jerhoa rat, Gerbillus hurrianæ, in incredible numbers, perhaps a burrow in every square yard.

A traveller proceeding from the 'Khachee' or flats of Sind to the east, sees the line of the desert distinctly marked, with its elevated teeba or sand ridges, under which flows the Sankra, which is generally dry, except at periodical inundations. These sandhills are of considerable elevation, and may be considered the limit of the inundation of the 'Sweet-river,' the Meetha Muran, a Scythic or Tartar name for river, and by which alone the Indus is known from the Punjnud to the ocean. The teeba or sandhills occupy a large tract in Eastern Sind, extending the whole length of the province along the edge of the Indus alluvium. They are in ridges which run E. and W. or N.E. and S.W. Sir B. Frere says some of them are 400 or 500 feet high.

The Runn, Ran, or Rinn is a salt marsh, 150 miles broad, into which the Loni or Looni or salt river enters, and then runs on to the sea. The Looni rises in the Aravalli. In Marwar it separates the fertile land from the desert, afterwards runs through the Chauhan territory, dividing it into the eastern part, called Raj-Bah or Sooi-Bah, and the western part, called Parkar or 'beyond the Khar or Looni.' The Kaggar rises in the Siwalik Hills, flows under Bhatnair walls, and once emptied itself between Jeysulmir and Rori Bukkur. The rainfall is 18 inches at Nagar Parkar, 11·8 inches at Omerkot, but much less near Jeysulmir and the centre of the desert.

The Desert of India is known on its borders as Maroost'hali, the region of death, from Mri, SANSK., to die, and St'hali, arid or dry land, but is also known as the desert of Rajputana. Maroost'hali is bounded on the north by the flat skirting the Gara; on the south by the Runn, and Koliwara; on the east by the Aravalli; and on the west by the valley of Sind. It covers an area of 77,600 square miles. But for the Aravalli, which runs N.E. and S.W., dividing Rajputana into two equal parts, Central India would be submerged in sand; nay, lofty and continuous as is this chain, extending almost from the sea to Dehli, wherever there are passages or depressions, there floating sand-clouds are wafted through or over, and form a little t'hul even in the bosom of fertility. Whoever has crossed the Bunas near Tonk, where the sand for some miles resembles waves of the sea, will comprehend this remark. This desert has small scattered spots of fertility, with great arid portions called thar, thur, or t'hul, denoting tracts particularly sterile, therefore the converse of the oasis of the Greeks, and each with a distinct name, as the t'hul of Kawur, the t'hul of Goga, and others. A tradition exists to the effect that in remote ages it was ruled by Powar or Pramara Rajput princes from nine fortresses, viz. Poogul, Mundore, Maru, Abu, Kheralu, Parkar, Chotun, Omerkot, Arora, and Lodorva. From Bhalotra on the Looni, throughout the whole of Dhat and Oomra-i-Soomra, the western portion of Jeysulmir, and a broad strip between the southern limits of Daodputra and Bikanir, there is real solitude and desolation. But from the Sutlej to the Runn, a space of 500 miles of longitudinal distance, and varying in breadth from 50 to 100 miles, numerous oases are found, where the shepherds from the valley of the Indus and the T'hul pasture their flocks. The springs of water in these places have various appellations, ter, par, rar, dur, all expressive of the element, round which assemble the Rajur, Soda, Mangulia, and Sahrai, inhabiting the desert. The whole of Bikanir and that part of Shekhavat north of the Aravalli are comprehended in the desert. Jeysulmir is nearly in the centre of what may be termed entire desert, is in fact an oasis, but the largest oasis of the desert, everywhere insulated by immense masses of t'hul, some of which are 40 miles in breadth. The rock on which the castle is built has three peaks or tri-cuta. Westward from this, from 400 or 500 miles, with 100 or 200 miles in breadth, are little scattered oases, on which the shepherds of the desert have their huts.

The whole of the Bikanir principality, with the exception of a few isolated spots or oases scattered here and there, consists more or less of sand. From the eastern to the western boundary, in the line of greatest breadth, it is one continuous plain of sand, though the teeba or sandhills commence in the centre of the country, the principal chain originating in the tracts bordering the eastern valley of the Indus, and terminating its elevations about the heart of Bikanir. On the N.E. quarter, from Rajgurh to Nohur and Raotsir, the soil is good, being black earth, slightly mixed with sand, and having water near enough to the surface for irrigation; it produces wheat, gram, and even rice in considerable quantities. The same soil exists from Bhatnair to the banks of the Gara. The whole of the Mohilla tract is a fertile oasis, the teeba just terminating their extreme offsets on its northern limit; being flooded in the periodical rains, wheat is abundantly produced. In 1881, the population of Bikanir was 509,021.

The deterioration of the Bikanir region, within three centuries since the Rajput supplanted the Jit, almost warrants our belief of the assertion that these deserts were once fertile and populous. The princes of Bikanir used to take the field at the head of 10,000 of their kindred retainers. The commercial towns of Churu, Rajgurh, and Rinne, as entrepôts, supplied the country with the productions of Sind and the provinces to the westward, or of those of Gangetic India. The same cause affected Jeysulmir, Bikanir, and the more eastern principalities. The Maldote of Jeysulmir, and the Larkhani of Jeypore, were as notorious as the Beedawut of Bikanir; and to these may be added the Sahrai, Khossa, and Rajurh, in the more western desert, who in their habits and principles Tod described as demoralized as the Bedouins of Arabia. The line of greatest breadth of Bikanir extends from Poogul to Rajgurh, and measures about 180 miles, while the length from north to south between Bhatnair and Mahajin is about 160 miles; the area may not exceed 22,000 miles. Formerly they reckoned 2700 towns, villages, and hamlets scattered over this space, one-half of which are no longer in existence. The tract to the N.W. of Jaetpur in Colonel Tod's time was perfectly desolate, and nearly so from that point to Bhatnair; to the N.E. the population was but scanty, which observation also applied to the parts from the meridian of Bikanir to the Jeysulmir frontier; while internally from these points it is more uniform, and equals the northern parts of Marwar. Three-fourths of the people are Jit; the rest are their conquerors, descendants of Beeka, including the Sarsote Brahmans, Charans, Bards, and a few of the debased classes, whose numbers are not one-tenth of the Rajputs. In Colonel Tod's time the Jit were the most wealthy as well as the most numerous portion of the community. Many of the old Bhumia landlords, representatives of their ancient communal heads, were men of substance. *Sarsote*, properly Saraswati, Brahmans are found in considerable numbers throughout this tract. They aver that they were masters of the country prior to the Jit colonists. They are a peaceable, industrious race, and without a single prejudice of the order. They eat meat, smoke tobacco, cultivate the soil, and trade even in the sacred kine. The *Charan* are the sacred order of these regions. The warlike tribes esteem the heroic lays of the Bard more than the homily of the Brahman. The Charan are throughout reverenced by the Rahtor, and hold lands, literally, on the tenure of an old song.

The *Jhallawar* or *Jhalore* tract is one of the most important divisions of Marwar. In 1881 its population was 340,488. It is separated from Sewanchi by the Sookri and Khari, which, with many smaller streams, flow through them from the Aravalli and Abu, aiding to fertilize its 360 towns and villages, forming a part of the fiscal domains of Marwar. The important fortress of Jhalore, guarding the southern frontier of Marwar, stands on the extremity of the range extending north to Sewanoh. *Sewanchi* is the tract between

the Looni and Sookri. Macholah and Morseen are the two principal dependencies of Jhalore. Beenmal and Sanchore are the two principal divisions to the south, each containing 80 villages. Bhadrajoon, a fief of Jhalore, has a Joda chief and Meena population.

The *T'hul of Goga* is very thinly inhabited; it has many sandhills, t'hul-ka-teeba.

The *T'hul of Tiruroe* lies between Goga Deo and Jeysulmir.

The *T'hul of Khawar* is between Jeysulmir and Barmair, in the most remote angle of Marwar.

Barmair t'hul, also called the *Malli-nat'h-ka-t'hul*, is occupied by cattle-breeders.

The *Kherdur*, or land of Kher, and Nagar Gooroh, on the Looni, are the chief t'hul.

The *Chauhan Rajput* of the desert has, on the N. and E., the above tracts of Marwar, to the south Koliwara and the Runn, to the west the desert of Dhat. The sterile ridge which passes through Chotun to Jeysulmir passes west of Bankasir on to Nagar Parkar. The wells are 65 to 130 feet deep. The Sahrai, Khossa, Koli, and Bhil inhabitants are predatory. The Chauhan Rajput does not wear the zonar, and does not much respect the Brahmans. The Pit'hil and Banya are farmers and traders.

Malli and Noe, gardeners and barbers, are important members of every Rajput family, and to be found in all the villages, of which they are invariably the cooks.

Choora and Thaori were, in Colonel Tod's time, actually castes of robbers,—the former from the Lakhi jungle, the latter from Mewar. Most of the chieftains had a few in their pay, entertained for the most desperate services. The Bahaderan chief had expelled all his Rajputs, and retained only Choora and Thaori. The Choora were highly esteemed for fidelity, and the barriers and portals throughout this tract were in their custody. They enjoy a very singular perquisite, which would go far to prove their being the aborigines of the country, namely, a fee of four copper coins on every dead subject, when the funeral ceremonies are over.

The *Rahtor* of Bikanir bear a martial reputation. The Rahtor of the desert have fewer prejudices than their more eastern brethren; they will eat food without inquiring by whom it was dressed, and will drink either wine or water, without asking to whom the cup belonged. They would make the best soldiers in the world if they would submit to discipline, as they are brave, hardy, easily satisfied, and very patient; but in the inordinate use of opium, and smoking intoxicating herbs, are said to exceed all the Chatees Rajcula, the thirty-six royal tribes of India. The piala or 'cup' is a favourite with every Rajput who can afford it, and is, as well as opium, a panacea for ennui, arising from the absence of all mental stimulants, in which they are more deficient, from the nature of the country, than most of their warlike countrymen.

Bhatnair, now an integral part of Bikanir, was anciently the chief abode of another Jit community, so powerful as at one time to provoke the vengeance of kings, and at others to succour them when in distress. The Bhatti annals confirm what might have been assumed without suspicion, that to a colony of this race Bhatnair owes its name, though not its existence. The whole of the northern part is called Nair in the ancient geographical nomenclature of Maroost'hali; and when some of the Bhatti clans became Mahomedan proselytes, they changed the vowel a to u, to distinguish them from the parent stock, viz. Bhatti for Bhutti. In all probability, the Yadu-Bhatti is the original Yuti colony from Central Asia; and the Jit prince of Salpur was the predecessor of these very races. Bhatnair has attained great historical celebrity, from its position being in the route of invasion from Central Asia to India. It is more than probable that the Jit race who resisted the advance of Mahmud of Ghazni in a naval warfare on the Indus, had long before that period established themselves in the desert as well as in the Panjab; and as we find them occupying a place amongst the thirty-six royal tribes, we may infer that they had political power many centuries before that conqueror. In A.D. 1205, only twelve years after the conquest of India by Shahab-ud-Din, his successor Kutub-ud-Din was compelled to conduct the war in person against the Jit of the northern desert, to prevent their wresting the important post of Hansi from the empire; and when the unfortunate and intrepid queen Razzia, the worthy heiress of the great Firoz, was compelled to abandon her throne to a usurper, she sought and found protection amongst the Jit, who, with their Scythic brethren the Ghikar, assembled all their forces, and marched, with their queen at their head, like Tomyris of old, to meet her foes. She was not destined to enjoy the same revenge, but gained a glorious death in the attempt to overturn the Salic law of India. Again, in A.D. 1397, when Timur invaded India, Bhatnair was attacked for having distressed him exceedingly on his invasion of Multan, when he in person scoured the country, and cut off a tribe of banditti called Jit. In short, the Bhatti and Jit were so intermingled, that distinction was impossible. Shortly after Timur's invasion, a colony of Bhatti migrated from Marote and Phoolra, under their leader Bersi, and assaulted and captured Bhatnair from a Mahomedan chief.

The Indian desert differs very materially from that portion of the great African desert in the same latitudes. Water at 20 feet, was found at Mourzuk by Captain Lyon; this, in the Indian desert, is unheard of. At Daismok'h, near the capital, the wells are more than 200 cubits, or 300 feet, in depth; and it is rare that water fit for man is found at a less distance from the surface than 60 feet, in the tracts decidedly termed t'hul or desert; though some of the flats or oases, such as that of Mohilla, are exceptions, and abundance of brackish water fit for cattle is found throughout at about 30 feet. All the wells are lined with basketwork made of p'hok twigs, and the water is generally drawn up by hand-lines. Water is sold in all the large towns by the Malli race, or gardeners, who have the monopoly of this article. Most families have large cisterns or reservoirs called tanka, which are filled in the rainy season. They are of masonry, with a small trap-door at the top, made to exclude the external air, and having a lock and key affixed. Some large tanka are established for the community, and this water keeps sweet for eight and twelve months' consumption.

It was through this tract that Humayun sought refuge to the Dhat country; and at Omerkot, its capital, Akbar was born. Omerkot was

wrested from the Soda race by the Rahtor tribe of Marwar, and since then the chiefs of the expelled clan have dwelt in Chore, 15 miles N.E. of Omerkot. At one time, every third year brought famine. The Soda women of this desert tract of Dhatta are proverbially handsome. In this desert and in the valley of the Indus are the Soda, Cat'hi, and Mallani, descendants of the Sogdi, Cat'hi, and Malli, of Getes and Yuti, many of whom call themselves Baluch, or keep the ancient name of Numri, whilst the Zj'hut or Jut retain their primitive appellation; also remains of the Johya and Dahya, who, with the Gete, Jut, or Hun, hold places amongst the 36 royal races of ancient India. The Baraha and Lohana tribes are there, the Sahrai, the great robber of the desert, the Bhatti, Rahtor, Joda, Chauhan, Kaorwa, Johya, Sultano, Arora, Khoomra, Sindil, Maisuri, Bishnavi, Jakhur, 'Shiag, Ashiag, and Pooniah.

The origin of the Mahomedan Kullora and Sahrai is doubtful, but the Nyad or proselytes from Rajput or other Hindu tribes are Jut, Rajur, Oomra, Soomra, Mair or Mer, Mor or Mohor, Baluch, Loomri or Looka, Sumaicha, Mangulia, Baggreah, Dahya, Johya, Khairowi, Jangurea, Oondur, Bairowi, Bawuri, Tawuri, Chrendea, Khossa, Sudani, Lohana. These converts were ferocious and intolerant.

Arora, a thrifty race, tradesmen and farmers.

Bhattiah, formerly martial, now traders like the Arora, and both these have commercial agencies all over India.

Brahman, Bishnavi, cultivators and graziers, numerous in Dhat, some in Chore and in Omerkot, Dharnas, and Mitti.

Daodputra, founded by Daoud Khan from Shikarpur.

Dhote or *Dhati*, like the Kaorwa, a pastoral race of Dhat; their cows give 8 or 10 seers of milk daily.

Kaorwa, a peaceable nomade race, chiefly in the t'hul of Dhat, rear cattle.

Kullora and *Talpur*, Sind tribes, which furnished the last two ruling dynasties. The Kullora claim descent from the Abbasside khalifs, and the Talpuri from Mahomed, but both seem to be Baluch, which are essentially of Jit or Gete origin. The Talpuri (Tal or Tar, Borassus flabelliformis or palmyra, and Pura, a town) amount to one-fourth of the population of Hyderabad, which they call Lohri or Little Sind. There are none in the T'hul.

Lohana, numerous in Dhat and Talpura; they are scribes and shopkeepers.

Jakhur, *'Shiag*, and *Pooniah*, harmless, industrious, in the desert and the valley, are denominations of the Jit race, but most of these sections have became Mahomedans, and call themselves Zj'hut.

Johya, *Dahya*, and *Mangulia*, once Rajputs, are now Mahomedans; are few either in the valley or desert, as also are the Baluch, Bairowi, Khairowi, Jangurea, Oondur, and Baggreah, descended from the Pramar and Sankla Rajputs.

Zj'hut, *Jut*, or *Jit*, dwell in Sind from the sea to Daodputra, but not on the T'hul. They are the oldest of the proselytes to Mahomedanism.

Mair or *Mer*, of Bhatti origin.

Mor or *Mohor*, of Bhatti origin.

Noomri, *Loomri*, or *Looka*, all of which mean fox, a subdivision of the Baluch race.

Oomra and *Soomra* are converts from the Puar or Pramara race; have mixed largely with Mahomedans.

Rajur, a convert from the Bhatti, cultivators, shepherds, and thieves, and evil-livers.

Rebarri, a race who in Hindustan profess Mahomedanism, and rear camels, here were a tribe who rear camels, or, with the Bhatti, stole them.

Sahrai is the most numerous of the Mahomedan tribes of the desert, of which he was the terror. The Khossa is a branch of the Sahrai, whom in habits he resembles, plundering on camels, but they are cowardly and faithless.

The *Soda* is scattered over the desert, some are Mahomedans; the Sumaicha is a Mahomedan proselyte from the Soda.

Sumaicha, converts to Mahomedanism from the Soda race; some are pastoral, some are plunderers. They are dirty, and never shave.

Tawuri, *T'hori*, or *Tori*, dwell in the t'huls of Daodputra, Beejnote, Noke and Noakote, and Oodur; they own and hire out camels, but, like the Bawuri and Khengar, are great thieves, and are called 'bhoot,' or evil spirits, and sons of the devil.

Desert of Gobi. The great highway between Pekin and Europe from time immemorial, has been the caravan tract from the western end of the great wall across this desert. The route issues from the western end of the great wall, and, moving through the Kiayu pass, has to traverse N.W. 500 miles of a desolate sand tract to reach the city of Khamil. At this town the road bifurcates, the upper branch leading through Barkul, Urumchi, and Kurkur-usu into Zungaria; the lower through Pijan, Turfan, Karashar, and Kuchu to Aksa in Eastern Turkestan. While Chinese rule prevailed, Zungaria and Eastern Turkestan formed the province of Ili.

Gobi desert in 1860 reached within 6 miles of the town of Ilchi on the N.E., but its shifting sands move along in vast billows, overpowering everything. Mr. Johnson was told that on one occasion, in the space of 24 hours, 360 towns were buried. Ilchi and Yarkand are said to have been founded after this event. Near Ilchi, the edge of this desert has the appearance of a low range of broken hills, and consists of hillocks of moving sand, varying in height from 200 to 400 feet.

The belief that wildernesses are haunted places, is a very old and general one. Jesus himself, in a very solemn passage (Luke xi. 24), adopts the Jewish phraseology as to this belief. Pliny says (vii. 2) that in the deserts of Africa phantoms in human shape appear to travellers, and immediately vanish again. But the belief is especially prevalent among the nations of Central Asia. By them deserts are held to be the especial headquarters and rendezvous of malignant spirits; hence the wilderness of Turan, and particularly the great sand waste of Gobi, have from hoar antiquity had an evil fame. The Turks have a saying that evil spirits play at ball in desert places. Both Fa Hian and Marco Polo allude to the evil genii of the deserts of Central Asia; and Rubruquis tells of a frightful defile, where the demons were said to snatch travellers off their horses. The Afghans believe each of the nume-

rous solitudes in the mountains and deserts of their country to be inhabited by a lonely demon, whom they call the Ghol-i-Biaban, or spirit of the waste, a gigantic and frightful spectre, which devours passengers.—*Schmidt*, p. 352; *Yule's Cathay*, i. p. 157; *Tod's Rajasthan*, i. p. 19, ii. pp. 196, 202, 211, 289; *Mignan's Travels*, p. 32; *MacGregor, Khorasan; Mr. Johnson, R. Geog. Soc. Jr.* 1867; *Sir Bartle Frere on the Runn of Cutch; Pottinger's Travels; G. Rawlinson*, i. p. 1; *Major R. D. Upton*, p. 165.

DESHASTH. MAHR. A native country. Deshasthulu, natives. Deshasth is a term by which the Brahmans of Maharashtra are designated. They are described as a class of sedentary habits, extremely fond of their native place, very fond of display, and fond of rich and splendid clothes. On occasions of marriage and other festival ceremonies, they are lavish. Deshastha Brahmans have acquired some literary celebrity, and have been largely employed under the several governments of India, chiefly in the revenue departments. The few Prakrit poets that have made their appearance are Deshasth, such as Wamon, Moropant, and Jagnath. Deshasth Brahmans are better-featured than the Konkanasths, but the Konkanasth Brahman is fairer.

The social and political life of the Konkanasth Brahmans has undergone a complete change since the beginning of the 18th century. Before that they were solely an agricultural class of people, visiting towns only on very unavoidable occasions. They possessed a good knowledge of the Vedas and Shastras, and were liberally rewarded on that account by the patrons of those branches of learning. They rarely held offices under Government, or in mercantile houses; on the advent of the British, they were compelled to look out for employment, and they at once spread all over the extensive table-land of Syhadri, called the Desh. Every department of Government contains Konkanasth Brahmans, and they have shown themselves active, intelligent, liberal-minded men. The Deshastha from time out of mind have been in the possession of the rich table-land, and been Zamindars, Deshmukhs, Deshpandies, etc. They have never been distinguished for their knowledge of the Vedas or the Shastras. Once they were in sole possession of Government offices, but they have been greatly thrown into the background by the Konkanasth. All the lower class of offices, such as village accountants, etc., are, however, still in their hands.

DESI, indigenous, belonging to the country. Par-desi, a foreigner, a stranger, a native of Northern India.—*Elliot; Wilson.*

DESIDERI. Père Desideri, a missionary, started from Goa in November 1713, and, passing through Dehli and Kashmir into Baltistan, arrived at Leh or Ladakh on the 25th June 1714, and remained there for an entire year. From thence he continued his journey, in the autumn of 1715, to Lhassa, by a route of extreme elevation and great cold, which occupied from August 1715 to March 1716. Desideri found the temporal sovereignty of Lhassa in the hands of a Tartar prince (a Si Fan), who had recently conquered the country. —*Prinsep's Tibet*, p. 15.

DESIMA, the commercial site long occupied by the Dutch in Japan. It stands upon, and wholly covers, a little artificial fan-shaped islet, about 600 feet in length by 240 in breadth, and is joined to the island and town of Nagasaki by a small stone bridge, at the end of which was a strong Japanese guard-house. — *MacFarlane's Japan*, p. 54.

DES-KULKURNI, under the Mahratta government, a revenue officer.

DESMANTHUS NATANS. *Willde.*

Pani najak, . . BENG. | Sunday kiray, . . TAM.

This sensitive plant, with reddish flowers, floats in the tanks of India. Spongy bodies, formed between the joints, act as floats. When the water leaves it, it soon perishes. The leaflets and pods are eaten by the natives.—*Jaffrey; Voigt; Thwaites.*

DESMODIUM, a genus of small trees and bushes of the natural order Fabaceæ. Voigt enumerates twenty-eight species in India. The bark of D. argenteum is steeped in water and made into ropes, which, when as thick as the wrist, bore a heavy strain where English rope snapped. The bark of D. tiliæfolia is also made into rope, and its leaves are the shal-purni of the Panjab bazar. Dr. Cleghorn says the Desmodium paper shrub is exceedingly plentiful in the districts of Chota and Bara Banghal, and in the Ravi valley; the plant having a wider range, and the bark being more easily stripped off, the fibre would be available in the plains at less cost than that of Daphne papyracea.—*Drs. J. L. Stewart, Panjab Pl.; Voigt, Riddell, Cleghorn, Panjab Report.*

DESMODIUM ARGENTEUM. *Wall.*

Sambar, . . . CHENAB. | Muss, Chiti of . SUTLEJ.
Pri, ... RAVI. | Martan, Mort, . ,,

A shrub of some size, which is found on several of the rivers, where the climate is somewhat dry, at from 3500 to 9000 feet. In Kanawar its bark is used for ropes, after steeping in water. These are not lasting, but very strong; and on the Hindustan and Tibet road, when plaited as thick as the wrist, were found to stand under a heavy temporary strain when English rope snapped. Cleghorn states that in Kanawar the bark is used for making paper.—*J. L. Stewart, M.D.*

DESMODIUM GYRANS, *D. C.;* Hedysarum gyrans, *Linn.* This small plant has pale yellow flowers, tinged with blue; its leaf is composed of three parts, a large broad leaf, having at its base two straight leaves. And during the entire lifetime of the plant, night and day, in drought or in humidity, exposed to the sun or in darkness, these small leaves make unceasingly little droopings, somewhat resembling the movements of the second hand of a watch. One of the two rises, and at the same time its twin leaf falls to a like amount. When the first descends the second remounts, and so on. These movements are more or less rapid in proportion to the heat and moisture of the weather. In India, these have been counted up to sixty regular falls in a minute. The large leaf makes similar movements, but less marked.

DESMODIUM TILIÆFOLIUM. *Don.*

Kathi, ... BEAS. | Chamkat, . . JHELUM.
Gurkats, ... CHEN. | Marara, . . . KANGRA.
Dud shambar, . . ,, | Kalanchi, . . . PANJ.
Gur shagal, . . . ,, | Pirhi, Pri, . . . RAVI.
Chamgar, Chamra, JHEL. | Laber, Kali-mort, SUTLEJ.

This large, pretty flowering shrub grows near all the Panjab rivers at 2800 to 8000 feet of elevation. It is browsed by cattle; the twigs are

used for tying loads; and its tough bark is recommended for papermaking. Its lilac-coloured flowers grow in clusters.

DESMODIUM TRIFLORUM. *De Candolle.*

D. heterophyllum, *D.C.*	H. stipulaceum, *Burm.*
Hedysarum trifl., *L.*, *Willd.*	Æschynomene trifl., *Poir.*
Kudalia, . BENG., HIND.	Munudna-muddu, . TEL.

Grows in Bengal and Peninsular India in several varieties. The fresh plant is applied to indolent sores.—*Drury; F. v. Mueller.*

DESMOSTEMON ZEYLANICUS. *Thw.* Walkakunu-gaha of the Singhalese. Central province of Ceylon, up to 4000 feet. Timber used for ordinary work.—*Wright; Fergusson.*

DESMUKH or Deshmukh, a hereditary native officer under the Mahratta governments, exercising chief police and revenue authority over a district. In the Akola district of Berar there are many Mahomedan Deshmukhs, descendants of Mahratta and Brahman converts.

DESPANDYA, the hereditary revenue accountant of a district.

DESWAL, a tribe of Taga, in villages of Bhagpur.

DESWALA. HIND. Applied by Mahrattas to a native of the N.W. Provinces.

DESYADES. PANJ. Land beyond the influence of inundation.

DETERGENTS. The Hindu and Mahomedan natives of India employ the following vegetable substances as detergents in the place of soaps:—Elupa kottai, kullee munnoo, kuppu munjal, kusthoori munjal, mara kalam pattai, nalla yennai, patchi pairu, ponnung kattai, sikai, sikaranthool, vellum cumboo.

DETICUS, *sp.*, insects of the grasshopper tribe; they are kept by the Chinese in cages, for combating. They live for months in captivity.—*G. Bennett*, p. 271.

DEUTZIA STAMINEA.

Phul kanri . of HAZARA.	Sai . . . . of CHAMBA.
Phurili . . of KASHMIR.	Aruchi, Deus, of BUSHAHR.

A small-sized Panjab wood, white and close-grained. The Deutzia genus is of the natural order Philadelphaceæ. The leaves of D. scabra of Japan are so rough, that they are used for joiners' work.—*Powell.*

DEVA, a deity; Devi, a goddess. The term is Sanskrit, and from the root Div, to shine, or Diu, the sky, the air, and is written and pronounced Deo, Deb, Dewa. Deva is cognate with the Latin Deus, Greek Ζεύς, Lithuanian Diewas, modern Persian and Hindi Deo,—Dewal (deo and alaya) being the house of God. Maha-deva, a title given to Siva by the Saiva sect, means great or supreme god, as Maha-devi, his wife,—title of Bhavani or Parvati,—means the supreme goddess. Deva, however, may equally, by the Vaishnava, be Vishnu. The word may also denote an idol, a man of high rank or sovereign, or a Brahman, or as a cognomen suited to Brahmans, as Chandra-deb. Amongst the compounds of this word are Dewal or Deval, a Hindu temple, from Deva-alaya, a house of God; Deva-sena, from Deva, a god, and Sena, a soldier; Deva-jani, from Deva, a god, and Jaya, a wife; Devarshi, from Deva, a god, and Rishi, a sage. The Devata are subordinate deities in Hindu mythology; divine beings, celestials. They are not superior deities, nor are they deified mortals. The Devata people Swarga, the paradise of Indra, but are found also in Kailasa, that of Vishnu. When the Western Aryans broke off from their brethren the East Aryans and rejected the worship of their gods, the word Deva, which they specially applied to them, came to have a meaning equivalent to fiend, devil. The last term comes from the Greek, Latin, Italian, French.

Amongst the Hindus, there are three kinds of Devata, or deities to whom worship is given,—the Gramadevata, or village god; the Kula Devata, the race or household or family god; and the Ishta Devata, the patron or personal deity of individuals. Adhi-devata is a primitive deity, Sthana Devata is a local deity. The Aryan Hindu does not recognise the village gods of S. India, but the non-Hindu Turanian races largely worship them; and even many of those Turanian races who have been converted to Hinduism worship them. They are mostly shapeless pieces of wood or stone smeared with vermilion, and mostly represent evil spirits or devils. These are the Amma, Ammun, and Amür of the eastern and southern parts of the Peninsula, and the Satwai, Bhairo, Massoba, Chamanda, Asra, Ai, and Marri-ai of the northern and western parts of the Peninsula, all of whom are recognised as causing harm to individuals. In health they are neglected; but when sickness occurs, either to individuals or as an epidemic, these spirits of evil are worshipped with much solemnity, and bloody sacrifices are made to them of goats and sheep and bullocks and buffaloes.

DEVA-DARA. HIND. Cedrus deodara, *Loud.*; Erythroxylon areolatum? Devadaram, TAM., is Sethia Indica, *D.C.*; and Guatteria longifolia, *Wall.*

DEVA-DARSANA. SANSK. In the south of India, a visit to an idol by a bride and bridegroom, with their friends, at a particular period after marriage.

DEVA-DASA. SANSK.

Hierodulæ of BABYLON.	Murali, ... MAHR.
Dancing girls, . . ENG.	Balladeiras, . . PORT.
Temple ,, . . ,,	Basava, ... TEL.
Bayadere, . . . FR.	Jogin, Bhavin, . . ,,

To the temples of Venus in Western Asia, and in later times in Greece, large bodies of hierodulæ were attached, who were at once prostitutes and ministers to the goddess. The daughters of the most illustrious families in Armenia passed from the service of the goddess Anaitis into matrimony with those of equal rank, and no stain adhered to them from their former mode of life. We find traces of the same usage in the distant settlements of the Phœnicians on Mount Eryx, and at Sicca Venerea in the Carthaginian territory. In Babylon, no woman, of whatever rank, could escape the obligation of once prostituting herself in the temple of Mylitta. This debt once acquitted, as the necessary preliminary to marriage, they were ever afterwards faithful to its obligations, with whatever price they might be tempted. In Hindu mythology, the Deva-dasa are the courtesans of Swarga, the heaven of Siva. The earthly Deva-dasa women, or dancing girls in attendance at the temples of the Hindu deities, by their name of Deva-dasa call themselves the servants or slaves of the god. Exodus xxxii. 19 tells us of the Israelites dancing in the presence of the idol which Aaron had made for them in the form of a calf, doubtless the Nandi bull, the vahan of Siva of the Hindus of to-day, and dancing before the

Hindu idols is a daily rite, and takes place at every Hindu festival.

The temple women of the Hindus originally appear to have been intended for the gratification of the Brahmans only, but they were, in some parts of India, obliged to yield to all who solicited them, though consecrated in a special manner to the worship of the Hindu gods. Every temple, according to its size, entertains a band of them, to the number of eight, twelve, or more. The service they perform consists of dancing and singing. The first they execute with grace, though with lascivious attitudes and motions. Their chanting is generally confined to the obscene songs which relate to some circumstance or other of the licentious lives of their gods. They perform their religious duties at the temple to which they belong twice a day, morning and evening. They are also obliged to assist at all the public ceremonies, which they enliven with their dance and song. They are reared to this life from their infancy. They are taken from any caste, and are not unfrequently of respectable birth. It is nothing uncommon to hear of pregnant women, in the belief that it will tend to their happy delivery, making a vow, with the consent of their husband, to devote the child then in the womb, if it should turn out a girl, to the service of the pagoda. And in doing so they imagine they are performing a meritorious duty. The life to which the daughter is destined brings no disgrace on the family. Until towards the middle of the 19th century, these women were the only Hindu females in India who might learn to read, to sing, and to dance. Such accomplishments belonged to them exclusively, and were for that reason held by the rest of the sex in such abhorrence, that every virtuous woman would have considered the mention of them as an affront. That feeling has now greatly changed. They are now very generally kept by the wealthier Hindu men. In some of the Hindu temples they are numerous. The temple of Kamakhya or Kamichcha is sacred to Durga, the Sakti of Siva. It is built on a hill rising about 700 feet from the river Brahmaputra, just below Gowhatty. It is said that in former times there were 5000 young girls attached to the temple. In 1872 there were still some hundreds there. In an inscription on a slab in the Bengal Asiatic Society's Museum, of date Samvat 32 of the Gaur era, about A.D. 1174, mention is made of Bhava Deva giving 100 damsels to a temple.

The eldest daughter of every family of the weaver caste, at the small town of Tiru-kalli-kundram in the Chingleput collectorate of the Madras Presidency, is devoted to the temple. She is sent to the pagoda before the age of puberty, where dancing and music masters are provided. The Murli girls of the Mahratta country correspond to the Basava of the Teling race. The Basava women are usually devoted to the god Siva, and become prostitutes. They are called the Linga or Garudu Basava, according as they are devoted to one or other deity. They are called also Jogin, and they are married sometimes to a dagger, sometimes to an idol. In making female children over to the service of a temple, a girl, generally an infant, is taken and dedicated for life to the service of some idol by a ceremony called Shej. A khanjar or dagger is put on the ground, and the girl who is to undergo the ceremony puts a garland on the knife. Her mother then puts rice on the girl's forehead. The officiating Bhutt then weds the girl to the dagger, just as if he were uniting her to a boy in marriage, by reciting the Mangalasalok, or marriage stanzas, a curtain being held between the girl and the dagger. The girl thus becomes a Bhavin, dedicated to the service of the temple. In many parts of the south of India, the non-Aryan races thus devote their young women, in order that they may follow prostitution openly, under the cloak of a religious rite. It is not easy to trace the origin of this custom; but at the Mylitta festivals, which were connected with the worship of Baal or Moloch, the women, as slaves to the goddess, were obliged to purchase exemption from being sacrificed by prostitution. Almost all the Jewish prophets down to Jeremiah complain that this service was carried on in the high places by the Jews. In general, throughout the Dekhan southwards to Cape Comorin, devoting a female child to the gods for the purpose of being common, as a Murli, Basava, Bhavin, or Jogin, is deemed disreputable. But the Deva-dasa or temple servants are in a recognised office, and are obtained from Hindu races whose custom it has been for ages; or by Hindus vowing, in sickness or other affliction, to give one of their daughters to some particular temple, and the vow is scrupulously kept at the proper time; or by adoption. In the selection of girls for adoption in this profession, good-looking, well-made girls are chosen, and they are taught to dance at the early age of five. Older girls, when they adopt the profession, are also taught to dance. The lessons in dancing are given daily, two hours before daylight in the morning, one of which is devoted to singing and the other to dancing. In the evening, after 4 P.M., the same number of hours are devoted, so that each girl has to practise for four hours daily, and in about three years she is supposed to have mastered the arts of singing and dancing. In Southern India there are reckoned six chief kinds of dancing:—1. Audo girathoo; 2. Ananecum; 3. Lenchenee nateum; 4. Moodeiydoo cirathoo; 5. Hereacoothoo; 6. Colu auteum. And the art of dancing, or Abimayam, is said to be exhibited in six different ways during these performances,—1. By the movements of the eyes, and 2. action of the features, and 3. attitude of the breast and chest, and 4. position of the hands, and 5. action of the feet, and 6. by calisthenic performances. By commencing their studies at the early age of five, these girls are able to make their appearance at about seven or eight years of age, very rarely earlier than that, and they continue dancing till thirty or forty years of age. When attached to pagodas, they receive certain sums as wages, the amount of which is dependent on the wealth, sanctity, and popularity of the particular temple which they have joined. The money salary they receive is nominal, seldom exceeding a few annas, and sometimes a rupee or two a month. The chief object in being paid this sum as a salary, is to indicate that they are servants of the temple; in addition to this, one or more of them receive a meal a day, consisting merely of a mass of boiled rice rolled into a ball. They are required to dance six times a day at the temple before the deity, while the priests are officiating, but this duty is performed by turns. Dancing girls attached to pagodas are generally wealthy, and when they appear before

the public are well covered with the usual gold ornaments; if poor, tinsel is used, or golden ones are borrowed from others. Their heads, ears, nose, neck, arms, wrists, fingers, ankles, and toes are overdecked with jewels, and their hair frequently has flowers. The hair is divided in front along the centre, combed back, and plaited into a single plait, falling loose on the back like a tail, averaging from two to two and a half feet in length, and always ornamented with jewels and flowers. Their dancing dress comprises usually the short bodice or choli, a pair of ravake or string drawers tied at the waist, termed paijama or pavadai (both these are generally of silk), and a white or coloured muslin wrapper or saree. One end of the saree is wound round the waist, and two, three, or more feet, according to the length, is gathered and tucked into the portion encircling the waist, and permitting of a folding fringe or gathering of the cloth in front; while the other end, taken after the usual native fashion over the left shoulder, falls towards the waist, where the end or munthani is opened out and allowed to drop in front, one end of it being tucked into the waist on the side and the other left free. This portion of the saree is usually highly ornamented with golden thread, tinsel, etc. The free end descends to the middle or lower part of the thighs; the other free end of the saree hanging down towards the legs is now caught hold of, passed between the legs, and fastened to the tie around the waist at the back, and the whole encircled by a gold or silver waist-belt. By this mode of dress a fold of the muslin saree forms a loop round each leg, and descends nearly down to the ankles, whilst the gathering hangs in the front between the legs free. At home they wear the choli and saree, with a petticoat or pavadai; this, in fact, is their usual dress, except when about performing they exchange the pavadai for the paijama or sharai. The pavadai is made of chintz or silk, according to the means of the individual. A string of small brass bells, known by the name of shullungay or jedjum, is tied around each leg immediately beneath the ankles.

The dancing girl caste have peculiar laws for adoption and inheritance. A dancing girl can adopt a daughter, with the permission of the authorities of the pagoda to which she belongs; but she cannot adopt a son for the transmission of property, it being immaterial whether she have a son or not. The adopted girl cannot share her mother's property during her lifetime; and although she may be the heiress, she is not bound by the laws of caste to support her brother's widow. Among dancing girls property descends in the female line first, and then to males as in other castes. In the failure of issue, the property of a dancing girl goes to the pagoda to which she belongs. A simple recognition on the part of a dancing girl of a child as her daughter, in the presence of one or more individuals, is sufficient to constitute her claim to adoption.

Dancing girls are respected by the several castes or sects of Hindus, and are allowed to sit in the assembly of the most respectable men, such honour not being accorded to their own wives and daughters. As a rule, it is seldom that these women have children of their own, unless, perhaps, they had lived in continual concubinage with some single individual; consequently they are always anxious to adopt girls, not only to become their successors in the temple, but that they may inherit their property likewise. Formerly a large trade was carried on by kidnapping good-looking girls from large towns and remote villages, who were sold to these women. Famines in Ganjam, Orissa, and Bengal were taken advantage of, not only by abandoned characters, but also by immoral native princes, for the basest purposes. During a criminal session in Calcutta, two women were sentenced to seven years' imprisonment each, for having purchased a girl under sixteen years of age, for one rupee ten annas. In some places there are said to exist two kinds of dancing girls,—the dancing women differing from the pagoda dancers. The latter are said to live in concubinage as a rule. They are a privileged class under the Aylah Santanam, or descent by the daughter's children, or in the female line, and the law of Dhya applies to them; Dhiya Baga, or division by favour, Merasi heritage of right to official emoluments, operates as an inducement. These classes are recognised as Dasi and Deva Dasi. The Dasi dancing women belong for the most part to itinerant bands, and are frequently made up of women of low caste, who practise their professional accomplishments and prefer living in concubinage. The Siva temple of the Soournamookie (Kalastry), a zamindari in the North Arcot district, maintains a large establishment of what is termed Deva Dasi or pagoda dancers, forming a distinct community there (Audapapalu), who live exclusively in concubinage. Their sons, who know no father, pass by the appellation of Nagari Kumarada, or sons of the country, and are slaves to the zamindar. Of the daughters, after supplying the vacancies in the pagoda staff, the remainder are brought in the list of drudges of the palace. The dancing-master or teacher receives from fifty to five hundred rupees, with other presents, for teaching a girl the usual dances. This generally forms a contract which is greatly dependent on the wealth and position of the parties.

Dancing girls, when performing, are accompanied by two men singers, termed Nuthuvan and Padowen, who, while singing, also play the cymbals; these instruments are of two kinds and sizes. While the cymbal is played with the right hand, the left hand, open, is generally applied to the left ear while they sing, bowing their bodies forward as well as from side to side, contorting their faces in like manner, and making grimaces. In singing they scream as loud as their voice and lungs will admit; one or more old women join in the song, and frequently clap their hands during the performance; they are generally dancing girls who have given up the profession from age or other causes. Some of the girls are very good-looking, handsome, with open countenances, large sparkling eyes, regular features, and intelligent pleasing appearance. They are perfectly self-possessed in manner, verging on assurance, staring at one with their large, intelligent-looking eyes. Notwithstanding, they possess a vast deal of courtesy and polish, tempered with languid grace and serene self-possession, whilst their manners are courteous and their bearing unembarrassed, possessing all the teaching which experience of the worst side of human nature gives, and they know but one form of pleasure, the degrading manner in which

their lives are spent. The majority possess some natural gifts. As to conversational powers, they seldom possess any beyond the usual laugh and giggle, and monosyllabic replies given to commonplace questions. Some of the Telugu girls are very handsome, of a light pale colour, somewhat yellowish in tinge, with softness of face and feature, a gentleness of manner, with a peculiar grace and ease, which one would little expect to find among them. A ladylike manner, modesty and gentleness, such beautiful small hands and little taper fingers, the ankles so neatly turned, as to meet the admiration of the greatest connoisseur. They can generally read and write their own language, and pretty correctly—some two languages. One girl at Conjeveram wrote three; the third was English, in which she wrote her name in a fair round hand, and spoke the language with some fluency; Tamil and Telugu were the other two languages, which she wrote tolerably well. She was said to have received her education in a mission school at Madras, but did not appear ashamed of her profession. She was doubtless a girl who had been devoted to the temple in her infancy. A similar case of a mission-taught girl occurred in Mysore about 1870. Their songs generally comprise praises in honour of their several idols, filled with repetitions and unmeaning expletives. These songs are often vulgar and lewd, and sung before assemblies of men, and before the deities, but they time the quality of their songs to suit the place and audience before which they have to appear. Nautches are given on all occasions of marriage ceremonies, feasts, and other public occasions. Among rajas, zamindars, and others, they are almost things of daily occurrence. A few of these girls can play the native guitar or violin tolerably well, and some of their songs have a mournful and melancholy tune; the harsh grating of the songs of the attendants, and the rattling of the wind instruments and tom-toms, are, however, disliked by European ears, though they charm the natives. When their services are demanded outside the temple, larger sums of money have to be paid for them, the charge being increased according to the renown and position of the girl, as some few will not give their services to any one unless a raja or some person of rank. Some travel to other districts when their services are needed by petty rajas or zamindars, and they are contracted for as many days as they have to perform, in addition to being well paid. They frequently receive valuable presents, in money, shawls, gold bangles or rings, which are bestowed on them during the performance. Every village of importance has a temple with a few of these women attached to it, and in some of the large towns, possessing temples of repute for sanctity, these are filled with them. It is perhaps one of the worst institutions connected with Hinduism, from the recognition and support it receives from all classes of idol-worshipping devotees, the women being the victims of such a system, recognised and patronised in every part of India where Hinduism predominates. These poor creatures being taught to read and write their own and other languages, with a view to be better able to master the lewd immoral songs; whilst their own wives, the mothers of their children, are deprived of learning of any kind, and are carefully shut out from society, not even allowed to appear in public before any assembly of men, and are allowed, further, to grow up in the greatest ignorance and superstition. To some extent female education and enlightenment are now penetrating the masses, and the natives themselves are seeking enlightenment and intelligence, from which their own mothers, wives, and daughters have hitherto been secluded.—*Dr. Shortt, the Anthropological Society of London Journ.* iii., 1867–68.

DEVADAT, brother-in-law of Sakya. He raised a schism against the teaching of Sakya, whom he attempted to kill, but, according to the Buddhist legend regarding him, the earth opened and destroyed him and all his followers, and as he fell down into hell he was transfixed with three perpendicular hot irons, whilst three others pierced his shoulders transversely. The Burmese consider that Devadat was Jesus Christ, and the Siamese think that Devadat is the God of Europe.

DEVA-DATA or Deo-dat, a Hindu man's name, literally god-given—Theodotus.

DEVA-DEVI, an island in Bombay harbour, known to sailors as Butcher Island. The native name, properly Deva-dwipa, means the Island of the gods, or Holy Island.

DEVADIGAR. KARN. A low-caste menial in the temples of the south of India.—*Wils.*

DEVAKI, sister or cousin to Kansa, king of Mathura, and the wife of Vasudeva. Krishna was their eighth child.

DEVAL. HIND. A Hindu temple, a Christian church.

DEVALA, MAHR., also Devalana, KARN., a Brahman of an inferior order, who attends upon idols, and lives upon the offerings made to them. Devalaya, from Deva, a god, and Alaya, a house, a temple; the house of God. The same term is applied to an oath taken in a temple.

DEVALA. Several Sanskrit writers had this title. One was author of a code of law, one an astronomer, one was grandfather of Panini, and one a Hindu mendicant who resided at Hurdwar, and was one of the Smriti writers.—*Ward*, iv. p. 28.

DEVALA. HIND. An ordeal. See Divination.

DEVA-LOKA. SANSK. The habitations of the Deva. In Hinduism there are six celestial worlds between the earth and the Brahma-loka.—*Hardy's Eastern Monachism*, p. 435.

DEVA-NAGARI, an alphabet in use in India. It was introduced into Tibet from Kashmir in the first half of the 7th century of the Christian era. Deva-Nagari is the ancient alphabet of India, inscriptional, in capitals, and is a modification of the inscriptional and monitary Pali. The alphabets of the various languages allied to the Hindi are modifications of the Deva-Nagari alphabet. It is the character in which Sanskrit is usually written. Mr. Wathen, like Mr. Prinsep, refers the modern Deva-Nagari, through various changes which he shows in inscriptions of different ages, to the Old Pali lat or column character.

DEVANG. KARN. A Lingaet, one who carries the emblem of Siva on his person.

DEV-ANGA or Devanaga. TEL. Devangada, KARN. The title assumed by the caste of weavers in the Karnatica.

DEVANGANA, amongst Hindus, the celestial minstrels who perform before Mahadeva. They are also called Gandharva, also Apsaras. Their instruments are the tambourine, cymbals, castanets, lute, and violin.

DEVANHALLI, a small town in Mysore, 23 miles from Bangalore. It was formerly the seat of a family of Polygars, who traced their descent from one of the refugees of the Morasa Wakkala tribe, who founded petty dynasties throughout Mysore in the 14th century. The last of the Gauda, as the chiefs were called, was overthrown in 1748 by the Hindu raja of Mysore. It was in the siege of Devanhalli, on this occasion, that Hyder Ali first gained distinction as a volunteer horseman, and it was here that his son Tipu was born. Hyder erected a fort of stone, which was captured by Lord Cornwallis in 1791.—*Imp. Gaz.*

DEVA PAL DEVA. From a copper tablet discovered at Monghir, Raja Deva Pal Deva appears to have reigned in the 9th century as far as the Karnatic and Tibet.?

DEVARAM, a famous Saiva poem, part of the so-called Tamil Veda.

DEVASTHALA. SANSK. A temple of the Hindus, any sacred place.

DEVASTHANAM, the superintendence of Hindu temples, conducted by trustees called Dharma Karta.

DEVATA, from Deva, a divinity, a spirit, a demigod. The Devata are benign spirits, governed by Indra, properly the inhabitants of the North Pole, for the Devata are said to have day when the Daitya have the night, and *vice versâ*. Amongst the Hindus there are several kinds of Devata or deities to whom worship is given,—the Gramma-devata or village god; the Kula-devata, the race, household, or family god; and the Ishta-devata, the patron or personal deity of individuals; Adi-devata is the primitive deity; Sthana-devata, local deity. The Aryan Hindu does not recognise the village gods of Southern India, but the non-Hindu Turanian races largely worship them; and even many of those Turanian races who have been converted to Hinduism, worship them. They are mostly shapeless pieces of wood or stone smeared with vermilion, and usually represent evil spirits or devils. These are the Amma, Amman, and Amur of the eastern and southern parts of the Peninsula, and the Satwai, Bhairo, Massoba, Chamanda, Asra, Ai, and Marryai of the northern and western parts of the Peninsula, all of whom are recognised as causing harm to individuals. In health they are neglected; but when sickness occurs, either to individuals, or as an epidemic, these spirits of evil are worshipped with much solemnity, and bloody sacrifices are made to them of goats and sheep, and bullocks and buffaloes. Gotra or Kula mean a family, and is used amongst Kshatriya and Vaisyas as well as Brahmans. The Gotra depend on a real or imaginary community of blood, and then correspond to what we call families. No Hindu house is supposed to be without its tutelary divinity, but the notion attached to this character is now very far from precise. The deity who is the object of hereditary or family worship, the Kula-devata, is always Siva, or Vishnu, or Durga, or other principal personage of the Hindu mythology; but the Griha-devata or household god rarely bears any distinct appellation. In Bengal, the domestic god is sometimes the Saligram, sometimes the tulasi plant, sometimes a basket with a little rice in it, and sometimes a water jar, to any of which a brief adoration is daily addressed, most usually by the females of the family. Occasionally small images of Lakshmi or Chandi fulfil the office, or, should a snake appear, it is worshipped as the guardian of the dwelling. In general, in former times, the household deities were regarded as the unseen spirits of ill, the ghosts and goblins who hovered about every spot, and claimed some particular sites as their own. At the close of all ceremonies, offerings were made to them in the open air, to keep them in good humour, by scattering a little rice, with a short formula. Thus, at the end of the daily ceremony, the householder is enjoined by Menu (3.90) 'to throw up his oblation (bali) in the open air to all the gods, to those who walk by day, and those who walk by night.' In this light the household god corresponds better with the *genii locorum* than with the Lares or Penates of antiquity.—*Wilson's Hindu Theatre; Warren, Kala Sanhita.*

DEVA-TOTTHA-PANA. SANSK. Dismissing or releasing the deities who have been invited to a ceremony, at its conclusion.

DEVAYANAI or Devasena, one of Subhramanya's wives.

DEVENDRA, the king of the Deva.

DEVER, the tribal designation of the Maravar race in Ramnad, Madura, Shivaganga, and Tinnevelly. It seems identical with the Telugu Dewara or Devera, a respectful mode of address to a superior.

DEVI. SANSK. A goddess, the feminine of Deva, a god. It is one of the titles of the Hindu goddess Durga, also known as Kali, and when used alone is understood to designate Parvati, the sakti or wife of Siva. Devi, as Durga, in the south of India is represented in paintings as a beautiful woman riding on a tiger, but in a fierce and menacing attitude, as if advancing to the destruction of one of the giants, against whom her incarnations were assumed. Devi, as Kali, in another form, an especial favourite in Bengal, is represented with a black skin, and a hideous and terrible countenance streaming with blood, encircled with snakes, hung round with skulls and human heads, and in all respects resembling a fury rather than a goddess. Her rites in those countries correspond with this character. Goats and sheep and other animals, and even human beings, are offered in sacrifice. See Chandra; Dasahara or Dashara; Kali; Kerari; Linga; Lustral Ceremonies; Mahadeva; Mahadevi; Parvati; Sacrifice, Satarupa; Serpent, Vishnu; Yavana.

DEVICOTTAH, a fortress on a small island at the mouth of the Colerun, in lat. 11° 22′ N. Devicottah frequently changed hands during the contests between the British and French in the 18th century.

DEVIL BIRD of Ceylon has its ordinary cry like that of a hen just caught. Its screams are like those of a youth in agony. It is said to be an owl, the Syrnium Indrani, also a species of Gualama. Mr. Mitford supposed it to be a goat-sucker, a cuckoo, or a blackbird.

DEVIL GOAD.

Croton oblongifolium, *R.* iii. p. 685.

Bhatamkusam, . SANSK. | Bhutala bhairi, . TEL.

The Telugu name signifies 'demon driver' or 'devil goad,' and sticks made of this tree are carried as a protection against evil spirits.

DEVILS and Devil-dancers. The ordinary

word in use in the Tamil country to designate a devil is Paisacha or Pisacha, and the temple raised to a Paisacha is a Pekoil; but the former seems rather to be an evil spirit, and the latter a temple to an evil spirit. All the Aryan and non-Aryan Hindu and Buddhist races of India, and all the races in the Malaya and the Eastern Archipelagoes recognise the existence of spirits both good and bad; and the whole series of the funeral ceremonies from the date of the demise of a Hindu until the demise of his son, are instituted from the belief that the spirit of the deceased is present and can accept oblations; and there are even instances where contracts have been entered into or renewed with the spirit of a deceased owner. The Hindus have a hell, Narakam, and a devil, but the spirits of the non-Aryan races seem to refer to evil spirits. In their belief, if any good man die, his spirit may occupy a tree or stone or other locality, and be an evil spirit; may even take possession of one of his votaries, in which event the screaming and gesticulating of the possessed person are attributed to the spirit in possession, and in the Urdu tongue the phrase would be, 'Saya, uska ang bhara,' the shade has filled his body; and the possessed person prophesies. In their belief, every malady may be the infliction of an evil spirit. To dispossess the spirit, wild music and dancing are had recourse to, and the possessed, generally a woman, exhausted by her Pythonizing, falls down utterly exhausted, is seized with violent hysteria, or goes into convulsions. The non-Aryan races are constantly recognising new spirits from amongst deceased natives of India or Europeans, particularly from amongst those whom death or accident have suddenly cut off, and they have also introduced the deities of the Hindus as demons; but the Amman or earth-deity is in every village throughout S. India, and the worship of all the demon gods is by blood-sacrifices and ardent spirits. Amongst the Shanar race in the south of the Peninsula of India, the belief is that sometimes demons are content with frightening the timid without doing any real harm. Failures in trade or in crops are attributed to demons. People hear a strange noise at night, and immediately they see a devil making his escape in the shape of a dog as large as a hyæna, or a cat with eyes like two lamps. In the dusk of the evening devils have been observed in a burial or burning ground, assuming various shapes, one after another, as often as the eye of the observer is turned away; and they have often been known at night to ride across the country on invisible horses, or glide over marshy lands in the shape of a wandering, flickering light. In all their journeyings they move along without touching the ground, their elevation above the ground being proportioned to their rank and importance. Dr. Caldwell has known a village deserted, and the people afraid even to remove the materials of their houses, in consequence of the terror caused by stones being thrown on their roofs at night by invisible hands. Demons more malicious still have sometimes been known, under cover of the night, to insert combustible materials under the eaves of thatched roofs. Even in the day-time, about the close of the hot season, when the winds fail, demons may often be seen careering along in the shape of a whirlwind, catching up and whisking about in their fierce play every dry stick and leaf that happens to lie in their path. In short, writes Dr. Caldwell, the demons do much evil, but no good. They often cause terror, but never bestow benefits, or evince any affection for their votaries. They must be placated by sacrifice, because they are so mischievous; but there is no use supplicating their favour. If in any case the hope of obtaining a benefit seems to be their votary's motive in worshipping them, further inquiry proves that it is under the supposition that the demon's malignity stands in the way of what would otherwise be obtained as a matter of course. And it may be said to be the object of the worship of all the non-Aryan races, to avert from themselves the evils which the demons could inflict; for gratitude for good received, or resignation to the will of a Supreme, are not parts of the Amman or spirit-worship. A similar superstition respecting goblins and demons exists all over India. Every Hindu work containing allusions to native life, and the dictionaries of all the Hindu dialects, prove the general prevalence of a belief in the existence of malicious mischievous demons, in demoniacal inflictions and possessions, and in the power of exorcisms. The chief peculiarity of the superstition, as it exists amongst the Shanars, consists in their systematic worship of the demons in which all believe. In every part of India, innumerable legends respecting goblins and their malice are current; but scarcely any trace of their worship in the proper sense of the term, much less of their exclusive worship, can be discovered beyond the districts in which Shanars, or other primitive illiterate tribes, are found. In travelling down to Tinnevelly from the north, the first village which is found to be inhabited by Shanars, Virduputty, about thirty miles south of Madura, is the first place where Dr. Caldwell observed systematic devil-worship. In like manner, in Travancore, devil-worship appears to commence with the first appearance of the Shanar race in the neighbourhood of Trivandrum, from whence it becomes more and more prevalent as you approach Cape Comorin. The demon-worship of the Shanars and a few other illiterate tribes is a degradation beneath which the human mind cannot descend. The places in which the demons are worshipped are commonly termed Pe-koil, or devil-temples; some of the temples, especially those erected to the sanguinary forms of Kali, are small, mean, tomb-like buildings, with an image at the further end of the cloister. But the majority of the devil-temples are built neither with stone nor brick; the roof is neither terraced nor tiled, nor even thatched. A heap of earth, raised into a pyramidical shape, and adorned with streaks of whitewash, sometimes alternating with red ochre, constitutes both the temple and the demon's image; and a smaller heap in front of the temple, with a flat surface, forms the altar. In such cases a large conspicuous tree—a tamarind tree, an umbrella tree (Acacia planifrons), or even a palmyra, whose leaves have never been cut or trimmed — will generally be observed in the vicinity. This tree is supposed to be the devil's ordinary dwelling-place, from which he snuffs up the odour of the sacrificial blood, and descends unseen to join in the feast. Turnour mentions that an ordinance of one of the kings of Ceylon commanded that a devil-dancer should be provided for every ten villages.

Buddhists of Ceylon still resort to the incantations of the devil-dancers in case of danger or emergency.

The educated European of the 19th century cannot realize the dread in which the Hindu stands of devils. They haunt his paths from the cradle to the grave. The Tamil proverb in fact says, 'The devil who seizes you in the cradle, goes with you to the funeral pile.' The chief anxiety of the Tamil father, when his child is about to be brought into the world, is to see that the leaves of the margosa tree are carefully fixed over the threshold, to prevent the devils from entering and seizing upon the child at the moment of birth. If he have lost two children before, and this be a son, a bracelet is placed upon the child's arm as a safeguard, a golden ring is fixed in its nose, and it is solemnly dedicated to some particular demon, who is entreated to protect it. The child is then perhaps named Payen (the Devil's Own), a name of frequent occurrence in S. India. The ring is allowed to remain in the nose till the child is grown, a great feast is then made by the parents, and sacrifices of sheep or cocks offered at the shrine of the tutelary demon. The periods of marriage and pregnancy are times at which devils are supposed to be especially malignant, and ceremonies are then performed to avert the influence of the evil eye, ill omens, and devils. In so slight a matter as the boring of a child's ears for ear-rings, it is considered necessary to propitiate Karuppan with the sacrifice of a goat, or a cock at least. A European seeing a crowd assembled under an odiya tree (Odina pinnata), which the massive iron chain hanging from its trunk betokened to be dedicated to Karuppan, rode up, and found there the quivering body of a ram just sacrificed to the demon. The head had been severed from the body by one blow of a large sickle-shaped weapon, which was courteously handed for inspection. It was made, handle as well as blade, of native iron, and had lately been presented to the shrine by a devotee. The sacrificer had made the present offering on the auspicious occasion of an infant son having his ears bored. The head of the ram fell, as usual, to the share of the officiating priest, while the body, slung on a pole, and carried on the shoulders of two men, amid the beating of tom-toms was taken home to furnish the evening feast. No temple was near, but on a pedestal under the tree reposed a hideous object made of potter's ware. This particular demon is supposed to be, when propitiated, very liberal in the bestowal of benefits; and the pujari mentioned to the looker-on that if he would make a sacrifice of a goat or two, he would guarantee that his devil should obtain for him a lucrative appointment under Government! The sacrifice of goats is almost continuous,—sometimes as many as twenty goats are sacrificed at one time. The flesh is generally cut up, cooked, and eaten on the spot; and round the shrines may often be seen a number of small earthen ovens. The strongest oath a Sudra can take is to swear by the most famous devil of the district; and often, before a lawsuit is carried into court, the aggrieved party will say to his opponent, 'I will be satisfied if you will go to such a demon's shrine, and there, on the justice of your cause, blow out the flame of a lamp in the presence of the Kali.' A man who would not hesitate a moment to commit perjury in court, would never dare to perform this ceremony knowing his cause to be unjust, for then he firmly believes that he would immediately be stricken down by the demon. So swears Latinus in the Æneid:

'Tango aras, medios ignes et numina testor.'

Under this ever-present fear of demons, the Hindu often hesitates to go even a hundred yards in the dark. He will not enter a forest alone; he fears to stand on the borders of a lonely lake, for there dwells the spirit which in Scotland is known by the name of the Kelpie, and it is near the water where, he has heard, may be often seen in the darkness of the night the 'fiery-mouthed devil,' ignis-fatuus. But most of all he fears the sandy plain, for it is a notion thoroughly oriental, that the unclean spirit 'walketh through dry places,' which are called in Tamil, Pai Kadu, devil-deserts. Devils are especially said to abound in the sandy wastes between Madura and Tinnevelly, where the mirage (in Tamil, Pai Ter, the devil's chariot), is frequently seen, and is said to be produced by them. When a fire takes place in a village, it is owing to the wrath of the village devil. His worship has been neglected, or some insult has been offered to him, and he thirsts for revenge. Near the village of Vediarpuram, in the Tanjore district, for about four or five years accidental fires had been of annual occurrence, and it was commonly reported to be owing to the anger of Aiyanar, a demon whose shrine is situated to the west of the village. A banyan tree near the spot, dedicated to him, was some years ago felled without his permission, and since that time the enraged demon, refusing to be propitiated by the usual sacrifices, yearly burned down a house or two. Many races besides Hindus are very prone to make vows in times of sickness. Formerly, we are told, people used to go from all parts of England to Canterbury,

'The holy blissful martyr for to seek,
That them hath holpen when that they were sick.'

The Hindu makes a vow to go to a particular shrine, and there pour offerings of oil and spices. If a diseased member have been restored, oftentimes a golden image of it is made and presented to the shrine. A person suffered from a serious affection of the eyes. A vow was made that in case of recovery two golden eyes should be made and presented to the shrine of Mari Amman. In like manner, the Philistines, we read, when afflicted with emerods, thought, after consulting with their soothsayers, that they could best propitiate the God of Israel by making and offering to him golden images of the emerods. As may be expected, the devils are most busy in the

'last scene of all
That ends this strange eventful history;'

and a young girl fears to cross a dying man, lest his latest breath should pass into her, in which case she would be possessed beyond recovery. For a similar reason, a Hindu at the point of death, is always removed to expire without the house, which would otherwise be haunted. As the corpse is carried away, parched rice is scattered along the route of the funeral procession. It is believed that the devils will stop to pick it up, and it is considered advisable to keep them so engaged till next sunrise, for should they return to the house before that time, they would probably not be satisfied without another victim. A native

proverb says, 'A Saturday's corpse goes not alone.' When, therefore, a death takes place on a Saturday, to prevent evil consequences, a live cock is taken with the corpse to the burning ground, and it is there given away to some person of low caste, or, like the scapegoat of old, allowed to escape into the adjacent jungle. Brahmans, averse to bloody sacrifices, substitute for a cock the bolt of the door of the house, which they burn with the corpse. When a dead body is buried, instead of being burnt, as in the case of Suniyasi (ascetic devotees), salt is placed in the grave, and frequently with it the leaves of the margosa tree, so famous as a charm against devils. Salt was till recently also in England placed on the corpse of Roman and Lutheran Christians, for the avowed purpose of keeping it secure from the evil one, and the practice is still said to linger in the Highlands of Scotland. It was seen in 1833, placed over the dead body of a young girl at Greenwich. The Highlanders, indeed, in many of their superstitions are remarkably similar to the Hindus. They formerly planted the rowan or mountain ash, regarding it as a safeguard against devils, just as the Hindus regard the margosa. Throughout India, the belief is as common as it was formerly in Europe, that a man who dies a sudden or a violent death becomes a demon. All the women in the district are immediately possessed by him, and innumerable mischiefs result. A Brahman, accidentally drowned in the river Cauvery, about the year 1870, became in consequence a Brahma Rakshasa, one of the fiercest of demons. An officer of artillery, killed at the battle of Assaye, was buried beneath a tree near the village, and his spirit is worshipped there to the present day. Dr. Caldwell mentions the case of Captain Pole, an English officer who was mortally wounded at the taking of the Travancore lines in A.D. 1809, and has been invoked by the Shanars. His worship consisted in the offering to his manes of spirituous liquors and cheroots. About the middle of the 19th century, a Brahman who was sentenced to be hanged at Madras, for the murder of another Brahman going on pilgrimage from Benares to Rameswaram, threatened that though they were about to hang him, he would not die, but would become a Brahma Rakshasa, and torment all those who had given evidence against him.

Bells and chains are almost always used in devil-worship and exorcism; the notion involved seems less to be that of scaring the devil, than that of charming him, just as a snake-charmer charms a snake by music. Near the fanes of the popular devils there are massive iron chains hanging from the trees, with bells and knives attached to them. In the well-known Sanskrit work, the Hitopadesa, occurs a story relating to a famous devil, called Ghanta-karna or Bell-ear. This Rakshasa was believed to dwell on the top of a mountain near the town of Brahmapura. One day a thief, having stolen a bell (probably one of those near the demon's fane), was killed by a tiger as he was carrying off his plunder. The monkeys who dwelt in the adjacent forest obtained the bell, and amused themselves by ringing it. The people of the town having found the dead body of the man, and continually hearing the sound of the bell, were filled with intense horror, fully believing that the demon, enraged, had killed the thief, and was now ringing the bell. The town was in consequence nearly deserted, when an old woman, guessing the truth, went to the king, and said that for a small sum she would undertake to settle the demon. The king, delighted, gave her what she asked, and the old woman, after tracing the cabalistic circle,—the Kolam,—and pretending to go through certain incantations, entered the forest. By means of fruits which she strewed on the ground, she was enabled to decoy the monkeys, and, having obtained the bell as a trophy of her victory over the demon, she returned in triumph to the town. So little has the belief in devils been shaken, that in the India of the present day, it would, in a like case, be just as easy to deceive the people, and even their native Hindu rulers. Dr. Caldwell mentions that the process of demonification is still going on amongst the Shanars; and in every case the characteristics of the devil and his worship are derived from the character and exploits of his human prototype. There is a continued succession of devils claiming the adoration of the Shanars, and after a time sinking into forgetfulness. Among the demons most feared at the middle of the 19th century, he mentions Palevesham, a notorious robber during the latter period of the Mahomedan government.

A few of the demons are forms of Kali, connected with a debased and comparatively modern development of the Brahmanical system.

Devil-worship in Ceylon by the Rodya is performed in the jungle. A kind of altar is erected, and covered with the skin of the plantain tree. It is then scented with dammer resin, and cooked vegetables, placed on a plantain leaf, are laid on it, to which is added rice and flowers, and the blood of a red cock. The Kattadiya, or devil-dancer, then recites a charm, and the cure is supposed to be complete. The offering is left to be eaten by birds or animals. The devils Gerre and Meleyi are of two kinds.—*Dr. Caldwell on the Shanar; Kenrich's Phœnicia*, pp. 307, 314; *Dubois' India, quoted in Cole.'s Hind. Myth.* p. 378; *Sonnerat's Voyage*, p. 29; *Bunsen*, iv. p. 210; *Williams' Story of Nala*, p. 208.

DEVILS' HORSES. See Insects.

DEVISTHAN, a Hindu temple. Devisthana, temple revenue.

DEVOTTHANA. SANSK. Also Deotthan. The eleventh day of the light half of the month Kartik, when Vishnu is supposed to rise up from his four months' sleep at the end of the rainy season.

DE VRIESE, author of various memoirs on Malayan Island Plants, and also of a Monograph of Marattiaceæ, a work of great labour.

DEW.

H'nung, ...	BURM.	Shabnam, Aoos, .	HIND.
Rosée, ...	FR.	Ruggiada, ...	IT.
Thau, ...	GER.	Roci, ...	SP.

Some one has ventured the remark that at full moon, near the equator, more dew falls than at new moon, and to this are ascribed the moon heads (man hoofden), which, however, Jansen had but once seen during all the years which he had spent between the tropics. In British India, during the cold weather months, when rain very rarely falls, the dew is of very great importance to all the crops then in the ground.—*Jansen, in Murray's Phys. Geog.* p. 146.

DEWA, a divine being, whether resident upon earth or in a dewa-loka.—*Hardy*, p. 435.

DEWAK. HIND. Termes, white ants.

DEWAL. The Hindu temple in which the idol is placed, is called, as temples generally are, Dewal or Deval, from Deva, a deity, and Aleiya, a house, or, literally, a house of god. The British and other people call it pagoda, a word unknown in India beyond the reach of European colloquial instruction, but which has been supposed to be derived from But-khana, two Persian words, or But-gada, Telugu words, both meaning the ghost-house. It may, however, be from Paigudi, a devil temple; also from Dahgopa, a Buddhist relic shrine. Dewal, in Sind, was so called from its celebrated pagoda. Its site is now doubtful.

DEWALA. HIND. Bankrupt.

DEWALA DEVI, daughter of Kamala Devi. On the fall of Nerwalla, the ancient capital of Gujerat, Kamala Devi was captured and taken into the harem of Ala-ud-Din; but her daughter Dewala Devi escaped with her father. She had been asked in marriage by the son of Ram Deo, the raja of Deogiri (Dowlatabad), but her father, proud of his Rajput origin, had refused to give her to a Mahratta, even though a prince. Kamala Deva, however, having expressed to Ala-ud-Din a wish to be joined by her daughter, Ala-ud-Din sent a strong army under a general to bring Dewala Devi to Dehli. In this extremity her father accepted the Mahratta prince, and sent off his daughter under an escort, but the escort was overtaken, the fair maiden seized, and carried to Dehli, where she was married to Khizr Khan, son of Ala-ud-Din. A few years after the death of Ala-ud-Din, the throne of Dehli was filled by Kafoor, a converted Hindu, who put out the eyes of Khizr Khan, filled the capital with Hindu troops, put to death all the survivors of Ala-ud-Din's family, and transferred Dewala Devi to his own zanana. See Kamala Devi.

DEWALDI, a heroine of Hindustan. When Cholan was on the throne of Dehli, Dewaldi roused her sons to battle, and, observing their unwillingness, she said, 'Would that the gods had made me barren, that I had never borne sons, who thus abandon the name of the Rajputs, and refuse to succour their prince in danger!' They acceded to her request. She then said, 'Farewell, my children, be true to your salt; and should you lose your head for your prince, doubt not you will obtain the celestial crown.' When Akbar invaded Chitor, the mother of Putta of Kailwa charged her son to put on the saffron robe, and die for his country.—*Calcutta Review*, No. 109.

DEWALI, properly Dipawali. SANSK. From Dipa, a lamp, and Ali, a row. A Hindu religious festival held about the end of October, in the last two days of the last half of Aswin and three days of Kartik, in honour of the goddess Kali and of Lakshmi, and to commemorate the destruction by Vishnu of the demon Taraki. The Hindus, after bathing in the Ganges or other river, anoint with oil, put on their best attire, perform a sraddha, and at night worship Lakshmi. On this festival of lamps all Hindus propitiate Lakshmi, the goddess of wealth and fortune, by offering at her shrine. In Rajasthan, on the Amavus, or ides of Kartik, every city, village, and encampment exhibits a blaze of splendour from lamps. Stuffs, pieces of gold and sweetmeats, are carried in trays and consecrated at the temple of Lakshmi, to whom the day is consecrated. The rana of Mewar dines with his prime minister; and this officer and his near relatives offer an oblation by pouring oil into a terra-cotta lamp, which the sovereign holds. Every votary of Lakshmi tries his chance of the dice, and from their success in the Dewali foretell the state of their affairs for the ensuing year. On the first day of the Dewali, the whole Hindu population of an Indian city bear branches of the sami, tulsi, and other sacred trees in procession, and walk round all the temples in the neighbourhood, offer salutation and prayer to their country's gods, in their several incarnations. A rainfall at that period of the year is highly advantageous to growing crops, and a proverb of the people of N. India is,—

'Je min piya Diwali,
Jiya phus, jiya hali.'

'If showers fall about the time of the Diwali festival,' [what matter] whether you are lazy (lit. a bundle of sticks) or a real ploughman, [the crops are sure to be equally fine.]—*Postans' W. India*, ii. p. 177; *Tod's Rajasthan*, i. 70, 279. See Leviticus xxiii. 40.

DEWAN. ARAB., PERS. In India, the chief officer of a second-rate sovereign. In Persia, a court of justice or of other business. A reception room is generally called the Dewan-i-Am, or public reception-hall. The Dewan Khana is the office room of the dewan, that part of the house of a Mahomedan where the master receives his visitors, and in which the men-servants reside; and the Dewani means pertaining to the dewan. The Dewani Adalat, under the E. I. Company, was a court of civil and criminal jurisdiction.—*Rich's Kurdistan*, i. p. 83.

Dewan, PERS., a collection into one volume of the entire odes of an author, whether in the Persian or the Hindustani tongue. In bringing them together, they are arranged alphabetically according to the letters in which the verses terminate. The Dewan-i-Sadi and Dewan-i-Hafiz are generally known.

Dewani is the civil department, in contrast to the foujdari or criminal. Dewan-i-Am, a privy council chamber. The Dewani of Bengal, Behar, and Orissa was conferred on the British by Shah Alam II., on the 12th August 1765. The office was a viceroyalty, and comprised the collection of the revenue, then three kror of rupees, and the administration of civil justice. The net revenue was two kror.

DEWANAGI-WANLU. TEL. Religious mendicants in Southern India, who accept charity only from one or other of the artisan goldsmith castes.

DEWA PUJA, or worship of the implements in use as the means of subsistence, observed by all Hindus, and by all the Kayasth caste at the Dewali and Hooly festivals.—*Malcolm's Central India*, ii. p. 167.

DEWAR, Diwar, perhaps more correctly Deehwar or Dehwar, is the god under whose special care a village is placed; the gramma-deva or *genius loci*, for whom a portion of grain is always set apart at each harvest.—*Elliot.*

DEWAR-GIRI. HIND. Tapestry, or cloth for adorning a wall.

DEWAS, a native state in Malwa, lat. 22° 42′ to 23° 5′ N., long. 75° 57′ to 76° 21′ E. The Dewas chieftaincy is held by a Mahratta, whose

ancestors came to Malwa with the first Baji Rao. The revenue of the state is 4,25,000 rupees, the area 256 square miles, and the population 25,000 souls. The chiefs have each received a sunnud guaranteeing to them the right of adoption. The chiefs are equal in rank, and have an equal share in all receipts. Each receives a salute of fifteen guns.—*Aitcheson's Treaties*, iv. p. 334.

DEWAT, the 6th note in the musical scale, 'La.'

DEXTRIN has the same composition as starch, but it is soluble in cold water.

DHA. BURM. A bill, a sword; in various forms, it is the inseparable companion of every man among the hundred forest tribes of Trans-Gangetic India. Among the civilised Burmans, however, it is more confined to the lower orders, the peasant and boatman, except as a weapon of war. The Burman's dha is a weapon about three feet long, with a slight uniform curve from end to end. About three-sevenths of this length is helve, the rest blade. The blade is generally about an inch and a quarter wide, with an obtuse point. It serves every purpose that a cutting weapon can serve, from making a toothpick to felling a tree, killing a pig or an enemy in battle. Very long and heavy dhas are worn by officials of the Burmese court.—*Yule's Embassy*, p. 158.

DHAE. HIND. A nurse. In Rajputana, the Dhabhae, or foster-brothers, often hold lands in perpetuity, and are employed in the most confidential places, on embassies, marriages, etc.—*Tod's Rajasthan*, i. p. 278.

D'HAGHA. GUJ. Thread.

DHAGOBA. See Buddha; Dagoba; Dhatu-garbha; Topes.

DHAHIMA, a tribe of Rajputs recorded amongst the 36 royal races. They were the lords of Biana, and bore a high name for deeds of chivalry. Colonel Tod considered the tribe to be extinct, but they have three or four villages in Baghput. There are also Dhahima Ahir and Dhahima Jat in the same neighbourhood.—*Rajasthan*, i. p. 199.

DHAI or Dahi. HIND. Curdled milk.

DHAKH of Kashmir, a red and white bean, Phaseolus lunatus, etc.

D'HAKKA. SANSK. A form of the drum that was one of the insignia of royalty of the Chalukya dynasty when ruling at Kalian.

DHAKUN, a witch. Witchcraft is believed in all over Rajputana; but the people of Mewar, whose capital is Udaipur, have most faith in the belief. Her powers are believed to be unlimited, particularly at seasons of the Dassera and Dewali. In certain provinces a man will not marry into a family unless they have a witch among them, who may protect him from evil. Such witches are called Rakhavali, or guardians. The Jiggar Khor, or liver-eater of Sind, is the genuine vampire. An officer, after a long chase in the valley of Udaipur, speared a hyena, whose abode was the tombs, and was known as the steed on which the witch of Ar sallied forth at night. Evil was predicted; and a dangerous fall subsequently, in chasing an elk, was attributed to his sacrilegious slaughter of the weird sister's steed.—*Tod's Rajasthan.*

DHAL. HIND. A shield, an ear ornament.

D'HALIZ-KOONDLANA, treading the threshold, a Mahomedan marriage ceremony.

DHAL-PHOR. HIND. A sept of the Kurmi, a great agricultural tribe in Hindustan; the words mean clod-breaker.

DHAL SAHIB, a Maharram ālam, or banner; literally, Mr. Shield.

DHAMA-PADAM, a Buddhist sacred book of high authority. It gives the most faithful picture of the ethical spirit of Buddha's teachings.—*Bunsen, God in Hist.* i. p. 343.

DHAMAYANGYEE. Flat arches of stone and brick are not uncommon in Burma. Captain Yule observed two of brick, in windows in the Dhamayangyee temple at Pagan, where no suggestion of European or Indian aid could have helped. There is one flat stone arch in the northern gate of the fort, and another in a tomb, at Kurnool. There is one in the mediæval building of Roslin Castle, and in the magnificent Saracen gateway of Cairo, called Bab-el-Fitoor.—*Yule's Embassy.*

DHAMEE, this old Rajput state became independent of Kuhlor after the Gurkha war. The state was bound to supply forty begar, but this was commuted to a tribute of Rs. 720. Revenue, Rs. 4000; population, 2853.

DHAMEK, near Benares, a fine grove, the ancient Mriga-dawa, where Buddha first publicly preached his doctrine, which king Asoka commemorated by erecting a tower.

DHAMI. HIND. A follower of Prannath, a Hindu reformer who flourished in the 17th century in Bundelkhand.—*Wilson.*

DHAMMA. PALI. Dharma, SANSK. Law, duty; the doctrines or sacred writings of the Buddhists.—*Hardy, Eastern Monachism*, p. 435.

DHAMMAN or Dhamnoo. PANJ. Grewia elastica, *Royle*; G. oppositifolia, *Buch.* Grewia tiliæfolia? are trees of Cuttack. G. elastica has a reddish-coloured wood, pliable, strong, very plentiful in the Santal jungles; used chiefly for cart wheels.—*Calcutta Eng. Journal*, July 1860.

DHAMNAR, about 40 miles S.E. from Nemuch, but close to Chundivassa, contains Buddhist caves with a Brahmanical rock-temple behind. The principal group are Buddhist.—*Burgess*, p. 392.

DHAMNI. HIND. Portulaca oleracea? P. sativa, DUKH., Helicteres isora.

DHAMUN. HIND. Green tea, in Ladakh; also brick tea, in Kashmir. Tea in cakes, both black and green.

DHAN. HIND. Oryza sativa, unhusked rice or paddy, also growing rice. Dhan marri, a rice field.

DHAN. HIND. Wealth. Tan, Man, Dhan, body, mind, and substance.

DHANA, the Gond portion of a Hindu village, which is always separate from the rest. Also applied generally in the north-west as Wuzra, Nugla, or Poorwa.—*Elliot's Suppt. Gloss.*

DHANAK. HIND. Very narrow gold ribbon.

DHANAPATTI and Srimantoo, a romantic Hindu tale of adventures of a father and son, wealthy Banya merchants of the Ganges, who travelled to Coromandel, Ceylon, Java. Both of them were imprisoned in Ceylon.

DHAND. SIND. A pool of water, a marsh.

DHANDORA. HIND. Proclamation by beat of drum.

DHANGA. HIND. Riot, rebellion; any hiding-place of robbers.

DHANGAR is the Danaga of the Canarese-speaking races. The Dhangar in Telingana are in twelve tribes, who do not eat together nor intermarry. In the centre and south of the Peninsula, Dhangar are shepherds and wool-weavers,

kitchen gardeners and labourers. In the hill country of Ramgarh and Chutia Nagpur, there is a tribe so called, some of whom descend periodically into the plains for labour. There are 8059 Dhangar in Amraoti. Many Dhangar are settled in the towns of the south of India, occupied as labourers, kitchen gardeners, and dairymen, and they arrange themselves accordingly. Dhangars have largely settled as cultivators in the Indapur, Bhimatherry, and Purandhar talukas of the Bombay Presidency. The Maharaja Holkar, the sovereign of Malwa, whose capital is Indur, is a Dhangar. The Asal, or pure Dhangar, are pastoral only. The pastoral Segar Dhangar also weave blankets. The Teling Dhangar are cultivators, milkmen, and weavers of coarse woollens. The Mahratta Dhangar graze cattle and sheep, and clarify their butter into ghi. The Bangar Dhangar are purely shepherds, as is indicated by the term 'Ban-gar,' wild man or forest man.

The Dhangar of the peninsular Dekhan are of two sections, the Kota Pullia Dhangar, who keep sheep, and the Barji Hatkar, or 'shepherds with the spears.' The latter still hold much land on the N. borders of the Nizam's territory, and, until the British took it over, were notorious for pugnacity and rebellion, and they still continue a quarrelsome and obstinate race. They are supposed to have come from Hindustan in twelve tribes, and been impelled by the Gonds towards Hingoli and Bassim, which locality got the name of Bara Hatia, or the twelve tribes. They now occupy the hills on the north bank of the Païn Ganga. To die in the chase or in war is deemed honourable; and the Hatkar who is so killed is burned with his feet to the east; otherwise he is interred sitting with a small piece of gold in his mouth. The Hatkar are fine, able-bodied men, independent but arrogant; many of them never shave nor cut the hair of their face. The Hatkar can only have one laggan, but may have several pāt wives. Their widows can contract a pāt marriage.

The Dhangar in the centre of the Peninsula are dark, almost black men, of slender and spare forms; they are quite dissimilar from the Gaoli in personal appearance, and all the sheep (Kuru, Karnatica, a sheep) are under the Kurubaru or Kurumbar race. They are also wholly distinct from the Ydayan or Yadava cowherd race, who are known in all the Tamil country as 'Pillai.' In all probability the dispersed Kurumbar of the Peninsula of India, some of them in towns and others almost nomade, are the fragments of the great shepherd race who held sway in the Arcot district in the early centuries of the Christian era. The Kurumbar and Dhangar have no similarity in appearance.

Dhangar, in the Lukti territory, bordering on Udaipur and Sultanpur, are short but muscular and able-bodied men, who speak a separate language. They do not follow Hindu rites, and they have no temples, but set up near their villages a stone with some rude carvings, which they worship in times of famine or sickness or calamity. They bury but sometimes burn their dead.

The Gaola is a cowherd, a dairyman, from Hindustan to Hyderabad.

The Kurubar are in the Canarese region, in the centre of the Peninsula. The Kurubar or Kurumbar and the Gaola dairymen keep aloof from each other.

The Mirda are a caste of migratory shepherds in the south of India.—*C. J. P. C. R.* pp. 6 and 7; *Campbell*, p. 33.

DHANGAR BASSA, a bachelor hall amongst the Bhuiya.

DHANK, 30 miles N.W. from Junagarh, formerly an important city, has a group of small caves. A few miles to its west is the village of Siddhsar, and in a ravine, called Jhinjuri Jhar, are five plain caves, cut out in calcareous sandstone. N.W. of Dhank, near Hariesan, on the W. side of Gadka Hill, are other nine caves.—*Burgess*, p. 201.

DHANKLI. HIND. A machine for raising water, called Pecottah in Tamil.

DHANUK. HIND. A bowman. Dhanuk and Danusha are names of a race in Northern India, but numerous in Behar, employed as archers, fowlers, and house guards, also in several menial occupations both of the house and field. Wherever they reside, the females are specially in request as midwives. Dr. Buchanan describes the Dhanuk of Behar, Bhagulpur, and Puraniya as engaged in agriculture like the Kurmi. Many of them are agricultural slaves. The Dhanuk are descended, according to the Padma Purana, from a Chamar and a Chandal woman. From the Dhanuk have proceeded Aherya, who are said not to eat dead carcases, as the Dhanuk do. There are reported to be seven subdivisions of the Dhanuk, Loungbusta, Mut'hurea, Kut'hurea, Jyswar, Magahi, Dojwar, and Chhilatya. These do not intermarry, or even eat or smoke together. They mix, indeed, so little with one another, that an individual Dhanuk is seldom able to mention more than two, or at most three, of these names as belonging to his fraternity. There are several Dhanuk in Dehli, and they are scattered over the North-Western Provinces; but Behar is the country in which they most abound. —*Wils. Glos.; Elliot's Suppl. Gloss.; Postans' Western India*, i. p. 167.

DHANUR VEDA, a book on weapons.

DHANWANTARI. There have probably been several persons of this name, and at different eras. The name occurs, along with those of Charaka and Susruta, in poems written in the time of Nala Raja. Professor Wilson supposed Charaka and Susruta to be of the 9th or 10th centuries A.D. A Dhanwantari is supposed to have been king of Kasi or Benares, and as such styled Deva-dasa Kasi Raja. He is regarded as the founder of Hindu medicine, and he takes in India the place occupied by Æsculapius amongst the Greeks. A medical work, bearing this name as its author, is still extant, and in use amongst all the Hindu physicians of British India. His era can only be conjectured to have been before Christ. The name is applied also to a teacher of medical science, to whom the authorship of the Ayur Veda is attributed; but other physicians, Bhela, Devodasa, and Palakapya, are also so named; and a physician of this name was one of 'the nine gems' at the court of Vikrama. It is also the name of a Vedic deity, to whom offerings at twilight were made in the N.E. quarter. In one Brahmanical account of the deluge, a Dhanwantari is said to have been, with other thirteen precious products, a physician produced at the churning of the ocean. Takaji-ca-coond, or 'fountain of the snake-king,' is about two miles east of Naoli, near the boundary of Bhynsror and Bhanpura. The road, through a jungle, over the

flat highland or Pat'har, presents no indication of the fountain, until you suddenly find yourself on the brink of a precipice nearly 200 feet in depth, crowded with noble trees, on which the knotted korū is conspicuous. The descent to this glen is over masses of rock; and about half-way down a small platform, are two shrines, one containing the statue of Takshac, the snake-king, the other of Dhanwantari, the physician who was produced at the churning of the ocean. The coond or fountain is at the southern extremity of the abyss. Dhanwantari of the Hindus has not an attendant serpent, like his brother Æsculapius of Greece. 'The health-bestowing Dhanwantari, the celestial physician, arose from the sea when churned for the beverage of immortality.' He is generally represented as a venerable man with a book in his hand.—*Rajasthan*, ii. p. 718; *Colem.'s Hind. Myth.* p. 383; *Moor*, p. 342; *Dowson.*

DHAOLA DHAR or Dhalola Dhar, a mountain chain in Kangra district, Panjab, formed by a projecting fork of the outer Himalayan range. Below, the waste of snow-fields is succeeded by a belt of pines, giving way to oaks as the flanks are descended, and finally merging into a cultivated vale, watered by perennial streams. The highest peak attains an elevation of 15,956 feet above sea-level, while the valley has a general height of about 2000 feet. Dhaola Dhar means White Mountain, from Dhavala, SANSK., white. The whole length of the outer or sub-Himalaya is nearly 300 miles from S.E. to N.E. It is pierced by the Ravi, the Chenab, the Punach, and the Jhelum rivers, which divide it into separate districts. The snow-line is about 16,000 feet in height. Dhaola Dhar is called by several names in the maps,—Mani Mahes ki Dhar, or the mountains of the holy lake of Mani Mahes; and Hugel calls it Palam-ki-dar and Chamba-ki-dar. The rocks are clay and mica slate.—*Imperial Gazetteer; Cleghorn's Report*, p. 97.

DHAR, a native state in Central India, between lat. 22° 1′ and 23° 8′ N., and long. 74° 43′ and 75° 35′ E.; and the town of Dhar, lat. 22° 35′ N., long. 75° 21′ E., in Malwa, 33 miles W. of Mhow. The level of the railway, 1850 feet. The Puar family was one of the most distinguished in early Mahratta history; and Anand Rao Puar is usually considered as the founder of the principality of Dhar, which, with some adjoining districts, and the tribute of some Rajput chiefs, was assigned to him by the first Baji Rao, Peshwa. For twenty years before the British conquest of Malwa, the Dhar state was subjected to a continued series of spoliations, chiefly at the hands of Sindia and Holkar, and was preserved from destruction only by the talents and courage of Meena Bai. Anand Rao Puar died in 1807, and was succeeded by his posthumous son, Ramchander Rao Puar, on whose mother, Meena Bai, the administration devolved. Ramchander died early, but Meena Bai, with the consent of the neighbouring chiefs, adopted her sister's son, under the name of Ramchand Puar. The Dhar state rebelled in 1857, and was confiscated, but it was subsequently restored to Anand Rao Puar, with exception of the Bairsea pargana. The area of the state is estimated at 2091 square miles, and the population at about 125,000 souls.—*Buch. Hamilton; Treaties, Engagements, and Sunnuds*, iv. p. 425.

DHARA. SANSK. A bearer or supporter. Chau-dhari, the four bearers, supporters of the platforms of Hindu temples.

DHARALA. MAHR. Applied to the Koli, Paggi, and others, who habitually wear arms.

DHARI, name of a waterfall near the Hirnphal, or Deer's Leap, on the Nerbudda.

DHARICHA. HIND. Second husband of a widow.

DHARINJO. URIYA. A common tree of Ganjam and Gumsur; extreme height 60 feet, circumference 4 feet. The bark is used medicinally by women after childbirth; the juice of the leaves is supposed to cure itch.—*Captain Macdonald.*

DHARMA, a tract of country in Kumāun district, N.W. Provinces, lying on the Tibetan side of the main Himalayan range, between lat. 30° 5′ and 30° 30′ N., and between long. 80° 25′ and 80° 45′ E. It is of considerable elevation, its chief peak, Lebong, rising 18,942 feet above sea-level; while the Dharma pass, on the northern frontier, leading into Hundes, reaches a height of about 15,000 feet. The habitable portion consists of narrow and very rugged valleys, traversed by the river Dhauli and its tributaries. The inhabitants are Bhotiya, a Tibetan race, who carry on a trade between Hundes and Kumaun, by means of pack-sheep, over the Dharma pass. Estimated area, about 400 square miles.—*Imp. Gaz.*

DHARMA. HIND., SANSK. Charity, law, virtue, morality, justice, religious ritual, religious law, legal or moral duty. Dharma, Artha, and Kama are the three principles on which Hindus base their ideas of life and its duties. Dharma, the acquisition of virtue and religious merit and obedience to the ordinances of religion; Artha, the acquisition of arts, friends, and property, land, gold, wealth, cattle, equipages; and Kama is the enjoyment of appropriate objects by the five senses. Dharma-karta, the manager of a Hindu temple, a churchwarden. Dharmsala, a resting-place for travellers. Dharma-sala, a religious assembly. Dharma-sastra, the Hindu code of laws, the whole science of law. Dharma-kari, a judge. Dharma-das, a temple servant. Dharma-swama, literally faith (dharma), to his lord (swama). In the Dharmarcha or Dharm-adharma ordeal, figures or drawings of dharma and adharma, virtue and vice, are covered with cow-dung and put in a covered vessel, and the accused is allowed to draw; if the dharma image be withdrawn, he is innocent.

DHARMA, the eight scriptures of the Nepalese Buddhists.

DHARMAPADESAKA, the teacher of Dharma, the ordinary term in use to designate a religious teacher.

DHARMAPURI, a mythological city of the Hindus, twelve months' journey from Yamapuri, another fabulous city of Hindu mythology. It is the same with the purgatory of St. Patrick in the gold island.

DHARMA-RAJA, the title of the spiritual ruler of Bhutan, literally king of virtue. He succeeds by incarnation.

DHARMA-RAJA, Shinje, Telūgū, and Choigyal, Tibetan, is from Dharma, justice, and Raja, a king. A name of the Hindu deity Yama in his beneficent form. He is the king of justice, whose countenance the virtuous only see; the wicked see him as king of the infernal regions. In the Hindu religion he is the god of eternal justice. Antaka

is an attribute of Yama or Dharma-raja, in the character of the destroyer.—*Cole.'s Myth.* p. 379.

DHARMA-SASTRA, the whole code of Hindu law, but more especially applied to the laws of Manu, Yajnawalkya, and other sages, variously enumerated from 18 to 42, who are supposed to have recorded the Smriti, or recollections of what they received from a divine source. Of these, the greatest are Manu and Yajnawalkya. The works are generally in three parts,—Achara, rules of conduct and practice; Vyavahara, judicature; and Praya schitta, penance.—*Dowson.*

DHARMA-SUTRA, a term sometimes given to the Samaya charika rules.—*Müller.*

DHARMSALA, a sanatorium in the Kangra district of the Panjab, in long. 76° 22′ 46″ E., and lat. 32° 15′ 42″ N. The houses are built up the hill, the lowest being at 4000 feet, the highest 7000 feet. The sanatorium is on one of the spurs running south from the great range of Dhaola Dhar. This range runs east and west, at heights of from 13,000 to 19,000 feet, and forms a great wall on the north; it is due to this range that the climate of Dharmsala is so mild, and has such a heavy rainfall. Kangra, said by Lord Canning to be the most beautiful district in India excepting Kashmir, is surrounded by lofty mountains, interspersed with undulating hills, and situated between the rivers Ravi and Sutlej. On one side it has the territories of Kashmir and Chumba, on the other the wild but romantic hunting-fields of Kulu, Spiti, and Ladakh. Various races of men, speaking different languages, are distributed over its surface. Every tone of climate and variety of vegetation is here to be met with, from the scorching heat and exuberant growth of the tropics, and barren heights destitute of verdure and capped with perpetual snow.—*Dr. W. P. Dickson*, 1870; *India Annals*, No. 227, 1870; *Paharee.*

DHARMSALA. Hind. A building erected for a religious or charitable purpose. It is like the sarai or caravansari of Persia. A house for the accommodation of travellers or pilgrims, or for the reception of the sick or poor. In India they are of varied forms,—sometimes a quadrangle, open all round and to the sky, and with one entrance; sometimes small rooms, both on the inside and outside of the surrounding walls.

DHARNA BAITHNA, literally, to sit Dharna, was a practice put in force in several parts of India by creditors, who sat down before the doors of their debtors, so as to close all exit unless over the sitter's body, and thus compel a payment of their claims. The practice, up to the 19th century, was familiar at Benares, and may be translated caption or arrest. It was used by the Brahmans to gain a point which could not be accomplished by any other means; and the process was as follows:—A brahman who adopts this expedient for the purpose mentioned, proceeds to the door or house of the person against whom it is directed, or wherever he may most conveniently intercept him. He there sits down in dharna, with poison or a poniard, or some other instrument of suicide in his hand, and, threatening to use it if his adversary should attempt to molest or pass him, he thus completely arrests the debtor. In this situation the brahman fasts; and by the rigour of the etiquette, which is rarely infringed, the unfortunate object of his arrest ought also to fast, and thus they both remain until the institutor of the dharna obtains satisfaction. In this, as he seldom makes the attempt without resolution to persevere, he rarely fails; for if the party thus arrested were to suffer the brahman sitting in dharna to perish by hunger, the sin would for ever be upon his head. This practice has become almost unheard of in late years; the last occasion in Madras was about A.D. 1846; but formerly even the interference of British courts often proved insufficient to check it, as it had been deemed in general most prudent to avoid for this purpose the use of coercion, from an apprehension that the first appearance of it might drive the sitter in dharna to suicide. The discredit of the act would not only fall upon the officers of justice, but upon the Government itself. The practice of sitting in dharna was not confined to brahman men. It was had recourse to by Benu Bhai, the widow of a man of the brahmanical tribe, who had a litigation with her brother-in-law, Bal Kishen, which was tried by arbitration, and the trial and sentence were revised by the court of justice at Benares, and again in appeal. The suit of Benu Bhai involved a claim of property and a consideration of caste, which her antagonist declared she had forfeited. Originally it was practised by brahmans, but was prohibited by Res. 7 of 1820 of the Bengal Code. In the south of India it is done before idols for obtaining the object of desire. It is an ancient practice. Genesis xxiv. says, 'I will not eat until I have told mine errand,' and a brahman sometimes went to a house, sat down, and refused to eat till he had obtained the object he had in view. The 'Englishman' newspaper relates that about 1850, a man named Chutterbhooj, son of a well-known and respectable Charan of Udaipur, carried to the late chief of that state certain grievances which he considered himself to be suffering in connection with his village. Failing to secure redress by ordinary measures, he took the unusual course of intruding on the chief without permission, for which breach of etiquette he was forbidden to enter the palace again. Accordingly, being under a sense of degradation, ill-feeling, and annoyance, engendered by the prohibitory order, he indulged in satires and philippics against his chief, who thereupon confiscated his village. Upon this, Chutterbhooj proceeded to Sulumbur, which at that time was at enmity with the chief of Udaipur, and this step only incensed the chief all the more against him. Here he appears to have been provided for, but subsequently wandered about from place to place trying to obtain redress, but without being able to secure either the forgiveness of his chief or the restitution of his village. In this state of feeling he appears to have given way to the superstitious idea, still prevailing amongst the Rajputs, that the shedding of his own blood or the blood of his family would bring destruction upon those who had offended him, if it did not secure a ready attention to his real or imaginary wrongs. In 1859, therefore, whilst travelling through the jungle with his two wives, two slave girls, and a servant, together with a party of the Meena, who were his retainers, he one day dismounted and gave his horse in charge to the servant, and began to smoke. Then, advancing a little distance, he suddenly killed the servant, and called upon the Meenas to dismount the women. His orders were obeyed. One slave girl fled away with her boy to a neighbouring village, and escaped, but the three

other women were killed. The slave girl informed the villagers of what had occurred, and they went out and saw the dead bodies, and carried them away, and burnt them. The slave girl died the next year, and Chutterbhooj never turned up for six years after the offence had been committed. He then came in and confessed to having murdered the women and servant. Accordingly he was tried and convicted of murder, and the Viceroy was fully of opinion that the man deserved hanging, but that, considering the number of years which had elapsed, the prevalence of superstition, and the lawlessness which prevailed in that part of Rajputana at the period in question, when many such acts were committed with impunity, His Excellency commuted the sentence to transportation for life. The inviolability of a brahman, and the sin attached to causing the death of one in any way, is inseparable, and to this, according to Sir William Jones, may be traced the practice of dharna.

DHARNI, a Nepal weight of three seers.

DHARWAR, a town which gives its name to a revenue district in the Southern Mahratta country, lying between lat. 14° 17′ and 15° 50′ N., and long. 74° 51′ and 75° 57′ E., with 988,037 inhabitants. Between 1787 and 1796, famine occurred from a succession of droughts, accompanied by swarms of locusts. The next famine was in 1802–3, occasioned by the immigration of people from the valley of the Godavery and the march of the Peshwa's army through the country. In 1832, from want of rain, prices ruled very high. Owing to successive hot seasons, famines recurred in the years 1866 and 1877.—*Imp. Gaz.*

DHASHT-i-KIPCHAK, the Sahara of Asia.

DHASRA, religious mendicants in Southern India, who hold an iron worshipping lamp in their hands, and perform on the jangata, tarte, and sinku. They walk before a corpse when being carried to the funeral pile.

DHAT, an isolated and now dependent chieftainship of which Oomerkote is the capital. It separates the Bhatti race from the Jareja race. Its prince is of the Pramara race and Soda tribe, ancient lords of all Sind. The Dhatti is the Rajput tribe inhabiting Dhat, and in no greater numbers than the Kaorwa, whom they resemble in their habits, being entirely pastoral, cultivating a few patches of land, and trusting to the heavens alone to bring it forward. They barter the ghi, or clarified butter, made from the produce of their herds, for grain and other necessaries of life. Rabri and chauch, or porridge and buttermilk, form the grand fare of the desert. A couple of seers of flour of bajra, jooar, and kaijri is mixed with some seers of chauch, and exposed to the fire, but not boiled, and this mess will suffice for a large family. The cows of the desert are much larger than those of the plains of India, and give from eight to ten seers (eight or ten quarts) of milk daily. The produce of four cows will amply subsist a family of ten persons from the sale of ghi; and their prices vary with their productive powers, from ten to fifteen rupees each. Rabri, analogous to the kous-kous of the African desert, is often made with camel's milk, from which ghi cannot be extracted, and which soon becomes a living mass when put aside. Dried fish from the valley of Sind is conveyed into the desert on horses or camels, and finds a ready sale amongst all classes, even as far east as Barmair. It is sold at two dokra (coppers) a seer. The poora, or temporary hamlets of the Dhatti, consisting at most of ten huts in each, resemble those of the Kaorwa.—*Tod's Rajasthan*, i. p. 45.

DHATUGARBHA, from Dhatu, relic, Garbha or Gabba, a casket, softened into the Dhagoba, is the altar, shrine, or relic receptacle in which the relics of Buddha are kept. The dhagoba is the descendant of the sepulchral tumulus of the Turanian races, whether found in Etruria, Lydia, or among the Scyths of the northern steppes. By some it is supposed to be the source of the word Pagoda. It is also known by the Sanskrit word Chaitya. Dhagoba is a Buddhist shrine enclosing or protecting some sacred relic; but by some they are supposed to be shrines built over the remains of persons of the Buddhist faith, and consecrated to their saints.—*Prinsep's Antiquities by Thomas*, p. 154. See Dhagoba.

DHAULI, 20 miles south of Khatak, and 20 miles north of Jaganath, has two separate edicts of Asoka. The first edict is addressed to the public officers of the city of Tosali, and commands murderers to be imprisoned. Both edicts appoint two tuphas, or colleges for meditation and the propitiation of Heaven. The question of atheism in ancient Buddhism is set at rest by these edicts, which repeatedly speak of this world and the world hereafter; and the people are expressly commanded to propitiate Heaven, and to 'confess and believe in God, who is the worthy object of obedience;' or, more literally, 'Him, the eternal, ye shall propitiate by prayer.'—vi. p. 442.

DHAURA. Hind. Grislea tomentosa. The scarlet flowers, dhau ka phool, are considered stimulating, and given to women in labour; are also used in dyeing. The gum, dhaura or dhau ka gond, is white in colour, like the katira and tragacanth gums, swells in water. In dyeing cloth it is applied to those parts that the dye is not wished to touch. It is eaten in Luddoo. One maund costs ten rupees.—*Gen. Med. Top.* p. 133.

DHAURI. Hind. Coarse leather shoes.

DHAUSSA. Hind. A kettle-drum, carried on horseback.

DHAVA. Hind. A thatch grass.

DHAWALIGIRI, a mountain in Nepal, in lat. 29° 11′ N., long. 82° 59′ E. One of the loftiest peaks of the Himalayas, rising 27,600 feet above sea-level.—*Imp. Gaz.*

DHAWAR. Mahr. A tribe of iron-smelters.

DHAYA. Hind. Land on a river bank, but subject to the occasional overflow of water; also ridges along the dry course of a river, which has turned in another direction.
